Pinion Bearing Assembly. Use tool J-1292-B to remove and install pinion shaft on propeller shaft. Install front pinion bearing with shielded side toward front (splined end of shaft) with loading groove in outer race toward top to prevent oil leakage into torque tube. When installing pinion assembly in carrier, when pinion is larger in diameter than rear roller bearing so that bearing outer race cannot be tapped into place in housing, use special tool J-1192 inserted between pinion and rear bearing and drive on end of pinion with bronze driving block to seat bearing.

Torque Tube (40, 50, 60, 70). Do not disturb bolted connection between torque tube flange and carrier flange unless installation of new gasket required to stop oil leaks (special gasket required). Tube and carrier are matched and must be kept lined up (furnished as an assembly only, separate parts not available).

Pinion Setting. Production pinions not ground on face and gauge measurements must be made at particular pinion tooth. When using gauge measure to blank tooth between tooth having factory inspection number and tooth with + or — mark and again at opposite side of pinion (place adapter on pinion with blank tooth up and then with blank tooth down) and average these two readings to determine shim correction. Pinion setting figures same as for 1939 models (.379 for 40, 50, 60, 70; .203 for 80, 90). NOTE—Service pinions have ground face. Above procedure required for production pinions only.

Differential Bearing Adjustment. Should be set 2-2½ notches tight (same as for 1939 models).

Ring Gear Backlash. Should be .006-.010" (new gears) with slight increase over .010" permissible for worn gears (same as for 1939 models).

BUICK REAR SUSPENSION

Used On:

SERIES 40-40, 50, 60, 70, 80, 90 (1940)

This "BuiCoil" type suspension same as used on 1938-39 Buick models except as noted below.

TYPE:—Design changed for 1940 models as follows:

Shock Absorbers (40, 50, 60, 70). Shock absorbers are double-acting, parallel cylinder Delco type mounted on brake backing plate by two bolts (remove wheel and brake drum to remove shock absorbers). Upper end of shock absorber arm link is fastened to lower flange of frame side rail.

Shock Absorbers (80, 90). Delco double-acting, end-to-end discharge type mounted on frame side rails and linked to axle housing at spring seat (same as 1939).

SERVICING:—Serviced in same manner as previous models. ***See "Buick Rear Suspension" article in Mechanical Equipment Section of manual and note following changes:***

Trim Dimension (Spring Height)—With car at curb weight (ready for road but no passenger load), check distance from lower face of frame side rail (straight section to rear of spring on 40, 50, 60, 70; insulator seat on 80, 90) to lower face of spring on axle housing bracket. If trim dimension less than shown in table below, replace spring (see spring data).

Car Model	Trim Dimension
40, 50, 60, 70	6¼-7¼"
80, 90	6¾-7¾"

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Rear Spring Specifications—Springs have identical ends at top and bottom. Spring part number stamped on coil near end and spring paint marked for identification as follows:

Car Model	Spring Part No.	Color Mark
41, 41C, 48	1312433	Yellow
41T	1310399	Red
46, 46S	1315049	Blue
46C	1315105	Brown
51	1312433	Yellow
51C	1317788	
56S	1315047	
56C	1317790	
59	1315231	
61, 61C	1310399	Red
66, 66S	1315049	Blue
66C	1315105	Brown
71	1310399	Red
71C	1317789	
76S	1312433	Yellow
76C	1317788	
80C; 81, F, C; 87, F	1309893	
90, 90L	1308803	
91	1309892	

Heavy Duty (Overload) Springs. If spring bottoms excessively when loaded, a spring from a heavier model car may be installed providing that new spring does not increase trim dimension (above) more than 1". Make certain that same type spring installed on both right and left sides of car. For use with trailers or when heavy loads carried in rear compartment (not to exceed 500 lbs. in addition to normal passenger load of 500 lbs.), special rear springs may be installed as follows:

Heavy Duty Rear Springs

Model	200 lb. Overload	300 lb. Overload
41, 41C, 48, 51	1310399	1315233
46, 46S, 46C, 56S	1312433	1315231
61, 61C, 71	1315231	1315233
66, 66S, 66C	1312433	1315231
76S	1310399	1315233
80C; 81, F, C; 87, F	1304586	1305365
90, 90L, 91	1305365	1305366

Rear Stabilizers:—When installing stabilizer links, nuts should be tightened down to ends of threads which should compress rubber grommets to over-all length of 1 11/16" (to outer face of metal cup on each end of grommet), adjust nuts as required to secure this dimension. On 80, 90 models, grommet cups are positioned on link by collars and each grommet must be adjusted separately. On other models a tubular spacer is used on the link between the inner grommet cups. Over-all free length of new grommets is ⅞" (40, 50, 60, 70), 15/16" (80, 90).

CADILLAC-LA SALLE HYPOID TYPE

Used On:

CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)
CADILLAC V16, SERIES 40-90 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)

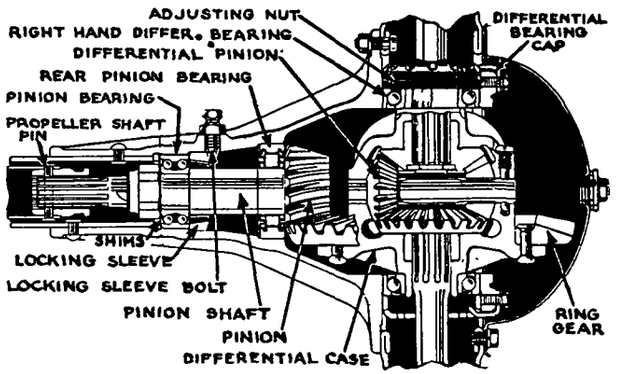
These axles same design as used on 1939 models.

TYPE:—Hypoid gear. Same design as used on 1939 car models with pinion bearing adjusting spacer as follows:

Pinion Bearing Adjusting Spacer—Compressible steel spacer is installed on pinion shaft between pinion bearing cones. Tightening of rear universal joint companion flange nut causes the spacer to "buckle" and pre-loads bearings.

SERVICING & OVERHAUL:—Differential carrier assembly should be serviced by replacement. Manufacturer recommends that no attempt be made to disassemble axles further than removal of carrier assembly or replacement of pinion shaft and axle shaft oil seals.

CHEVROLET HYPOID TYPE (PASSENGER CARS & TRUCKS)



Used On:

PASSENGER CAR TYPE
SPECIAL DELUXE KA, MASTER DELUXE KH ('40)
MASTER '85', MODEL KB (1940)

TRUCK TYPE
HALF TON KC, ¾ TON KD, ¾ TON SPEC. KE ('40)
These Axles same design as used on 1939 models except as noted (Truck Axle New Hypoid Gear Type).

TRUCK AXLE NOTE:—Truck axles are same design as those used on Passenger Car Models except they are of heavier construction. Truck axles also have improved lubrication system as follows:

Pinion Bearing Lubrication—Drilled passage in differential carrier provided for greater oil flow to front (double row ball) pinion bearing. Oil retainer installed in carrier in front of rear (roller) pinion bearing retards oil return to axle housing so that front bearing operates in an oil bath.

TYPE:—Same design as used on 1939 Passenger Car models. Passenger car axles marked for identification as follows:

Rear Axle Ratios & Marks—Axle used on each Passenger Car model may be identified by prefix letter of part number stamped on top of differential carrier casting on right side of center rib as follows: 'B'—4.11-1 Ratio (KA, KH), 'C' or 'CB'— 3.73-1 Ratio (KB). NOTE—This 4.11-1 axle ratio is new, 3.73-1 ratio is same as used on 1939 Master '85'.

SERVICING & OVERHAUL:—All specifications and servicing operations same as for previous models except as noted below. *See 'Chevrolet Hypoid Type (Passenger Cars)' Rear Axle article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions and note following new specifications:*

Ring Gear Backlash—Should be .005-.008" for all models.

Axle Shaft Endplay (Passenger Cars)—Controlled by spacer assembled on differential pinion shaft between inner ends of axle shafts. Endplay should be from a Free Fit to .014" max. Spacer blocks now furnished in three types providing four sizes as follows: Narrow—1.0105". Medium—1.0195" and 1.0295", Wide—1.0345". These dimensions taken across ground faces of block and block should be installed with these ground faces toward axle shaft ends. NOTE—Medium block ground on all four sides and may be installed either way to secure either of these two sizes.

Axle Shaft Endplay (Trucks)—Same as for Passenger Car (above) except that spacer blocks furnished in two types for three sizes as follows: Narrow—1.1485", Wide—1.1575" & 1.1675" (this block ground on all four sides and may be installed either way to secure both sizes).

Pinion Bearing Assembly (Trucks)—When assembling pinion bearings on shaft, install rear roller bearing and lock ring, then thread pinion front bearing oil retainer on shaft with bevel of large diameter of retainer toward pinion, assemble bearing lock sleeve with bevel side toward pinion, install front double row ball bearing and bearing retainer nut. All other assembly and adjustment instructions same as for passenger car models.

CHEVROLET FULL-FLOATING HYPOID TRUCK TYPE

Used On:

1½ TON MODELS WA, WB; SCHOOL BUS WC ('40)
CAB-OVER-ENGINE TRUCKS, WD, WE, WF (1940)

NOTE—Two axle ratios used (5.43-1 and 6.17-1) and each type may be identified by prefix letter of part number stamped on top surface of top rib on right side of differential carrier casting as follows: 5.43-1 Ratio—'B' or not lettered (straight part number), 6.17-1 Ratio—'H' or 'HB'.

TYPE:—Hypoid Gear, full floating type. Similar to design used on previous Chevrolet Truck models except for new Hypoid Gears and new Ring Gear Mounting (ring gear held on differential case by same screws as used to clamp differential case halves together). NOTE—Ring gear can now be replaced without replacing differential case (as required on previous model).

SERVICING:—Gear Adjustment—Pinion not adjustable. Backlash should be .005-.008" (see Differential Bearing Adjustment below).

Axle Shaft & Wheel Bearings:—Wheels mounted on double barrel type roller bearings on outer end of axle housing and axle shafts can be removed without disturbing bearings. To remove axle shaft, bend lugs of lock plate away from bolt heads (on axle shaft flange on wheel hub), remove eight ½" capscrews, remove and discard lock plate. Install two ½" x 13 capscrews in tapped holes in flange (between mounting screw holes), turn these screws up evenly to loosen axle shaft, remove axle and aluminum gasket. When installing shaft, use new aluminum gasket and new lock plate, tighten capscrews evenly and securely, then bend lock plate lugs against screw heads.

Wheel Bearing Adjustment—Remove axle shafts (above), remove adjusting nut locknut and lock (within wheel hub), use special wrench J-870 (see Note below) and turn adjusting nut up tight, then back nut off 45° (⅛ turn). Rotate wheel hub by hand to make certain that it turns freely. Install lock and see that tangs line up with slots in adjusting nut, bend lock tang into slot in nut. Install and tighten outer locknut, bend lock tang into notch in nut. Re-install axle shaft. NOTE—Wheel bearing adjusting nuts on later trucks do not have slots extending entirely across face of nut (slotted at

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

outer edge only) and the J-870 wrench must be reworked for use on these models as follows: Remove wrench handle, mount wrench body in lathe and machine inner ends of wrench lugs to inside diameter of 2½".

Wheel Bearing Assembly—To remove wheel bearings, remove axle shafts (above), take out locknut, lock, adjusting nut, remove hub and drum assembly. Install clamp on brake cylinder. Use puller J-918 to remove inner bearing and oil seal. To remove outer bearing from wheel hub, tap outer race to relieve tension on snap ring, remove snap ring on inside of hub, use long ⅛" punch inserted through mounting screw holes in end of hub and tap outer race out of hub (inner race and roller assembly will come out with outer race—use extreme care to tap on outer race only and to drive race out evenly). Wash bearings in gasoline and pack roller assemblies with #2½ cup grease. To replace outer bearing, place inner race, roller assembly and outer race on wheel hub with thin edge of outer race toward hub, use bearing replacer J-872-1 in an arbor press and press bearing in hub just far enough so that snap ring can be installed, install snap ring, then tap bearing out against snap ring (use driver J-872-3 inserted through mounting screw holes and tap on outer race only). To install inner bearing, use special driver J-872-4 to press outer race in against seat (install with wide side of race toward hub), install inner race and roller assembly. Press oil seal in place using oil seal replacer J-872-2 in arbor press, stake oil seal in place by prick punching at three equally spaced points on edge. Install wheel hub and drum assembly (turn wheel to seat bearings) and adjust bearings (above).
NOTE—Oil slinger on rear axle housing must be installed with special tool J-973 so it will be correctly positioned in relation to slinger in wheel hub. Always install new slinger whenever removed.

Rear Propeller Shaft Front Bearing—Consists of a bronze bushing and oil seal in forward end of housing retained by a dowel pin. To replace bushing, drill out dowel pin, use old shaft to drive out old bushing and oil seal from rear end of torque tube. Dip new oil seal in heavy oil, install in front end of torque tube with free end of leather toward front, use driver J-1362 to seat oil seal against shoulder in tube. Install bushing with end which has machined angle on face toward oil seal and seat bushing in tube with same J-1362 driver. Drill dowel hole in bushing (use care not to break through inner wall), install new dowel pin and peen in place,

Front Propeller Shaft Assembly:—To disassemble, remove capscrews retaining rear universal joint ball retainer, remove retainer and ball. Use long socket wrench and remove capscrew in rear end of shaft (visible through hole in universal cross), remove universal from shaft. Take out snap ring retaining ball bearing in shaft housing, withdraw shaft and bearing from housing, press bearing from shaft.

Front Bearing—Consists of a bronze bushing and oil seal in forward end of shaft housing similar to rear propeller shaft front bearing (see above) and installed in same manner except that special driver J-1363 should be used.

OVERHAUL:—Disassembly—Remove ring gear thrust pad, adjusting nut locks, bearing cap bolts and lock-washers, take off bearing caps (bearing caps now piloted on carrier by sleeve type dowels to maintain alignment), lift differential case and ring gear assembly out of carrier. Take out bolts mounting torque tube on differential carrier, remove torque tube, withdraw propeller shaft assembly.

Pinion Bearing Assembly:—To disassemble, cut off rivet heads holding pinion shaft in coupling, drive out rivets, use special replacer and removal press J-985 and press pinion and coupling off propeller shaft, use press plates and press coupling off pinion shaft in an arbor press. Remove lock ring retaining bearing on end of pinion shaft, use special press plate J-1453 and press pinion and shaft out of this bearing (use extreme care that press plate bears against inner race of bearing only—bearing will be damaged if pressure applied to outer race). Clamp pinion shaft in vise (use universal joint yoke as clamp plate), remove pinion bearing retaining nut. Thread special pinion bearing bearing remover over pinion (J-1439 for 6 tooth pinions, J-1440 for 7 tooth pinions) and against bearing, press bearing off shaft. To assemble, reverse directions given above and note following points: Use new bearing retaining nut, tighten nut securely and lock by cutting sleeve on nut in line with keyway and driving edge of nut sleeve into keyway. Install rear roller bearing on shaft with chamfered side of inner race toward pinion, use lock ring installer J-1364 to install lock ring on end of shaft. Make certain that holes in coupling and shaft line up when pressing coupling on, use new flat head rivets and securely rivet ends. Check runout.

Propeller Shaft Run-out—Support assembly on 'V' blocks at double row pinion bearing (rear end), ground diameter back of shaft splines (front end). Run-out must not exceed following maximums (straighten shaft assembly if excessive): .003" at roller bearing on rear end of shaft, .010" at finished part of shaft in front of coupling, .015" at rough section in middle of propeller shaft, .005" at extreme front end of shaft.

Pinion Setting:—Pinion position not adjustable. Double row bearing should be seated against shoulder in carrier and is retained by torque tube

Differential Bearing Assembly:—Bearings are press fit on differential case hubs. Use special puller to remove bearings (puller fingers must fit in notches in case so that pressure applied to inner races only). Mark differential case halves before dis-assembly to insure reassembling in same position—this is very important. Remove twelve ½" bolts holding case halves and ring gear together, lift off case cover, remove differential pinions and side gears, tap ring gear off case with soft-faced hammer. When reassembling, oil pinions and side gears and install in left side of case, assemble right side of case being careful to line up marks made before disassembly, install guide pins in two opposite bolt holes (guide pins can be made up of two #2652253 ring gear screws with heads removed and end slotted to permit removal). Make certain that ring gear seat on case is clean and not burred, install ring gear on guide pins, install bolts in all holes (except guide pin holes), tighten all bolts evenly and securely until ring gear face is flush with flange on case, remove guide pins, install remaining bolts and tighten all bolts. Use special driver to install differential side bearings on case hubs and see that wide side of inner race is toward case. Check differential case run-out which must not exceed following maximum figures: .004" at ring gear pilot on case and face on which ring gear is bolted, .007" on back of ring gear after gear bolted in place.

Differential Bearing Adjustment:—When installing differential assembly in carrier, make certain that bearing cap marks line up with marks on carrier, tighten bearing capscrews until lock washers just flatten out, screw both bearing adjusting nuts up until snug to seat bearings. Back off right hand adjusting nut, tighten left hand nut until all clearance or backlash between ring gear and pinion is just taken up, then back off adjusting nut two notches to locking position (slot in nut in line with lock). Tighten right hand adjusting nut solidly, back nut off until free of bearing, then tighten right hand adjusting nut until all play in bearing is taken up, and then tighten nut one to two notches more to locking position, tighten bearing cap screws and install adjusting nut locks. Check backlash.

Ring Gear Backlash Adjustment—If backlash not correct after setting up bearings as directed above, loosen left hand adjusting nut one notch and tighten right hand nut one notch (if backlash less than .005-.008"), or loosen right hand nut one notch and tighten left hand nut one notch (if backlash greater than .005-.008"). In making any backlash adjustment both adjusting nuts must be turned an exactly equal number of notches (in opposite directions) to avoid disturbing bearing adjustment.

Ring Gear Thrust Pad Adjustment:—Examine bronze tip on ring gear thrust pad and replace if worn. To adjust, tighten thrust pad adjusting screw until bronze tip engages back of ring gear lightly (turn gear while making adjustment), then back screw off 1/12 turn, hold screw from turning and tighten locknut. This adjustment will give clearance of .005-.007" between thrust pad and ring gear.

CHEVROLET TWO-SPEED (DOUBLE REDUCTION) TRUCK TYPE

Optl. Equipment On:
CHEVROLET TRUCK, ALL MODELS (1940)
This Axle same design as used on 1939 models.

SERVICING, OVERHAUL & ADJUSTMENT:—All operations same as for 1939 Two-speed Rear Axle except as noted below. *See 'Chevrolet (Double Reduction) Two Speed Type' Rear Axle article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions and note following new data:*

Axle Shaft Gasket—Soft aluminum gasket used between wheel hub and axle shaft flange. Install new gasket whenever axle shafts are removed. NOTE—This type aluminum gasket can be installed on previous truck models (to replace earlier type Vellumoid gasket) to correct oil leaks at this point.

Wheel Bearing Servicing—Wheel bearings installed in same manner as on regular full-floating axle (see preceding article) except that when using Outer Wheel Bearing Driver J-872-3, the eight studs must be removed from the hub in order to permit the driver pins to engage the bearing outer race and seat the bearing firmly against the snap ring. NOTE—The regular J-872-3 driver can be reworked by drilling four 9/16" holes midway between pins. With this change, it will be necessary to remove 4 studs only from hub instead of entire 8.

Shifter Sleeve Installation Note—Shifter sleeve has three tapered teeth which must line up with poppet balls and springs in shaft. These tapered teeth are unevenly spaced on the shaft and in the sleeve (two groups of 8 teeth and one group of 9 teeth between these tapered teeth). Determine the 9 tooth group on the sleeve and the 9 space-between-teeth group on the shaft and mesh these together. CAUTION—If sleeve and shaft not meshed in this manner, one or more lock balls will be out of position in the sleeve.

CHRYSLER HYPOID TYPE

Used On:

CHRYSLER, MODEL C25 ROYAL & WINDSOR ('40)

CHRYSLER, C26 TRAVELER, SARATOGA, NEW YORKER (1940)

DE SOTO, MODEL S7 CUSTOM & DELUXE (1940)

DODGE LUXURY LINER, D14 DELUXE, D17 SPECIAL (1940)

PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)

These Axles same design as types used on corresponding 1939 car models.

SERVICING & OVERHAUL:—All service operations same as for previous models. *See "Chrysler Hypoid Type" Rear Axle article in Mechanical Equipment Section of manual for complete data and adjust axles to following specifications:*

Axle Shaft Endplay—Should be .003-.008". When dismantling axle, make certain that shims installed between backing plate and axle housing flange are saved and replaced when axle reassembled. If new shaft installed, adjust shim thickness for correct endplay as noted above (adjust equally at both wheels).

Ring and Pinion Gear Backlash—Should be .006-.010". When making this adjustment (by backing off one differential bearing adjusting nut and tightening opposite nut), note new differential bearing adjustment data below.

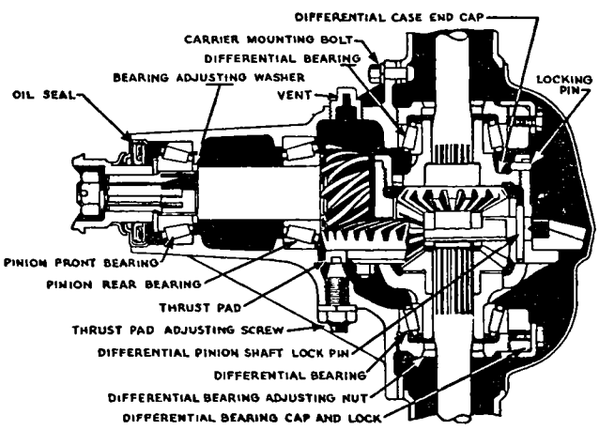
Pinion Bearing Adjustment—Bearings should be .0015-.0025" tight (draw or tension). Use dial indicator to check with sufficient shim stock installed between spacer and front bearing cone so that pinion shaft has some endplay, then remove shim stock equal to this measured endplay plus .0015-.0025" so as to provide this amount of draw or tension when installed on car. Universal joint flange must be in place on shaft and pinion shaft nut must be tight when checking bearing adjustment. Oil seal need not be installed until after bearing adjustment completed (use special drift C-359 to seat oil seal in carrier bore).

Pinion Setting—Controlled by washer (Chrysler C25, De Soto, Dodge, Plymouth except 7 Pass. cars), shims (Chrysler C26 and Chrysler C25, De Soto, Dodge, Plymouth 7 Pass. cars) between pinion and pinion shaft rear bearing cone. Shims or washer thickness should be varied to secure correct pinion mesh (pinion assembly must be dismantled to remove or install these washers or shims).

Differential Bearing Adjustment—When checking adjustment, both bearing adjusting nuts should be tightened sufficiently to seat bearing cups solidly against rollers, then back off adjusting nuts to relieve strain and tighten until assembly turns with slight drag. NOTE—Adjustment can be checked by setting up dial indicator to measure bearing post 'spread' as adjusting nuts are tightened. With correct adjustment, bearing support pedestals should spread or move out .008-.010" measured at the bearing caps.

Ring Gear Backlash Adjustment—When adjusting backlash, note number of notches one adjusting nut is backed off and tighten opposite nut exactly same number of notches to avoid disturbing bearing adjustment.

Differential Side Gear Assembly—Differential pinion gear shaft retained by pin (except 7 Pass. cars), lock screw (7 Pass. cars). Gears can be dismantled (with ring gear removed) by taking out this pin or lockscrew, pulling out shaft and removing thrust block (on center of shaft). When reassembling, make certain that this thrust block installed on shaft with spacer on shaft between block and each differential pinion, and that thrust washers installed in back of each differential pinion and side gear. Clearance between side gears and pinions should be .004-.012" (controlled by thrust washers in back of gears).



CHRYSLER NEW C27 HYPOID TYPE

Used On:

CHRYSLER, MODEL C27 CROWN IMPERIAL ('40)

TYPE:—New design Hypoid Gear, semi-floating type with 'barrel type' differential case. Differential case has open end on right hand side through which differential gears are installed, this opening then being closed by cap which is threaded into case and locked by pin extending through drilled hole in case and cap. Right hand differential case side bearing is seated on shoulder on cap. Pinion shaft bearing cups are seated against shoulders in carrier bore and front bearing cone seats against shoulder on shaft (spacer washer between cone and shaft shoulder), no tubular shaft spacer being used. Special ring gear thrust pad and adjusting screw is installed in left hand side of differential carrier so as to contact back of ring gear.

SERVICING:—Gear Adjustment—Paint gears to check mesh. Backlash should be .006-.010". Adjusted by backing off one differential bearing adjusting nut and tightening opposite nut equally. See Differential Bearing adjustment below.

Axle Shaft Replacement—To remove shaft, remove wheel, axle shaft nut, hub and shaft key (use special hub puller C-319). Disconnect brake line, remove stud nuts holding oil seal and backing plate on housing, remove oil seal, backing plate, and wheel bearing adjusting shims (save shims and reinstall when assembling). Use shaft puller C-158 to pull shaft and bearing (if bearing to be removed from shaft use puller C-293). When installing new shaft, adjust shim thickness at each wheel equally for desired endplay of .003-.008" (shims furnished .010", .0125", .015", .030" thick). NOTE—Shims must be installed or removed equally at each wheel to maintain correct position of spacer block on differential pinion shaft at inner end of axle shafts.

Wheel Bearing Oil Seal—Use special puller C-358 to remove oil seal washer from housing, special drift C-201 to install new seal washer.

OVERHAUL:—Disassembly—Mark differential bearing adjusting nuts and bearing caps to insure replacement in correct position. Remove adjusting nut locks, back off adjusting nuts, take out bearing cap screws, remove bearing caps, lift differential assembly out of carrier. Remove drive pinion shaft nut, pull universal joint drive pinion flange, remove pinion and shaft through rear end of carrier. Use special puller C-293 to remove rear bearing cone from pinion shaft. Use special puller C-358 to remove pinion oil seal from carrier bore, special drift C-359 to install new seal. NOTE—Seal can be serviced without disassembling carrier assembly. New seals should be soaked in thin oil for 30 minutes and leather should be worked by rolling with smooth bar until it is pliable.

Pinion Bearing Adjustment:—Bearing should be .0015-.0025" tight (draw or tension) with pinion shaft nut securely tightened. To check bearings, mount dial indicator so as to measure pinion shaft endplay. Install pinion bearing washer of sufficient thickness between front bearing cone and shoulder on pinion shaft so that shaft has measurable endplay (pinion assembly must be dismantled to change this washer). Then install washer which is thin enough to take up all endplay plus .002" to provide proper draw or tension on bearings (subtract measured endplay plus .002" from first washer thickness to find correct final washer thickness).

Differential Gear Assembly:—To disassemble differential gears, use special puller C-293 and puller blocks to remove right hand differential bearing from differential case cap. Drive cap locking pin through hole in case so that pin is entirely within cap. Heat differential case in boiling water, then unscrew cap from right hand end with special spanner wrench. Drive differential pinion shaft locking pin out of case, withdraw pinion shaft and all differential gear parts. When reassembling, make certain that thrust washers installed behind each differential pinion and side gear and that thrust block installed on center of pinion shaft with spacer between block and each pinion. Peen edge of differential pinion shaft locking pin hole after pin installed to prevent pin working out in service. Heat differential case in boiling water before installing end cap, tighten end cap securely, drill new hole through cap and case and drive new groove pin in hole until flush (do not reuse old groove pins). Clearance between differential pinions and side gears should be .004-.012" and is controlled by thrust washer thickness installed in back of gears.

Differential Bearing Adjustment:—When installing carrier assembly, turn adjusting nuts up to marks made before disassembly, then check bearing adjustment as follows: Tighten both bearing adjusting nuts sufficiently to seat bearing cups solidly

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

against rollers, then back off nuts to relieve strain and tighten until differential assembly turns with slight drag or bearing support pedestals 'spread' .008-.010" as measured at bearing caps (use dial indicator to measure this spread or outward movement of pedestals as nuts are tightened). Replace bearing and adjusting nut locks and tighten bearing cap screws securely.

Ring Gear Backlash Adjustment—When adjusting backlash, note number of notches one adjusting nut is backed off and tighten opposite nut exactly same number of notches to avoid disturbing bearing adjustment. Make certain that ring gear thrust pad has sufficient clearance to permit ring gear movement and adjust thrust pad after correct backlash of .006-.010" is secured.

Ring Rear Thrust Pad Adjustment:—Clearance between thrust pad and back face of ring gear should be .006-.008". To adjust, loosen locknut on thrust pad stud (on left hand side of carrier housing), turn stud up finger tight, then back stud off slightly less than ⅛ turn, tighten locknut.

FORD (PASSENGER CAR) & MERCURY

Used On:

FORD, 022A (60), 01A (85), PASS. CARS (1940)

FORD, 022C (60), 01C (85), 09C (95) COMM'L. ('40)

MERCURY, MODEL 09A (1940)

These Axles same design as used on corresponding 1939 models except as noted below.

NOTE:—Ford '60' Comm'l. Model—Axle used on this model has new 4.55-1 Ratio and uses a new Part No. 022A-4209 Matched Gear & Pinion Set. Axle ratios on all other models are same as on corresponding 1939 models.

SERVICING & OVERHAUL:—All specifications and service operations same as for previous models except as noted below. *See 'Ford (Passenger Car)' Rear Axle article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions and note following new specifications:*

Ring & Pinion Gear Backlash—Should be .012" Maximum (All Ford models), .010" Maximum (Mercury).

FORD TWO-SPEED TRUCK TYPE

Optl. Equipment On:

FORD TRUCKS, ALL '60', '85', '95' MODELS (1940)

This Axle same design as used on 1939 models.

SERVICING & OVERHAUL:—All specifications and service operations same as for 1939 model. *See 'Ford Two Speed Truck Axle' article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following new specifications:*

Pinion Bearing Setting—Force required to turn pinion shaft should be 8-12 inch lbs. (measure with ABV-129 gauge).

FORD FULL-FLOATING TRUCK TYPE

Used On:

ALL '60', '85', '95' TRUCK MODELS (1940)

TYPE:—Spiral bevel, full-floating type with Hotchkiss drive. Axle similar to design used on previous truck models except that Torque Tube has been discontinued and axle has been designed for Hotchkiss drive by adding grease container and bearing support on forward end of axle housing.

¾ & 1 Ton Truck—Axle used on these models same as on other trucks except that pinion bearing sleeve (double bearing cup) is not flanged and is retained in housing by separate bearing retainer which is bolted on front end of housing with separate grease retainer assembly.

SERVICING:—Gear Adjustment—Backlash should be .004-.016". No adjustment provided.

Axle Shafts—Shafts can be removed without disturbing wheels and hubs as follows: Take out two screws in hub cap, remove cap. Remove nuts on 8 studs on axle shaft flange, turn two bolts (located between studs) in evenly to loosen axle shaft flange from hub. Then back off these two bolts, strike sharp blow on center of axle shaft flange to loosen locking cones on studs. Remove locking cones, pull axle shaft out. When installing shaft, see that gasket in place under axle shaft flange, back off loosening bolts sufficiently to allow axle shaft to seat on hub, install locking cones on studs, tighten stud nuts evenly and securely, then tighten the two loosening bolts just enough to prevent their loosening in service.

Wheel Bearing Adjustment—Remove axle shaft (above), remove outer locknut, lockplate, and grease retainer (except on ¾ and 1 Ton). Turn inner bearing adjusting nut up tight, then back nut off ⅛ turn, install lockplate being certain that locking pin in nut engages notch in lockplate (except ¾ & 1 Ton), bend lockplate tang against nut (¾ & 1 Ton). Install outer locknut and tighten securely. Rotate wheel by hand and see that it turns freely. Re-install axle shafts.

Wheel Bearing Assembly—To disassemble wheel bearings, remove axle shafts, remove outer locknut, grease retainer, lockplate and inner adjusting nut, remove wheel hub. Remove snap ring in inner end of hub, use puller BB-139 to remove grease retainer. remove inner bearing roller assembly, use puller BB-148 to remove inner bearing cup from hub. Remove outer bearing roller assembly from hub, use puller BB-148 to remove bearing cup from hub. Re-install parts in same manner using BB-150 to install both bearing cups in hub and to install grease retainer. Make certain that grease retainer snap ring installed in inner end of hub. Adjust bearings after hub installed on axle (see above).

OVERHAUL:—Disassembly—Remove axle shafts and wheel hubs, take out capscrews holding left hand axle housing on right hand housing, remove left hand housing using care not to lose thrust pin and plate. Withdraw ring gear and differential assembly from housing (differential side bearing roller and cone assembly will come out on differential case hubs, bearing cones will remain in housing halves). Remove and service pinion assembly and differential assembly as directed below.

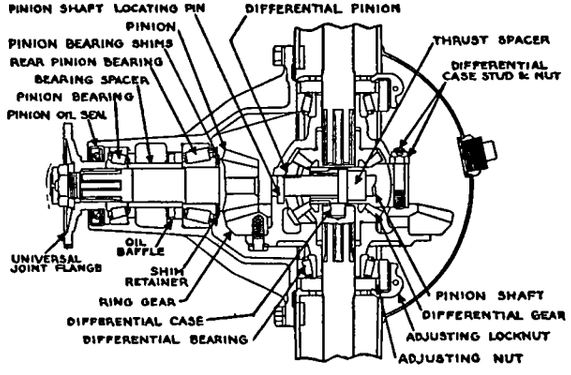
Pinion Bearing Assembly (Except ¾ & 1 Ton):—To disassemble, take out screws mounting grease retainer and pinion sleeve flange on forward end of axle housing, remove grease retainer and pinion assembly. To disassemble pinion, remove locknut, lockplate, adjusting nut, and washer on end of pinion shaft, use tool AATA13 to remove pinion from sleeve (rear bearing roller and cone will come out with shaft). Use BB-142 to remove and install this rear bearing on pinion shaft. If bearing cups to be removed from sleeve, use puller BB-143 to remove cups and BB-144 press to install bearing cups. Use puller BB-145 to remove outboard bearing from axle housing and BB-147 to install this bearing. Reinstall pinion and bearings in sleeve in this same manner, tighten adjusting nut until force required to turn pinion shaft is 12-16 inch lbs. (use ABV-129 gauge which reads directly in in. lbs.). Tighten locknut securely and see that lockplate tangs turned over against both nuts.

¾ & 1 Ton Models—Pinion bearing sleeve is not flanged and pinion assembly should be removed from axle housing with special driver (after grease retainer and bearing retainer removed). Bearings are removed from pinion shaft as an assembly with special puller (after pinion bearing adjusting nut and locknut have been taken off). When installing bearings, install rear bearing first, then install front bearing and bearing sleeve or cone as an assembly. Heat axle housing before installing pinion assembly and check bearing adjustment only after assembly installed in housing. Force required to turn shaft should be 16-20 inch lbs. (same as other models) and is adjusted in same manner .

Pinion Setting:—Pinion position not adjustable. If pinion mesh with ring gear not correct, replace all worn parts.

Differential Assembly:—To disassemble take out capscrews holding right hand half of differential case on left hand half, remove right half of case and lift out differential gears, pinions and pinion shaft. To remove differential bearing rollers and cones from differential case hubs, use special puller AATA1. Replace these bearings with tool BB-147. Use BB-148 to remove bearing cups from axle housing and BB-149 to install these bearing cups. Ring gear is serviced as a unit with the differential case and should not be removed. Differential bearings are not adjustable and use of additional gaskets between axle housing halves to control bearing adjustment is not recommended.

Assembly Note:—When reassembling axle, see that thrust block and thrust pin not worn and properly installed in left hand axle housing, use one 61-4035 gasket (¾ & 1 Ton), BB-4035 gasket (Others) between axle housing hlaves.



HUDSON SPIRAL BEVEL TYPE

Used On:

SIX, 40T TRAVELER, 40P DELUXE (1940)
SUPER SIX 41, COUNTRY CLUB SIX 43 (1940)
EIGHT 44, COUNTRY CLUB EIGHT 47 (1940)

This Axle same as used on corresponding 1939 models except as noted below.

TYPE:—Spiral bevel, semi-floating type of same design as used on 1939 cars except that axle construction is heavier throughout (housing wall section increased, carrier ribs and mounting flange heavier) and new perforated bronze thrust washers used on differential pinions (replaces former bakelite type). Housing is vented by new threaded type vent with loose cap installed on housing in place of former brake tube bolt. NOTE—This new bronze thrust washer can be used on previous models as service replacement (has longer life than former bakelite type).

Model 40 Changes—This model has 2¾" wheel bearings and axle shaft with 1 5/16" diameter at bearings (other models have 2⅞" bearings and shaft diameter of 1⅜"). New Optl. gear ratio of 4⅞-1 requires special re-designed differential carrier and new pinion bearing spacer (ring gear larger than on other gear ratios). This special ratio used on Model 40 only.

SERVICING & OVERHAUL:—All specifications and service operations same as for previous models except as noted below. *See 'Hudson (Own Make)' Rear Axle article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following new specifications:*

Ring Gear Backlash—Should be .0005-.0035".

Axle Shaft Endplay—Should be .002-.004". Adjust by removing shims from under bearing cap at both wheels equally (necessary to keep thrust spacer centered on differential pinion shaft—if adjustment made at one wheel only, spacer will bind on shaft).

LINCOLN V12 TYPE

Used On:

LINCOLN, V12 MODEL (1940)

This Axle same design as used on previous models.

SERVICING & OVERHAUL:—All specifications and service operations same as for previous models. *See 'Lincoln (Own Make)' Rear Axle article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data.*

LINCOLN-ZEPHYR HYPOID TYPE

Used On:

LINCOLN-ZEPHYR, MODEL 06H (1940)

This Axle same design as used on 1939 model.

SERVICING & OVERHAUL:—All specifications and service operations same as for previous models except as noted below. *See 'Lincoln-Zephyr Type' Hypoid Rear Axle article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following changes:*

Replacement Exchange Axle Assemblies:—Furnished in assemblies consisting of differential housing (axle housing center section) with pinion gear installed (set up for correct bearing adjustment and ring gear mesh) and mated ring gear. This assembly is Part No. 86H-4020 and can be used on Models 86H ('38), 96H ('39), 06H ('40).

Ring Gear Backlash—Should be .002-.004" and should be set at figure etched on the particular ring gear being used (ring and pinion gears mated and it is very important that these individual clearance figures be used for each set of gears).

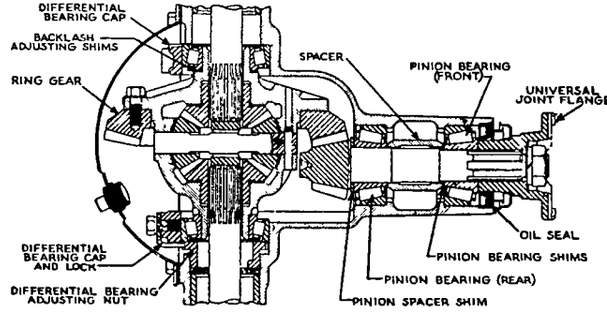
Pinion Bearing Adjustment—Correctly set at factory and should not be disturbed in service. Bearing pre-load should be 18-20 in. lbs. (force required to turn pinion shaft with bearings properly adjusted). Use ABV-129 gauge to measure this setting.

Differential Gear & Ring Gear Backlash Adjustment—Controlled by gasket thickness between axle housing halves and differential housing. Normal gasket thickness for correct backlash and differential bearing adjustment is .005-.008" at each side of differential housing. Gasket furnished in three thicknesses as follows: .008-.010" (86H-4035-A), .004-.006" (86H-4035-B), .013-.018" (86H-4035-C). Vary thickness at left hand housing to adjust backlash (keep total thickness for both sides same to avoid disturbing differential bearing adjustment), vary thickness at right hand side to adjust differential bearings (do not change thickness on left hand side to avoid disturbing backlash).

NASH HYPOID TYPE

Used On:

NASH-LAFAYETTE, MODEL 4010 (1940)
NASH AMBASSADOR 6, MODEL 4020 (1940)
NASH AMBASSADOR 8, MODEL 4080 (1940)



TYPE:—Hypoid gear, semi-floating type with Hotchkiss drive. Same design as "Small Type" spiral bevel gear axles used on previous Nash models except for Hypoid gear feature.

NOTE—Axles on all models similar except for size. May be identified by diameter of tubes (pressed and welded in center casting) which are 2½" (4010, 4020), 3" (4080).

SERVICING:—Gear Adjustment—Paint gears to check mesh. Backlash should be .005-.007". Adjusted by adding or removing shims located between shoulder on differential case and cone of left hand differential side bearing. See Pinion Setting and Differential Bearing Adjustment below.

Axle Shaft Replacement—To remove shaft with wheel and hub removed, take off nuts on bearing retainer (rear brake support plate), remove oil seal, retainer plate, bearing adjusting shims, then pull axle shaft and bearing assembly. When installing shaft, add or remove shims between retainer plate and axle housing flange to secure desired axle shaft endplay of .003-.006".

OVERHAUL:—Disassembly—With axle shafts out, remove rear housing cover, mark adjusting nut on right hand differential side bearing to insure replacing in same position, back adjusting nut off, remove bearing cap bolts and bearing caps, lift differential assembly out. To remove pinion, remove nut on end of pinion shaft, pull universal joint flange, press pinion out of housing toward rear. Remove pinion shaft oil seal, use special pullers to remove bearing cups from housing.

Pinion Bearing Assembly:—Bearing adjustment controlled by shims located on pinion shaft between spacer and forward bearing cone. When installing pinion, install correct washer and shim pack for correct pinion mesh (see Pinion Setting below) on shaft against pinion, install rear bearing cone and bearing spacer. Install sufficient shims on shaft in front of spacer to insure positive endplay of shaft when installed in housing, install front bearing cone, universal joint companion flange or special tool (splined sleeve) and tighten nut on shaft securely. Then check bearing adjustment as directed below. NOTE—Do not install oil seal until after bearing adjustment has been made.

Pinion Bearing Adjustment—Use dial indicator to check pinion shaft endplay with companion flange nut securely tightened (oscillate shaft in both directions while applying end pressure to insure bearings seated). Disassemble pinion shaft and remove shims from between spacer and front bearing cone equal to the observed endplay **plus .003"** to insure the bearings being correctly pre-loaded or set .003" tight.

Pinion Setting:—Pinion mesh controlled by washer or washer and shim pack installed on shaft between pinion and rear bearing cone. Use Pinion Setting Gauge SE-534-A to determine washer thickness for each pinion as follows: Make certain that rear bearing cup properly seated in housing, coat bearing with film of light oil, install bearing and bearing cone, roll bearing back and forth while applying

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

pressure to insure bearing being seated. Install rectangular checking block on bearing cone, install gauge and make certain that end discs seated in differential bearing bores in housing (tap lightly with hammer to insure seating). Turn gauge micrometer until end of shaft just contacts ground surface of checking block while pinion bearing is being rotated under pressure. Subtract gauge reading from .408" which will give correct washer thickness for standard pinions (marked by figure =0 following the set number stamped on the end of the teeth). If pinion marked by + or — figure, subtract shims (if pinion marked +), add shims (if pinion marked —) equal in thousandths to the figure following this plus or minus mark. Install washer and shims equal to this final figure on the shaft between the pinion and the rear bearing cone when installing pinion in housing.

Pinion Adjusting Washer Note—Pinion Adjusting Washers furnished in six thicknesses as follows: .117",.118",.119" and .129",.130",.131". These washers can be used with not more than three .003" shims to make all necessary thicknesses from .117" to .140". CAUTION—Install washer with chamfered side toward pinion and shims (if used) between the washer and the bearing cone.

Pinion Setting without Gauge—If new pinion being installed and pinion setting gauge not available, note washer and shim thickness used for old pinion, secure standard washer thickness for this housing by adding (if pinion marked +), subtracting (if pinion marked —) shims equal to figure following this plus or minus mark on the old pinion, finally correct this standard washer thickness in accordance with new pinion marking as directed under Pinion Setting above.

Differential Gear & Bearing Assembly:—To dismantle differential gear assembly, drive out pin in differential pinion shaft, remove shaft, axle shaft thrust block, pinions, side gears and thrust washers. When reassembling, make certain that thrust washers installed in back of each side gear and pinion and that thrust block is installed on pinion shaft (this block transmits thrust from one shaft to the other).

Differential Bearing Adjustment:—With lock on right hand bearing adjusting nut removed, and bearing cap loosened so that adjusting nut can be turned, turn adjusting nut up until all bearing endplay is just removed and notch on nut is in line with lock on cap, then tighten adjusting nut two notches additional for correct bearing pre-load. Tighten bearing cap bolts and install adjusting nut lock.

Ring Gear Backlash Adjustment—Check backlash with dial indicator at several points around ring gear. If backlash not within limits of .005-.007", dismantle axle, remove left hand differential side bearing, add or remove shims on hub behind bearing (add shims to decrease backlash, remove shims to increase backlash), reassemble axle, readjust differential bearings (bearing adjustment affected by change in shim thickness).

OLDSMOBILE HYPOID TYPE

Used On:

'60' SERIES SIX, MODEL F-40 (1940)
'70' SERIES SIX, MODEL G-40 (1940)
'90' SERIES EIGHT, MODEL L-40 (1940)

This Axle same design as used on 1939 models.

SERVICING & OVERHAUL:—All service operations same as for corresponding 1939 models. *See "Oldsmobile Hypoid Type" Rear Axle article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following changes:*

Axle Markings—Ring and pinion gear ratio stamped on upper outer surface of differential carrier on all axles for identification purposes as follows: 41-10 (F-40 Std. 4.1-1 Axle), 43-10 (G-40, L-40 Std. 4.3-1 Axle), 41-9 (4.55-1 Optl. Mtn. Ratio Axle for all models).

Housing Cover—Rear banjo cover welded in place and not removable. Axle may be drained by taking out lower differential carrier mounting capscrew.

Ring Gear Backlash Setting—When installing differential assembly in carrier, backlash adjustment will be simplified if left hand adjusting nut turned up to eliminate all backlash between ring gear and pinion (right hand nut must be backed off to permit this movement) and then backed off 4 notches so that lock slot in adjusting nut and bearing cap are lined up. Adjust differential bearings by turning right hand nut only and then check backlash which should be within limits of .004-.008". If any readjustment necessary, adjust left hand adjusting nut and turn right hand adjusting nut exactly same number of notches in opposite direction to avoid disturbing bearing adjustment.

OLDSMOBILE REAR SUSPENSION

Used On:

'60' SERIES SIX, MODEL F-40 (1940)
'70' SERIES SIX, MODEL G-40 (1940)
'90' SERIES EIGHT, MODEL L-40 (1940)

This Coil-spring type Rear Suspension same design as used on 1939 Oldsmobile models.

SERVICING:—All service operations same as for corresponding 1939 models. *See "Oldsmobile Rear Suspension" article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note new spring specifications as follows:*

Oldsmobile Rear Springs

Car Model	Color Mark
F-40 Coupes	Blue (2)
F-40 Sedans	Red (2)
G-40 Coupes	Orange
G-40 Sedans	White
L-40 Coupes	Green
L-40 Sedans	Yellow

PACKARD HYPOID TYPE

Used On:

'110' SIX, MODEL 1800 (1940)
'120' EIGHT, MODELS 1801, 1801A (1940)
'160' SUPER 8 MODELS 1803, 4, 5 (1940)
'180' CUSTOM SUPER 8, 1806, 7, 8 (1940)

These Axles same design as used on 1939 models.

TYPE:—Hypoid type. Same design as used on corresponding 1939 car models. Ring Gear Support Roller used on Super Eight '160' and '180' models only.

SERVICING:—Gear Adjustment—Backlash should be .003-.005". Adjusted by backing off one differential side bearing adjusting nut and tightening opposite nut equally. See Differential Bearing Adjustment below. Pinion position not adjustable (for gear mesh adjustment).

Axle Shaft Replacement—To remove axle shaft, remove wheel and hub, disconnect brake lines, remove backing plate and wheel bearing adjusting shims, pull axle and bearing assembly. When installing axle shaft, select shim thickness between housing flange and backing plate on each side so that total axle shaft endplay is .004-.007".

OVERHAUL:—Pinion Bearing Adjustment—Pinion bearing pre-load controlled by compressible spacer on pinion shaft between bearings and adjusted by tightening universal joint companion flange nut. Bearing pre-load must be adjusted whenever this nut is loosened or disturbed. To adjust, tighten nut until spacer is felt to buckle, then check pull required to rotate pinion shaft. If less than 25 inch pounds (5 lbs. pull on end of 5" lever arm), tighten nut further until pre-load is 25-30 inch pounds. Special scale, Packard ST-5087, may be used to check this pre-load. Adjust only with both wheels jacked up or differential carrier out to eliminate drag on pinion shaft.

Pinion Assembly:—Pinion position not adjustable. Pinion mounted on taper roller bearings with bearing cups seated directly against shoulders in carrier bore and compressible spacer on pinion shaft between bearing cones. Bearing pre-load must be adjusted by compressing or "buckling" spacer whenever universal joint companion flange nut is loosened (see above).

Differential Gear Assembly:—Differential side gear endplay should be .002-.005". Adjust by installing thrust washer of correct thickness between side gear and differential case. These washers furnished in various thicknesses as follows: .031" (No. 330797), .036" (324583), .041" (324584), .046" (324585). When assembling differential gears, make certain that thrust block installed between inner ends of axle shafts (this block transmits thrust from one shaft to the other).

Differential Bearing Adjustment:—Bearings should be pre-loaded so that "spread" of bearing support pedestals of .010-.012" is secured. To make this adjustment, free adjusting nut locks. Loosen bearing

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

cap nuts slightly to free adjusting nuts, make certain that there is some backlash between ring gear and pinion and clearance between ring gear and support roller (Super 8 only). Then back off right hand bearing adjusting nut until ring gear and differential assembly is loose in its bearings. Use accurate caliper and set caliper so that it will just slide over differential carrier with one leg resting on machined boss (adjusting nut lock pin boss) on each side of carrier **with .010" feeler between boss and caliper on one side.** Remove feeler, tighten right hand adjusting nut until caliper will just slide in place with the feeler removed (pedestals will have 'spread' this .010"). Correct pedestal spread should be .010-.012". Then adjust ring gear backlash and support roller clearance (Super 8 only).

Ring Gear Backlash Adjustment—After adjusting differential bearings (above), check ring gear backlash with dial indicator. If not within limits of .003-.005", adjust by backing off one differential bearing adjusting nut and tightening opposite nut exactly the same number of notches (to avoid changing bearing adjustment). Back off right hand nut to decrease backlash, left hand nut to increase backlash, use extreme care to tighten opposite nut exactly same amount. Then tighten bearing cap nuts and install adjusting nut locks.

Support Roller Adjustment (Super 8 Models):—Clearance between roller and back face of ring gear should be .005". To adjust, loosen lockscrew on roller stud sector plate, turn roller shaft (apply wrench to square end of shaft) until correct clearance secured, tighten sector plate lockscrew securely.

PACKARD REAR SUSPENSION

Used On:

'110' SIX, MODEL 1800 (1940)

'120' EIGHT, MODELS 1801, 1A (1940)

'160' SUPER EIGHT, MODELS 1803, 4, 5 (1940)

'180' CUSTOM SUPER EIGHT, 1806, 7, 8 (1940)

This Rear Suspension same design as used on corresponding 1939 models except as noted below.

TYPE:—Design changed from that used on 1939 car models as follows:

Model 1800 Six. Lateral Stabilizer and 'Fifth' shock absorber not used. New Direct Acting Shock Absorbers (Monroe on domestic cars, Delco for export) are used and mounted diagonally crosswise of the car so that the lateral stabilizer not required.

Model 1801 Eight, 1803, 6 Super Eight. Lateral Stabilizer and 'Fifth' shock absorber are same design as for 1939. Rear Shock Absorbers are direct acting type (Delco on 1801 and 1803, 6 Export; Monroe on 1803, 6 domestic cars) and are mounted diagonally lengthwise of the car. No Roll Bar is used.

Model 1801A Comm'L, 1804, 5, 7, 8 Super Eight. Rear suspension on these models same design as on 1939 cars (Lateral Stabilizer, 'Fifth' Shock Absorber, Double-acting Shock Absorbers, and Roll Bar).

SERVICING:—Service operations same as for 1939 models. ***See Packard Rear Suspension article in Mechanical Equipment Section of manual (or 1939 Supplement) for data and note following changes:***

Shock Absorber Servicing & Refilling—See separate articles on Delco and Monroe Direct Acting Shock Absorbers for refilling, servicing, and valve calibration data on these new type rear shock absorbers.

Rear Springs—Spring inserts (Rubber, Silenite, or Antimony-Lead type) are installed in recesses in ends of rear spring leaves. Arrangement and type of insert for each spring leaf is shown in table below.

NOTE—Inserts are numbered 1-2-3 etc. from outer end (shackle end) of spring toward center.

Rear Spring Inserts

Model	Insert No.	Type	Part No.
1800, 1801	1, 2, 3	Silenite	333746
	4	⅜ Rubber	354799
	5	7½% Ant.-Lead	327954
	6	10% Ant.-Lead	327726
1803, 1806	1, 2, 3	Silenite	333746
	4	⅜ Rubber	354799
	5	5% Ant.-Lead	327753
	6, 7	7½% Ant.-Lead	327954
1804, 1807	1	5/16 Rubber	347427
	2, 3, 4, 5, 6, 7	Silenite	333746
1805, 1808	1	5/16 Rubber	347427
	2, 3, 4, 5, 6	Silenite	333746
	7, 8	5/16 Rubber	347427

PONTIAC HYPOID TYPE

Used On:

SPECIAL SIX 40-25, DELUXE SIX 40-26 (1940)

DELUXE EIGHT 40-28, TORPEDO EIGHT 40-29 (1940)

This Axle same design as used on 1939 models.

TYPE:—Same design as for 1939. Axles now marked for identification by paint mark on end of right hand or left hand end of axle shaft as follows:

Torpedo 40-29 Note—Axles for this model have blue mark on shaft in addition to regular ratio color mark.

Axle Ratio	Color Mark
4.3-1 Std. Ratio	White
4.55-1 Mtn. Ratio	Yellow
4.1-1 Plains Ratio	Green
3.9-1 Econ. Ratio	Red

SERVICING & OVERHAUL:—All service operations same as for corresponding 1939 car models. ***See Pontiac Hypoid (Own Make) Axle article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following corrections:***

Pinion Setting Shims—Shims furnished in following thicknesses and marked for identification for all 1939-40 models as follows:

Shim Thickness	Part No.	Color
.012"	499528	Plain
.014"	503063	Copper
.015"	499529	Blue
.018"	499530	Plain

Ring Gear Backlash—Backlash should be .003-.012" for new gears (same as 1939). Slight excess over .012" permissible for worn gears.

WILLYS SPIRAL BEVEL TYPE

Used On:

MODEL 440 (1940)—PASS. CAR & PICK-UP

This Axle same design as used on 1939 Willys cars.

NOTE:—Model 440 Panel Truck has Spicer (Salisbury) Model 21-1 Rear Axle. See Spicer Rear Axle article for data on this type axle.

SERVICING & OVERHAUL:—All service operations same as for previous Willys models. ***See "Willys (Own Make)" Rear Axle article in Mechanical Equipment Section of manual for data and note following specifications:***

Ring Gear Backlash—.004-.008" (1939-40).

NOTE:—Where car models marked 'Rear Only," see separate articles on Delco Double Acting Type, or special Knee Action Type for front shock absorber

DESCRIPTION & OPERATION:—Shock absorber arm is pivoted on a shaft in the shock absorber case with an operating cam locked on this shaft within the case. Cam is always in contact with the piston in the shock absorber cylinder (piston forced out against cam by heavy spring within cylinder). Cylinder is kept filled with fluid which flows freely through intake check valve in piston head from fluid reservoir in case which surrounds cylinder. On rebound, after car springs have been compressed by road shock, shock absorber arm can return to original position only by forcing piston back into cylinder and displacing fluid which has filled the cylinder during the outward stroke. Fluid can flow out of cylinder only through rebound or relief valve located under filler plug on opposite end of case (on some models this valve is incorporated in intake valve assembly in piston). This valve restricts fluid flow and provides shock absorbing action.

NOTE—On Buick 40, rebound valve is two stage or double type providing softer control for light road shocks.

SERVICING:—Disassembly. Use special fixture to clamp shock absorber on bench (clamping cylinder in vise will cause piston to bind). Take out relief valve plug, relief valve. Remove end cover screws, take off cover and gasket. Rotate arm, remove piston, spring and intake valve. Do not remove shock absorber arm or shaft, replace shock absorber if bearing wear excessive or if packing washers worn so oil leaks around shaft (caused by operation with low oil level). Intake valve or intake and relief valve assembly can be removed from open end of piston after piston and spring have been separated.

Assembly. Use new gasket under cover and new lead washer under filler and relief valve plugs. Tighten cover screws securely to prevent leaks.

Filling. Remove filler plug, fill reservoir to level of plug hole with genuine Shock Insulating Fluid, replace plug, work arm up and down vigorously to work oil into cylinder, then remove plug and adjust fluid level so that it is level with lower edge of filler plug hole.

ADJUSTMENT:—Performance can be changed only by changing valves. Standard valve calibrations are shown in table below.

Rebound Valve Type.

Car Model	Front	Rear

1939 Rebound Valve Type

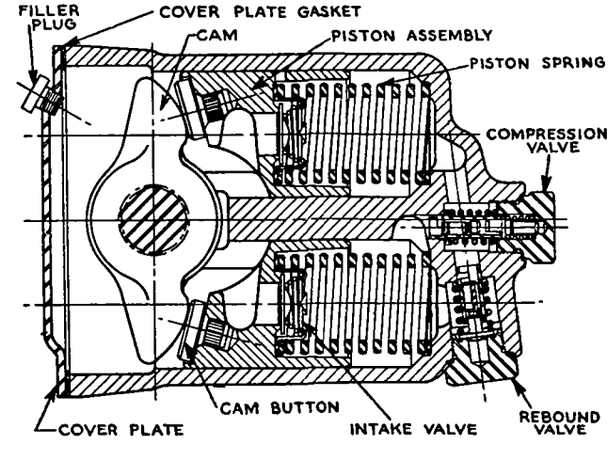
Model	Front	Rear
Chevrolet Mstr. JB		5G
Chevrolet ½ Ton JC	4CG	3CG
Chevrolet ¾ Ton JD, JE	4CG	3CG
Crosley A	2D	1C

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

DELCO 1939 PARALLEL CYLINDER HYDRAULIC TYPE

Used On:

Car Model	Front	Rear
Buick 39-40, 60 (1939) First		2103A, B
Buick 39-40, 60 (1939) Later		2103E, F
Chevrolet Mstr. Deluxe JA (1939)	2200A,B	2100A, B



BUICK NOTE:—First type shock absorbers (2103A, B) used on early cars with short frame side rails. Later type 2103-E, F used on longer frame (these models have heavier arms and new valve calibration—see below). NOTE—Front shock absorbers are Delco Double acting, opposed piston type (see preceding article for data).

TYPE:—New design double acting hydraulic type with end-to-end discharge. Independent pistons are used (located in parallel cylinders). Each piston is held out against lever arm cam by a spring installed in the cylinder and has a plain intake valve in the piston head. Fluid displaced by the piston movement flows through a channel in the housing to the opposite cylinder and is controlled by the compression and rebound valves which are installed in tapped holes in the housing (valves are plug type).

REFILLING:—Fluid level in shock absorber should be checked twice yearly and level maintained at bottom of filler plug hole. When adding fluid, move car up and down several times to displace all air in cylinder. When filling to correct poor perfomance complaints, disconnect shock absorber link and move arm through full stroke several times, then recheck fluid level. Use only Delco Shock Absorber fluid.

SERVICING:—No service operations possible other than tightening valve and filler plugs and tightening cover or replacing cover gasket to stop leaks. Pistons, springs, and intake check valve assemblies cannot be removed or serviced.

ADJUSTMENT:—Standard valve calibration for all models shown in table below. Valves can be changed for special operating conditions, if necessary, by removing valve plug and taking out valve assembly. Make certain that valve plugs are securely tightened to prevent leaks. Valve calibration is stamped on valve for identification.

Compression & Rebound Valves

	Front		Rear	
Car Model	Compr.	Reb'd.	Compr.	Reb'd.
Buick 40, 60 (See Note 1)	2E	2	30	L
Buick 40, 60 (See Note 2)	1.5E	4	30	L
Buick 40, 60 (See Note 3)	2E	2	30	L
Chevrolet JA	D-.5	2E	D-.5	5F

Compr.—Compression valve. **Reb'd.**—Rebound valve.

Buick Note 1—Used on cars before Serial No. 3452659 (Flint), 3400716 (South Gate), 3440754 (Linden)

Buick Note 2—Used on cars after above serial numbers with first type short frame.

Buick Note 3—Used on later cars with new type frame with longer side rails.

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

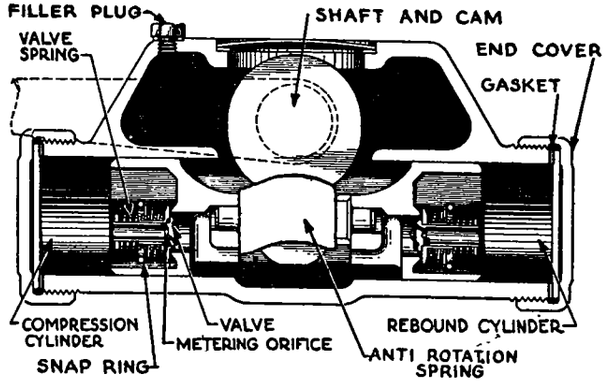
NOTE:—Where other type shock absorbers are used for front or rear of car, see separate articles for data on Delco Single Acting or Direct Acting Types.

Buick 39-40, 39-60 (1939)—Front Shock Absorbers are interchangeable from right to left side of car (single model used). Rear shock absorbers on domestic cars are new Delco Parallel Cylinder type (see separate article for complete data). On export cars, rear shock absorbers are same as on other Buick models (1751-R, S).

Chevrolet Truck Models. Double acting shock absorbers are optional equipment on all truck models. Service data below applies to these types.



Packard Six, Eight, Super Eight (1939)—These cars have 'Fifth' shock absorber (Houde Model NFT) for Lateral Stabilizer control as well as the above regular shock absorber equipment. See Houde (Houdaille) Shock Absorber article for data on this 'Fifth' shock absorber.

Pontiac (1939)—Three different valve calibrations have been used (changed after 4000 cars and again after 54000 cars). First type valve calibration should be changed to third type (or second type for slightly firmer control at high speeds) as shown in Valve Calibration table below. Rear Shock Absorbers on domestic cars are Delco Direct Acting type (same valve changes made on these models also). See separate article for data on Direct acting types.

TYPE:—Opposed piston types (Units for Independent suspension cars have double lever arm) with valve arrangement and fluid flow as follows:

Types 1721, 23, 31, 32, 37—Center discharge with outside rebound valve (Rebound valve is plug type assembled in tapped hole in housing with simple intake check valve in rebound piston head. Compression valve combined with intake valve and located in compression piston head).

Types 1751, 54; 1946, 51, 52, 66; 2000, 6—End-to-end discharge type with outside compression and rebound valves (both valves are plug type installed in tapped holes in housing). Spring-loaded intake check valve is used in rebound piston head only.

Types 1713, 1947, 48—Center discharge (Compression and rebound valves are combined with intake valves and located in piston head). Type 1948 is inverted with cam and shaft located below centerline of cylinders.

Type 1902—Center discharge type with Inertia Control (compression and rebound valves combined with intake valves and located in piston heads). Inertia control consists of an inertia weight controlled rebound valve which controls fluid flow through by-pass channel and static valve (static valve is outside type installed in tapped hole in housing).

Types 2010, 52—End-to-end discharge with Inertia control and Ride Control adjustment. Compression, Rebound, and Static (Inertia) Valves are plug type installed in tapped holes in housing. Ride control adjustment consists of a separate control valve which is adjusted by means of a slotted adjustment screw on the side of the shock absorber housing (standard setting with mark on valve stem in line with 'M' mark on valve cap nut, turn to 'S' mark for softer action, 'F' mark for firmer action).

DESCRIPTION & OPERATION:—Operates on same principle as single acting type. Piston is double-ended (shock absorber cam engages piston at center) and cylinder is formed with compression chamber at each end. Fluid forced out of one chamber and regulated by 'Compression' valve to control shock when car springs are compressed, and out of opposite chamber and regulated by 'Rebound' valve to control rebound when car springs return to normal position. In each case, when fluid is forced out of one chamber into the reservoir through the relief valve, it flows freely into the opposite chamber (where piston is making a suction stroke) through the intake check valve in the piston head. On most designs, intake valve and relief valve are incorporated in a single assembly mounted in the piston head at each end (see special types below).

'End to End' Discharge Type. On this type, fluid is not expelled into the reservoir from the chamber but flows through a channel in the shock absorber casting to the opposite chamber which is not under compression. Compression and rebound valves are located under plugs on the side of the shock absorber and each control the fluid flow through the channel in one direction. Intake valve in each piston head (or in one piston head only on some models) consists of a simple spring-loaded disc check valve which allows fluid to flow freely into chamber (when fluid in chamber not under compression) to make up for any loss in operation.

Ride Control Types. This type employes the 'end to end' discharge system and has an adjustable by-pass valve or 'Control' valve which supplements the rebound valve. Control valve may be linked to a dash control lever so that the operator can vary the shock absorber action at will (Buick '32-33, Cadillac '32-35, etc.), or may be adjustable at the shock absorber (Cadillac '36-37, etc.). On these types, intake valve is mounted in the compression chamber piston head only.

Inertia Control. Consists of a 'static' (restricting) valve and 'inertia' (cut-off) valve controlling a by-pass around the regular rebound valve through which fluid is allowed to flow from the shock absorber chamber during rebound. Inertia valve remains open as long as frame and body movement is small, so that static valve (which has lighter action than regular rebound valve) controls fluid escape and provides a very soft action. Whenever frame and body movement upward is sudden or severe, inertia weight lags behind (consists of a large lead weight balanced on a spring) closing the inertia valve and cutting off the flow through the static valve. Rebound action is then controlled by the regular rebound valve.

ADJUSTMENT:—When adjusting ride control types, see that all shock absorbers are adjusted evenly (operate dash control lever several times and recheck lever position at each shock absorber). Types without ride control adjustable only by replacing compression and rebound valves. Standard valve calibrations shown in table below.

Cadillac Type—To adjust, turn slotted valve stem (in center of valve cap nut) counter-clockwise toward 'S' mark for softer action, clockwise toward 'F' mark for firmer action. Standard setting is with reference mark on valve stem in line with center 'M' mark on valve cap nut.

(E)—First 665 cars. (F)—After 665 cars.
(G)—First 5025 cars. (H)—After 5025 cars.
(I)—Except Convertibles. (J)—Convertibles.

NOTE—On some models, special valve design used which consists of two thin spring steel washers inserted between tapered valve and valve seat. Old type valves (without these washers) must not be used in place of this new type (valves will leak and performance will be unsatisfactory).

SERVICING:—Disassembly. Use special fixture to clamp shock absorber on bench (do not clamp cylinder in vise.) Use special wrench to remove end cap at each end of cylinder. Remove retainer ring or snap ring which locks valve assembly in piston head, remove valve assemblies. On types with compression, rebound, or control valves mounted under plugs on side of case, unscrew plugs, remove valve assemblies. When installing valve assemblies, use special tool to compress spring while snap ring installed.

Assembly. Use new gasket under end caps and make certain that end caps are securely tightened

Filling:—Remove filler plug on side or top of shock absorber body (on Inertia Control types, also remove vent plug on top of Inertia weight housing), use genuine shock absorber fluid and fill to level of filler plug hole, replace plug, move car up and down several times, remove plug and add additional fluid (if required) to bring level up to plug hole. NOTE—When filling shock absorber after servicing or when performance is unsatisfactory, move shock absorber arm up and down to expel all air from cylinder.

(1) Soft Ride. (2) Firm Ride & 20" wheel Equipment.

NOTE:—Chrysler Models. Monroe Direct Acting Shock Absorbers used on domestic models, Delco Direct Acting (Adjustable) type on export cars. See other Shock Absorber articles for data on these types.

Dodge Models. Delco Direct Acting (Adjustable) type used on Seven-Passenger models. See article (following) for data on this type.

Pontiac Models. Front Shock Absorbers are Delco Double-acting type (part of Independent Suspension assembly). See Delco Double Acting Shock Absorber article for data on this type.

CAUTION:—When clamping shock absorber in vise for refilling, engage flat of 'eye' in vise jaws. When disassembling 'bayonet' type (stud and nut at lower end), use special fixture clamped in vise to hold shock absorber. Do not clamp shock absorber tube or bayonet end in vise under any circumstances.

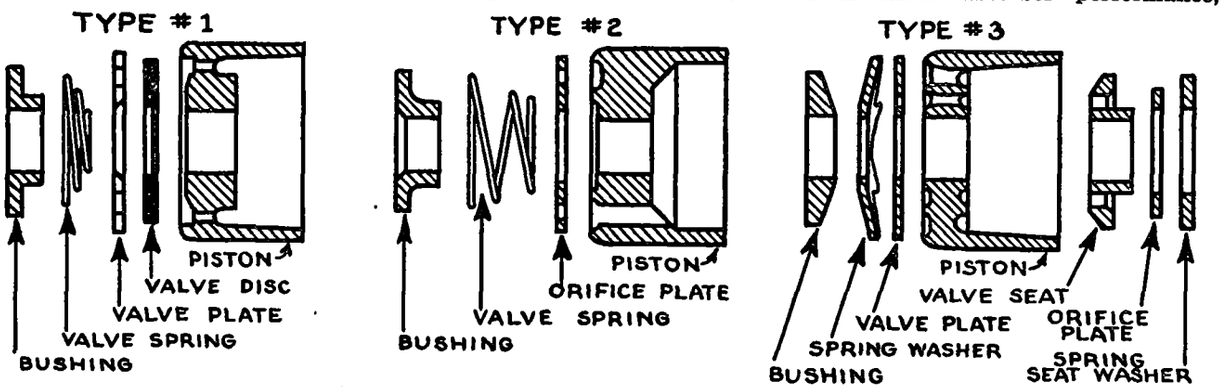
Refilling—New fluid must not be added unless all old fluid has been removed. Use only correct amount (excess will damage oil seal).

DESCRIPTION & OPERATION:—Direct acting type. Consists of a piston rod and piston attached to the car frame working within a compression cylinder attached to the axle. Reservoir cylinder surrounds compression cylinder and oil seal at upper end contacts piston rod. Outer dust shield cylinder is attached to upper piston rod end of shock absorber. Rebound valve (two types used—see illustration) is located within the piston and controls fluid flow through piston holes from one end of cylinder to the other on compression and rebound. Excess fluid (on compression) is forced out into reservoir chamber through compression valve (in center of compression and intake valve assembly) at bottom of compression cylinder. On rebound, this fluid flows back into the cylinder through the intake valve part of the assembly.

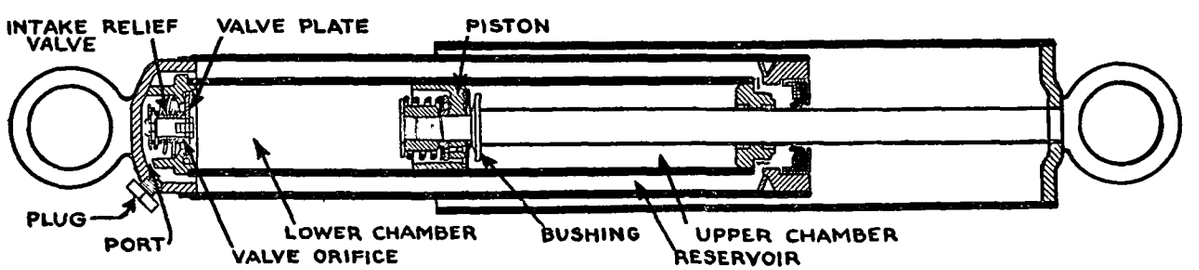
REFILLING:—10,000 Mile Intervals. Remove shock absorber from car, clean thoroughly particularly around filler plug at lower end, pull shock out to extended position, remove filler plug, pump all old fluid out by repeated strokes with filler opening down. Clamp eye at filler plug end in vise at 45° angle with filler hole up (on bayonet type, clamp eye at top in vise), collapse shock absorber to shortest length, screw special filling cup (#494) in filler hole, close shut-off valve, pour correct amount of fluid (see table below) in cup, open shut-off valve, pull shock absorber out to fully extended position, work piston back and forth using short quick strokes until all fluid is drawn into cylinder, replace filler plug and tighten securely.

Capacity Note—Capacity designated by suffix or last letter of model number (see car listing above) as shown in following table for each 'model letter'.

Fluid Capacity



Model Letter	Ounces	CCs.	Model Letter	Ounces	CCs.
A	3½	104	N	5⅝	156
B	3⅝	109	P	5¾	171
C	3⅞	114	Q	6	177
D	4	119	R	6⅛	182
E	4¼	124	S	6¼	187
F	4⅜	129	T	6½	192
G	4½	135	U	6⅝	197
H	4¾	140	V	6⅞	203
J	4⅞	145	W	7	208
K	5⅛	150	X	7¼	213
L	5¼	156	Y	7⅜	218
M	5½	161	Z	7½	223



SERVICING:—Disassembling—Thoroughly clean shock absorber, pull out to fully extended position, clamp vertically in vise engaging flat of filler end eye in vise jaws (End Eye Type), or engage filler plug in slot of fixture (#493) clamped in vise (Bayonet End Type), insert special wrench (#491) through slot in dust shield so that lugs engage slots in top guide (see that wrench does not damage piston rod), unscrew this guide, lift top of unit off, remove wrench. Compression and intake valve assembly cage is light press fit in cylinder and may be removed by light tapping. Wash all parts in gasoline and dry with air. If valve assemblies are to be taken apart or oil seal renewed follow directions below.

Oil Seal Assembly & Top Guide Renewal—Clamp top eye of shock absorber in vise, disassemble and remove rebound valve assembly and piston (see below), pull compression cylinder and top guide assembly off piston rod. If guide is to be renewed, remove from cylinder tube by tapping lightly (press fit). Use special puller (#489) to remove old seal assembly. Insert new piston rod seal gasket using flat end of 1 1/16" round stock to seat gasket evenly on shoulder in guide. Use this same 1 1/16" stock to press in new seal assembly until it rests firmly on gasket (use arbor press—pressure must not be great enough to distort top of seal). Use special thimble (#496) on end of piston rod when inserting rod through seal to avoid damage.

Compression & Intake Valve Assembly—Support assembly on bench, spring end up, engage special tool (#492) under stem head and over square washer so that recessed portion of tool engages open side of washer, press down on tool and press washer from under stem head. Assembly can then be taken apart. Reassemble in same position. Cylindrical valve (on stem) or spring (heavy spring which engages collar on valve) may be changed to alter shock absorber performance.

Piston Rebound Valve—Various types of Rebound Valve assemblies have been used (see illustrations). To disassemble all types, clamp top eye in vise, use special socket wrench to remove piston nut. Mark piston in line with punch mark on rod (replace in same position), remove valve assembly parts and piston. To alter shock absorber performance,

DELCO DIRECT ACTING CONT.

change Valve plate (Type 1), orifice plate (Type 2), valve spring or orifice plate (Type 3). Reassemble valve parts in original positions. Tighten piston nut securely and stake to prevent loosening.

Car Model	Valve Assembly Illustration
De Soto, Dodge, Plymouth	Type 3
Graham	Type 1
Hudson, Pontiac	Type 3
Studebaker	Type 2

Reassembling—See that all valve assemblies made correctly (see illustrations). Assemble piston in exact original position on piston rod. If new piston installed, before tightening piston nut, pull pressure cylinder to fully extended position, rotate 90°, force downward to locate piston properly on rod. Tighten piston nut securely and stake. Operate through entire travel to make certain that piston does not bind. Use new rubber gasket in reservoir tube under top guide (dip gasket in shock absorber fluid and stretch to fit), replace steel gasket retainer if necessary. Reassemble shock absorber by reversing disassembling directions making certain that top guide is securely tightened to prevent leakage past gasket.

TROUBLE SHOOTING:—Shock Absorber Noisy. See that shock absorber brackets on frame are tight and that shock absorber does not strike or rub on frame or chassis parts. Check rubber mounting bushings, replace if worn. Check shock absorber, see that dust shield does not strike reservoir tube, operate shock absorber by hand slowly and see that piston does not bind in compression tube. Check fluid. Disassemble shock absorber and check valves.

Oil Leaks—If fluid leaks at filler plug, tighten plug. If fluid leaks at top, see that top guide is screwed down tightly. Replace guide seal assembly or top guide gasket (see Servicing data).

Performance Unsatisfactory—Valve calibration may be changed to compensate for unusual operating condition (see standard calibration below).

CONTROL VALVE CALIBRATION:—Standard calibration for all models as given below.

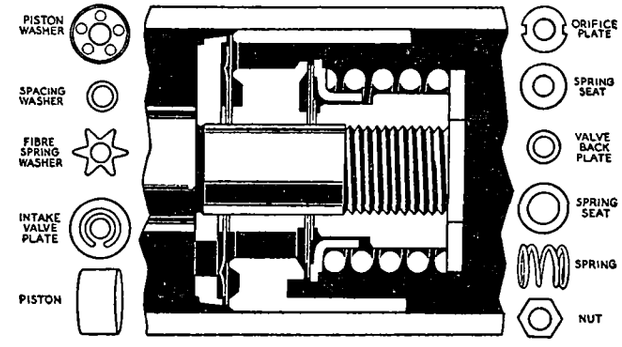
Pontiac 8 39-28 (1939)		1116V

NASH NOTE—Export Models with Heavy Spring.

NOTE:—Chevrolet Models—Delco Single Acting Hydraulic type shock absorbers used on rear end.

Chrysler, De Soto, Dodge, Plymouth Models—Three separate valve calibrations for 'Soft', 'Firm', and 'Super' Control used on these models. Monroe Direct Acting shock absorbers used on some Chrysler cars and Delco Adjustable Direct Acting Shock Absorbers (1" and 1⅜" Cylinder Types) used on Export Cars.

Nash-Lafayette & Nash Models—Gabriel Direct Acting Shock Absorbers used on some cars.



Pontiac Models—Three different valve calibrations have been used (changed after 4000 cars and again after 54000 cars). First type valve calibration should be changed to third type (or second type for slightly firmer control). See Valve Calibration data below.

TYPE:—Double acting piston type similar to previous types except for new piston guide oil seal (double type), new valve assemblies, and new lower housing without filler plug. NOTE—Filler plugs provided on some models but should not be used when refilling units—see refilling directions below).

SERVICING:—Disassembly—To service shock absorbers, remove unit from car, clamp in vise in upright position (engage lower mounting eye in vise jaws, use special clamping fixture for bayonet end types—do not clamp shock absorber tube in vise jaws), pull out to fully extended position, insert prongs of special wrench through holes in outer dust shield tube on side opposite model number stamping so as to engage slots in top of piston rod guide, unscrew guide from upper end of reservoir tube, lift entire top assembly (dust shield, piston rod, pressure tube and compression valve assembly) out of lower reservoir tube. Press in on compression valve plunger (at lower end of pressure tube) and pour out old fluid in cylinder. Remove compression valve from end of cylinder by tapping with blunt chisel against groove in edge of valve body (valve assembly is light press fit in cylinder), do not dismantle valve (serviced as an assembly). Mount top assembly in vise (grip upper mounting eye in vise jaws), press cylinder down on piston press so that piston rod nut accessible, remove nut, lift off piston and valve parts, remove pressure tube and piston rod guide as an assembly. Tap guide and seal assembly out of pressure tube (guide is press fit in upper end of tube). Do not remove oil seal from guide (serviced as an assembly).

Servicing—Wash all parts in naptha or gasoline and dry with compressed air (do not use cleaning compounds which may damage oil seal).

Reassembly—Install guide in top end of pressure tube (press on outer rim of guide only—not on oil seal), use special thimble (Chrysler MT-104, Pontiac J-475-3) on piston rod end (to prevent damage to oil seal) and install pressure tube and guide assembly on piston rod. Install valve parts and piston in correct order (see illustration), then install piston nut. With nut tight, check piston alignment by working piston up and down in cylinder. If piston binds, loosen nut, work piston up and down several times, tighten nut and recheck alignment. When piston works freely in cylinder, tighten piston nut with 20 lb. pull on 5" wrench (100 in. lbs.), stake nut to prevent loosening in service. Pull cylinder up on piston rod, measure exact correct amount of new fluid in measuring cup (see Capacity Chart above), pour fluid into cylinder above piston until cylinder is full. Install compression valve in end of cylinder and tap in place with a soft mallet. Pour remainder of fluid into reservoir tube. Install new gasket in upper end of tube, install top assembly and tighten guide securely with special wrench. NOTE—Install rear shock absorbers on car with stone shield (welded to reservoir tube) to front.

REFILLING:—All shock absorbers should be removed from car and disassembled, old fluid poured out, and refilled with exact correct amount of new fluid when reassembled. See chart below for correct fluid capacity for each type and servicing section (following for disassembly directions.

NOTE—Shock Absorbers with filler plugs at lower end should be refilled in same manner as types without plugs by disassembling units. Do not disturb filler plugs (used for initial filling at factory). Capacity for each unit determined by suffix letter of model number (1110-C) as follows:

Fluid Capacity Chart

Pontiac (All)—See (G)	.....	B4	.....	6G6

(A)—Soft Control. **(B)**—Firm Control.
(C)—Super Control.
(D)—Export Cars with heavy spring.
(E)—Used on first 4000 cars. Should be changed to third type (G) valves or, for slightly firmer control, to second type (F) valves.
(F)—Used after 4000 cars up to 54000 cars. Provides slightly firmer control at high speeds than third type (G) valve calibration.
(G)—Used after 54000 cars. This valve calibration should be installed on first 4000 cars with first type (E) valve calibration.

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

TROUBLE SHOOTING:—Shock Absorber Noisy. See that mounting brackets are tight. Replace rubber grommets in shock absorber mounting eyes if worn. Check shock absorber alignment. See that unit not striking or rubbing on frame or body or other parts of car. Disconnect one end of shock absorber and operate by hand to make certain that piston not binding in cylinder. Dismantle unit, check fluid level, see that valves correctly assembled and that piston rod nut tight on piston.

Oil Leaks—Tighten piston rod guide securely. If leakage continues at piston rod or around edge of guide, dismantle unit, replace guide and seal assembly, make certain that new gasket installed at top of reservoir tube when guide reassembled.

Performance Unsatisfactory—Operate shock absorber by hand to see that piston not binding in cylinder and all parts operate freely. Dismantle unit and check fluid level and valve assembly. Change valves for unusual operating conditions (see Valve Calibration data above.

DELCO 1936 TYPE DIRECT ACTING HYDRAULIC

Used On:

AUBURN EIGHT, 852 (1936-37)
GRAHAM CRUSADER, MODELS 80, 80A (1936)
GRAHAM CAVALIER, MODELS 90, 90A (1936)
GRAHAM SUPERCHARGER, MODEL 110 (1936)
HUDSON SIX, MODEL 63 (1936)
HUDSON EIGHT, MODELS 64, 65, 66, 67 (1936)

DESCRIPTION & OPERATION:—Direct acting, hydraulic type. Same design as Spicer 1935 type and operates in same manner (see article on Spicer Direct Acting Shock Absorbers).

REFILLING:—See Spicer article for complete directions. Capacity for all Hudson units is 4¾ fluid ounces (front), 5¼ fluid ounces (rear).

SERVICING:—Serviced in same manner as Spicer (second type). See Spicer article for complete data.

DELCO 1937 ADJUSTABLE DIRECT ACTING TYPE

Used On:

Car Model	Model Number Front	Model Number Rear
Studebaker Dict., 5A (Late '37)	1180-L	1182-U
Studebaker Dict., 6A (Late '37)	1181-S	1182-U
Studebaker Pres., 3C (Late '37)	1181-S	1182-X

DESCRIPTION & OPERATION:—Similar to type used on early 1937 cars except for adjustable feature. This consists of a mask or shield over the rebound valve orifice which can be turned to open or close the orifice ports providing a softer or firmer action. Shock absorber need not be dismantled for adjustment.

REFILLING:—Refilled in same manner as other types (see preceding article) using filler cup #494 and shut-off valve #490. Note rebound orifice setting (see adjustment instructions below) and take care not to disturb this setting when manipulating shock absorber. Capacity can be determined by suffix letter of model number as shown in table below.

Fluid Capacity Chart

Model Letter	Capacity Ozs.	Capacity CCs.	Model Letter	Capacity Ozs.	Capacity CCs.
A	3½	104	N	5⅝	166
B	3⅝	109	P	5¾	171
C	3⅞	114	Q	6	177
D	4	119	R	6⅛	182
E	4¼	124	S	6¼	187
F	4⅜	129	T	6½	192
G	4½	135	U	6⅝	197
H	4¾	140	V	6⅞	203
J	4⅞	145	W	7	208
K	5⅛	150	X	7¼	213
L	5¼	156	Y	7⅜	218
M	5½	161	Z	7½	223

ADJUSTMENT:—Disconnect bottom end of shock absorber and collapse unit so that notch at lower end of dust shield is adjacent to graduations on reservoir tube. Hold in this collapsed position and rotate lower end until ratchet spring on rebound orifice valve can be felt to engage notch in lower end of cylinder. With 'normal' factory setting, notch in lower edge of dust shield should line up with inverted 'V' at center of graduations at this point. To adjust, turn cylinder to right for firmer action, left for softer action as indicated on scale, being careful not to allow ratchet spring to disengage from notch in cylinder. Shock absorbers on both sides of car must be adjusted equally. This is important.

SERVICING:—Serviced in same manner as other types except that rebound orifice setting must be set at 'normal' (notch in dust shield in line with 'V' of scale with ratchet engaged in notch in lower end of cylinder) before unit is disassembled. Take care not to change ratchet adjustment when removing piston nut (valve assembled as unit on nut). Check normal, or standard position when unit is reassembled, and if necessary make a new notch on the dust shield opposite the 'V' of the scale to indicate this position (fill up old notch to avoid possibility of confusion).

Plymouth P7, 8 Exp. 20" Wheels	1134E	1130Y

MODEL IDENTIFICATION NOTE:—1" and 1⅜" Shock Absorber models can be readily distinguished by diameter of outer dust shield tube which is approximately 2" (1" types), 2⅝" (1⅜" types).

NOTE:—Chrysler Models. Monroe Direct Acting Shocks used on domestic models, Delco Direct Acting (Non-adjustable) Shocks on Canadian cars.

Nash Models. Gabriel Direct Acting Shocks used on some cars. See Gabriel article for data.

TYPE:—Double acting piston type similar to other Delco models except for adjustable feature which consists of an adjustment cam assembled on the piston rod nut below the piston by which the spring tension of the Rebound valve can be varied from 'Soft' to 'Firm' for special operating conditions. This adjustment can be made without dismantling the shock absorber (see Adjustment section below).

DELCO ADJ. TYPE CONT.

REFILLING:—Shock absorbers must be removed from car, all old fluid pumped out, and refilled with exact correct amount of new fluid in same manner as other Delco models. Capacity designated by suffix or last letter of model number (see car list above) for each model as shown in following table. See preceding Direct Acting Shock Absorber article for complete filling directions.

1939 Type—Shock absorbers must be removed from car and disassembled, old fluid poured out, and refilled with exact correct amount of new fluid when reassembled. See chart below for correct capacity for each type and Servicing section (following) for disassembly directions. NOTE—Shock absorbers with filler plugs at lower end should be disassembled for refilling in same manner as types without plugs. Do not disturb filler plug (used for initial filling at factory).

Fluid Capacity—Capacity for each unit determined by suffix letter of model number (1114-C) as follows:

Fluid Capacity—1" Types

Model Letter	Ounces	CCs.	Model Letter	Ounces	CCs.
A	3½	104	N	5⅝	166
B	3⅝	109	P	5¾	171

A, B, C Note—When these units fitted with hexagonal headed filler plug, capacity is 4¾ ozs. (A), 5¼ ozs. (B, C).

Fluid Capacity—1⅜" Types

Model Letter	Capacity (in Ozs.)
E	6¾
S	10½
W	12
Y	12⅝

ADJUSTMENT:—Disconnect lower end of shock absorber (keep upper end stationary), collapse unit fully and rotate lower end of shock absorber until adjustment engages (tang on adjusting cam washer will engage slot in pressure cylinder lower end within unit). Note position of notch on dust shield with relation to mark on cylinder (two settings only —'F" firm, 'S' soft). To change setting, rotate lower end of shock absorber in **counter-clockwise direction only** as viewed from below until a stop position is felt (unit will tend to shorten slightly when approaching 'Firm' position, lengthen when approaching 'Soft' position). There are six stop positions in one complete revolution which are alternately Soft and Firm. In order to line up reference notch on dust shield with mark on reservoir tube in each position, turn lower end 1/6 revolution (to change setting from Firm to Soft), or 5/6 revolution (to change setting from Soft to Firm). See that filler plug points toward rear of car when re-connecting shock absorber. Adjust shock absorbers on both sides of car for same setting to insure balanced operation.

SERVICING:—Serviced in same manner as other Delco type (see preceding Direct Acting Shock Absorber article) except for following points:

Disassembly. Set shock absorber in 'Soft' position before disassembling. This is important. When clamp fixture (#493) used to hold 'bayonet end' type on bench, filler plug must be removed and special steel plug (#44288) installed in filler plug hole to prevent sheering off plug when shock absorber turned with wrench.

Rebound Valve Assembly. Use Allen wrench (#488) to remove piston rod nut (regular wrench cannot be used as nut has tangs which engage adjusting cam washer), lift off adjusting cam washer, valve spring, valve back plate, spring disc, and orifice plate (orifice plate not used on all models). Mark piston to insure replacing in same position on rod, remove piston, valve plate, spacer washer, spring washer and bushing. Assemble in same order. Replace valve spring, orifice plate, or spring disc for lighter or heavier rebound resistance.

Assembling. When installing piston rod nut, see that tangs on nut are in depressions in cam washer so that spring is not compressed (soft position). Stake nut on rod to prevent loosening in service. Check reference marks as follows: With shock absorber completely reassembled and filled with fluid, collapse unit and turn until tang on adjusting cam washer is felt to engage notch in pressure cylinder lower end. If notch on dust shield does not line up with 'S' mark on pressure cylinder, cut new notch in dust shield in line with 'S' mark, fill up old notch to prevent confusion. NOTE—Before making new notch, make certain no one of the three identical soft settings (equi-distant apart in one complete counter-clockwise revolution of shock absorber lower half) lines up with old notch. Adjust shock absorber for Firm or Soft action before installing on car (See Adjustment section above).

IMPORTANT NOTE—Always adjust shock absorbers on both sides of car for same setting to insure balanced operation).

CONTROL VALVE CALIBRATION:—Standard Compression and Rebound Valve calibrations for each model are listed in table below.

1938 Compression & Rebound Valves

Car Model	Compr. Valve Front	Compr. Valve Rear	Rebound Valve Front	Rebound Valve Rear
Chrysler C18, 19, 20	J0	D0	0FR8	0FR6

DELCO 1938 BUICK TYPE DIRECT ACTING HYDRAULIC

Car Models	Model No.
Buick, Models 38-40, 60, 80, 90 (1938)	1100-S

NOTE:—This type shock absorber used at rear end only in conjunction with new type rear suspension. Delco double-acting hydraulic shock absorbers used at front end (part of independent suspension assembly).

TYPE:—This type has larger (1⅜") piston and may be identified by larger dust shield (outer tube) which is approximately 2⅝" in diameter. Similar to design used on other models except for valve assemblies (see Servicing), special orifice in rod guide at top of upper cylinder (this orifice will keep cylinder free of air if shock absorber properly mounted on car), and baffle ring assembled below rod guide at upper end of reservoir tube.

REFILLING:—Shock Absorber must be removed from car (see special Removing Instructions), all old fluid pumped out, and refilled with exact correct amount of new fluid twice each year. See preceding Direct Acting Shock Absorber article for complete instructions. If Delco #494 filling cup used, assemble with #490 shut-off valve and adapter. Buick type filler cup is No. J-1108. Capacity for all units is 10 ozs.

REMOVING & INSTALLING SHOCK ABSORBERS:—Removal. Take out two bolts mounting upper bracket on frame, remove shock absorber and upper bracket as a unit. To remove bracket, use Frame Bracket Tool (Delco #854, Buick No. J-1111), and compress upper rubber grommet slightly in a vise or arbor press, remove snap ring from end of frame bracket stud.

Installing. Make certain that stone shield is on forward side (necessary for correct action of top cylinder rod guide orifice).

SERVICING:—Serviced in same manner as other Delco types (see preceding Direct Acting Shock Absorber article) except for following points:

Disassembly. Collapse shock absorber to shortest length and remove knock-out plug on side of dust shield (this will prevent damage to piston rod). Extend shock absorber, install special wrench (Delco #582, Buick No. J-1117) and unscrew rod guide retainer nut being careful not to damage piston rod with wrench. If gaskets stick to reservoir tube when lifting off top unit, pull up on dust shield.

Rebound Valve Assembly. To disassemble, use ⅝" socket wrench to remove nut on lower end of piston rod under piston, lift off valve spring, valve reinforcing plate, valve back plate, spring disc, and orifice plate. Mark piston to insure replacing in same position on rod, remove piston, valve plate, spacer washer, spring washer, and bushing. Assemble in same order making certain that dowel on bushing engages hole in piston. Replace spring, orifice plate, or spring disc to secure lighter or heavier rebound resistance.

Compression & Intake Valve Assembly. Has new type valve assembly consisting of spider (riveted to spring stud), valve disc and spring seat in cage at upper end of spring. Valve assembly retained by light spring at lower end of cage and safety hairpin spring at upper end. To disassemble, depress octagonal washer at lower end of spring stud until head of stud is freed from grooves in washer, turn washer 45° and slip off. Change spring or valve disc for lighter or heavier compression resistance. Reassemble in same order. Valve assembly is light press fit on lower end of pressure tube and should be tapped on and off.

DELCO (1938 BUICK) TYPE CONT.

Piston Rod Guide & Seal. Can be removed from reservoir tube by tapping lightly. Seal cannot be serviced and complete guide and seal assembly should be replaced if seal is defective. When installing, make certain that baffle is in place on lower surface of guide, use new reservoir gaskets (dip gaskets in shock absorber fluid), install cork gasket first, then rubber gasket on shoulder on guide assembly. Use special thimble (Delco #583, Buick No. J-1109) on piston rod end when installing rod through guide assembly to avoid damage to seal.

CONTROL VALVE CALIBRATION:—Standard valve calibration for all 1938 models as follows:

Car Model	Compr. Valve	Rebound Valve
38-40C, 41, 44, 46, 46S, 47, 48, 46C	6C3	2E6
38-61, 64, 66C, 66S, 67, 68	6D3	2E6
38-81, 81F, 80C	6D3	2F8
38-90, 90L, 91, 91F	8D3	2G8

DELCO HYDRAULIC TYPE (SPECIAL CHEVROLET-PONTIAC TYPE)

CHEVROLET MSTR., DA ('34), EA ('35), FA ('36), CHEVROLET MASTR. DELUXE, GA ('37), HA ('38) PONTIAC SIX, 701A (1935), 36-26A (1936) PONTIAC EIGHT, 603 ('34), 605 ('35), 36-28 ('36)

NOTE:—This type used on front end of these models in conjunction with special 'Knee Action' unit. See separate article on Delco Single Acting Shock Absorbers for type used on rear end and for other Chevrolet and Pontiac models.
NOTE—Each unit consists of complete cylinder and piston assembly.

DESCRIPTION & OPERATION:—Similar in design to Single Acting type (spring loaded single acting piston with intake and relief valve assemblies located in head). Two units used (upper—compression unit, lower—rebound unit) so that double acting shock absorber action provided. Units are bolted directly on front face of knee action case with pistons extending through case to contact cams on suspension unit shaft. Shock absorbers operate on fluid used to fill suspension unit case and case acts as reservoir or supply tank (fluid drawn into shock absorber cylinder on suction stroke, expelled through relief valve into case on compression stroke).

SERVICING:—**Disassembly.** To remove units, turn all three capscrews in mounting flange out evenly one turn at a time to relieve spring pressure. With unit removed, withdraw piston, spring, valve assembly.
Assembly. Assemble spring, valve and piston in cylinder, press piston in until small hole on side lines up with hole in cylinder under mounting flange, insert cotter pin in this hole to hold assembly together while it is being installed (withdraw cotter pin as soon as mounting screws are started). See that gasket under mounting flange is in good condition and use new lead washers on mounting screws. Turn all screws up evenly and securely.

ADJUSTMENT:—No adjustment provided. Valve assemblies are calibrated and should not be changed. Standard valve calibration as follows:

Car Model	Valve Number Compression	Rebound
Chevrolet ('34-36)	2B	2BX
Chevrolet ('37-38)	1B	1BX
Pontiac 6 & 8 ('34-36)	GO	3C

*—Use Model KT for replacement.
†—Gabriel-Walex type (see separate article for data on this type).

DESCRIPTION & OPERATION:—Single vane, double acting, hydraulic type. Vane mounted on shaft displaces fluid from working chambers on compression and rebound. Fluid flow from chamber restricted by non-adjustable fixed orifice on compression, adjustable piston valve on rebound. Rebound valve control types are as follows:
Manual Adjustment. Consists of an adjusting screw within filler plug opening which can be turned to vary action.
Ride Control Type. Adjusting lever on shock absorber case linked to dash control lever so that shock absorber action can be varied at the will of the operator.
Automatic Thermostatic Control Type. This type fitted with adjusting screw located within filler plug opening but screw connected to valve by thermostatic element so that valve position is automatically compensated for temperature, assuring even shock absorber action regardless of temperature changes.

SERVICING:—**Fluid Level.** Inspect at 5000 mile intervals and fill with genuine Gabriel fluid to level even with bottom of filler plug hole (unit must be in normal mounting position). Work arm up and down several times to expel air bubbles.

ADJUSTMENT:—**Ride Control Types.** All units should be adjusted evenly. Linkage should be adjusted so that levers are against stops when dash control button is in extreme inner or outer position.
Manual & Thermostatic Control Types. Use special filler plug wrench and adjusting tool, remove filler plug, use wrench to turn adjusting screw slightly in or clockwise for firmer action, out or counter-clockwise for softer action. Adjustment range is from 1½ to 3 turns out from the inner seated position (see table below for standard setting for each car model). To adjust setting, turn screw in until it is seated (count turns required to determine original setting), then turn screw out specified amount for correct setting. Do not use excessive force when turning screw in to check seated position.

Car Model	Setting (Turns Open) Front	Rear

GABRIEL-WALEX

Used On:

LAFAYETTE, 3610, 3612 ('36) AFTER SERIAL No. L-33847.

NOTE:—This type used on rear only. Regular Gabriel Hydraulic Shock Absorbers used on front end on these cars and both front and rear on early 1936 cars. See separate Gabriel service article for data on these regular types.

DESCRIPTION & OPERATION:—Hydraulic, single acting, piston type. Operated by eccentric pin on shock absorber arm shaft within case which contacts movable cylinder which slides on stationary piston and is kept in contact with operating pin by spring. Intake valve (by which cylinder is kept filled with fluid) is a ball check type and is located in the piston head. Control valve which restricts fluid flow from cylinder on rebound stroke is a spring loaded ball check type and is located within the piston with an adjusting screw at the opposite end. Cylinder is sealed by a leather packing ring assembled on the head of the piston.

SERVICING:—Entire cylinder, piston, valves and springs assembled as a unit in a 'cartridge.' Parts not furnished separately and cartridge should not be disassembled. To remove cartridge, unscrew large hexagonal nut on opposite end of unit from lever, withdraw cartridge from housing.

GABRIEL-WALEX TYPE CONT.

Fluid Level. Special Garbriel-Walex fluid must be used. Unit will not operate satisfactorily it filled with standard Gabriel Thermostatic type fluid.

ADJUSTMENT:—Remove small hexagonal headed plug on end of cartridge. Use special adjusting wrench, Nash No. SE-783, turn adjusting screw within plug recess clockwise or in for firmer action, counter-clockwise or out for softer action. Check performance after turning screw ¼ turn. Do not turn screw out more than 3 turns. Standard setting for each model as follows:

Car Model	Setting (Turns Open)
Lafayette 3610 (Sedan)	2½ turns
Lafayette 3612 (Coupe)	2¼ turns

NOTE—One fourth turn will have noticeable effect on riding quality of car.

GABRIEL HYDRAULIC ADJUSTABLE DIRECT ACTING TYPE

Used On:

Nash Ambass. 6, 3820 ('38), 3920 ('39)
Nash Ambass. 8, 3880 ('38), 3980 ('39)
Nash-Lafayette, 3810 ('38), 3910 ('39)

NOTE:—Delco Direct Acting Shock Absorbers used on some cars. See separate article for data an Delco Shock Absorbers.

TYPE:—Direct Acting, adjustable, piston type. Shock Absorber case is welded in assembly and cannot be dismantled for servicing or refilling.

SERVICING:—Serviced by replacement (case is welded and Shock Absorber cannot be dismantled).

ADJUSTMENT:—Shock absorbers set at factory for normal control (valve 1 turn open) and performance should be satisfactory for all average riding conditions. Before changing adjustment to correct riding complaints, see that tires are properly inflated, springs and shackles lubricated and properly adjusted.

To Adjust—Remove shock absorber from car or disconnect lower mounting (necessary in order to collapse instrument fully). Collapse shock absorber fully by pressing upper and lower halves together and hold in this position until adjustment completed. Turn shock absorber cylinder to right (clockwise) slowly until adjustment key can be felt to drop into and engage slot in valve (within shock absorber). Continue to turn cylinder to right until a definite stop is felt (1-2 turns rotation) which indicates that valve is closed. Then turn cylinder to left (counter-clockwise), to open valve, desired number of turns as shown in table below.

IMPORTANT NOTE—Shock absorbers on both sides of car must always be adjusted alike (Right & Left Front same, Right & Left Rear same).

Valve Opening (No. of turns)	Type Control
¼-1 turn open	Very Firm to Firm
1-1½ turns open	Standard
1½-2 turns open	Soft

CAUTION—Adjustment valve must be at least ¼ turn open (operating with valve fully closed will damage shock absorber and mountings). Maximum adjustment is 2 turns open (do not force valve beyond this position). Use hand pressure only when making adjustments and do not force beyond fully closed and fully open positions. Operate shock absorber only in upright position (do not invert). When installing rear shock absorbers, see that stone shield faces forward.

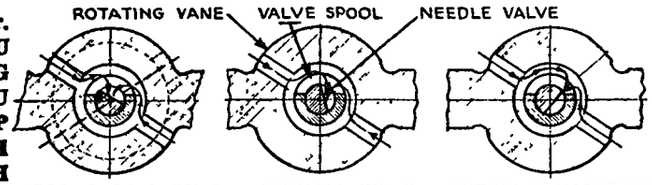
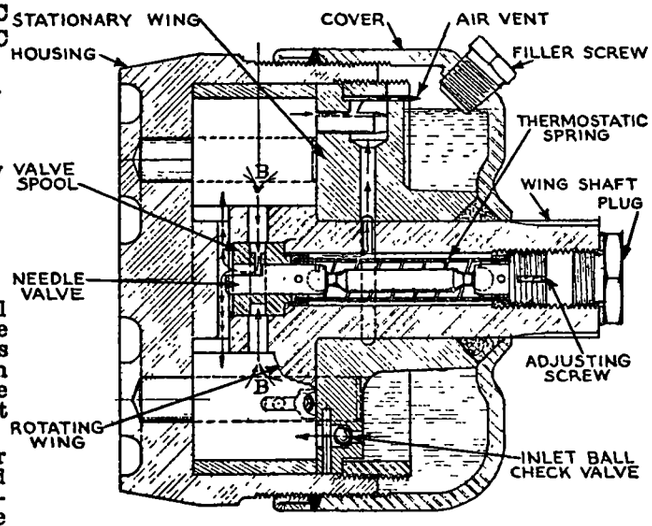
Packard (see Note) 1939)		NFT



NOTE:—**1938 Packard.** Front shock absorbers special double lever type (shaft extended through case with lever mounted on each end, levers serve as upper control arm of independent front suspension assembly). Units have base mounting lugs and are bolted on top of frame side rail. No adjustment provided (replace valves to change action).



Production Change Note—First type shock absorber with domed filler plug (using #1402 fluid) should be replaced by later thermostatic control type exchange shock absorbers with flat filler plug (use #800 fluid).

1939 Packard Models—On Six 1700, '120' Eight 1701, 1A, 2 and Super Eight 1703, 3A, 5 models. This Model NFT shock absorber is the 'Fifth' Shock Absorber used to control the Lateral Stabilizer at the rear of the car. Regular shock absorbers are Delco double-acting, opposed-piston type. See separate article for Delco Shock Absorber data.

DESCRIPTION & OPERATION:—Double vane, hydraulic type. Case is divided into two semi-circular chambers by stationary wing or partition. Rotating wing is integral with shaft to which shock absorber arm is attached and moves backward and forward in the chamber displacing the fluid from the compression space (in front of the moving vane) to the non-compression space behind it. Fluid escape from compression chamber is regulated by valves in the movable wingshaft as detailed below for each type. In addition, on the compression stroke (when car springs compressed by road shock) fluid is allowed to flow through ball check valves in the stationary wing into the opposite non-compression chamber which lessens the shock absorbing action. On the rebound these check valves close and all fluid flow is regulated by the movable wingshaft valves.

Adjustable Orifice Type. By-pass in rotating wing-shaft controlled by needle valve which is adjustable by turning handle at end of shaft within shock absorber lever or by removing plug on end of shaft and turning valve stem with special adjusting tool.

Thermostatic Automatic Ride Control Type. By-pass valve in rotating wingshaft consists of an inserted valve spool and a needle valve controlled by a thermostatic coil. The opposite end of the thermostatic coil is connected to an adjusting screw under the plug on the end of the shaft within the shock absorber arm (this adjustment not provided on all models). Needle valve is formed with a flat portion within the valve spool which causes valve to close somewhat under the impact of fluid velocity so that flow is restricted to provide firmer control on rough roads. Thermostatic coil positions valve so that action is uniform for all temperatures.

HOUDE TYPE CONT.

ADJUSTMENT:—Adjustment provided for both Adjustable Orifice type and Automatic Thermostatic Control type so that softer or firmer shock absorber action can be secured for particular operating conditions. Adjustments are sensitive and screw should not be turned more than 1/32" at a time (road test car to check performance).

Adjustable Orifice Type (Ford, Lincoln-Zephyr). Adjusting handle located at end of wing-shaft within lever. Original standard setting indicated by one or two chisel marks on shaft (center pointer on single mark or between double marks), turn handle clockwise to increase, or counter-clockwise to decrease shock absorber action. Stops provided to limit motion in each direction. Do not force adjusting handle beyond stops.

Adjustable Orifice Type (Studebaker front units). Adjusted in same manner as Automatic Thermostatic Control types (adjusting valve stem under plug on end of shaft which can be turned by special tool toward 'O' mark for softer action, 'S' mark for firmer action. Valve must not be turned beyond marks (turning valve beyond 'S' mark will result in excessive pressures and damage to unit).

Automatic Thermostatic Type (Lincoln, Pierce Arrow, Studebaker rear units)—Remove cap on end of wingshaft within shock absorber arm, note position of arrow on adjusting screw within shaft recess (with standard factory setting, arrow should be in line with reference mark on shaft between 'O' and 'S' marks. Reference marks 'O' (open), 'S' (shut) indicate limits of adjustment and adjusting screw must never be turned so that arrow is beyond these points. This is important as additional adjustment may cause excessive pressure and leakage. To adjust, use special adjusting tool, turn screw 1/32" at a time toward 'O' for softer action or toward 'S' for firmer action, road test car before repeating adjustment. See that copper gasket under cap is in good condition and tighten cap securely.

Packard 1938 Type—See Production Change Note (above) for later type thermostatic control shock absorbers which should be installed on cars with first type units. Shock absorbers are adjustable by turning adjusting screw in shaft (accessible by taking out plug) but adjustment is very sensitive and screw should not be turned more than 1/16 turn at a time. **Do not turn screw more than ½ turn**

Willys 48 (1939) H. D. Cont.	637645	637644

These part numbers stamped on outside of dust shield on shock absorber.

NOTE:—Hudson & Terraplane 1934 Models. These types are not serviceable (piston and valve are a single assembly) and later type should be used to replace them. Later type can be adjusted by replacing relief valve and metering washer with parts having different calibration. Spicer Direct Acting Shock Absorbers also used on Hudson Eight (see separate article for data).

1939 Hudson Models. Beginning with Car No. 41494 (90&98 Sedan), 39272 (91, 92), new type shock absorbers were used. See following article for data.

Reo Models. Shock absorbers used on Royale 'S' models not adjustable and should be replaced by new type No. 290 (front), No. 291 (rear) which can be adjusted by changing piston and valve assembly

CAUTION:—New fluid must not be added until all old fluid has been removed from shock absorber. Correct amount of fluid should be used (see Refilling directions below).

DESCRIPTION & OPERATION:—Direct acting type. Consists of a piston rod and piston attached to the car frame working within a compression cylinder attached to the axle. Reservoir cylinder surrounds compression cylinder with oil seal at upper end contacting inner of two concentric dust shield cylinders attached to the upper piston rod end of the shock absorber. Control valves (assembly with piston) control fluid flow through piston holes from one end of cylinder to the other on compression and rebound. Excess fluid (on compression) is forced out through bleed hole at lower end of cylinder into reservoir. On rebound, this fluid flows back into the cylinder through a flapper valve.

NOTE—On 1937 Terraplanes, a valve similar to the piston valves located at the bottom of the compression cylinder below the flapper valve and bleed hole. This valve does not open on compression until pressure builds up to a definite point improving the control.

REFILLING:—Use special refill kit and filler cup to measure fluid. Remove shock absorber from car, clean all dirt from around fillers plug at lower end of shock absorber, remove plug, pump all old fluid out by repeated strokes with filler plug opening down. Clamp shock absorber in vise at lower end with filler opening up. Compress unit, screw filler cup in opening, pour exact amount of fluid in cup (see table below), fully extend shock absorber which will draw all fluid in, remove filler cup, replace filler plug (using new gasket), tighten securely.

Fluid Capacity

Car Model	Front	Rear
Auburn 653	4 ozs.	5 ozs.
Chrysler C14, C16	4¾ ozs.	5½ ozs.
Chrysler C15	4¼ ozs.	5½ ozs.
Chrysler C18, C19, C20	4 ozs.	5½ ozs.
Hudson 116" WB '34	4 ozs.	5 ozs.
Hudson 122" WB '34	4 ozs.	5½ ozs.
Hudson 89 '38	5 ozs.	5½ ozs.
Hudson All '39	5 ozs.	5½ ozs.
Overland 39 '39	3¾ ozs.	4¼ ozs.
Reo 6A, 6D	4 ozs.	5 ozs.
Reo 4S, 5S, 7S	4 ozs.	5½ ozs.
Terraplane All '34-36	4 ozs.	5 ozs.
Terraplane All '37-38	5 ozs.	5 ozs.
Willys All '37-38-39	3¾ ozs.	4¼ ozs.

SERVICING:—Disassembly—Clamp base of unit in vise. Compress top fully and rotate until pin in top engages hole in piston rod bushing, tap top lightly to insure full engagement of pin, turn top counter-clockwise (using bar engaged in grommet hole) until bushing is freed from cylinder, pull top off. Clamp top of unit in vise, remove piston rod nut. Valve and piston assembly can then be dismantled.

Servicing—Wash all parts with gasoline and dry with air. Oil seal or gasket at top of reservoir cylinder cannot be removed (replace shock absorber if oil leaks at this point). Flapper valve and control valve (Terraplane) at lower end of compression cylinder are staked in place and cannot be taken out.

MONROE DIRECT ACTING TYPE CONT.

Reassembly—Reverse disassembling directions. See that washers and valve springs are correctly assembled on piston rod (see illustration). Tighten piston rod nut securely and stake to prevent loosening.

TROUBLE SHOOTING:—Shock Absorber Noisy. See that brackets are tight on frame, check rubber grommets at top and bottom, replace if worn or loose. See that shock absorber does not strike frame. On rear units, see that gravel shield (welded to lower tube) is toward front of car. Drive car with shock absorbers removed. If noise definitely located in shock absorber, check fluid, or disassemble as directed above.

Oil Leaks. If oil leaks at filler plug, replace plug gasket. If oil leaks excessively at oil seal gasket at upper end of reservoir cylinder (oil will run down cylinder and be apparent at lower end of dust cover), shock absorber must be replaced (oil seal permanently assembled in cylinder and cannot be serviced).

Performance Unsatisfactory. Check fluid, check tire inflation and springs. Valve calibration may be changed for special service requirements such as heavy loads (Heavy Control) or low speeds on smooth roads (Light Control). See section below.

CONTROL VALVE CALIBRATION:—To change control for special service, disassemble shock absorber (see Servicing above), replace relief valve and metering washer with correct type as noted below (Fr.) Front, (Rr.) Rear, (All) front and rear.
IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

Reo Valve Calibration.

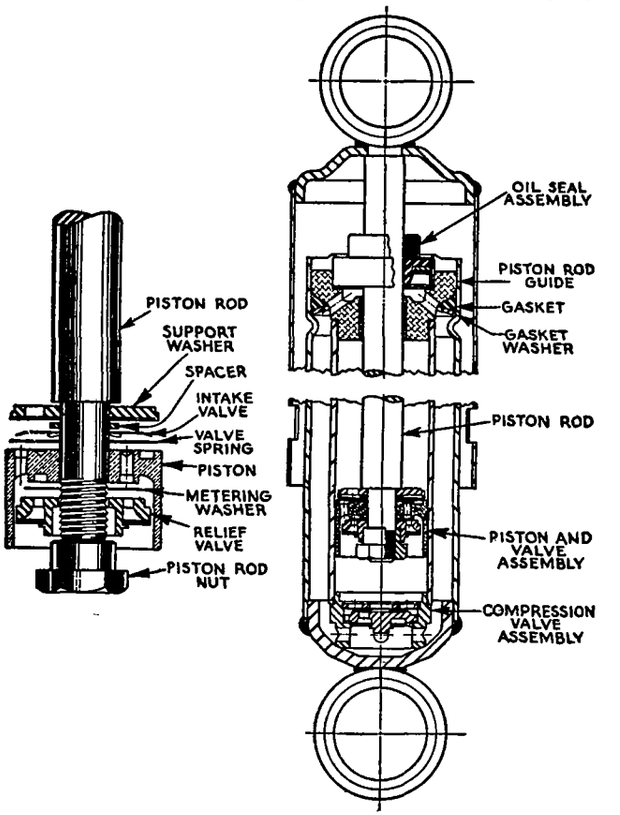
Hudson 1938-39 Note—For softer ride, new .008" metering washer, Hudson Part No. 157075, may be installed in place of the original types.

MONROE DIRECT ACTING (NEW 1939 TYPE)

Used On:

Car Model	Front	Rear
Chrysler Royal C22 (1939)	696240	696242
Chrysler Imp. C23 (1939)	696240	696242
Chrysler Cust. Imp. C24 (1939)	696241	696242
Hudson 90, 91, 92, 98 Sedan ('39)	See Note	

NOTE:—Delco Direct Acting Shock Absorbers used on some cars. See separate articles for data on Delco Shock Absorbers.
Hudson 1939 Note—These shock absorbers used beginning with Car No. 41494 (90, 98 Sedan), 39272 (91, 92). See preceding article for data on type used on first cars.



DESCRIPTION & OPERATION:—Direct acting type similar to previous Monroe designs except for new valve design and new piston guide (requires new dismantling instructions as given below). No filler plug provided (dismantle unit for refilling).

REFILLING:—Refill at 25000 mile intervals for ordinary driving conditions (more frequently for hard service or if unit shows serious leakage or loss of control). To refill, disassemble unit as directed in Service section below, clean out all old fluid and wash all parts, install correct amount of new fluid when reassembling.

Fluid Capacity Chart

Car Model	Front	Rear
Chrysler (all models)	3⅞ ozs.	6½ ozs.
Hudson (all models)	6 ozs.	6½ ozs.

SERVICING:—Disassembly—Remove shock absorber from car, clamp lower eye in vise with unit vertical, pull out to fully extended position, insert prongs of special T-317 wrench through slots in outer dust tube so as to engage holes in top of piston rod guide, turn wrench counter-clockwise to unscrew guide from reservoir tube, lift entire head assembly out. Clamp upper eye in vise so that head assembly mounted vertically, remove compression valve assembly by

tapping it lightly while working assembly out of pressure tube. Remove nut on end of piston rod, remove piston and valve parts from piston rod. If piston rod seal to be replaced, remove pressure tube and piston rod guide from piston rod, tap guide out of pressure tube (guide is press fit in end of tube). Seal should not be removed from guide (serviced as an assembly). CAUTION—Do not clamp pressure tube in vise and use extreme care not to distort tube.

Servicing—Wash all parts in clean naptha or gasoline, replace all worn or defective parts, always use new gasket under piston rod guide in reservoir tube when reassembling.

MONROE (NEW) DIRECT ACTING CONT.

Reassembly & Refilling—Use Thimble T-343 to install piston rod guide on piston rod to avoid damage to seal, install all valve parts and piston in correct order (see illustration—metering washer not used on all models), tighten piston nut securely. Measure correct amount of new fluid in measuring cup, pull pressure tube and guide up on piston rod, pour fluid into tube above piston until tube is full. Install compression valve assembly on upper end of pressure tube, tapping valves securely in place in tube and using extreme care not to spill fluid out of tube. Clamp base assembly in vise vertically, pour remainder of fluid into reservoir tube. Use new gasket in top of reservoir tube, install head assembly and tighten piston rod guide securely with T-317 wrench.

NOTE—See that stone shield (on lower tube) faces forward on rear shock absorbers when installed.

CONTROL VALVE CALIBRATION:—Standard Control relief valve and metering washer calibration should provide satisfactory control for normal operating conditions. Shock absorber performance can be varied for special operating conditions by changing valve calibration to 'Light Control' or 'Heavy Control' as shown in table below.

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

Relief Valve Specifications

Car Model	Light Control	Standard Control	Heavy Control
Chrysler C22 (Front)	74-15	74-17	74-22
Chrysler C22 (Rear)	74-17	74-20	74-25
Chrysler C23 (Front)	74-15	74-17	74-22
Chrysler C23 (Rear)	74-17	74-20	74-25
Chrysler C24 (All)	74-17	74-20	74-25

Metering Washer Specifications

Car Model	Standard Control	Light & Heavy Control
Chrysler (All—Rear)	10641-3	10641-4

NOTE—Metering washers not used in Front Shocks.

Hudson Specifications.

Car Model	Metering Washer Size Front	Rear
90, 98 Sedan	.004"	.005"
91, 92	.006"	.005"

TROUBLE SHOOTING:—Shock Absorber Noisy. Make certain that mounting bolts are tight and that shock absorber not striking any part of car. If rubber grommets in mounting eyes are worn, install new grommets, using liquid soap, if grommets tight fit, to assist in working grommets in eyes.

Fluid Leaks. If fluid leakage serious, disassemble unit and replace piston rod guide and seal assembly. **Performance Unsatisfactory.** Check tire inflation, spring and shackle lubrication and adjustment first. Check fluid level in shock absorber and refill.

MONROE SINGLE ACTING HYDRAULIC TYPE

Used On:

ESSEX-TERRAPLANE SIX, K, KU (1932-33)
ESSEX-TERRAPLANE EIGHT, KT (1933)
WILLYS, MODEL 77 (1933-34-35-36)

DESCRIPTION & OPERATION:—Single Acting, hydraulic type. Piston within cylinder is held out against cam on shock absorber shaft by spring within cylinder. On outward stroke (when car springs compressed by road shock), fluid flows freely into cylinder through check valve in piston head. On rebound stroke, fluid escape from cylinder is restricted by adjusting needle valve in by-pass channel and by relief valve in piston head.

ADJUSTMENT:—Adjusting needle valve should be turned in for firmer action, out for softer action. Standard settings are ½ turn open (Essex Terraplane), 2/3 turn open (Willys). To adjust, turn valve in until it is seated, then back off required amount. Valve must not be set at less than 1/6 turn open.

SERVICING:—Refilling. Remove top cover screw, fill case with Monroe fluid to level even with lower edge of screw hole.

Disassembly. Take out cover screws, remove cover and gasket, withdraw piston, spring and valve assembly. When reassembling, see that gasket in good condition and tighten cover screws securely to prevent leaks.

SPICER DIRECT ACTING HYDRAULIC TYPE

Used On:

AUBURN SIX, MODEL 652X, Y (1934)
AUBURN EIGHT, 850X, Y ('34), 851 ('35)
GRAHAM SIX, 74, 73 ('35)
GRAHAM EIGHT, 72 (1935)
GRAHAM SUPERCHARGER, 75 ('35)
HUDSON SIX, MODEL GH (1935)
HUDSON EIGHT, LL, LT, LTS ('34), HT, HU, HHU ('35)

NOTE:—Monroe Direct Acting Shock Absorbers used on some Hudson Eight models for 1934. See article on Monroe Shock Absorbers for data on these cars.

DESCRIPTION & OPERATION:—Direct acting type. Consists of a piston rod and piston attached to the car frame working within a compression cylinder attached to the axle. Reservoir cylinder surrounds compression cylinder and has a leather oil seal at its upper end which contacts piston rod. Outer dust shield cylinder is attached to upper or piston rod end of shock absorber. On compression stroke the fluid displaced from the lower end of the cylinder flows through valve ports in the piston into the upper portion of the cylinder. Excess fluid (to compensate for displacement of piston rod in upper end of cylinder) is expelled through a bleed hole in the flapper valve at the lower end of the cylinder into the reservoir. On rebound stroke, fluid is trapped in upper cylinder until valve plate is sprung away from valve disc (valve assembly mounted on top of piston), and then flows through piston ports into lower end of cylinder. Flapper valve permits free flow of fluid into lower cylinder from reservoir so that cylinder is kept full at all times.

REFILLING:—Remove shock absorber from car, pull out to fully extended position, remove filler plug and lead washer. Place unit in horizontal position on bench with filler plug hole up (use special fixture, do not clamp housing in vise). Pour genuine Spicer fluid slowly into filler hole until fluid rises to top of bleeder hole at side of filler hole. Do not fill above this point as sufficient air space must be left above fluid in reservoir. See that lead washer is in good condition and tighten filler plug securely.

Hudson Models. Special filler cup furnished so that required amount of fluid can be installed. Remove old fluid by pumping piston back and forth with filler plug and gasket removed. Clamp base end of shock absorber in vise (mounting eye, not housing) so that housing is horizontal and filler plug hole up. Collapse to shortest length, screw filler cup in place in filler hole, pour correct amount of fluid in cup (see table), pull shock absorber out to fully extended position and work piston back and forth with short quick strokes to draw all of fluid in, remove filler cup, install filler plug.

Capacity (Fluid Ounces).

Car Model.	Front	Rear
Hudson 8 116" WB. ('34)	4¾ ozs.	5 ozs.
Hudson 8 122" WB. ('34)	4¾ ozs.	5¼ ozs.
Hudson 6 & 8 ('35)	4¾ ozs.	5¼ ozs.

SERVICING:—1934 model cannot be dismantled and is serviced as an assembly (replace as a unit). Later types can be dismantled and serviced as directed below.

Disassembly. Remove all fluid by pumping piston with filler plug removed. Clamp top eye of shock absorber in vise (do not clamp housing), collapse shock absorber and turn slowly until pin in top engages hole in top guide (top of pin must be flush with outside top surface of housing), continue turning toward left until top unit can be lifted off. Clamp top eye in vise, remove piston nut, take off piston, valve plate, valve disc, spring and guide. Remove piston rod guide and oil seal assemblies.

Servicing. Wash all parts with gasoline and dry with air.

Reassembly. Reverse disassembly directions. Use special two or three prong tool when assembling valves. Install piston on tool with valve side down, press ends of pins against valve to compress spring so that end of bushing projects slightly above top surface of valve disc, press piston down into tube until it bottoms against bushing maintaining tool pressure on valve, withdraw tool without releasing pressure on piston, install nut loosely. Extend shock absorber to full length, rotate 90° and collapse it again before tightening piston nut securely. This will align piston on rod. To check assembly, use tool to see that valve can be depressed slightly.

DELCO SINGLE ACTING TYPE

Car Model	Delco Model Number Front	Rear
Chevrolet KB Mstr.		1201-E, F
Chevrolet KC ½ Ton	1430-CA, DA	1430-LA, MA
Chevrolet KD ¾ Ton	1430-CA, DA	1431-X, Y

Pontiac 40-29 Exp. ('40)	1947-C, D	1754-G, H

NOTES:—Buick 40, 50, 60, 70—Front Shock Absorber interchangeable from right to left side of car (single model used). Rear Shock Absorbers on these models are Delco Parallel Cylinder type (see separate article for data).

Nash & Nash-Lafayette—Rear Shock Absorbers are Delco Direct Acting type (see separate article for data).

Packard Models—Other Packard models have Delco Parallel Cylinder (front), Delco or Monroe Direct Acting Type (rear) shock absorbers. 'Fifth' Shock Absorber (lateral stabilizer control) is Houde (Houdaille) double acting type. See separate articles for data on these types.

Pontiac Models—Rear Shock Absorbers are Delco Direct Acting type (see separate article for data).

TYPE:—Same design as previous Delco double-acting opposed-piston types with valve arrangement and fluid flow as follows:

Types 1723, 1730, 1731, 1732—Center discharge type with outside rebound valve (rebound valve is plug type installed in tapped hole in housing). Compression valve combined with intake valve and located in compression piston head. Valve in rebound piston head is simple intake check valve.

Types 1751, 1754—End-to-end discharge type with outside compression and rebound valves (valves are plug type installed in tapped holes in housing). Spring-loaded intake check valve is located in piston head.

Type 1902—Center discharge type with Inertia Control. Compression and rebound valves are combined with intake valves and located in piston heads. Inertia control consists of an inertia weight controlled rebound valve which controls fluid flow through by-pass channel and static valve (static valve is plug type installed in tapped hole in housing). Static valve controls rebound except when cut off by inertia valve closing (on rough roads) in which case rebound controlled by rebound valve in piston head.

Type 1946, 1951, 1966, 2007—End-to-end discharge type with outside compression and rebound valves (both valves are plug type installed in tapped holes in housing). Spring loaded intake check valve located in piston head. All types except 2007 are used with independent front suspension (shock absorbers have double arms which form upper control arm of suspension unit).

Type 2010—End-to-end discharge type with Ride Control Adjustment. Compression and rebound valves are plug type and installed in tapped holes in housing. Intake check valve is spring-loaded type and located in piston head. Ride Control Adjustment consists of a separate control with a slotted adjustment screw located on the underside of the shock absorber housing (see Adjustment below).

ADJUSTMENT:—Cadillac 75, 90 Ride Control—Standard setting is with mark on adjusting screw in line with 'M' mark on valve locking cap. To change adjustment, press up on locking cap to free adjusting screw, turn screw clockwise to 'F' position (for firm control), counter-clockwise to 'S' position (for soft control). CAUTION—Both shock absorbers (right and left) must be adjusted alike.

Other Models—No adjustment provided other than changing control valves. See standard Valve Calibration table below.

REFILLING & SERVICING:—Same as for previous models. ***See 'Delco Double Acting Hydraulic Type' Shock Absorber article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note new specifications as follows:***

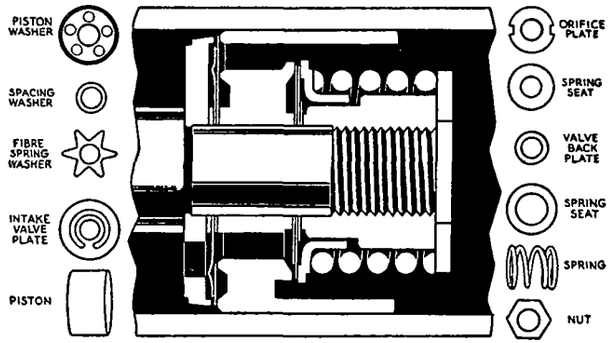
①—Cars with 18" Wheels.
②—Cars with 18" or 20" Wheels.
③—Cars with Light Springs.
④—Cars with Heavy Springs.

NOTES:—**Chevrolet KB**—Rear Shock Absorbers are Delco single acting type (see separate article).

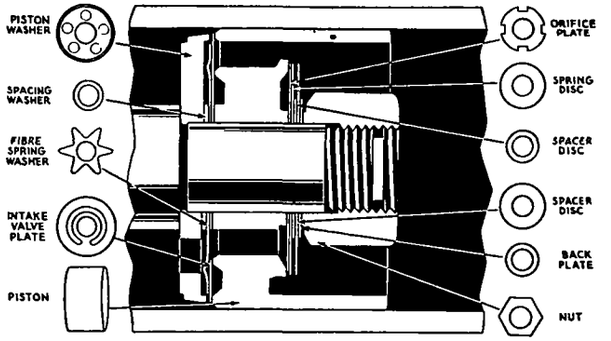
Chrysler, DeSoto, Dodge, Plymouth Models—Delco Direct Acting Adjustable Shock Absorbers are optional or special equipment on these models. See separate article (following) for data. Monroe Direct Acting Shock Absorbers also used on Chrysler Models C25, C26 (see separate article for data).

Hudson—Monroe Direct Acting Shock Absorbers used on other Hudson models (see separate article).



Nash—Front Shock Absorbers are Delco double acting type (part of front suspension assembly). See separate article for data on this type.

Packard—Front Shock Absorbers are Delco Parallel Cylinder double acting type (see separate article). Delco Direct Acting Adjustable Shock Absorbers are used on export models (see following article).



Pontiac—Front Shock Absorbers are Delco double acting type (part of front suspension assembly). See separate article for data on this type.

TYPE:—Double acting, three-tube, piston type similar to previous types used on 1939 car madels except that piston rod diameter is ½" and seal can be replaced (requires new service tools). NOTE—These models do not have filler plugs and must be disassembled for refilling (see Refilling directions following).

REFILLING:—Shock absorbers must be removed from car and disassembled as follows: Clamp lower eye in vise with shock absorber vertical (use special two-piece fixture #730 to hold bayonet end types—do not clamp bayonet end or shock absorber tube in vise). Pull shock absorber out to fully extended position, insert prongs of special wrench through holes in dust cover tube so as to engage slots in top guide (at upper end of reservoir tube—use care not to mar piston rod), unscrew guide, lift entire top assembly off, remove wrench. Remove lower end assembly (reservoir tube) from vise and pour out old fluid. Tap inlet and compression valve assembly out of lower end of pressure tube (top assembly), pull pressure tube out of dust tube and piston rod assembly so as to remove all old fluid from cylinder. Clamp top eye of shock absorber in vise with top assembly vertical and pressure tube fully extended. Measure exact correct amount of new fluid (see Fluid Capacity data below) and pour fluid into pressure tube until it is filled within ¼" of top, pour remainder of fluid into reservoir tube before it is installed. Install inlet and compression valve assembly in end of pressure tube. Clamp reservoir tube in vise, install new rod guide retainer gasket in top of reservoir tube (soak gasket in fluid and see that it seats properly in upper end of tube), install top assembly and tighten rod guide securely.

Type 1000, 1, 2, 3

Type 1006, 7, 8

Fluid Capacity:—Fluid capacity differs for each type shock absorber and correct amount can be determined by suffix letter of model number or collapsed length as explained below.

Model Suffix Letter—Letter following model number—1000-C—indicates capacity as shown in table below. NOTE—Do not confuse this letter with valve calibration lettering which is also stamped on outer dust tube of shock absorber.

Collapsed Length—Fluid capacity may also be determined by measuring length with shock absorber fully collapsed. On 'Eye End' types, measure from center of eye on each end (on eye end types with one bayonet end, measure from center of eye to base of bayonet stem on opposite end). On 'Bayonet End' types, measure from base of bayonet stem on each end.

Model Letter	Collapsed Length Eye End	Bayonet End	Fluid Capacity Ozs.	CCs.
A	8 3/16"	7¼"	3½	102
B	8 7/16	7½	3⅝	107
C	8 11/16	7¾	3¾	112
D	8 15/16	8	4	117
E	9 3/16	8¼	4⅛	122
F	9 7/16	8½	4¼	127
G	9 11/16	8¾	4½	133
H	9 15/16	9	4⅝	138
J	10 3/16	9¼	4⅞	143
K	10 7/16	9½	5	148
L	10 11/16	9¾	5⅛	153
M	10 15/16	10	5⅜	158
N	11 3/16	10¼	5½	163
P	11 7/16	10½	5⅝	168
Q	11 11/16	10¾	5⅞	173
R	11 15/16	11	6	178
S	12 3/16	11 1/16	6¼	183

W	13 3/16	12¼	7	204
X	13 7/16	12½	7⅛	209
Y	13 11/16	12¾	7¼	214
Z	13 15/16	13	7⅜	219
AA	14 3/16	13¼	7½	224
BB	14 7/16	13½	7¾	229
CC	14 11/16	13¾	8	234
DD	14 15/16	14	8⅛	239
EE	15 3/16	14¼	8¼	244
FF	15 7/16	14½	8⅜	249

CONTROL VALVE CALIBRATION:—Standard valve calibration for each type shock absorber shown in table below. Valves consist of Compression and Inlet Valve Assemby (seated in lower end of pressure tube) and Rebound and Relief Valve (assembled on piston and held in place by piston nut).

Compression & Inlet Valve Assembly—This assembly cannot be dismantled and must be replaced as a unit.

Rebound & Relief Valve—See illustration for valve assembly which is different for the series 1000 to 1003 and 1006 to 1008 shock absorbers. Performance is controlled by the Orifice Plate (all models), Valve Disc and Valve Spring (1000 to 1003 only), Spring Discs and Spacing Discs (1006 to 1008 only).

③—Super Control.

④—18" & 20" Wheels (Models 1000C & 1001W).

⑤—18" & 20" Wheels (Models 1002C & 1003W).

⑥—18" & 20" Wheels (Models 1002C & 1003T).

⑦—3-8-6-4-10-10.

⑧—5-8-4-10-10.

⑨—0-8-8-4-10-10.

⑩—3-10-4-10-10.

⑪—4-4-6-10 (4010, 20 First Cars), 4-4-6-10-6-10 (4010,20 Later Cars, 4080 All Cars).

⑫—2-10-10-10-10.

IMPORTANT SERVICE NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

SERVICING:—Disassembly—Remove top assembly (outer tubes, piston rod, and piston) as directed under Refilling (above). Unscrew piston rod nut (nut is staked in place), remove piston and valve parts (mark piston to insure replacement in same position on piston rod, note position of valve parts to insure correct order of replacement). Withdraw pressure tube and piston rod guide (see guide removal directions below if seal is to be replaced). Wash all parts of shock absorber in gasoline and dry with air (do not use solvents which will damage seal). All parts must be absolutely clean and dry.

Piston Rod Guide Seal Renewal—Remove guide from end of pressure tube by inserting handle of long screwdriver in tube and tapping guide out using care not to damage guide threads. Use Seal Extractor Fixture #724 (for shock absorbers with ½" piston rod) clamped in vise with round end up, place guide assembly on end of extractor and hold firmly while seal is being pried out with screwdriver. Press new seal in being careful to press only on outer edge of seal on types with leather wiper or raised center portion (use old shock absorber piston as press tool). On types without this leather wiper or raised center portion, apply pressure evenly on all sides of seal (use round stock of same diameter as seal).

Piston & Valve Assembly—When re-installing old piston, use care to line up marks on piston and rod (made before disassembly) to prevent piston binding in cylinder and install all valve parts in same order as removed. If new piston being installed, check for binding in cylinder after piston nut is tightened by moving tube up and down. If piston binds, loosen nut and try new position on rod. Piston can also be seated before piston nut is tightened by pulling cylinder out to fully extended position and then rotated 90° and forced down on piston. Nut should then be tightened and staked in position to prevent loosening in service. Recheck for binding by moving shock absorber through entire travel.

Reassembly—If piston rod removed from rod guide (for seal removal, etc.), install special #721 thimble on end of rod when installing rod through seal assembly and rod guide to prevent damage to seal. Install piston and valve assembly (above), then fill with exact correct amount of new fluid and reassemble as directed under Refilling above.

DELCO ADJUSTABLE DIRECT ACTING TYPE

Std. Equipment On:	Delco Model Number Front	Delco Model Number Rear
Chrysler C27 (1940)	1134-E	1130-W
Spec. Equipment On:		
Chrysler C25, 26 ('40)	1134-E	1130-W
Chrysler C25 ('40) 18" Whls.	1134-E	1130-Y
De Soto S7 (1940)	1134-E	1130-W
De Soto S7 ('40) 18" Whls.	1134-E	1130-Y
Dodge D14, 17 (1940)	1134-E	1130-W
Dodge D14, 17 18"&20" Whls.	1134-E	1130-Y
Packard 1800, 1, 3, 6 ('40) Exp.		1130-W
Plymouth P9, P10 (1940)	1134-E	1130-W
Plymouth P9, 10 18"&20" Whls.	1134-E	1130-Y

NOTE:—Chrysler, De Soto, Dodge, Plymouth—Delco Direct Acting Shock Absorbers (not adjustable) used as standard equipment on all models except C27 (see preceding article for data). Monroe Direct Acting Shock Absorbers also used on Chrysler models (see separate article for data).

Packard Models—Delco or Monroe Direct Acting Shock Absorbers used on domestic cars. See separate articles for data on these types.

TYPE:—1⅜" piston, double acting, three tube, piston type with adjustment for Soft and Firm control. Same as types used on 1939 car models (see Orifice Plug data below). NOTE—These large type shock absorbers with 1⅜" piston may be readily identified by larger diameter of outer dust tube (approx. 2⅝").

Orifice Plug—Consists of a calibrated metering restriction installed in the piston rod guide at the top of the pressure tube which allows fluid to escape from the cylinder directly into the reservoir tube when the shock absorber is being extended (rebound stroke). See Orifice Plug service data below.

REFILLING:—Shock absorber must be removed from car, disassembled, old fluid poured out, and filled with exact correct amount of new fluid when being reassembled. Procedure same as for non-adjustable types (see preceding article) except as follows: Shock absorber must be set in 'Soft' position before being disassembled (see Adjustment directions following) and knock-out plugs in dust tube slots must be removed before wrench can be inserted. Retainer nut is separate part and not combined with rod guide and oil seal assembly. When assembling shock absorber use new cork and rubber guide gaskets under retainer nut (install cork gasket first and rubber gasket on top). IMPORTANT—Check Adjustment before re-installing shock absorber on car.

Fluid Capacity:—Differs for each type and correct amount can be determined by model letter or collapsed length as follows:

Model Suffix Letter—Letter following model number—1134-**W**—indicates capacity as shown in table below. NOTE—Do not confuse this letter with valve calibration lettering which is also stamped on outer dust tube of shock absorber following model designation.

Collapsed Length—Fluid capacity may also be determined by measuring length with shock absorber fully collapsed. On 'Eye End' types, measure to center of eye on each end (on models with one bayonet end, measure from center of eye to base of bayonet stem on opposite end). On 'Bayonet End' types, measure to base of bayonet stem on each end.

Fluid Capacity

Model Letter	Collapsed Length Eye End	Collapsed Length Bayonet End	Capacity Ozs.	Capacity CCs.
E	9"		6¾	202
L	10⅜"		8¾	260
S		11 9/32"	10⅞	320
T	12⅛"		11⅛	330
W	12⅞"		12	359
Y	13⅜"		12⅝	379

ADJUSTMENT:—Disconnect lower end of shock absorber or remove unit from car (upper end must be held stationary while adjustment being made). Collapse unit fully and turn lower end in direction of arrow on tube (counter-clockwise) until tang on adjusting cam engages slot in lower end of pressure cylinder within unit (determine engagement by feel). Note position of notch on dust tube in relation to marks on (two positions only—'S' Soft, 'F' Firm; if unit has been disassembled these marks may not indicate setting correctly). To change setting, rotate lower end of unit in **counter-clockwise direction only** until a stop position is felt (unit will tend to shorten slightly in Soft position, lengthen slightly in Firm position). There are six stop positions in one revolution which are alternately Soft and Firm (collapsed length changes approximately 1/16" between positions). In order to line up reference marks on housing in each position, rotate lower end 1/6 revolution (to change from Soft to Firm), 5/6 revolution (to change from Firm to Soft). IMPORTANT NOTE—Shock absorbers on both sides of car must be set alike to insure balanced operation.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SERVICING:—Disassembly—Clamp lower eye in vise with shock absorber vertical (use special fixture for bayonet end types—do not clamp bayonet end or shock absorber tube in vise), remove knock-out plugs in dust tube holes, pull shock absorber out to fully extended position, insert prongs of special wrench through dust tube holes and engage slots in retainer nut (use care not to mar piston rod), unscrew retainer nut, lift entire top assembly off. Tap compression valve assembly out of lower end of pressure tube. Use Allen wrench to unscrew nut on lower end of piston rod (nut seats in adjusting cam so that ordinary wrench cannot be used), withdraw piston and valve parts (mark piston to insure replacement in same position on piston rod, note position of valve parts to insure correct order of replacement). Wash shock absorber parts in gasoline (do not use solvents which will damage seal), dry with air. All parts must be absolutely clean and dry.

Rod Guide & Seal Assembly—Seal is integral part of guide assembly and cannot be removed (serviced as an assembly). If guide removed from pressure tube, make certain that baffle ring installed on upper end of tube under guide with open end at seal drain hole (diametrically across from Orifice Plug). See Valve Calibration data for Orifice Plug sizes.

Rebound Valve Assembly—When re-installing old piston, use care to line up marks on piston and rod (made before disassembly) to prevent piston binding in cylinder. If piston not marked, or new piston being installed, align piston in cylinder before piston rod nut is tightened by pulling tube out to fully extended position and then rotating tube 90° and forcing it down on piston. Nut should then be tightened and staked to prevent loosening in service. All valve parts should be installed in same order as removed and adjustment cam should be turned to 'Soft' position (spring not compressed).

Compression Valve Assembly—Serviced as an assembly but can be dismantled to change valve parts. To disassemble, use special tool to press in on valve washer (on lower end of intake valve stem), turn washer until hole registers with square end on stem, remove washer. Remove hairpin retainer spring in upper end of valve mounting and remove valve parts.

Reassembly—If piston rod removed from rod guide, use special thimble #583 installed on end of piston rod when inserting rod through seal and guide (will prevent threads on rod damaging seal). Install piston and valve assemblies (above), then fill with exact correct amount of new fluid and complete assembly by reversing disassembly directions above. Use new gaskets under retainer nut (install cork gasket first, rubber gasket on top). Check setting marks on shock absorber tube (if notch on dust tube not in line with 'S' mark, make new notch in line with mark and fill up old notch). Check shock absorber setting and adjust before installing on car.

CONTROL VALVE CALIBRATION:—Standard valve calibration for each type shock absorber shown in table below. Valves consist of Compression Valve (seated in lower end of pressure tube), Rebound Valve (assembled on piston), and Orifice Plug (in rod guide at top of pressure tube).

Compression Valve—Performance controlled by spring disc and valve spring (heavy inner spring).

Rebound Valve—Performance controlled by Orifice Plate, Spring Disc and Valve Spring (see illustration for valve assembly).

Plymouth	1	2

①—First Cars. ②—Later Cars.

IMPORTANT SERVICE NOTE—Shock absorbers on both sides of car must have same valve calibration and be adjusted alike for balanced performance (Right & Left Front same, Right & Left Rear same).

GABRIEL HYDRAULIC ADJUSTABLE DIRECT ACTING TYPE

Used On:

Car Model	Gabriel Model No. Front	Gabriel Model No. Rear
Hupmobile Sen. 6 922E ('39)	B-6002	B-7006
Hupmobile Skylark R ('39-40)	B-7005	B-7504
Willys 440 (1940)	B-5375	B-6250

NOTE:—Hupmobile Models—For data on Gabriel Double Acting (rotary) Shock Absorbers used on first 1939 cars, see 1939 Supplement.

Willys—Monroe Direct Acting Shock Absorbers (3 tube type) also used on these cars. See Monroe shock absorber article for data.

TYPE:—Direct Acting, adjustable, piston type. Shock Absorber case is welded in assembly and cannot be dismantled for servicing or refilling.

SERVICING:—Serviced by replacement (case is welded and Shock Absorber cannot be dismantled).

ADJUSTMENT:—Shock absorbers set at factory for standard control (see table below) and performance should be satisfactory for all average riding conditions. Before changing adjustment to correct riding complaints, see that tires are properly inflated, springs and shackles lubricated and properly adjusted.

To Adjust—Remove shock absorber from car or disconnect lower mounting (necessary in order to collapse instrument fully). Collapse shock absorber fully by pressing upper and lower halves together and hold in this position until adjustment completed. Turn shock absorber cylinder to right (clockwise) slowly until adjustment key can be felt to drop into and engage slot in valve (within shock absorber). Continue to turn cylinder to right until a definite stop is felt (1-2 turns rotation) which indicates that valve is closed. Then turn cylinder to left (counterclockwise), to open valve, desired number of turns as shown in table below.

IMPORTANT NOTE—Shock absorbers on both sides of car must always be adjusted alike (Right & Left Front same, Right & Left Rear same).

Adjustment Table

Car Model	Valve Opening (No. of Turns) Soft	Standard	Firm
Hupmobile (All) Frt.	2	¾	¼
Hupmobile (All) Rear	2	¾	¼
Willys (All) Front	2	¾	¼
Willys (Sedan) Rear	2	⅝	¼
Willys (Coupe) Rear	2	⅞	¼

CAUTION—Adjustment valve must be at least ¼ turn open (operating with valve fully closed will damage shock absorber and mountings). Maximum adjustment is 2 turns open (do not force valve beyond this position). Use hand pressure only when making adjustments and do not force beyond fully closed and fully open positions. Operate shock absorber only in upright position (do not invert). When installing rear shock absorbers, see that stone shield faces forward.

HOUDE (HOUDAILLE) TYPE

	Houde Model No. Front	Rear
Ford All '60' & '85' ('40)	BBDM	BBDX
Lincoln V12 (1940)	ALG	ALG
Lincoln-Zephyr 06H (1940)	BBCM	BBCX
Mercury 09A (1940)	BBDM	BBDX
Packard 1801,1A,3,4,5,6,7,8 (1940) —See Note		NFT
Studebaker Champ. 2G (1940)	BBFSS	BBDS
Studebaker Comm. 10A (1940)	BBFS	ACHS
Studebaker Pres. 6C (1940)	BBFS	ACHS

These Shock Absorbers same as types used on corresponding 1939 car models except as noted below.

PACKARD NOTE:—This Shock Absorber is the 'Fifth' shock absorber of the rear suspension system (lateral stabilizer control). Regular rear shock absorbers on these models are Delco or Monroe Direct Acting Type. See separate articles for data on these types.

TYPE:—Same design as used on 1939 car models except as follows:

Ford, Lincoln-Zephyr, Mercury 1939-40 Models—On late 1939 cars and all 1940 models a new spring-loaded automatic type packing gland is used which does not require attention in service. With this type construction, packing is installed within the housing end cover and uniform pressure is maintained on the packing by a spiral spring.

ADJUSTMENT:—Ford, Lincoln-Zephyr, Mercury Models—Adjustment handle and pointer provided on end of shaft. Original setting is with pointer in line with indicating mark on lever. Pointer can be turned approximately ¼ turn in either direction but must not be forced past stops on shaft. Turn pointer clockwise for firmer action, counter-clockwise for softer action. CAUTION—Do not turn pointer more than 1/32" at a time without road testing car (slight movement has considerable effect on performance). Shock absorbers on both sides of car must be adjusted alike for balanced performance.

Lincoln V12—Automatic, thermostatic control type. Can be adjusted by removing cap in end of shaft which will expose adjusting screw. Original setting is with slot in adjusting screw in line with indicator mark on end of shaft. Screw can be turned approximately ¼ turn in either direction but must not be turned past '0' and 'S' marks on end of shaft which indicate end-points for adjustment. Use special tool (do not use screwdriver) and turn adjusting screw clockwise toward 'S' mark for firmer action, counter-clockwise toward '0' mark for softer action. CAUTION—Do not turn adjusting screw more than 1/32" at a time without road testing car (slight movement has considerable effect on performance). Shock absorbers on both sides of car must be adjusted alike for balanced performance.

Packard 'Fifth' Shock Absorber—Shock absorber must be removed from car, disconnected from lateral stabilizer arm and clamped vertically in vise (regular mounting position) to check timing. Hang 50 lb. weight on shock absorber arm, place arm in extreme upper position, note time required for full travel of arm from upper to lower position which should be 18 to 24 seconds. If not within this time limit, adjust as follows: Remove plug in outer end of shaft which will expose adjusting screw, turn screw in (clockwise) to increase time, out (counter-clockwise) to decrease time, recheck timing.

Studebaker Champion (all), Commander & President (Front Shock Absorbers only)—Adjustment same as for Ford models (above) by turning adjusting handle and pointer on shaft between two end-stops.

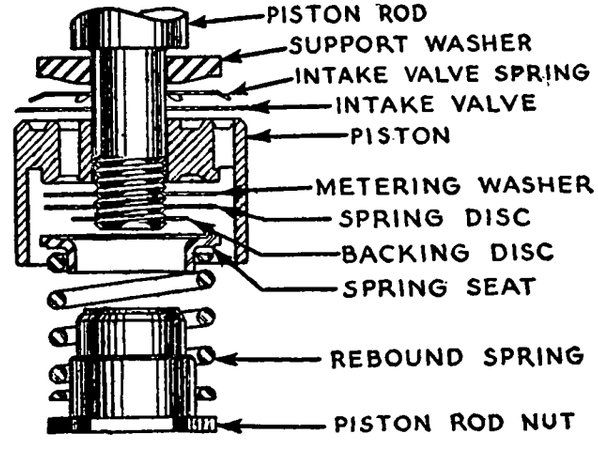
Studebaker Commander & President (Rear)—Automatic, thermostatic control type. Adjustment same as for Lincoln V12 (above).

REFILLING & SERVICING:—Same as for previous models. Shock absorbers should be inspected at 5000 mile intervals and filled to level of bottom of filler plug hole with genuine Houdaille fluid (unit must be in normal mounting position and arm should be worked up and down several times to allow all air to escape from cylinder—do not overfill).

MONROE DIRECT ACTING TYPE

Car Model	Monroe Model Nos. Front	Rear
Chrysler C25,26 ('40)	854568	854570
Chrysler C25 ('40) 7 Pass.	854569	854570
Hudson 90,1,2,8 (Late '39)		See Note
Hudson 40,1,2,8 ('40) ①	160101	160107
Hudson 40,1,2,8 ('40) ②	160102	160108
Packard 1800 (1940)		347416
Packard 1803,6 ('40)		351194
Willys 48, Overland 39 (Late '39)		See Note
Willys 440 (1940)	638316	638317

①Cars with regular springs.
②Cars with Heavy Duty springs.



LATE 1939 CHANGES:—Hudson 90,1,2,8—These new '3 Tube' Shock Absorbers used on these models after Car No. 41494 (90 & 98 Sedan), 39272 (91 & 92). Data on this new type given below (see 1939 Supplement for data on first type shock absorbers).

Willys 48 & Willys-Overland 39—These new '3 Tube' Shock Absorbers, Model 637798 (Front), 637799 (Rear), used on 1939 cars after Serial No. 13313 (Std.), 14039 (Heavy Duty). Data on this new type given below (see 1939 Supplement for data on first type shock absorbers).

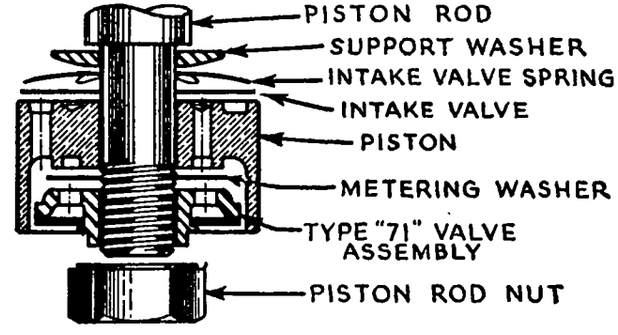
NOTE:—Chrysler Models—Delco Direct Acting Shock Absorbers used on some cars (see Delco article for data).

Hudson Models—Delco Direct Acting Shock Absorbers used on other Hudson models (see Delco article for data).

Packard Models—Delco Direct Acting Shock Absorbers used on export cars and other Parckard models. Fifth Shock Absorber (rear suspension control) is Houde Model NFT (see Delco and Houde articles for data).

Willys 1940 Models—Gabriel Direct Acting Shock Absorbers also used (see Gabriel article for data).

TYPE:—Double acting, hydraulic, piston type with '3 tube' construction (Inner Pressure Tube and Reservoir Tube are part of lower assembly, Outer Dust Tube part of top assembly). New type rod guide and seal assembly is screwed in upper end of reservoir tube and requires special T-317 wrench for removal (wrench inserted through slots in dust tube with shock absorber fully extended). Compression valve is light press fit in lower end of pressure tube (must be removed for refilling) and is serviced as an assembly. Rebound relief valve (on piston rod) differs on various car models (see Valve Calibration data below).



REFILLING:—Refill at 25000 mile intervals for ordinary driving conditions (more frequently for hard service or if unit shows serious leakage or loss of control). To refill, disassemble unit as directed in Service section below, clean out all old fluid and wash all parts, install correct amount of new fluid when reassembling.

Fluid Capacity Chart

Car Model	Front	Rear
Chrysler (all)	3¾ ozs.	6⅜ ozs.
Hudson 90,1,2,8	6 ozs.	6½ ozs.
Hudson 40,1,2,8	3¾ ozs.	6⅜ ozs.
Packard 1800,3,6		6¾ ozs.
Willys (all)	4¾ ozs.	5½ ozs.

SERVICING:—Disassembly—Remove shock absorber from car, clamp lower eye in vise with unit vertical, pull out to fully extended position, insert prongs of special T-317 wrench through slots in outer dust tube so as to engage holes in top of piston rod guide, turn wrench counter-clockwise to unscrew guide from reservoir tube, lift entire head assembly out. Clamp upper eye in vise so that head assembly mounted vertically, remove compression valve assembly by tapping it lightly while working assembly out of pressure tube. Remove nut on end of piston rod, remove piston and valve parts from piston rod. If piston rod seal to be replaced, remove pressure tube and piston rod guide from piston rod, tap guide out of pressure tube (guide is press fit in end of tube). Seal should not be removed from guide (serviced as an assembly). CAUTION—Do not clamp pressure tube in vise and use extreme care not to distort tube. **Servicing**—Wash all parts in clean naptha or gasoline, replace all worn or defective parts, always use new gasket under piston rod guide in reservoir tube when reassembling.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Reassembling & Refilling—Use Thimble T-343 (1939 Hudson & Willys), T-347 (all 1940 models) to install piston rod guide on piston rod to avoid damage to seal, install all valve parts and piston in correct order (see illustration—metering washer not used on all models), tighten piston nut securely. Measure correct amount of new fluid in measuring cup, pull pressure tube and guide up on piston rod, pour fluid into tube above piston until tube is full. Install compression valve assembly on upper end of pressure tube, tapping valves securely in place in tube and using extreme care not to spill fluid out of tube. Clamp base assembly in vise vertically, pour remainder of fluid into reservoir tube. Use new gasket in top of reservoir tube, install head assembly and tighten piston rod guide securely with T-317 wrench. NOTE—See that stone shield (on lower tube) faces forward on rear shock absorbers when installed.

CONTROL VALVE CALIBRATION:—Standard Control relief valve and metering washer calibration should provide satisfactory control for normal operating conditions. Shock absorber performance can be varied for special operating conditions by changing valve calibration to 'Light Control' or 'Heavy Control' as shown in table below.

CONTROL VALVES:—Consists of Rebound Relief Valve (on piston rod under piston) and Compression Valve Assembly (in lower end of pressure tube). Compression valve cannot be dismantled and is serviced as an assembly. Several types of Rebound Relief Valves have been used as follows (see Valve Calibration data below for part numbers for each car model):

Hudson '39, Packard, Willys '39 Type—Type '71' valve assembly installed on piston rod directly below metering washer. These Type 71 valves cannot be dismantled and are serviced as an assembly.

Chrysler, Hudson '40, Willys '40 Type—These Rebound Relief valves are built up of calibrated valve discs installed on piston rod directly below metering washer (two groups of two with spacer disc between each group—total number of valve discs differ on various models, see valve calibration chart below). Chrysler models have a spring below the valve assembly which increases the tension of the valve spring disc (see illustration).

IMPORTANT NOTE—Shock absorbers on both sides of car must have same valve calibration (Right & Left Front same, Right & Left Rear same).

MONROE SINGLE ACTING HYDRAULIC TYPE

Used On:

BANTAM, MODEL 65 PASS. CARS (1940)

NOTE:—This type shock absorber used on passenger car models only. See Bantam 'M' page for data on friction type shock absorbers used on other models.

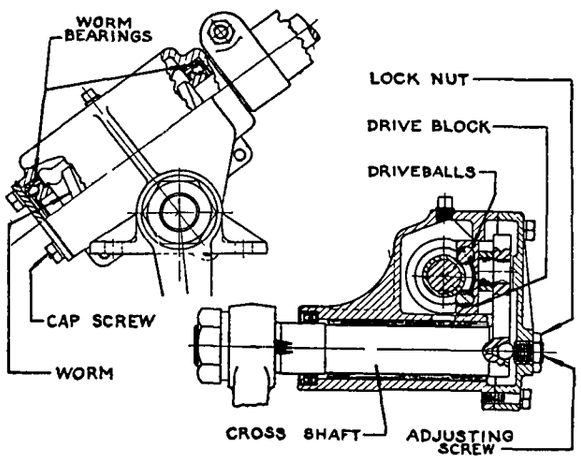
DESCRIPTION & OPERATION:—Single Acting, hydraulic type. Piston within cylinder is held out against cam on shock absorber shaft by spring within cylinder. On outward stroke (when car springs compressed by road shock), fluid flows freely into cylinder through check valve in piston head. On rebound stroke, fluid escape from cylinder is restricted by adjusting needle valve in by-pass channel and by relief valve in piston head.

ADJUSTMENT:—Adjusting needle valve should be turned in for firmer action, out for softer action. To adjust, turn valve in until it is lightly seated, then back valve off required amount to secure desired shock absorber action.

CAUTION—Valve must not be set at less than 1/6 turn open. Shock absorber will be damaged if operated with valve completely closed.

SERVICING:—Refilling. Remove top cover screw, fill case with Monroe fluid to level even with lower edge of screw hole.

Disassembly. Take out cover screws, remove cover and gasket, withdraw piston, spring and valve assembly. When reassembling, see that gasket in good condition and tighten cover screws securely to prevent leaks.



LAVINE MODELS.

Used On:

BANTAM, MODEL 60 (1937-38)
WILLYS, MODEL 77 (1933-34-35-36)

DESCRIPTION:—Steering worm on steering wheel shaft mounted on ball thrust bearings at top and bottom. Rotating nut or drive block on cross-shaft lever engages worm through two balls which are free to turn in block and worm. Adjustments provided for cross-shaft endplay (lash or play in steering wheel) and for worm shaft endplay (up and down movement of shaft and wheel).

ADJUSTMENT:—Before making any adjustment, jack up front end of car, turn wheels to straight ahead position, disconnect drag link at steering gear ball arm. See that front wheels turn freely without drag and without excessive looseness at drag link and tie rod ends. With steering wheel in straight ahead position, adjust as follows:

Cross-Shaft Endplay (Backlash between Drive Block and Worm):—Loosen locknut on adjusting screw on cover plate at inner end of cross-shaft, turn adjusting screw clockwise until all steering wheel play is eliminated, hold screw and tighten locknut. Check by rotating wheel through range from right to left extreme end positions. Wheel should be free at all positions. If wheel binds at any point, back off adjustment screw slightly.

Worm Shaft Endplay:—Check endplay by grasping steering wheel rim and noting movement when wheel pulled up. To adjust, take out four capscrews in housing lower end cover, take off cover, remove sufficient shims under cover to eliminate endplay, replace cover and tighten cover screws securely, check by rotating wheel through range from right to left extreme end position. Worm shaft should not bind at any point.

Note:—When adjustments completed, steering wheel should have no appreciable lash at center straight ahead position and should turn freely throughout range.

GEMMER WORM-AND-SECTOR TYPES

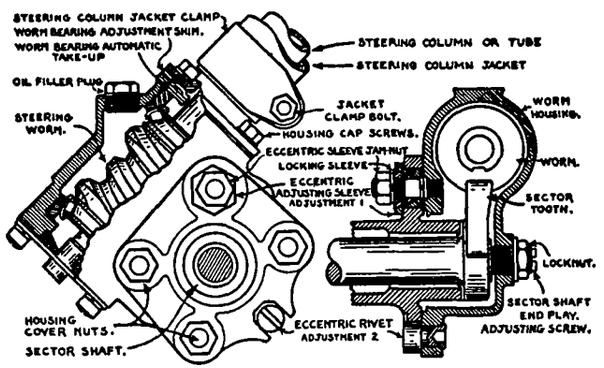
Used On:

CHRYSLER ROYAL EIGHT, MODEL CT (1933).
FORD V-8 (1932-33-34-35-36).
HUDSON SIX, (1933, 35 & 36).
(1) **HUDSON EIGHT (1932-33-34-35-36).**
HUPMOBILE 6, 417-W ('34), 517-W ('35).
TERRAPLANE 6, (1932-33-34-35-36).
TERRAPLANE 8 MODEL KT (1933).
WILLYS, 37 ('37), 38 ('38), 48 ('39)
WILLYS-OVERLAND, MODEL 39 (1939)

(1)—Hudson Eight, Models LT (1934), HHU (1935) only, are equipped with Gemmer-Worm-and-Roller type. See article on Gemmer Worm-and-Roller type.

DESCRIPTION:—Consists of 'hour glass' type worm mounted on steering shaft and carried on roller bearings at top and bottom. Bearings are provided with an automatic take-up under housing cover at upper end which eliminates necessity for adjustment except after considerable wear. The three-tooth sector on the cross-shaft engages the worm. Cross-shaft is provided with endplay adjustment. Housing cover in which cross-shaft is mounted is provided with eccentric adjusting sleeve and eccentric rivet adjustments to adjust sector clearance in worm.

ADJUSTMENT:—Before making adjustments, jack up front wheels and disconnect drag link to free steering gear (front wheels should turn freely with not more than 10 lbs. pull on drag link in either direction). Align steering column by loosening frame bracket bolts to allow gear to shift in frame, tighten bolts, then loosen instrument board bracket bolts to allow bracket to shift in alignment with column, tighten bracket bolts. Make adjustments in order as follows:



Worm Bearing Endplay:—Evidenced as up and down movement of steering wheel. Adjust when this exceeds .010" (to check, turn wheel 1 turn off center, hold wheel, shake front wheels). To adjust, loosen jacket clamp bolt above housing upper cover, shift clamp up ⅜" above lower end of jacket, loosen instrument board bracket clamp, work jacket down until lower end is against housing arm, remove housing capscrews, work jacket up as far as possible. This will provide approximately ⅜" clearance between housing cap and housing. Clip and remove one shim, reassemble gear, locating jacket clamp as near bottom end of jacket as possible. Check adjustment. Wheel should turn freely without stiffness.

Cross-shaft Endplay:—See that housing cover nuts and jam nut are securely tightened. Turn steering wheel to extreme end position and then back ⅛ turn. Loosen locknut and turn adjusting screw in housing at inner end of cross-shaft until shaft rotates freely with no endplay, tighten locknut.

Sector Tooth Mesh in Worm:—Turn steering wheel to 'straight ahead position' midway between end points, loosen housing cover nuts ¼ turn and eccentric sleeve jam nut ½ turn. Turn eccentric adjusting sleeve slowly clockwise until backlash can just be felt at ball end of steering arm. Check by turning steering wheel throughout full travel. If wheel is too tight in any position, turn eccentric sleeve counter-clockwise until wheel is free and then readjust. Sleeve must be turned clockwise to finish adjustment. Tighten eccentric sleeve jam nut, then tighten cover nuts. With correct adjustment sector should have minimum clearance at center position and gradually increased clearance toward ends.

Centralization of Tooth Contact:—Check clearance or backlash between sector teeth and worm at points 1/3 turn of steering wheel each side of center position. If clearance is not equal, note at which point (right or left) backlash is greatest, loosen cover nuts and eccentric sleeve jam nut, turn eccentric rivet in notch in edge of cover slightly clockwise (if greater clearance with wheel turned to right) or counter-clockwise (if greater clearance with wheel turned to left). Tighten cover nuts and jam nut securely, repeat test.

Steering Wheel Position (Hudson-Terraplane'36):—On these models, steering wheel spoke with trademark on underside must point straight down with wheels in 'straight ahead position'. If this spoke more than 2" on either side (position affected by Caster adjustment), steering gear pitman arm should be bent (first cars) or drag link adjusted (later cars) as follows:

To Bend Pitman Arm—Wrap hardened pitman arm ball in wet rags, drip water on ball, heat arm 2" above ball with torch until color begins to show, bend arm with bending bar approximately 3/64" backward (if spoke to right of center) or forward (if spoke to left of center) to correct each 1" that spoke is off center. Drag link must be disconnected and ball protected as directed to prevent destroying hardened finish.

To Adjust Drag Link—See Car Pages for serial numbers of cars on which adjustable drag link used. Adjustment consists of shims placed at both ends of pitman arm ball seats at rear end of drag link. Transfer shims from one position to the other to throw pitman arm back (wheel spoke to right) or forward (wheel spoke to left).

CHRYSLER WORM-AND-SECTOR TYPE

Used On:

CHRYSLER SIX MODEL CO (1933).
DE SOTO SIX, MODELS SC (1932), SD (1933).
DODGE SIX, MODELS DL (1932), DP (1933).
PLYMOUTH SIX, MODELS PC, PD (1933).

DESCRIPTION:—Consists of 'hour glass' type worm mounted on steering shaft and carried on roller bearings at top and bottom. The three tooth sector on the cross-shaft engages the worm. Adjustments provided for worm shaft endplay, cross-shaft endplay, and sector tooth mesh in worm.

ADJUSTMENT:—Before making adjustments jack up front wheels. Align steering column by loosening frame bracket bolts to allow gear to shift in frame,

CHRYSLER TYPE CONT.

tighten bolts, then loosen instrument board bracket bolts to allow bracket to shift in alignment with column, tighten bracket bolts. Make adjustments in order as follows:

Worm Bearing Endplay:—Evidenced as up-and-down movement of steering wheel. To adjust, turn steering wheel to 'straight ahead position' midway between end points, loosen clamp bolts in steering post dash bracket and clamp bolt on housing. Turn adjusting nut down until slight drag noticed when steering wheel turned through entire range. Back off adjusting nut ¼ turn, tighten clamp bolts in dash bracket and on housing. Check adjustment. Wheel should turn freely without stiffness.

Cross-shaft Endplay:—Turn steering wheel to extreme end position and then back ⅛ turn. Loosen locknut and turn adjusting screw at inner end of cross-shaft until shaft rotates freely with no endplay, tighten locknut.

Sector Tooth Mesh in Worm:—Turn steering wheel to 'straight ahead position' midway between end points. Loosen 4 studs holding adjusting plate to housing. Loosen locknut on worm adjusting screw, turn screw in until slight drag felt in 'straight ahead position' when turning steering wheel through entire range. Tighten locknut and 4 studs.

PACKARD WORM-AND-SECTOR TYPE

Used On:

PACKARD 8, MODELS 901, 2 ('32), 1001, 2 ('33).
PACKARD SUPER 8, 903, 4 ('32), 1003, 4 ('33).
PACKARD TWELVE, MODELS 905, 6 (1932).

DESCRIPTION:—Worm mounted on steering shaft and carried on roller bearings at top and bottom. Cross-shaft mounted in eccentric bushing and end thrust is taken by ball bearings mounted at either side of sector. Adjustments provided for worm endplay, sector shaft endplay, and sector tooth mesh in worm.

ADJUSTMENT:—Jack up front wheels and set steering wheel in 'straight ahead position' midway between end points. Make adjustments in the following order:

Worm Bearing Endplay:—To remove play in worm, loosen clamp bolt at top of gear case, turn adjusting nut to right (down) until all endplay removed. Tighten clamp bolt.

Cross-shaft Endplay:—Remove locking screw on housing at inner end of cross-shaft (do not remove locking plate). Move locking plate forward (toward front of car) to proper hole which will just take up endplay with cross-shaft free to turn, lock with locking screw.

NOTE—If, in order to remove all endplay, cross-shaft binds, back plate off one hole allowing cross-shaft to turn freely.

Sector Tooth Mesh in Worm:—Take out screw only in eccentric bushing lock plate(on outside of frame side rail), turn plate clockwise until all play taken up (test by moving steering arm with drag link removed). If proper setting requires position between holes, remove lockplate from serrations on bushing and engage it one tooth over to align with hole in frame side rail. Then tighten clamp at shaft end and insert screw and tighten.

NOTE—Thin side of eccentric bushing should be toward front of car.

GEMMER LINCOLN V12 MODEL WORM-AND-ROLLER TYPE

Used On:

LINCOLN V12 MODELS (1932 TO 1939)

NOTE:—This model similar in design and operation to other Gemmer models. Adjustments are not similar and are given below.

ADJUSTMENTS:—Make adjustments in order as follows:

Worm Bearing Endplay:—Take out worm adjusting nut lockscrew and plug on top of steering gear housing at upper end. Insert punch through plug hole, engage notches in adjusting nut, turn adjusting nut clockwise (down) until all endplay removed. If notch in worm adjusting nut does not coincide with lockscrew hole, back adjustment off slightly (do not tighten excessively to permit lockscrew to be entered). Insert lockscrew and tighten securely, replace plug.

Roller Shaft Endplay:—Remove locking screw on housing at inner end of cross-shaft (do not remove locking plate). Turn adjusting screw clockwise until all endplay removed. If hole in locking plate does not register with locking screw hole, back adjusting screw off slightly (do not tighten excessively to permit entry of locking screw), insert locking screw and tighten securely.

NOTE—Adjusting screw can be removed and locking plate turned over to secure better position of locking screw hole if necessary.

Roller Mesh in Worm:—Turn steering wheel to straight ahead position, disconnect connecting rod ball from steering gear connecting rod arm. Take out lock bolt in eccentric bushing plate on outside of frame side rail, turn plate clockwise until all play taken up (test by moving steering arm), insert lock bolt and tighten securely. Check adjustment by turning wheel off the straight ahead position. Small amount of play should be noted in all positions except straight ahead.

Final Check:—After adjustments completed, steering wheel should turn freely from one end position to the other without binding at any point. No play should be noticeable in center straight ahead position but small amount of play should exist at other points.

GEMMER WORM-AND-ROLLER TYPE (FIRST TYPE)

Used On:

CHRYSLER IMPERIAL, MODELS CH ('32), CQ ('33).
CHRYSLER CST. IMP., MODELS CL ('32), CL* ('33).
HUPMOBILE 8, MODELS 222-F, 226-I (1932).
HUPMOBILE 8, MODELS 322-F, 326-I (1933).
HUPMOBILE 8, MODELS 422, 426 (1934).
NASH 8, MODELS 1180, 1190 (1933).
PACKARD TWELVE, MOD. 1005, 6('33), 1107, 8(34').

DESCRIPTION:—Same design as later type Gemmer Worm-and-Roller type steering gears (see following article) except that roller mounted on plain bearing in cross-shaft lever.

ADJUSTMENT:—Before making adjustments, jack up front wheels and disconnect drag link to free steering gear (front wheels should turn freely with not more than 10 lbs. pull on drag link in either direction). Align steering column by loosening frame bracket bolts to allow gear to shift in frame, tighten bolts, then loosen instrument panel bracket bolts to allow bracket to shift into alignment with column, tighten bracket bolts. Make adjustments in following order:

Worm Bearing Endplay:—Evidenced as up and down movement of steering wheel. To adjust, turn wheel to either extreme end position, then back ⅛ turn. Loosen instrument panel bracket clamp bolts, loosen locknut on adjusting screw on top of housing, back off adjusting screw ½ turn, tighten housing clamp bolt as much as possible and then back off so that lockwasher under nut is only partially collapsed. Tighten adjustment screw as much as possible with 6" wrench, then back off screw 1/6 turn, hold screw in this position, tighten locknut. Tighten housing clamp bolt securely. Wheel should turn freely without stiffness throughout entire range.

Cross-shaft Endplay:—See that housing cover nuts and eccentric sleeve jam nut tightened securely. Turn wheel to either extreme end position, then back ⅛ turn. Loosen locknut on adjusting screw on housing cover at inner end of cross-shaft, turn adjusting screw in until all end play in shaft removed, hold screw in this position, tighten locknut. With correct adjustment, roller shaft should rotate freely when grasped at pitman arm hub with no perceptible end play.

Roller Mesh in Worm:—Turn steering wheel to center 'straight-ahead position' shake steering arm to determine amount of backlash between worm and roller. Loosen housing cover nuts and eccentric sleeve jam nut ¼ turn, turn eccentric sleeve clockwise slowely until all backlash taken up, tighten housing cover nuts and eccentric jam nut. Check by turning steering wheel throughout entire range. If wheel too tight at any point, back off eccentric sleeve and readjust as above (eccentric must be turned in clockwise direction to complete adjustment). With correct adjustment steering arm should have no perceptible backlash at center position and gradually increased clearance toward ends.

Centralization of Tooth Contact:—Turn steering wheel one turn to right of center straight ahead position, check clearance or steering arm backlash. Then turn wheel one turn to left of center position, repeat backlash check. If backlash at these two points not equal, note whether greater lash present at right or left. Turn steering wheel to center position, loosen housing cover nuts and eccentric jam nut ¼ turn, turn eccentric rivet on housing cover clockwise (if greater backlash at right) or counter-clockwise (if greater backlash at left), tighten housing cover nuts and repeat test. Readjust roller mesh in worm as directed above after making this adjustment.

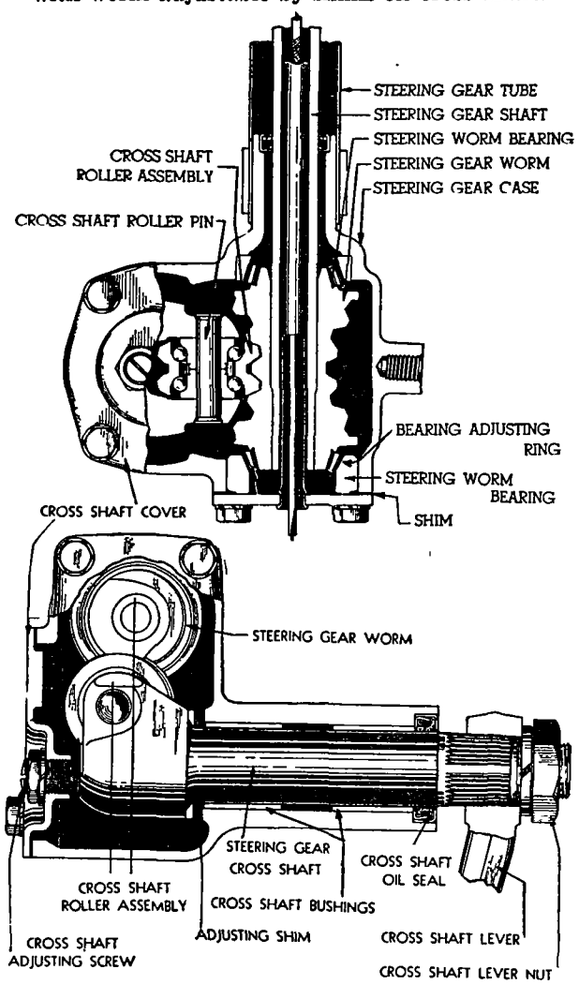
PLYMOUTH, MODELS P7, P8 (1939)

NOTE:—Steering Column Gear Shifts—For adjustment and servicing directions (removal, etc.) of steering column mounted gear shifts as used on some models, see separate articles on "Transmission Controls" in following section.

Dodge, Plymouth Models—These steering gears built by Chrysler but similar in design to Gemmer Model 300 and adjusted in same manner. Steering gear on Dodge 7 Pass. Model similar to Gemmer Model 305 (see following article).



Lincoln-Zephyr—This model has straddle-mounted roller shaft with shaft bushing mounted in steering gear case cover. Adjusted in same manner as other steering gears.

Packard Models—These steering gears built by Packard but similar in design to Gemmer Model 330 and adjusted in same manner.

Chrysler 330, 370; Cord 330 Models—Roller shaft 'straddle mounted' on these models with additional roller bearing on cover plate at adjusting screw end of shaft. Adjusted in same manner as other types.

Model 370—Roller cross-shaft on this model is straddle mounted with additional bearing in side cover. Serviced in same manner as other types.

DESCRIPTION:—Consists of 'hour glass' type worm mounted on steering shaft and carried on roller bearings at top and bottom. Bearings provided with shim adjustment under cover at lower end of case. A double-tooth roller on the cross-shaft engages the worm. Roller is mounted on double-ball bearing or on needle bearings and is free to turn at point of contact with worm. Cross-shaft mounting is integral with housing and endplay adjustment provided by adjusting screw on side cover. Roller mesh with worm adjustable by shims on cross-shaft.

ADJUSTMENT:—Before making adjustments jack up front wheels and disconnect drag link to free steering gear (front wheels should turn freely with not more than 10 lbs. pull on drag link in either direction (except Packard models), 45 lbs. (Packard models). Align steering column by loosening frame bracket bolts to allow gear to shift in frame, then loosen instrument board bracket bolts to allow bracket to shift, tighten bracket bolts. Make adjustments in order as follows:

Worm Bearing Endplay:—Evidenced as up-and-down play of steering wheel. Check by turning wheel one turn to right from center 'straight ahead position', secure wheel, shake front wheels, note endplay. To adjust all models with shims under lower cover (see Note below for spring-loaded type), loosen four screws on lower cover, separate top shim, clip shim and remove using care not to damage other shims. Tighten cover screws and check adjustment. Wheel should turn freely without any stiffness or appreciable endplay. If spring scale used, force required to turn wheel (through scale attached to rim) should agree with figures in table below. If less than minimum figure, remove additional shim, if more than maximum figure, add shim.

Car Model	Worm Bearing Setting
Chrysler C7, C8, C9, C10, C11	① ¼—1¼ lbs.
Chrysler C14, C15, C16, C17	① ½—1 lb.
DeSoto S2, S3; Dodge D2, D5	① ¼—1¼ lbs.
Dodge D8, D11	① ½—1 lb.
Plymouth P3, P4, P7, P8	① ¼—1¼ lbs.
Plymouth P5, P6	① ½—1 lb.
Packard 1937-38-39	②1½—2¼ lbs.

①Worm bearing drag only with roller on midpoint of worm (roller cross-shaft out or Roller shaft endplay adjusting screw backed off).

②With steering wheel turned so that roller off or away from midpoint on worm.

Spring-loaded Type—Used on Chrysler CA, CB '34, DeSoto SE '34, Dodge DR, DS '34, Plymouth PE, PF '34 and other car models. On this type, a spring washer is located under the lower worm bearing cup so as to control worm shaft endplay. Requires no adjustment. If this type gear develops endplay, remove lower cover and examine spring washer, replace if broken.

Roller Shaft (Cross-Shaft) Endplay:—Turn steering wheel to extreme end position and then back ⅛ turn. Check cross-shaft endplay at steering arm hub. To adjust, loosen locknut, turn up adjusting screw in inner cover until shaft turns freely with no endplay, tighten locknut.

Roller Mesh in Worm:—Turn steering wheel to center 'straight ahead position,' shake steering arm to determine play or backlash. If this exceeds 1/32", steering gear must be removed from car and roller shaft position adjusted. With gear out of car and held in vise, take off steering arm nut, remove steering arm, take off side cover, remove roller and cross-shaft. See that all shims on shaft behind roller are removed from housing. Remove steering jacket, replace wheel on steering shaft, check worm shaft bearing adjustment. Remove one shim, reinstall roller shaft. assembling roller shaft thrust washer with chamfered side next to roller shaft thrust face. Check by turning steering wheel nearly to extreme left position, hold roller shaft in against worm, turn wheel to center position, check play at splined end of roller shaft. If play apparent, remove additional shim and repeat test. Replace housing cover, reassemble steering arm (drive arm in roller shaft), adjust roller shaft endplay (see above). If adjustments have been made correctly, play at ball end of steering arm should be .006" and wheel should turn throughout range without heavy drag. Pull at steering wheel rim required to turn steering gear through center position must be within limits shown below. If outside these limits recheck adjustments (add or remove thin shim on roller shaft).

TYPES 300, 330, 370 CONT.

Car Model	Steering Gear Setting
Chrysler C7, DeSoto S2, S3	1—4 lbs.
Chrysler C8, C9, C11	½—3 lbs.
Chrysler C14, C15, C17	1—2½ lbs.
Chrysler C16	1½—3½ lbs.
Dodge D2, D5; Plymouth P3, P4	1—4 lbs.
Dodge D8, D11; Plymouth P5, P6	1½—3½ lbs.
Plymouth P7, P8	¾—2¾ lbs.
Packard 1937-38-39	3—4½ lbs.

NOTE—When removing roller shaft, wrap splines with tape or install special Packard thimble No. ST-5032 to avoid damage to oil seal.

STEERING GEAR POSITION:—With steering gear at mid-point, steering wheel position should be correct, intermediate steering arm should be parallel to center-line of car and wheels should point straight ahead. For all models with independent springing, see Front Suspension articles for tie rod adjustment to correct intermediate steering arm position, and check special points as follows:

Chrysler, DeSoto, Dodge, Plymouth Steering Wheel Height—Steering wheel may be lowered by installing special steering post bracket at dash. Steering gear frame bolts must be loosened to allow steering column to be aligned with new bracket without springing which will cause bearings to bind.

Packard Models—Steering gears may be raised or lowered by installing special brackets at dash as shown in table below. When installing new bracket, loosen steering gear mounting bolts on frame to allow gear to align with new bracket without springing which will cause binding of the shaft and jacket.

	Dash Bracket				
Model	To Raise		Standard	To Lower	
115C	320284		315612	320285	
120C	320286		315611	320287	
1600	326798	(¾")	326806		
	324850	(1⅝")	326806		
1601,2	324850	(1½")	326798	326806	(11/16")
1700	333104	(⅝")	333101		
1701,2,3,5			333104	333101	(⅝")

SPECIAL SERVICE NOTES:—On Independent Suspension cars, check linkage and intermediate steering gear arms as noted below (intermediate steering arms not used on all cars—on some cars, both tie rods linked directly to steering gear pitman arm).

Steering Linkage (with Intermediate Steering Arm):—On all models with intermediate steering arm, toe in adjustment should be made by adjusting both tie rods equally and tie rod lengths should be checked and equalized to insure intermediate steering arm being centered (on center-line of car) and steering gear roller on high point of worm with wheels in straight ahead position.

Steering Linkage (No Intermediate Steering Arm):—On Chrysler, DeSoto, Dodge, Plymouth models without intermediate steering arm, the longer (right hand) tie rod should be adjusted to the correct length first (see table below) and toe in adjustment should then be made by adjusting the shorter (left hand) tie rod. This will insure steering gear roller being on high point of worm with wheels straight ahead.

Car Model	Long Tie Rod Setting
Chrysler C7, C8, C16	31 7/32"
Chrysler C14	30 15/16"
DeSoto S1, S3	31 7/32"
Dodge D11, Plymouth P7, P8	31 11/16"

Intermediate Steering Arm (Chrysler CA, CB '34; Dodge DR, DS '34; Plymouth PE, PF '34):—Intermediate steering arm mounted on tapered roller bearings with bearing adjusting shims between housing and lower cover. Shims are .003" and .005" thick. To adjust, remove shims until arm moves freely but has no perceptible endplay with cover screws tight.

Chrysler C6, CZ '35; DeSoto SF '35—Intermediate steering arm roller bearings adjusted by tightening nut on bolt on top of arm. Tighten nut until arm turns with slight drag, then back nut off 1/6 turn and install cotter pin.

Chrysler Model C17 Intermediate Linkage—Consists of intermediate lever on left front corner of frame which is connected to steering gear pitman arm by adjustable intermediate link at top and to wheel steering arm by adjustable drag link at bottom. When installing this assembly, turn nut on intermediate lever shaft up solid and then back off to nearest cotter pin hole. Adjust upper intermediate link length to exactly 29 5/16" by loosening clamp bolts and turning tube. With steering wheel at mid-point, adjust lower drag link length so that wheels are straight ahead.

Packard '37-38—Adjust bearing pre-load by adding or removing gaskets under bearing covers until force of 3½-4½ lbs. required to move arm when applied at radius of 9 1/6" (attach spring scale to ball on arm).

Packard 1939—Bearings pre-loaded by spring washer on bolt shank above intermediate steering arm. Later cars had longer bolt with additional plain washer at each end of bolt (use this later type for replacement on all cars).

WORM-AND-ROLLER TYPES 305, 335, 375 WITH PUSH-PULL ADJUSTMENT

Used On:

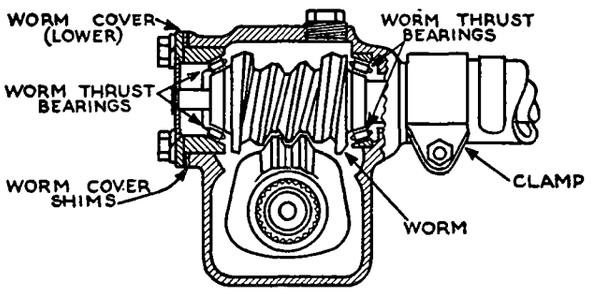
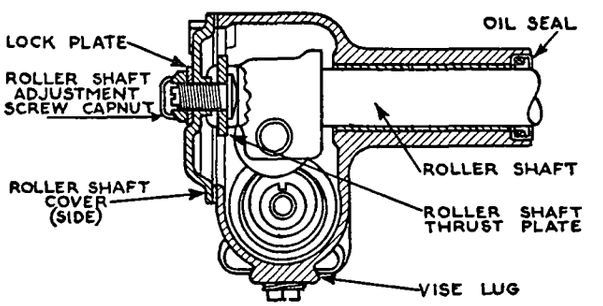
PACKARD 12, 1506,7,8 ('37), 1607,8 ('38), 1707,8 ('39)
DODGE & PLYMOUTH EXPORT MODELS (1938)
DODGE 7 PASS., MODEL D11 (1939)

NOTE:—Steering Column Gear Shifts—For Adjustment, Servicing, and Removal of steering column mounted gear shifts, as used on some models, see separate articles on "Transmission Controls" in following section.



Dodge—This steering gear built by Dodge but is same design as Gemmer Model 305 and adjusted in same manner.



Packard Models—These steering Gears built by Packard but are Gemmer design (similar to Model 375) and serviced in same manner.

Model 375. This model has a 'straddle-mounted' roller shaft with additional roller bearing at adjusting screw end of shaft within side cover. Adjusted in same manner as other models.

DESCRIPTION:—These models are similar in design to other Gemmer Worm and Roller types except that washer on adjusting screw head engages slot in end of roller shaft so that shaft is prevented from moving in either direction. Shims are not used.

ADJUSTMENT:—Before making adjustments, disconnect drag link at steering arm and jack up front wheels. Wheels should turn freely in both directions with not more than 10 lbs. pull on drag link (except Packard) or 45 lbs. pull on intermediate arm at ball end (Packard models). Align steering column by loosening frame bracket bolts to allow gear to shift in frame, tighten bolts. Then loosen dash bracket bolts to allow bracket to be aligned with column, if necessary shim bracket or elongate mounting holes so that column will not be sprung when bracket bolts are tightened.

Worm Bearing Endplay:—Check by turning steering wheel one turn to right, secure wheel, shake front wheels (drag link must be connected), check movement of steering wheel hub on column jacket. If endplay perceptible, adjust by loosening four screws in lower cover about ⅛", clip and remove top shim, being careful not to mar remaining shims. Tighten cover screws, check adjustment. Wheel should turn freely without stiffness at any point. On Packard models, pull at steering wheel rim required to rotate wheel should be 1½-2¼ lbs. with wheel turned off the center or mid-point. If outside these limits, add or remove additional shims.

Roller Mesh in Worm:—Check by turning steering wheel to center position (turn wheel back one-half total number of turns from either end position or place marked spoke straight up or straight down), shake steering arm at ball end. If play or backlash exceeds 1/32", adjust roller shaft position as follows:

GEMMER TYPES 305, 335, 375 CONT.

All Models except Packard—Take off adjusting screw cap nut on side cover, slide locking plate off until it clears lock boss on cover, turn slotted adjusting screw in just enough to take up backlash (further movement will cause damage to gear), engage locking plate, replace cap nut. Steering wheel should turn freely throughout entire range without binding at any point.

Packard Models—Take off adjusting screw cap nut on side cover, disengage lockwasher, engage Allen wrench in adjusting screw, turn screw in until pull on steering wheel rim required to move wheel through center position is 3-4½ lbs., engage locking washer, replace cap nut.

STEERING WHEEL POSITION:—With steering gear at midpoint (roller on high point of worm), intermediate steering arm should be on center-line of car (when used), wheels should point straight ahead, and steering wheel position should be correct as noted below. Check steering wheel position and height as follows:

Hudson, Terraplane Models—Flat spot on serrated end of steering tube should point straight down with roller on high point (center) of worm (visible after taking off horn button and wheel). If wheels not straight ahead with steering gear in this position, shift shims located at front and rear of pitman arm ball in drag link. Install steering wheel so that trademarked spoke (mark under spoke near rim) is straight down. Steering wheel adjustable for height by loosening 3 frame bracket bolts (to allow gear to shift in frame), loosening dash bracket bolts and moving wheel up or down. Add or remove bracket shims, tighten bracket bolts, move wheel to align gear in frame, tighten frame bracket bolts.

Packard Models—Steering wheel height adjustment provided by adjustable bracket at dash. When adjusting wheel height, loosen steering gear mounting bolts at frame to allow steering gear to shift without springing column which will cause binding between shaft and column jacket.

SPECIAL SERVICE NOTES:—On Independent Suspension cars, check linkage and intermediate steering arm position (when used) as follows:

Intermediate Steering Arm (Chrysler C20,C24):—Arm on frame cross-member and linked to each front wheel by individual tie rods and to steering gear pitman arm by short drag link. When adjusting toe in, both tie rods should be turned equally and lengths must be equal after adjusting to insure correct steering gear position (intermediate arm should be on center-line of car with wheels straight ahead).

Bearing Adjustment—Arm mounted on taper roller bearings. To adjust, tighten nut on upper end of steering arm bolt until slight drag felt when arm revolved, then back nut off 1/6 turn and install cotter pin.

Packard Models—Intermediate steering arm pivoted on frame cross-member linked to each wheel by individual adjustable tie rod and to steering gear pitman arm by adjustable drag link. Toe in adjustments should be made by turning both tie rods equally and lengths must be equal after adjustment. Steering gear roller must be on high point of worm with wheels in straight ahead position and intermediate steering arm on center-line of car (adjust drag link length to secure this setting).

Bearing Adjustment (Super 8)—Arm mounted on cup-and-cone ball bearings and adjustable by turning nut on upper end of steering arm bolt. Tighten nut until force required to turn arm (measured at ball on end of arm) is 3-4 lbs.

Bearing Adjustment (Twelve)—Arm mounted on two taper roller bearings. Adjustable by adding or removing gaskets under bearing covers. With correct adjustment, force required to turn arm should be 3½-4½ lbs. measured at ball end of arm with drag link and tie rods disconnected.

Drag Link Ball (Hudson '112' 1938):—To correct excessive movement of rear drag link socket in pitman arm ball, install special larger-than-standard drag link ball seats No. 158592 (.998" diameter). These larger ball seats used on 1939 cars before No. 17607 (new drag link with parallel ends on later cars).

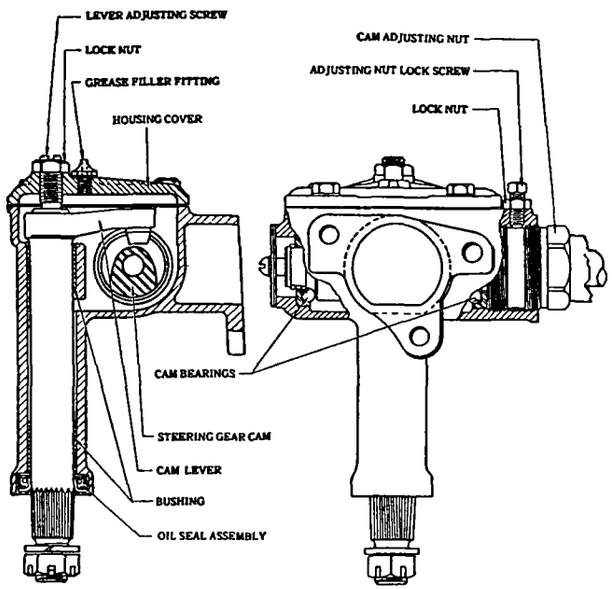
Steering Linkage (Chrysler, DeSoto, Dodge):—No intermediate steering arm used and steering gear pitman arm linked directly to each wheel by individual tie rods. When adjusting toe in, set longer (right hand) tie rod to exact length between ball centers as shown in table below, and then set toe in by adjusting shorter (left hand) tie rod. This will insure steering gear roller being on high point of worm in straight ahead position.

Car Model	Long Tie Rod Setting
Chrysler C18, C22; DeSoto S5, S6	31 5/8"
Chrysler C19, C20	30 25/32"
Dodge D11	31 11/16"

ROSS CAM-AND-LEVER TYPE

Used On:

AUBURN 6, 652-X, Y ('34), 653 ('35), 654 ('36-37)
BANTAM, MODEL 60 (1939)—LATER CARS
CROSLEY, MODEL A (1939-40)
GRAHAM 6, 65 ('33), 74 ('35), 80, 90 ('36)
GRAHAM CRUSADER, MODEL 85 (1937)
GRAHAM CAVALIER, MODEL 95 (1937)
HUPMOBILE 6, 518-D ('35), 618-G ('36)
STUDEBAKER 6, MODEL 56 (1933)
STUDEBAKER COMM. MODEL 73 (1933)
STUDEBAKER DICT. A & YR. AH'D (1934)
STUDEBAKER 6, 1-A, 2-A ('35), 3-A, 4-A ('36)



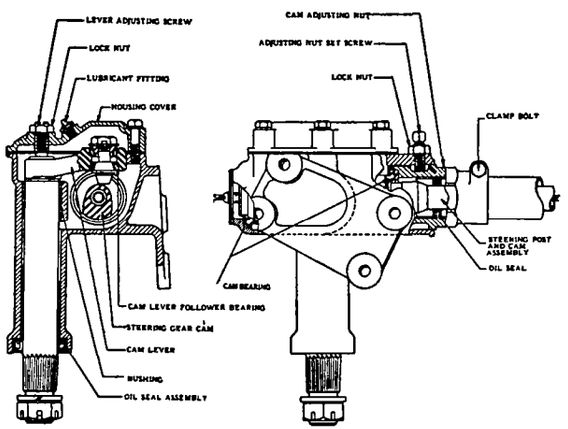
DESCRIPTION:—Consists of a worm-like cam mounted on steering wheel shaft engaging a tapered stud mounted on inner end of cross-shaft lever. Cross-shaft is carried in plain bushings and is adjustable for endplay. Cam is carried on ball thrust bearings at upper and lower end and bearing clearance or endplay is adjustable. Stud track in cam is grooved deeper at each end to provide minimum clearance at center. Adjustments must be made with wheel turned to 'straight ahead position' so that stud is at center of cam groove .

ADJUSTMENT:—Free steering gear from load by disconnecting drag link or jacking up front end of car. Loosen instrument board bracket clamp, loosen jacket tube clamp screw (if no clamp screw used, jacket tube is press-fit in adjusting plug and will turn with plug). Make following adjustments in order:

Cam Endplay (Adjusting Nut Type):—Up and down movement of steering wheel. Loosen housing plate adjusting screw and locknut (to free stud in cam groove). Loosen adjusting plug lockscrew locknut and back off lockscrew. Turn adjusting plug in until slight drag felt when turning wheel, then back off plug about 1/6 turn until wheel turns freely without any up-and-down movement, tighten lockscrew and locknut. Tighten instrument board bracket, check wheel. If movement is stiff steering column is sprung or out of alignment and must be corrected.

Cam Endplay (Shim Type):—Unscrew four clamp screws in upper cover, move cover up as far as possible (about ¼"). Separate top (.003") shim from remainder, clip and remove. Replace upper cover screws and tighten securely. Check adjustment. Wheel should turn freely (with light grip on rim) without any up-and-down movement with barely perceptible drag at mid-point. Remove additional shims, if necessary, until this adjustment secured. Shims are .003" (top), .010" (middle), .030" (bottom) thick with paper gaskets between. Do not destroy or remove gaskets between remaining shims.

Steering Column Alignment:—Loosen frame bracket bolts to permit gear to shift into alignment with instrument board bracket, tighten frame bolts. Loosen instrument board bracket bolts to allow bracket to shift to position of column, tighten bracket bolts. If bracket position not adjustable, change bracket mounting holes so that bracket is aligned with column, do not spring column to bracket.



Lever Shaft Endplay (Steering Wheel Backlash):—Turn wheel to straight ahead position so that stud at high point of cam. Never adjust with stud at other points. This will cause binding at center position. Loosen locknut on side cover adjusting screw (on inner cover plate), turn screw up until slight drag felt at center position when wheel turned from one extreme to other, tighten locknut. Drag must be slight and perceptible only in midposition.

Steering Wheel Position:—With drag link disconnected at steering arm, count number of wheel revolution from extreme right to extreme left, turn wheel back ½ this number of turns so that stud is at high point of cam. Turn wheels to 'straight ahead' position, see if drag link can be engaged with ball on steering arm without turning steering wheel. If not, take off nut, pull steering arm, replace arm in position to engage drak link, tighten nut.

STUDEBAKER PRES. MODEL 2-C (1936)

DESCRIPTION:—Similar in design to Cam-and-Lever Type with cam adjusting nut (see preceding article) except that tapered stud in lever shaft is mounted on double-row roller bearing and is free to turn at point of contact with lever.

ADJUSTMENT:—Cam Endplay, Steering Column Alignment, Lever Shaft Endplay or Steering Wheel Backlash, and Front Wheel Position adjusted in same manner as Cam-and-Lever Type with Cam Adjusting Nut (see following article). If these adjustments do not result in satisfactory performance, check and adjust stud roller bearing unit on lever shaft.

Stud Roller Bearing Adjustment:—Stud should have no perceptible end play and should turn with a slight drag when stud nut is gripped with the fingers (slightly tighter with new bearings). To adjust, straighten out prong in locking washer, tighten nut. If stud clamped to prevent turning, be careful not to mar or burr bearing surface of stud. Tap stud lightly to check adjustment, turn prong of locking washer up against nut (use new washer or different prong of old washer and remove prongs which have been used previously). Wash all grease out of bearing with gasoline and recheck adjustment.

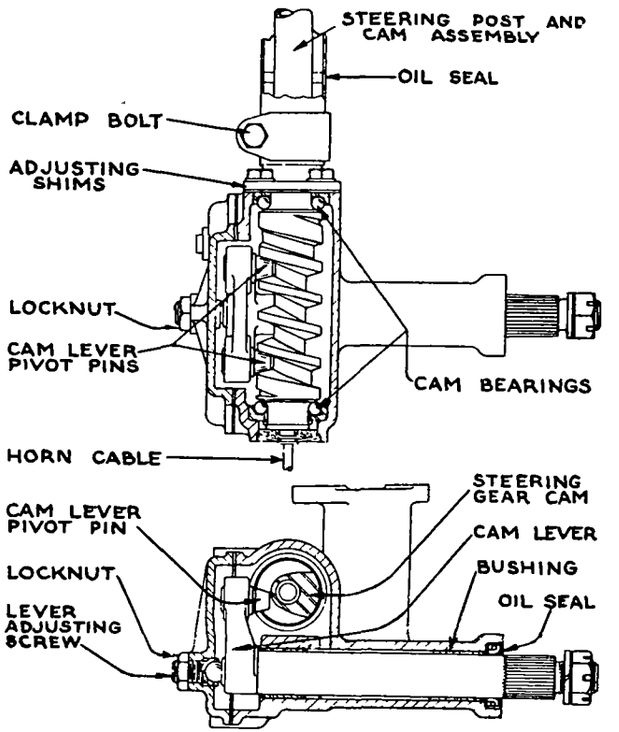
MODEL T-21

STUDEBAKER PRES. 3C (1937)

NOTE:—Bantam 1939—Ross Cam-and-Lever Model S-12 (single lever type) used on later cars. See separate article for data on this type.

DESCRIPTION:—Consists of a worm-shaped cam mounted on the steering column shaft engaging two tapered studs mounted on the inner end of the cross-shaft lever. Cross-shaft is mounted on plain bushings and is adjustable for end-play. Cam is mounted on ball thrust bearings at upper and lower ends and bearing clearance or endplay is adjustable. Stud track in cam is grooved deeper at ends to provide minimum clearance at each stud in 'straight ahead' position. All adjustments must be made with wheel turned to this straight ahead position.



ADJUSTMENT:—Free steering gear from load by disconnecting drag link or jacking up front end of car. Loosen instrument board bracket clamp, loosen jacket tube clamp screw (if no clamp screw used, jacket tube is press-fit in adjusting plug and will turn with plug). Make following adjustments in order:

Cam Endplay (Models T-14, T-21):—Before making adjustment, loosen locknut and back off lever shaft adjusting screw (on side cover) to free lever studs in cam groove. Take out four screws in upper cover, move cover up as far as possible on steering column jacket (about ¼"), separate top .003" shim from shim pack, clip shim and remove using care not to damage paper gaskets and remaining shims. Replace upper cover screws and tighten securely. Check adjustment by turning wheel with light finger grip on rim. Wheel should turn freely with no endplay or up-and-down movement and should have barely perceptible drag at center high point of cam. Shims are .003" (top), .010" (center), .030" (lower) thick and are installed with paper gasket between each shim. Use care not to damage these paper gaskets.

Model T-12—Adjust in same manner as Model T-14 (above) except that shims are located between housing and lower cover plate at bottom of steering gear. Loosen lower cover plate to get at these shims. Shim pack consists of .003", .010", .030" shims.

Steering Column Alignment:—Loosen frame bracket bolts to permit gear to shift into alignment with instrument board bracket, tighten frame bolts. Loosen instrument board bracket bolts to allow bracket to shift to position of column, tighten bracket bolts. If bracket position not adjustable, change bracket mounting holes so that bracket is aligned with column, do not spring column to bracket.

Lever Shaft Endplay (Steering Wheel Backlash):—Turn wheel to straight ahead position so that each stud at high point of cam. Never adjust with studs at other points. This will cause binding at center position. Loosen locknut on side cover adjusting screw (on inner cover plate), turn screw up until slight drag felt at center position when wheel turned from one extreme to other, tighten locknut. Drag must be slight and perceptible only in mid-position.

Steering Wheel Position:—With drag link disconnected at steering arm, count number of wheel revolutions from extreme right to extreme left, turn wheel back ½ this number of turns so that studs are at high point of cam. Turn wheels to 'straight ahead' position, see if drag link can be engaged with ball on steering arm without turning steering wheel. If not, take off nut, pull steering arm, replace arm in position to engage drag link, tighten nut.

WORM-AND-SECTOR TYPES.

Used on:

BUICK MODEL 50 (1932).
CADILLAC V-8, MODELS 355-B, C ('32-33).
CADILLAC V-12, MODELS 370-B, C ('32-33).
CADILLAC V-16, MODELS 452-B, C ('32-33).
LA SALLE V-8, MODELS 345-B, C ('32-33).
OLDSMOBILE 6, MODELS F-32 ('32), F-33 ('33).
OLDSMOBILE 8, MODELS L-32 ('32), L-33 ('33).
PONTIAC EIGHT, MODEL 601 (1933).
WILLYS 77 (1933-34-35).

DESCRIPTION:—Consists of 'hour-glass' type worm on steering gear mounted on roller bearings in steering gear case. Worm engages sector teeth on cross-shaft lever to which pitman arm is attached. Worm provides minimum clearance at center straight ahead position with greater clearance at end positions. Adjustments provided for worm shaft endplay, cross-shaft endplay, and for sector tooth mesh in worm.

ADJUSTMENT:—Jack up front wheels, turn steering gear to 'straight-ahead position', disconnect drag link at steering gear pitman arm, disconnect horn wire from steering post jacket or mast. Make following adjustments in order:

Worm Shaft Endplay:—Evidenced as up-and-down movement of steering wheel. To adjust, turn steering wheel to extreme end position (right or left), loosen clamp bolt at upper end of housing one turn or loosen locknut and back off lockscrew, and loosen column jacket clamp screw so that large adjusting nut at top of housing may be turned. Turn adjusting nut down as far as possible without stiffening the action of steering wheel while turning through its entire range.

NOTE—Some models have additional clamp bolt above adjusting nut. This must also be loosened in making above adjustment.

Cross-Shaft Endplay:—Loosen locknut on adjusting screw on housing at inner end of cross-shaft, turn adjusting screw in until all endplay removed from cross-shaft, tighten locknut.

Worm and Sector Backlash:—Be sure that steering wheel turned to 'straight ahead position' (wheel turned back ½ of total travel from either end position). Check backlash by moving pitman arm back and forth. Loosen all the cover stud nuts, loosen nut on eccentric bolt and sleeve exactly ½ turn, turn eccentric bolt and eccentric sleeve in opposite directions simultaneously and slowly until all backlash of pitman arm has been eliminated. This adjustment must be made slowly and bolt and sleeve should not be turned past the point where backlash has been eliminated but pitman arm moves freely. Tighten eccentric bolt nut and cover stud nuts.

NOTE:—Check steering wheel after all adjustments have been made. Wheel should turn freely throughout entire range. There should be no appreciable backlash in pitman arm at center straight ahead position and slight backlash at extreme right and left end positions.

WORM-AND-ROLLER (FIRST) TYPES

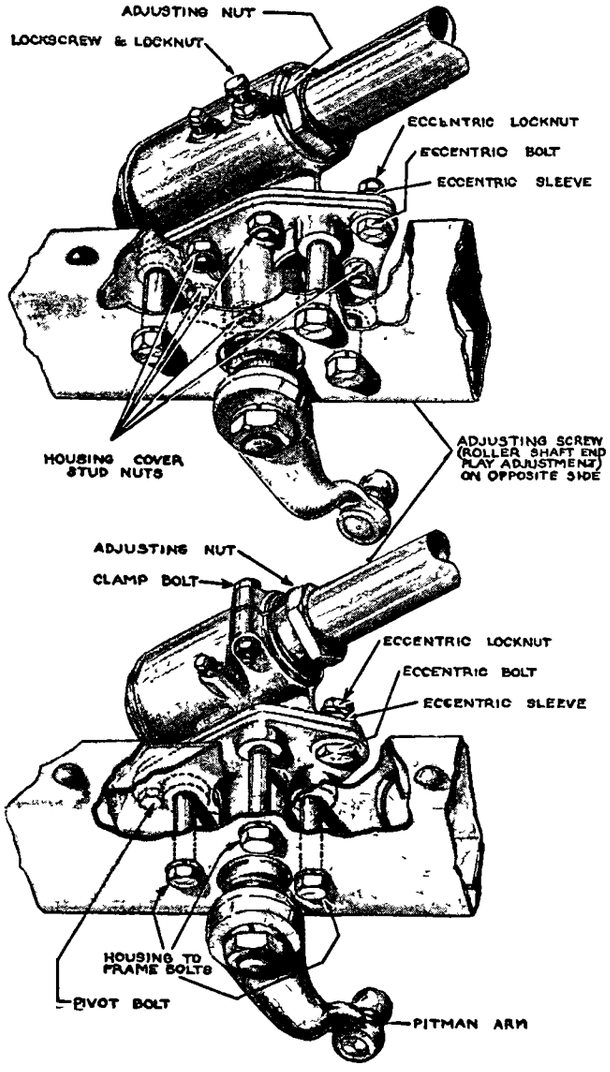
OLDSMOBILE 8, L-34 ('34), L-35 ('35), L-36 ('36).
PONTIAC 6 701A, B (1935), 36-26A, B (1936).
PONTIAC 8, 603 ('34), 605 ('35), 36-28 ('36).

(1) Models (except Mod. 50) use single tooth roller.

(2) Steering Gear on these models is inverted and mounted outside frame. See special adjustment instructions listed below.



NOTE:—On 80 '36, 75, 85 '36-'37 models, steering gear is offset from steering wheel shaft and two Mechanics Model 1½C universal joints are used (see article in Mechanical Equipment Section for Universal Joint data). The offset shaft and universal joints do not affect steering gear adjustments.

DESCRIPTION:—Consists of 'hour-glass' type worm on steering shaft and carried on roller bearings in housing. Worm engages double tooth roller carried on ball bearings in cross-shaft lever. Roller is free to turn at point of contact with worm. Worm provides minimum clearance at center 'straight-ahead position' with greater clearance at ends. Adjustments provided at upper end of housing (worm bearing adjustment), inner end of cross-shaft (cross shaft endplay) and for housing cover (roller mesh in worm).

ADJUSTMENT:—Jack up front wheels, turn steering wheel to 'straight-ahead position' (wheel turned halfway back from either end position), disconnect drag link at steering gear pitman arm, note ball seat, washer and spring assembly so that they may be reassembled in same order. See that reference mark on pitman arm and shaft are lined up, if pitman arm removed, replace in correct position and tighten nut securely with 18" wrench. Loosen steering post bracket, check column alignment (shim bracket out to column if necessary) tighten bracket bolts. Make following adjustments in order:

Cross-Shaft (Roller Shaft) Endplay:—See that frame mounting bolts are tight, loosen locknut, turn adjusting screw on side of housing at inner end of cross-shaft up until all endplay removed, tighten locknut. Check by turning shaft to extreme end positions (just clear of stops) and noting that pitman arm does not drag when turned through backlash clearance.

Worm Shaft Endplay:—Evidenced as up-and-down movement of steering wheel. To adjust, turn wheel to extreme right position, loosen clamp bolt at upper end of housing one turn or loosen locknut and back off lockscrew, and loosen column jacket clamp screw so that large adjusting nut at top of housing may be turned. Turn down adjusting nut until force required to turn wheel (measured by spring scale hooked to spoke at wheel rim and tangent to rim)

SAGINAW WORM-AND-ROLLER TYPE CONT.

is 1¼ lbs. all models (except Pontiac 6 and 8 '35-36 —½-1 lbs.) Nut must be turned down only to complete adjustment. Pressure in excess of these figures indicate bearings too tight and adjustment should be backed off slightly.

Cadillac V-8, 355D Series 30, V-12 370D, V-16 452D V-16, 90. Worm shaft endplay adjustment provided by plug at lower end of steering gear. To adjust, turn wheel to extreme end position (right or left), loosen lower clamp bolt and turn plug up until 1¼ lb. pull (measured as above) necessary to turn wheel, tighten lower clamp bolt.

Worm and Roller Backlash:—Turn wheel to 'straight-ahead position' (½ total number of turns back from end position or with wheel in position noted below). Check backlash by moving pitman arm back and forth. Loosen housing to frame bolts and pivot bolt ¼ turn, or loosen housing cover stud nuts ¼ turn then loosen eccentric locknut ¼ turn, turn eccentric bolt clockwise and eccentric sleeve counter-clockwise slowly and simultaneously until backlash is taken up (approximately ⅛ turn should be sufficient). Tighten all nuts. Check by turning wheel to right and left. Back off adjustment slightly if excessive binding is encountered at high spots. Force required to turn wheel through center measured on spring scale at wheel rim should be 2¼ lbs. (all models) and there should be no appreciable backlash in pitman arm.

Cadillac V-8, 355D Series 30, V-12 370D, V-16 452D V-16, 90. Backlash adjustment of worm-and-roller provided for by worm sleeve extending from gear case along steering gear shaft. With wheel in position as noted above, loosen upper clamp bolt, turn worm (eccentric) sleeve to take up backlash. Tighten clamp bolt. Check according to directions given above (spring tension should be 2-2½ lbs.)

CHEVROLET MASTER DELUXE GA (1937).
CHEVROLET MASTER DE LUXE MODEL HA (1938)
CHEVROLET MASTER MODEL HB (1938)
CHEVROLET MASTER DELUXE, MODEL JA (1939)
CHEVROLET MASTER '85', MODEL JB (1939)

TYPE:—Worm and Sector or Worm and Roller designs similar to other Saginaw models. Adjustments are not made in same manner as on other models and instructions below should be followed.

Worm & Roller Types. Double tooth roller forms the outer race for a double row ball bearing (all models except HB), loose needle or roller bearings (HB). On ball bearing types, inner race is made up of two sections held together by a snap ring at the center and bearing is pre-loaded to insure long life without adjustment. Roller and bearing assembly is retained in cross-shaft lever by capscrew. On the needle bearing (HB) type, side thrust is taken by a thrust washer assembled on each side of the roller. Roller and bearing assembly is retained by a riveted pin and cannot be dismantled.

1939 Master Deluxe JA—Steering shaft upper bearing in mast jacket has been changed to spring-loaded ball bearing. Ball bearing mounting ring is insulated from mast jacket and serves as horn button contact as on previous models.

ADJUSTMENT:—Jack up front wheels, turn steering wheel to straight ahead position, disconnect steering connecting rod or drag link from pitman arm (note ball seat and spring assembly so that parts may be replaced in same order). See that reference mark on pitman arm and roller shaft line up, tighten pitman arm nut with 18" wrench. Disconnect horn wire at mast jacket.

1939 Model Note—Disconnect the steering connecting rod (drag link) on Master 85 models, remove pitman arm from steering gear roller shaft on Master Deluxe models before making adjustments. Align steering column on Master model in same manner as in 1938. Master Deluxe model has new type frame mounting (roller cross-shaft vertical).

Steering Column Alignment:—Tighten dash bracket clamp, loosen frame bracket mounting bolts so that steering gear is free, check clearance between bracket and frame with feeler gauge. If clearance exceeds .031", install spacer shim, Part No. 476612, to avoid springing column when frame bolts tightened.

Worm Shaft Endplay (1933-38):—Loosen clamp on jacket at instrument board, loosen housing clamp bolt (at upper end of steering gear housing), see that adjusting sleeve clamp bolt (at lower end of mast jacket directly above housing clamp bolt) is tight, check to see that roller and worm have sufficient backlash to permit adjustment, turn mast jacket and adjusting sleeve down (grip clamp bolt with wrench) until all endplay removed from worm shaft and pull required to turn wheel is 1½-1¾ lbs. (All Models 1933-37), 1-1½ lbs. (Models HA, HB 1938) measured at wheel rim. Tighten housing clamp bolt, securely, loosen adjusting sleeve clamp bolt, turn mast jacket (sleeve will not turn if housing clamp bolt tight) until horn wire is at bottom, tighten clamp bolt and instrument board clamp bolt, connect horn wire.

1939 Models—Adjusting nut at the upper end of steering gear housing provided with hexagonal head so that adjustment simplified and should be made as follows: Loosen mast jacket clamp bolt (on lower end of jacket above housing, loosen housing clamp bolt (to free adjuster), use 1 9/16" wrench to turn adjuster at upper end of housing clockwise until all endplay removed and steering gear turns freely, tighten housing clamp bolt and mast jacket clamp bolt (not necessary to loosen instrument panel bracket clamp, do not turn mast jacket clamp when making adjustment as was required on previous models).

Roller Shaft Endplay:—Loosen locknut on engine side of steering gear housing, turn adjusting screw in until all endplay removed from roller shaft (check by shaking pitman arm), tighten locknut.

NOTE—On Master Deluxe JA (1939), this adjusting screw and locknut are located on cover on top of steering gear housing.

Worm and Roller Backlash:—Turn steering wheel to center or straight ahead position (turn wheel back one half total number of turns from either end position). Loosen three housing-to-bracket bolts, check backlash or play at pitman arm, loosen eccentric bolt locknut one half turn, turn eccentric bolt and eccentric sleeve equally in opposite directions until all backlash removed (approximately ⅛ turn should be sufficient). Tighten eccentric bolt locknut and housing bolts, check adjustment by noting pull at wheel rim required to turn wheel through center position. Should be 1¾-2½ lbs. (All Models 1933-37), 1½-2½ lbs. (1938-39 Models) measured at wheel rim. With correct adjustment wheel should have no backlash at center position but should turn freely throughout entire travel.

SERVICING:—**Removal (1939)**—On the Master Deluxe model, steering gear can be removed from car for overhaul without disturbing Vacuum Gearshift as follows: Remove horn button, steering wheel nut, steering wheel (use special puller and adapter), remove mast jacket upper bearing spring, spring seat, and bearing with horn wire. Remove mast jacket grommet from dash, loosen mast jacket instrument panel bracket clamp bolts and lower mast jacket clamp. Remove pitman arm (use J-1025 puller), loosen front screws in engine rear side pan, remove steering gear frame mounting bolts. Raise front end of car so that wheels approximately 6" off floor, pull steering gear assembly down and out of car without disturbing mast jacket.

SAGINAW (CHEVROLET) NEW TYPE

WORM-AND-SECTOR TYPE

Used On:

MASTER PASS. CAR, MODEL GB (1937)

HALF-TON, GC ('37), HC ('38), JC ('39)

¾ TON, HD ('38), JD & SPEC. JE ('39)

1 TON, HE (1938)

1½ TON, S ('37), T ('38), VA, B, C, D ('39)

1½ TON CAB OVER ENGINE, VE, F, G, H ('39)

DESCRIPTION:—New type steering gear with 'hourglass' type worm and three-tooth sector. Worm bearing adjusting screw located on lower housing cover in center of adjusting plate which controls sector mesh with worm (worm bearings mounted in eccentric sleeve which is rotated by adjuster). Sector shaft straddle mounted with additional bearing in side cover.

ADJUSTMENTS:—Jack up front wheels, turn steering wheel to straight ahead position, disconnect steering connecting rod or drag link from pitman arm (note ball seat and spring assembly so that parts can be replaced in same position). See that reference mark on pitman arm and sector shaft are lined up, tighten pitman arm nut with 18" wrench. Make adjustments in following order:

Steering Column Alignment:—Tighten dash bracket clamp bolt, loosen frame bracket mounting bolts so that steering gear is free. Check clearance between bracket and frame with feeler gauge. If clearance exceeds .031" at front or rear, install spacer shim, Part No. 476612, to avoid springing column when frame bolts are tightened.

Worm Shaft Endplay:—Tighten lower cover screws. Turn steering wheel to either end position (just clear of stops). Loosen adjusting locknut, tighten adjusting screw on lower cover until pull required to turn wheel is 1⅛ lbs. (measured at rim), tighten locknut.

Sector Shaft Endplay:—Tighten four side cover screws, loosen adjusting screw locknut, turn adjusting screw until all endplay is removed (check by shaking pitman arm), tighten locknut. Check adjustment by turning steering wheel to extreme end positions (just clear of stops), see that pitman arm does not bind.

Worm and Sector Backlash:—Tighten lower cover screws. Turn steering wheel to straight ahead position (turn wheel back one half total number of turns from either end position). Check backlash or play in pitman arm. To adjust, loosen lash adjuster lockscrew (hexagonal screw in adjuster slot), tap lash adjuster in direction of arrow above screw 1/16" at a time until pull required to turn wheel through center position is 1¾-2½ lbs. (measured at wheel rim), tighten lockscrew securely. With correct adjustment, no backlash should be evident in pitman arm at center position and wheel should turn freely throughout entire travel.

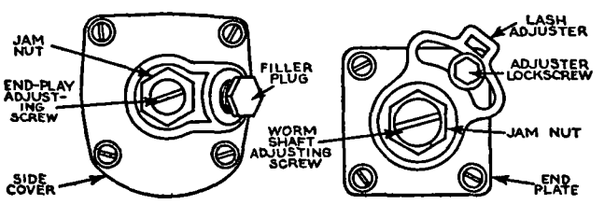
NOTE:—Steering Column Gear Shifts (all models)—See separate articles on 'Transmission Controls' in following section for complete adjustment and servicing data.

DESCRIPTION:—New type Steering Gear with 'hourglass' type worm and double-tooth roller. Worm bearing adjusting screw now located on lower housing cover in center of adjusting plate which controls worm mesh in roller (worm bearings mounted in eccentric sleeve which is rotated by adjuster). Roller shaft is straddle mounted with additional bearing in side cover.

ADJUSTMENTS:—Jack up front wheels, turn steering wheel to straight ahead position, disconnect steering connecting rod or drag link from pitman arm (noting ball seat and spring assembly so that parts can be reassembled in same order), see that reference mark on pitman arm and roller shaft are lined up, tighten pitman arm nut with 18" wrench, check column alignment by noting pull at steering wheel rim required to turn wheel through center position (if pull exceeds 1¾-2¼ lbs., align column as directed below.



Steering Column Alignment—Loosen dash bracket (except Buick), gear mounting bolts in frame bracket (Buick). If this relieves binding, shim bracket out so that column will not be sprung when bolts are tightened.

Cadillac Models—To correct up and down alignment, install special spacer Part No. 1419066 (37-50, 60), 405554 (37-65, 70) between instrument board and bracket. To correct alignment sideways, install special washer Part No. 871588 under front steering gear housing-to-frame bolts (if column to left of bracket), or rear bolts (if column to right of bracket).

Roller Shaft Endplay:—Tighten side cover plate screws, loosen adjusting screw jam nut, turn slotted adjusting screw down tight by hand, then back screw off 5-10°, tighten jam nut. Turn wheel to each end position (not against stops), check pitman arm to see that adjustment has not caused binding.

Worm Shaft Endplay:—Loosen adjusting screw jam nut on lower cover, turn slotted adjusting screw in slowly until pull at steering wheel rim required to turn wheel in extreme end positions (just clear of stops) is 1 lb. (Buick), 1-1¼ lbs. (Cadillac), 1½ lbs. (Oldsmobile), ½-1 lbs. (Pontiac). Tighten jam nut. When making this adjustment, do not back adjusting screw out which will allow bearings to get out of alignment.

Worm and Roller Backlash:—Tighten three lower housing cover mounting screws. Center steering wheel (turn wheel back ½ total number of turns from either end position or with marked spoke straight down (Buick, Pontiac), straight up (Oldsmobile). Check backlash or play at pitman arm ball end. To adjust, loosen lash adjuster lockscrew (hexagonal screw in adjuster slot), tap lash adjuster in direction of arrow above screw, not more than 1/16" at a time, until pull at steering wheel rim required to turn wheel through center position is 1¾ lbs. (Buick), 2-2½ lbs. (Cadillac), 1¾-2¼ lbs. (Oldsmobile), 1½-2 lbs. (Pontiac). Check for high spots by rotating steering wheel throughout range. Back off lash adjuster just enough to permit wheel to be turned through these high spots without excessive binding.

STEERING WHEEL POSITION:—See articles on Independent Suspension for tie rod adjustment to correct intermediate steering arm position. Steering wheel height and position adjustments as follows.

Buick 1937 Models:—Height is not adjustable as long (left hand) dash bracket bolt burred to prevent removal. If this bolt is removed, standard ⅜" spacer on dash bracket (80, 90 only) may be removed or replaced by spacers furnished ¼", ½", ⅝" thick to provide ½" wheel height variation. Loosen gear frame bracket bolts to permit steering gear to shift into alignment with new bracket position. Marked spoke on steering wheel (mark on under side of spoke at hub) should be straight down with roller on midpoint of worm and wheels straight ahead (drag link connected). Drag link not adjustable, but tie rods can be turned not more than 1 turn to throw intermediate steering arm 3/16" maximum off center, which will rotate steering wheel 2⅞" at rim, to correct spoke location. Wheel stops must be relocated to prevent intermediate steering arm striking cross-member.

Buick 40, 60 (1938):—Steering wheel height not adjustable but wheel can be raised 13/16" by installing 38-80 r 90 steering column bracket. When in-

WORM-AND-ROLLER (LATER) TYPES CONT.

stalling this bracket, elongate two rear steering gear mounting holes in frame ⅛" at upper end (do not touch front hole which locates gear), cut out dash mat, floor mat, and steering column floor felt pad and make certain that clearance between steering column and dash flange and toeboard is ¼", slot instrument panel holes if required so that bracket can be shifted to secure satisfactory lock operation.

NOTE—On models with Self-shifting Transmission, control lever housing will make it difficult to remove steering wheel unless new type puller J-1120 is used.

Steering Wheel Position. Intermediate steering arm not used on these models, steering gear pitman arm being connected directly to right hand wheel by long tie rod which has seat for short left hand tie rod near pitman arm end. Tie rods adjusted by loosening clamp bolt and turning threaded sleeve at wheel end of each rod (rods should be adjusted equally). If indented spoke on steering wheel more than ¾" from straight down position, adjust by lengthening one tie rod and shortening opposite tie rod equal amount (to avoid disturbing toe in). One complete turn of each adjusting sleeve will move wheel 2¼" at rim.

Buick 80, 90 (1938):—Adjusted in same manner as 1937 models (change spacer on dash bracket to adjust wheel height, shorten one tie rod and lengthen opposite rod not more than one complete turn which will shift wheel rim 2⅞" and throw intermediate steering arm 7/32" off center to center indented spoke). Intermediate steering arm bearing pre-load should be set at 4-5 lbs.

Buick 1939:—Wheel height not adjustable. Use special puller J-1120 (used for 1938 cars with self-shifting transmission) to remove steering wheel. Install wheel so that notch in steering tube (on right side) is in line with locating mark on wheel (this mark 90° counter-clockwise from marked spoke on solid-spoke wheels and in line with mark on underside of hub on flexible-spoke wheels).

Cadillac, LaSalle 1939:—Install steering wheel with middle spoke vertical and in line with notch in end of steering column shaft. On 39-75 and 39-90 cars, clamp bolt holding lower universal joint on worm shaft should be horizontal in this position. When installing horn button cap, see that emblem is horizontal.

Oldsmobile 1937:—Spoke opposite mark on hub (visible with horn button removed) should be straight up with roller on midpoint of worm and wheels straight ahead. Correct by removing wheel and changing its position on serrations in hub. Mark on steering column shaft must be in line with keyway.

Oldsmobile 1938:—Standard (3 spoke) wheel should be assembled with spoke opposite mark on hub (visible with horn button removed) straight down with roller on midpoint of worm and wheels straight ahead. Correct by removing wheel and shifting position on shaft serrations (mark on shaft should be lined up with hub mark). On the two spoke (bar type) steering wheel, bar should be horizontal in center position.

Oldsmobile 1939:—Install steering wheel with mark on hub in line with mark on shaft and spoke which is next to horn button connector pointing down (two widely spaced spokes will be up). Steering linkage is same design as used on La Salle (see preceding paragraph).

Pontiac 1937-38:—Steering wheel should be assembled with one spoke straight down within 5° with roller on midpoint of worm and wheels straight ahead. Keyway should be in line with this spoke and emblem on wheel should read across horizontally.

Pontiac 1939:—Install the steering wheel with key on shaft pointing up and two wide-spaced spokes horizontal in straight ahead position (narrow spaced spoke must point straight down within 5°). Steering linkage same design as used on La Salle (see Cadillac-La Salle paragraph above). If idler arm dismantled, turn bushing in on mounting stud so that distance from top face of arm to shoulder on support is exactly 23/32" when reassembled.

SPECIAL SERVICE NOTES:—Check following points when adjusting or servicing steering gear and linkage:

Intermediate Steering Arm:—On Independent Suspension cars with intermediate steering arm (not used on all models), see that intermediate steering arm is parallel to center-line of car with steering gear roller on high point of worm and front wheels in straight ahead position. When servicing linkage check these points:

Buick 1937-38 Intermediate Steering Arm Bearing—Adjust bearing pre-load by turning nut on bearing shaft so that force required to turn arm is 1½ lbs. Max. (40,60 '37), 3-4 lbs. (80,90 '37), 4-5 lbs. (80,90 '38) measured at ball stud end of arm with drag link and tie rods disconnected. NOTE—No intermediate steering arm used on 40,60 '38 or 1939 models.

Cadillac 37-50, 60 (1937)—Springs in the steering connecting rod at steering gear arm pivot were changed in production. New type is longer and heavier. Install new type springs (Part No. 263699) to correct chucking noise when driven over rough roads (first cars only). Check intermediate steering arm looseness if steering rattles develop. If tightening of the pivot bolt on cross-member does not correct looseness, install special shim, Part No. 1300203, at bottom of steering arm pin before tightening bolt.

Cadillac, LaSalle 1939—New type steering linkage used on Cadillac 39-61 and La Salle. Consists of drag link connected between steering gear pitman arm and idler lever on right frame side rail with individual tie rods linked between drag link and each front wheel. Toe in adjustments made in same manner as on previous models (adjust both tie rods equally to insure steering gear roller being on high point of worm in straight ahead position).

Cadillac, LaSalle Intermediate Steering Arm Rattles (1938-39)—On Models 38-50, 38-60, 39-60S, check intermediate steering arm for looseness if rattles develop in steering system. Tighten bolt on lower face of frame cross-member moderately tight. If this does not correct rattle, install additional shim at bottom of steering arm pivot pin.

Cadillac 75 & 90 Universal Joints—To correct chuckling noise caused by lower universal joint striking steering gear case, loosen universal joint clamp-screw, use bar or heavy screwdriver to force universal yoke up approximately 1/32", hold in this position and tighten clamp bolt. NOTE—If lower joint yoke cannot be forced up on shaft, loosen clamp bolt holding upper universal joint upper yoke on steering column shaft, force assembly downward and tighten clamp bolt. It should then be possible to raise lower joint lower yoke without trouble.

Steering Linkage Adjustments:—On 1939 cars with special idler arm type linkage, adjust idler arms as follows:

Cadillac 39-50, 39-61—Idler arm mounted on threaded bushing screwed in lever and secured by lock ring. When installing idler arm, tighten idler arm support additional ¼-1¼ turns after it seats firmly against the rubber bushing.

Oldsmobile 1939—Idler arm mounted on frame support by bushing which is threaded on support and in arm. If arm removed, install so that clearance between upper face of arm and shoulder on support is exactly 23/32". Assembly will be simplified if bushing first screwed in idler arm so that it is tight, and support removed from frame and screwed into bushing until clearance is correct.

Pontiac 1939—Idler arm mounting same as Oldsmobile. See Oldsmobile directions above for assembly and arm clearance (23/32").

GEMMER WORM-AND-SECTOR TYPE

Model 120

WILLYS, 440 PICK-UP, 440P PANEL DELVRY. ('40)

This Steering Gear same as type used on 1939 Willys.

ADJUSTMENT & SERVICING:—All adjustments made in same manner as on previous Gemmer 120 models. *See Gemmer Worm-and-Sector Steering Gear article in Mechanical Equipment Section of manual for complete data.*

GEMMER (LINCOLN V12) MODEL WORM-AND-ROLLER TYPE

Used On:

LINCOLN, V12 MODEL (1940)

This Steering Gear same design as on previous Lincoln V12 models.

ADJUSTMENT & SERVICING:—Same as for previous models. *See 'Gemmer Lincoln V12 Model, Worm-and-Roller Type' steering gear article in Mechanical Equipment Section of manual for complete data.*

GEMMER WORM-AND-ROLLER TYPES 250, 330, 370

Model 250—See Note

WILLYS, 440 SPEEDWAY & DELUXE PASS. CARS (1940)

Model 330

LINCOLN-ZEPHYR, MODEL 06H (1940)

Model 370

FORD, BUS MODELS (1940)

Special Types—See Note

DODGE, D14 & D17 ('40)—EXCEPT 7 PASS SEDAN
PLYMOUTH, P9 & P10 ('40)—EXCEPT 7 PASS. SEDAN
PACKARD SIX, '110' MODEL 1800 (1940)
PACKARD EIGHT, '120' MODEL 1801, 1A, (1940)
PACKARD SUPER 8, '160' 1803, 3A, 4, 5 (1940)
PACKARD CUST. SUPER 8, '180' 1806, 7, 8 (1940)
These Steering Gears same design as used on corresponding 1939 car models (except Willys).

NOTE:—Model 250 (Willys)—This is a new model which is similar to Model 300 except for size and fact that worm is mounted on ball bearings (each bearing takes thrust in one direction). This model adjusted and serviced in same manner as other models.

Dodge & Plymouth Models—These steering gears built by Chrysler but are similar in design to Gemmer Model 300 and adjusted in same manner. Steering gear on 7 Pass. Sedans is Gemmer Model 305 with push-pull adjustments (see following article for data).

Lincoln-Zephyr Model 330—This model has straddle mounted roller shaft with additional shaft bushing mounted in side cover on housing. Adjusted in same manner as other models.

Packard Models—These steering gears built by Packard but similar in design to Gemmer Model 330 and adjusted in same manner.

ADJUSTMENT & SERVICING:—Except for new specifications and adjustment data below, these models serviced in same manner as on previous cars. *See 'Gemmer Worm-and-Roller Type' steering gear article in Mechanical Equipment Section of manual for complete data and adjust as follows:*

Worm Shaft Bearing Adjustment—Loosen lower cover screws, separate and remove top shim (use care not to damage remaining shims), tighten cover screws and check adjustment. Steering wheel should turn freely without stiffness (if stiffness still evident after steering column alignment checked, worm bearings are too tight). On Dodge & Plymouth models, wheel should turn with ½-1 lb. pressure on rim with cross-shaft out of housing (worm bearing drag only). On Packard models, wheel should turn with 1½ lbs. min., 2¼ lbs. max. pressure at rim except at center 'high' point of worm.

Roller Shaft Endplay—To check, turn wheel to end position and back ⅛ turn. Check endplay at hub of pitman arm (with drag link disconnected). To adjust, loosen locknut and turn adjusting screw on side cover just enough to take up all endplay, tighten locknut. Check to see that steering gear turns through entire range freely but without evident endplay.

Roller Mesh in Worm—To check, place steering wheel in mid-position with roller on 'high' point of worm (count number of turns from one end position to the other, then turn wheel back ½ this number of turns), check play or lost motion at end of pitman arm. If this exceeds 1/32", roller mesh in worm should be adjusted. To adjust, dismantle steering gear and remove roller shaft from housing, remove shim from shoulder on shaft and housing so that play at end of pitman arm will be not more than .006" when reassembled and steering gear will turn freely without excessive drag. On Dodge & Plymouth models, wheel should turn through center position with 1½-3½ lbs. pull on rim (including ½-1 lb. pull required for correct worm bearing adjustment—above). On Packard models, pull of 3-4½ lbs. on rim of wheel should be required to turn wheel through center position. CAUTION—Make certain that thick thrust washer (between adjusting shims and shoulder on roller shaft) installed with bevel face toward roller (away from splined end of shaft. Use special thimble (Packard ST-5032) or wrap splined end of roller shaft with tape when installing roller shaft in housing to avoid damage to oil seal.

Steering Wheel Position (Packard):—Steering wheel height not adjustable but can be raised or lowered by installing instrument panel bracket from other models as follows: **Six**—Wheel cannot be lowered but can be raised approximately ⅝" by installing 1801 steering colum bracket. **Eight & Super Eight**—Wheel cannot be raised but can be lowered ⅝" by installing 1800 steering column bracket.

Steering Linkage (Dodge & Plymouth):—Steering gear arm connected directly to each wheel by separate long (right hand), short (left hand) tie rod. Toe-in adjustments should be made by shortening or lengthening both tie rods equally. If steering gear roller not on 'high' mid-point of worm with wheels in straight ahead position (after toe-in adjustment completed), correct steering gear position by lengthening one tie rod and shortening other tie rod exactly equal amounts (to avoid disturbing toe-in adjustment).

Packard Models—Intermediate steering arm used with individual tie rod for each wheel. If steering gear roller not on 'high' midpoint of worm and intermediate steering arm not centered with wheels straight ahead, check tie rod lengths (must be equal within ⅛") and correct by lengthening one rod and shortening other exactly equal amount (to avoid disturbing tie rod adjustment). Intermediate steering arm bearing is pre-loaded by spring washer on top (nut end) of arm shaft. Bearing not adjustable and nut should be tightened until it bottoms on bearing shoulder.

GEMMER WORM-AND-ROLLER WITH PUSH-PULL ADJUSTMENT TYPES 305, 335

Model 305

CHRYSLER 6, C25 ROYAL & WINDSOR (1940)
DE SOTO, S7 CUSTOM & DELUXE (1940)
DODGE, D14 7 PASS. SEDAN ONLY (1940)
FORD, ALL '60' & '85' MODELS (1940)
HUDSON SIX, 40T TRAVELER, 40P DELUXE ('40)
HUDSON, SUPER 6 41, COUNTRY CLUB 6 43 ('40)
HUPMOBILE, SKYLARK MODEL (1940)
MERCURY, MODEL 09A (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)
NASH SIX, MODEL 4020 (1940)
PLYMOUTH, P10 7 PASS. SEDAN ONLY (1940)

Model 335

CHRYSLER 8, C26 TRAV., SARATOGA, NEW YORKER (1940)
CHRYSLER 8, C27 CROWN IMPERIAL (1940)
HUDSON, EIGHT 44, COUNTRY CLUB 47 (1940)
NASH EIGHT, MODEL 4080 (1940)

These Steering Gears same design as used on corresponding 1939 car models except as noted below.

NOTE:—Dodge, Plymouth (other models)—Steering gear on other models similar to Gemmer Model 300. See preceding article for data.

Hudson—All models now have Independent Suspension and new type steering linkage. Steering gear reversed on frame (steering arm end of roller shaft in toward engine) and hand hole provided in left frame side rail for access to roller shaft endplay adjustment screw. Steering wheels are two-spoke type.

Nash & Nash-Lafayette—All models now have Independent Suspension and new type steering linkage (see Steering Linkage data below).

ADJUSTMENT & SERVICING:—Except for new specifications and adjustment data below, these models serviced in same manner as on previous cars. *See 'Gemmer Worm-and-Roller Type with Push-Pull Adjustment' steering gear article in Mechanical Equipment Section of manual for complete data and adjust as follows:*

Worm Shaft Bearing Adjustment—Loosen lower cover screws, separate and remove top shim (use care not to damage remaining shims), tighten cover screws and check adjustment. Steering wheel should turn freely without stiffness with drag link disconnected (if stiffness still evident after steering column alignment checked, worm bearings are too tight). On Chrysler, DeSoto, Dodge, Plymouth models wheel should turn with ½-1 lb. pull on rim with cross-shaft out of housing (worm bearing drag only).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Roller Mesh in Worm—To check, turn steering wheel so that roller on 'high' mid-point of worm (count number of turns from one end position to the other, then turn wheel back ½ this number of turns, or place steering wheel in straight ahead position as directed below), shake steering arm to determine play or lost-motion at ball end (with drag link disconnected). If lost-motion exceeds 1/32", adjust as follows: Remove roller shaft adjustment screw locknut on steering gear side cover (accessible through hole in frame rail on Hudson models), slide lock plate off far enough to clear lock boss on cover, tighten adjusting screw just enough to eliminate steering arm lost-motion but without causing roller to bind on worm (slight play preferable to any binding), slide lock plate into position so that it engages boss on cover, install and tighten locknut. Check to see that steering wheel turns freely through entire range without binding. On Chrysler, DeSoto, Dodge, Plymouth models, wheel should turn through this center 'high' point with 1½-3½ lbs. pull on rim of wheel (this pull includes ½-1 lb. worm bearing drag).

NOTE—No separate adjustment required for roller shaft endplay (shaft controlled in both directions by above push-pull adjusting screw).

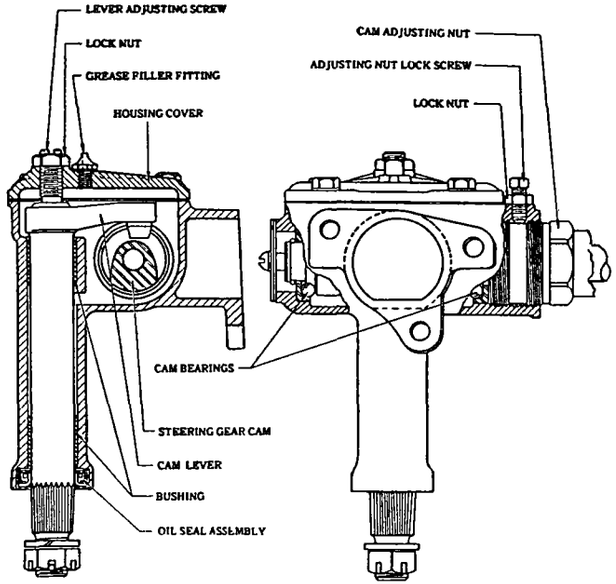
Steering Wheel Position (Hudson):—Notch in end of shaft should point straight down (visible with horn button and contact plate removed) and steering wheel spokes should be horizontal with roller on 'high' mid-point of worm. If wheel position not correct, adjust by shifting shims from one ball seat to the other in the steering arm end of the drag-link.

Nash & Nash-Lafayette—Steering wheel marked on underside of hub and mark should point straight down with roller on 'high' mid-point of worm.

Steering Linkage (Chrysler, DeSoto, Dodge, Plymouth models):—Steering gear arm connected directly to each wheel by long (right hand), short (left hand) tie rod. Toe-in adjustments should be made by shortening or lengthening both tie rods equally. If steering gear roller not on 'high' mid-point of worm with wheels in straight ahead position (after toe-in adjustment completed), correct steering gear position by lengthening one tie rod and shortening other rod exactly equal amount (to avoid disturbing toe-in adjustment).

Hudson—Center-point steering type linkage with intermediate steering arm on center of front crossmember and individual tie rods between this arm and each wheel. Toe-in adjustments should be made by lengthening or shortening both tie rods equally so that tie rod lengths equal and intermediate steering arm centered with wheels in straight ahead position. If steering wheel position not correct, adjust as directed above.

Nash & Nash-Lafayette—Center connecting rod linked between steering gear arm and idler arm on right frame side rail with individual tie rods from this connecting rod to each wheel. Toe-in adjustments should be made by lengthening or shortening both tie rods equally. If steering gear roller not on 'high' mid-point of worm with wheel straight ahead, correct by lengthening one tie rod and shortening other tie rod equally (to avoid disturbing toe-in adjustment).



ROSS CAM & LEVER AND CAM & TWIN LEVER TYPES

CAM-AND-LEVER TYPE
Model S-12
BANTAM, SERIES 63 & NEW SUPER FOUR 65 ('40)
CROSLEY, MODEL A (1939-40)

CAM-AND-TWIN LEVER TYPES
Model T-12
STUDEBAKER CHAMPION, MODEL 2G (1940)
Model T-14
GRAHAM SENIOR, 107 SCHGR., 108 SPEC. (1940)
STUDEBAKER COMMANDER, MODEL 10A (1940)
STUDEBAKER PRESIDENT, MODEL 6C (1940)
These Steering Gears same design as previous Ross Models.

DESCRIPTION:—Same design as previous S-12, T-12 & T-14 models.

ADJUSTMENT:—Before making adjustments, free steering gear from load by jacking up front wheels or disconnecting drag link (see Studebaker Steering Linkage data below). Check steering gear alignment by loosening instrument panel bracket.

Cam Endplay—Check up-and-down movement of steering wheel and shaft in column jacket with steering wheel in center position and lever studs on high points of cam. If movement perceptible adjust by removing four retaining screws in top cover on upper end of steering gear housing, move cover up on column jacket as far as possible (about ¼"), clip and remove one shim (shims are .003", .010", .030" thick and are assembled with paper gaskets between them) using extreme care not to damage remaining shims, tighten cover screws and check adjustment. Wheel should turn through center position with barely perceptible drag (thumb and finger grip on rim) and should not bind in any position.

Cam and Lever Backlash—Check end-play or lost-motion of lever shaft at pitman arm with steering gear turned to center position with lever studs on high points of cam. If play evident, adjust by loosening locknut on steering gear housing side cover and turning adjusting screw in until play just taken up and steering wheel turns freely throughout entire range with barely perceptible drag at center position, hold adjusting screw and tighten locknut. CAUTION—This adjustment should be made only with lever studs on high points of cam (straight ahead position). If adjusted in any other position, gear will bind at this center point.

Steering Wheel Position (Studebaker):—Center spoke should point straight down with lever studs on high points of cam. To check, count number of turns of the wheel from one extreme end position to the other, then turn wheel back exactly ½ this number of turns. If spoke does not point straight down, remove wheel and re-install on shaft in correct position. See linkage data below for steering gear pitman arm installation and location.

Other Models—Before connecting drag link, turn steering wheel to center position with lever stud on high point of cam (count number of turns of wheel from one end position to the other, then turn back ½ this number of turns), place front wheels in straight ahead position, then connect drag link without disturbing position of steering gear or front wheels.

Steering Linkage (Studebaker):—Steering gear pitman arm is special insulated type (see data below) and tie rod for left wheel is connected directly to this arm. A connecting rod is linked between the steering arm and an idler lever on the right frame side rail with tie rod for right hand wheel connected to this idler lever. This design similar to type used in 1939 but adjustments must be made differently as follows: See that punchmarks on end of steering gear lever shaft and steering arm adapter (short arm on shaft to which insulated steering arm is bolted) are in line and adjacent to each other. Set steering wheel in center position with lever studs on high points of cam (see Steering Wheel Position above), loosen clamp bolts on **left hand tie rod** (between steering arm and left wheel), turn this left hand rod until left front wheel is straight ahead (wheel should be parallel to rear wheel but ⅜" in on Champion, ⅝" in on Comm. and Pres. due to wider rear tread), tighten clamp bolts. Then make toe-in adjustment by turning **right hand tie rod only** without disturbing position of left hand tie rod after it has been correctly set for straight ahead position.

Insulated Steering Arm—On Champion, insulated steering arm can be removed by taking off nuts on two studs (on which neoprene insulators are mounted) without disturbing position of adapter on steering gear lever shaft. If adapter being removed, use puller J-871 and make certain that punchmarks on shaft and adapter lined up when adapter replaced. On Commander & President, pull insulated steering arm and adapter as an assembly using puller J-871 after removing cotter pin, nut and washer from lever shaft and disconnecting left tie rod and connecting rod from steering arm. Assembly can then be dismantled by taking off nuts on two mounting studs. When reassembling, tighten nuts on studs until washers seat against shoulders on studs. See that punchmarks on adapter and end of steering gear lever shaft line up when assembly installed.

Connecting Rod Idler Arm—Spring washer used on upper end of idler lever stud on Commander and President models to prevent idler lever rattles. This spring washer not used on Champion and idler lever stud nut should be tightened just enough to eliminate all up-and-down play of lever without causing lever to bind in bracket.

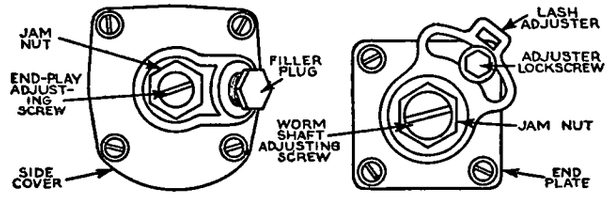
SAGINAW WORM-AND-ROLLER TYPES

Used On:

BUICK, SERIES 40-40,50,60,70,80,90 (1940)
CADILLAC V8, SERIES 40-60S, 62, 75 (1940)
CADILLAC V16, SERIES 40-90 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)
OLDSMOBILE 6, '60' F-40, '70' G-40 (1940)
OLDSMOBILE 8, '90' L-40 (1940)
PONTIAC SIX, 40-25 & 40-26 (1940)
PONTIAC EIGHT 40-28, TORPEDO 40-29 (1940)

These Steering Gears same design as used on corresponding 1939 car models.

NOTE:—**Cadillac 40-72**—Steering gear on this model is new Saginaw 'Recirculating Ball Type'. See separate article (preceding) for data on this type.



SPECIAL SERVICE NOTES:—**Cadillac 40-75 & 90**—To correct 'chuckle' in steering gear shaft universal joints, loosen clampscrew holding lower joint on steering worm shaft, use pinch bar or heavy screwdriver inserted between lower yoke and top of steering gear case to force yoke up approximately 1/32", tighten clampscrew. NOTE—If yoke cannot be forced up, loosen clampscrew locking upper universal joint upper yoke on steering wheel shaft, force top yoke down and tighten clampscrew. This will make it possible to adjust lower joint as above.

ADJUSTMENT & SERVICING:—Except for specifications and adjustment data below, these models serviced in same manner as on previous cars. ***See 'Saginaw Worm-and-Roller Type' steering gear article in Mechanical Equipment Section of manual for complete data and adjust as follows:***

Roller Shaft Endplay—If endplay perceptible with steering wheel turned to within ⅛ turn of either end position, adjust as follows: Tighten retaining screws on steering gear housing side cover (faces up on some models), loosen adjusting screw locknut, turn adjusting screw in until endplay is just taken up, hold screw and tighten locknut. Check to make certain that wheel revolves freely without binding.

Worm Shaft Endplay—Turn steering wheel to within ⅛ turn of either end position, loosen locknut on adjusting screw at center of lower cover, turn adjusting screw (adjusting nut on Cadillac 75, 90) in until steering wheel turns with pull of 1 lb. max. (Buick), ¾-1 lb. (Cadillac—1-1¼ lbs. on cars driven less than 1000 miles), 1-1½ lbs. (Oldsmobile), ⅜-⅝ lb. (Pontiac) measured at steering wheel rim with wheel turned near the end position. Hold adjusting screw and tighten locknut, recheck pull with locknut tightened. CAUTION—Do not back adjusting screw out which will allow bearings to get out of alignment.

Worm and Roller Backlash—Turn steering wheel to center position with roller on 'high' mid-point of worm (see Steering Gear Position adjustment below), tighten lower cover screws, loosen lash adjuster lockscrew on lower cover (hexagonal headed capscrew in lash adjuster slot), tap lash adjuster in direction of arrow cut in adjuster above lockscrew not more than 1/16" at a time until pull required to turn steering wheel through center 'high' position is 2½ lbs. max. (Buick), 1½-2 lbs. (Cadillac—2-2½ lbs. on cars driven less than 1000 miles), 1¾-2¼ lbs. (Oldsmobile), 1¼-1¾ lbs. (Pontiac), tighten lash adjuster lockscrew. Check to see that wheel turns freely throughout range without binding. CAUTION—Lash adjuster must not be tightened beyond maximum figure given above, and lash adjuster should be tightened only when making this adjustment (do not back adjuster off).

Steering Wheel Position (Buick):—Steering wheel spoke with small indentation on underside near hub should point straight down with roller on high point of worm and wheels in straight ahead position. If wheel position incorrect, see that mark on steering tube (visible with horn ring and cover removed) is toward indented spoke. CAUTION—Directional signal switch must be in 'off' position whenever steering wheel removed or replaced.

Cadillac—Center steering wheel spoke should point straight down and roller should be on high point of worm (within 10°) with wheels straight ahead. Adjust by changing tie rod lengths (see Steering Linkage Adjustment below).

Oldsmobile—On three-spoke wheels, spoke next to horn button connector opening should point straight down with roller on high point of cam and wheels in straight ahead position (mark on hub should be adjacent to and in line with mark on shaft). Adjust by removing wheel and changing position on shaft. Make certain that steering wheel nut staked to prevent loosening when wheel reinstalled.

Pontiac—Lower center spoke of wheel should point straight down within 5° with roller on high point of worm and wheels in straight ahead position. Steering wheel emblem must be horizontal.

Steering Linkage (Buick 40, 50, 60, 70):—Design same as 1939 type (long right hand tie rod between steering arm and right wheel, short left hand tie rod between other tie rod and left wheel). Adjuster at wheel end of each tie rod should be turned equally when making toe-in adjustments. If steering gear roller not on high mid-point of worm with wheels straight ahead, correct by lengthening one tie rod and shortening other tie rod equally (so that toe-in adjustment not disturbed).

Buick 80, 90—Same design as 1939 (intermediate steering arm and individual tie rod for each wheel). Both rods must be adjusted equally when making toe-in adjustment to insure intermediate steering arm being centered and steering gear roller on high mid-point of worm (check tie rod lengths if wheel position incorrect). Intermediate steering arm mounted on ball bearings which are pre-loaded by mounting bolt nut adjustment. To adjust pre-load, tighten nut on lower end of mounting bolt until pull of 4-5 lbs. (at steering connecting rod ball stud—rod must be disconnected) required to turn arm. Pre-load held constant in service by spring washer under nut.

Cadillac 60S, 62; LaSalle—Linkage same as 1939 (connecting rod between steering gear arm and idler lever on right side of frame, individual tie rods from connecting rod to each wheel). Tie rods should be adjusted equally when setting toe-in. If steering wheel position not correct and steering gear roller not on high mid-point of worm with wheels in straight ahead position, correct by shortening one tie rod and lengthening other tie rod equally. Recheck toe-in. Idler lever is threaded in bushing and idler arm support should be tightened ¼-1¼ turns after it seats firmly against rubber bushing.

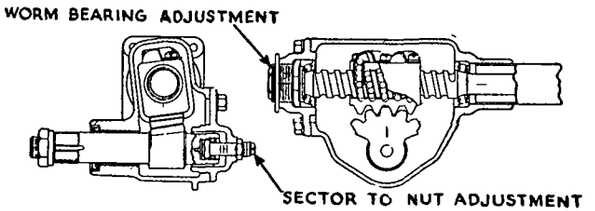
Cadillac 75 & 90—Linkage same as 1939 (intermediate steering arm on cross-member with individual tie rod to each wheel). Tie rods should be adjusted equally when adjusting toe-in. If steering wheel position not correct or steering gear roller not on high mid-point of worm with wheels straight ahead, check tie rod lengths and adjust by lengthening one rod and shortening other rod. Recheck toe-in. Intermediate steering arm mounted on ball bearings. If arm disassembled, pack bearings with G-12 wheel bearing grease and tighten nut on mounting bolt just enough to eliminate bearing play but without causing arm to bind.

Oldsmobile & Pontiac—Linkage same as 1939 (connecting rod between steering gear arm and idler lever on right side, individual tie rods from connecting rod to each wheel). Idler arm mounting has been changed and bushing is now threaded in arm and on support. Arm must be assembled as follows: Remove arm support from frame, screw bushing into idler arm and tighten securely, install seal on support and screw support into bushing until distance from shoulder on support to top face of arm is 23/32", then install assembly on frame.

SAGINAW RECIRCULATING BALL TYPE

Used On:

CADILLAC V8, SERIES 40-72 (1940)



NOTE:—**Cadillac (Other Models)**—Steering gears are Saginaw Worm-and-Roller Type. See following article for data.

DESCRIPTION:—New design Worm-and-Nut type steering gear with circulating ball contact. Balls are assembled in groove between worm and nut in two groups with return channels assembled on back of nut so that balls are free to move through circuit as nut moves up and down on worm (each circuit has 33 balls of which 23 or a total of 46 in both circuits carry the load). Gear teeth on nut mesh with sector teeth on cross-shaft so that cross-shaft (and steering gear pitman arm) rotate as the steering wheel is turned and the nut moves up and down on the steering shaft worm.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ADJUSTMENT:—Worm Bearings—Disconnect drag link at pitman arm, loosen steering column bracket, loosen locknut and back off pitman shaft adjusting nut a few turns (this adjusting nut on side cover on lower side of housing). Turn steering wheel to within 1 turn of extreme end of travel (CAUTION—do not turn steering wheel hard against stops which will damage ball return mechanism). Loosen locknut and turn worm bearing adjusting screw (on bottom endplate of housing) until pull at wheel rim required to turn wheel is ¾-1 lb. (1-1¼ lbs. on cars driven less than 1000 miles), hold adjusting screw and tighten locknut. Check clearance at steering column bracket to determine if column will be sprung when bracket screws tightened (if clearance at this point, loosen frame mounting bolts to allow steering gear to shift into alignment, or shim bracket), tighten steering column bracket. Recheck worm bearing adjustment setting.

Pitman Shaft End-play (Nut and Sector Mesh)—Turn steering wheel to center position with nut on high point of gear. Tighten pitman shaft adjusting nut on lower side cover until pull at wheel rim required to turn wheel through high point is 1½-2 lbs. (2-2½ lbs. on cars driven less than 1000 miles), hold adjusting nut and tighten locknut.

NOTE—This is push-pull type adjustment and controls pitman arm shaft endplay as well as gear mesh.

Steering Wheel Position:—Center steering wheel spoke should point straight down and nut should be on high point of gear (within 10°) with wheels in straight ahead position. Adjust by lengthening one tie rod and shortening other tie rod equally. Check toe-in after making this adjustment.

SERVICING:—Disassembly—Remove steering wheel, disconnect drag link at pitman arm, remove steering gear and column assembly from car. Remove steering column upper bearing. Loosen locknuts and back off both adjusting screws (on lower side and bottom cover plates). Remove screws on side cover and pull cover approximately 2" out of housing so that pitman arm shaft and sector gear will be disengaged from nut. Take out bottom cover screws, remove cover, lower worm bearing, cup and thrust washer. Pull steering worm and nut assembly out through lower end of housing. CAUTION—Hold shaft in horizontal position and use extreme care that nut is not allowed to run down on worm against stops which will damage ball return mechanism (nut will move of own weight if shaft tilted or vertical). Manufacturer recommends that worm nut and balls not be disassembled.

Reassembly—Replacement shaft and nut assemblies are taped to prevent nut moving on worm. When removing tape, hold shaft horizontally and use extreme care that nut does not run down on worm against stops which will damage ball return mechanism. Install shaft and nut assembly in steering gear housing, replace worm bearing, cup, thrust washer, gasket, bottom cover plate, insert and tighten cover screws. Install upper bearing spring seat and spring, bearing washer, cotter pin, steering wheel. Adjust worm bearings (see Adjustment above). Rotate steering wheel until nut in center of travel so that center tooth of pitman arm shaft sector gear will engage center tooth space on nut, push shaft and side cover into place, tighten cover screws. Fill housing with steering gear lubricant, re-install steering gear in car.

SAGINAW (CHEVROLET PASS. CARS) WORM-AND-ROLLER TYPE

Used On:

CHEVROLET, KA, KB, KH PASS. CARS & SEDAN DELIVERY MODELS (1940)

These Steering Gears same design as used on 1939 car models.

ADJUSTMENT & SERVICING:—Except for specifications and adjustment data given below, these models serviced in same manner as on previous cars. *See 'Saginaw (Chevrolet) Type' steering gear article in Mechanical Equipment Section of manual for complete data and adjust as follows:*

Steering Column Alignment (Model KB)—Check alignment by loosening frame mounting bolts (instrument panel bracket must be tight). If clearance between steering gear housing bracket and frame exceeds .031", install shim No. 476612 to prevent column being sprung when mounting bolts tightened.

Worm Shaft Endplay—With pitman arm removed (KA, KH) or drag link disconnected (KB), loosen jacket clamp bolt (on lower end of column directly above steering gear housing), loosen adjusting nut clamp bolt in upper end of housing, see that some backlash exists between worm and roller (if necessary, loosen locknut and back off roller shaft adjusting screw located on side of housing on KB, on top of housing on KA, KH). Use 1 9/16" wrench and turn adjusting nut in upper end of housing in until pull of ½ lb. at rim of steering wheel required to turn wheel. Tighten adjusting nut clamp bolt and jacket clamp bolt.

Roller Shaft Endplay—Loosen locknut and turn roller shaft adjusting screw (on side of housing on KB, on top of housing on KA, KH) in until tight, then back screw off until it is free, finally turn screw in until it just contacts end of roller shaft, hold screw and tighten locknut.

Worm and Roller Backlash—Turn steering wheel to center position with roller on high point of worm (count number of turn from one end position to the other, then turn wheel back ½ this number of turns). Check roller shaft backlash or play by shaking pitman arm. To adjust, loosen three steering gear cover bolts ¼ turn, loosen eccentric bolt locknut ½ turn. With one wrench on eccentric bolt and second wrench on eccentric bolt sleeve, turn bolt and sleeve slowly in opposite directions until pitman arm play has been taken up (CAUTION—Use extreme care not to turn eccentric bolt and sleeve more than necessary to take up play, any excess will damage steering gear, normal adjustment is approximately ⅛ turn). Hold eccentric bolt from turning and tighten eccentric bolt locknut, tighten housing cover bolts. Check steering gear to make certain that it turns freely. Pull of 1⅜ lbs. max. at wheel rim should be required to turn wheel through center high point.

Steering Linkage (Models KA, KH):—Individual tie rods used and are connected between special rubber-bushed link on steering gear pitman arm and each wheel. Long right hand tie rod is non-adjustable and toe-in adjustments should be made by turning short left-hand rod to insure steering gear roller being on high point of worm with wheels in straight ahead position.

Horn Ring Adjustment (Special Deluxe KA):—Horn ring tension is adjustable by turning steering wheel lower hub housing. To adjust, loosen lockscrew, turn hub under steering wheel until desired horn ring tension secured, then tighten lockscrew.

SAGINAW (CHEVROLET TRUCKS) WORM-AND-SECTOR TYPE

Used On:

CHEVROLET, ALL TRUCK MODELS (1940)

This Steering Gear same design as used on 1939 models.

ADJUSTMENT & SERVICING:—Except for new specifications and adjustment data given below, these models serviced in same manner as on previous trucks. *See 'Saginaw (Chevrolet) New Type' steering gear article in Mechanical Equipment Section of manual for complete data and adjust as follows:*

Steering Column Alignment—Check by loosening frame mounting bolts (instrument panel bracket must be tight). If clearance between steering gear bracket and frame rail exceeds .031", install shim No. 476612 before tightening mounting bolts to prevent column being sprung out of alignment.

Worm Shaft Endplay—With drag link disconnected from pitman arm, turn steering wheel to point near one end position (must not be at center 'high' point of worm). Tighten three cover screws on steering gear lower cover, loosen locknut and turn adjusting screw (in center of lower cover plate) until slight drag felt when wheel is turned, check in other extreme end position before tightening locknut. Check adjustment by noting pull required to turn wheel at point near end position which should be 1⅛ lbs. max. measured at wheel rim (greater pull required to turn wheel through center high point). CAUTION—Do not back adjusting screw out when making this adjustment as this will allow bearings to get out of alignment.

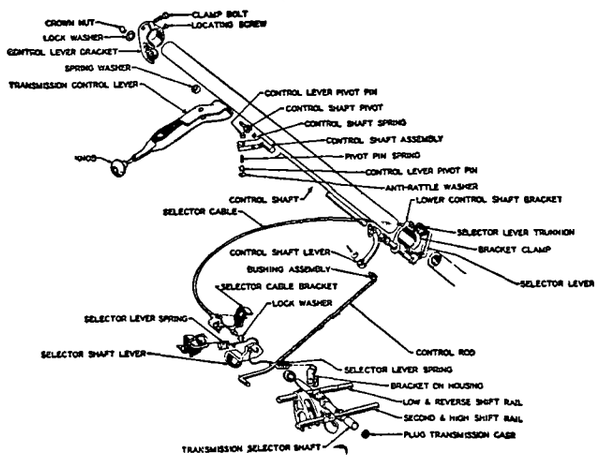
Sector Shaft (cross-shaft) Endplay—Tighten four screws in side cover plate on housing, loosen locknut and turn adjusting screw on cover plate in until endplay has just been removed, hold screw and tighten locknut. CAUTION—Do not use excessive force or turn screw in beyond point where all endplay just taken up when making this adjustment.

Worm and Sector Backlash—Place steering wheel in center position with sector gear on high point of worm (count number of turns of wheel from one end position to the other, then turn wheel back ½ this number of turns). Check backlash or lost motion between sector gear and worm. To adjust, loosen hexagonal headed lockscrew in lash adjuster on lower cover plate, tap lash adjuster in direction of arrow cut in adjuster not more than 1/16" at a time until play taken up and pull at steering wheel rim required to turn wheel through center position is 1¾-2½ lbs., tighten lash adjuster lockscrew. Check to see that cross-shaft has no play in center position and that steering wheel turns throughout entire travel without binding.

BUICK HANDI-SHIFT

Std. Equipment On:

BUICK, MODELS 39-40, 60, 80, 90 (1939)



NOTE:—Transmission used with this type control is similar to that used on previous models except for shifter mechanism (selector shaft with two fingers which engage slots in shifter shafts—endwise movement of shaft for cross-shift at neutral insures that only one finger engaged at a time). See separate article for complete Transmission servicing data.

TYPE:—Handi-shift remote control with shift lever mounted on steering column under steering wheel. Shift lever linked to selector shaft in transmission case by control rod (for gear engagement), and selector cable (for cross-shift). Movement of shift lever toward or away from steering wheel causes endwise motion of control shaft and actuates selector cable so as to pull on selector shaft (to engage low-reverse shifter shaft) or push on selector shaft (to engage second-high shifter shaft), one shifter shaft only being engaged at a time (when one finger of selector shaft engages notch in one shifter shaft, other finger is disengaged from opposite shaft and this free shifter shaft is prevented from moving by notch on shaft engaging larger diameter of selector shaft). Movement of shift lever forward and backward rotates selector shaft in transmission to engage gears.

ADJUSTMENT:—Place steering column shift lever in second gear position. Loosen clamp bolt on control shaft lever at lower end of control shaft (lever is serrated so as to grip smooth shaft firmly and slotted end of lever may need to be spread slightly to free shaft—clamp bolt groove on shaft will permit ⅛" up and down movement of the lever), loosen Allen type setscrew locking selector cable wire in trunnion at selector lever on control shaft lower bracket. Move shift lever forward in second gear position until clearance between lever and steering gear mast jacket is 1/16" (use scale or 1/16" stock as spacer). Set selector shaft lever on transmission in second gear position (push selector shaft into transmission case as far as possible and shift forward until detents can be felt to engage. Tighten control shaft lever clamp bolt securely without disturbing position of shift lever or selector shaft, then press in on end of selector cable wire at control shaft trunnion (make certain that selector shaft pushed in transmission case as far as possible), tighten Allen setscrew in selector cable trunnion securely.

NOTE—This adjustment provides farthest forward position of shift lever. If operator desires closer position of lever, leave more than 1/16" clearance between shift lever and steering gear mast jacket in second gear position (above). Make certain that shift lever has full stroke so that low and high gears are properly engaged.

SERVICING:—**Steering Column Unit**—See that shift lever bracket is tight on upper end of steering column mast jacket and that locating setscrew is centered in mast jacket hole. Shift lever should move freely on pivot pins (to remove lever, press in on both pivot pins to clear lever; when installing lever see that spring in place between pivot pins and that anti-rattle washer installed on one pin). Make certain that control shaft does not bind on grommet at floor boards and that all joints operate freely. Lever at lower end of control shaft should contact rubber bumper (on shaft between lever and shaft bushing) with shaft in lower (Neutral, Second, High) position but bumper must not prevent full stroke of shaft necessary to push selector shaft into transmission case as far as possible (lever can be adjusted ⅛" up or down on shaft by loosening clamp bolt). Make certain that control shaft lower bracket is tight on steering column mast jacket and that locating tip on bracket is centered in hole in mast jacket.

Transmission Case Unit—Selector cable must not be kinked or bent at sharp angles and bracket on transmission case must be lined up so that cable wire is straight (bent bracket for alignment). Selector lever springs designed for over-center action (no spring tension in neutral position) and must be hooked to brackets and lever in correct manner. Selector shaft must not bind in transmission case seal (lever side of case) and must rotate freely.

NOTE—To avoid damage to seal, shaft must always be removed through opposite side of case (free lever and shift fingers on shaft, drive shaft through case which will drive out sealing plug in case) and installed on seal side of case (seal plug hole on opposite side of case with sealing compound).

CADILLAC-LA SALLE 1938 TYPE

Used On:

ALL CADILLAC & LA SALLE MODELS (1938)

NOTE:—Transmission used with this type control similar to previous model except for new shifter mechanism (conventional shifter shafts not used).

TYPE:—Consists of special shift lever assembly mounted on steering column under steering wheel. Lever can be moved toward or away from steering wheel at neutral position to engage lug on either of two concentric shafts at side of steering column. Movement of lever then engages gears by rotating shaft which is linked to shift lever on transmission case by adjustable rod. Inner shaft (upper lug—engaged by pressing shift lever away from steering wheel) is linked to forward shifter shaft lever on transmission and controls second-and-high, outer shaft (lower lug—engaged by pressing shift lever toward steering wheel is linked to rear lever on transmission and controls low-and-reverse sliding gear. Lugs on shafts must be lined up to permit this cross-motion at neutral.

ADJUSTMENT:—**Shifter Rods.** Make certain that steering column control lever, torsion shafts, and transmission gears and shifter mechanism in neutral (spring loaded lock balls engage notches on inner ends of transmission levers in each gear position). Tighten adjustable end of each rod in succession (adjusting clevis and locknut at rear end of each rod) until control lever just starts to move. This adjustment must be accurately made or control lever will not cross over at neutral from high & second to low & reverse torsion tube lug.

Shifter Levers. See Note below for first cars on which spacers and spring-washers not used. Use tool J-1204 installed on lower end of steering column shafts (tool cannot be used on first cars with tapped hole at lower end of inner shaft instead of groove). Loosen clampscrews on both shaft levers (leave loose while tension being adjusted), tighten thumbscrew on tool until correct feel secured for low gear shift (lever action smooth with no binding or up-and-down play in the tube), tighten clampscrews on low-and-reverse lever. Check second-and-high lever action, adjust in same manner and tighten clampscrew on lever. If tool not used, make trial setting for each lever, check shifting action.

NOTE—If correct setting cannot be secured on first cars (without spring-washers), disassemble levers at lower end of control and reassemble with correct washers as follows: At bottom of shifting tube bracket install two spring-washers (#1425904), spacer #1427417, low-and-reverse lever, two spring-washers (#1424479), second-and-high lever.

SERVICING:—Entire steering column mechanism exposed by removing steering wheel. Transmission case mechanism not disturbed by transmission removal (disconnect control rods at transmission case, on Model 60 only remove levers also—see assembly directions below for lever replacement).

Assembly:—Assemble the control in order beginning at the steering column shift lever and working toward the transmission. Assemble levers as directed below and adjust control rod lengths (see Adjustment above).

Steering Column Shaft Levers—Lever at lower end of inner shaft can be assembled in two positions. Install lever in lower position (50, 60, 60S), upper position (75, 90).

Transmission Shifter Shaft Levers—Levers can be installed in two positions. Install levers in upper position on all models.

CADILLAC-LA SALLE 1939 TYPE

Std. Equipment On:

CADILLAC V8, SERIES 39-60S, 61, 75 (1939)

CADILLAC V16, SERIES 39-90 (1939)

LA SALLE V8, SERIES 39-50 (1939)

TYPE:—Same design as used on 1938 car models except as follows: Steering Column Control Shaft Levers assembled differently with outer shaft lever (low-reverse) above mounting bracket and spring washers between mounting bracket and lower lever only. Transmission case forward shift lever (second-high) shortened for more convenient shifting.

ADJUSTMENT:—See that steering column shift lever, control shafts, and transmission case shift levers are all in neutral position. Loosen locknut and turn

CADILLAC-LA SALLE 1939 TYPE CONT.

adjustable end (transmission case end) of each control rod until shift lever can be lifted into low-reverse position without interference. This adjustment important to insure correct cross-over at neutral from Second-high position to low-reverse position.

SERVICING STEERING COLUMN UNIT:—Disassembly—Remove horn button, steering wheel nut and steering wheel. Remove lower (second-high) lever on steering column, loosen clampscrew holding upper (low-reverse) lever in place. Remove cross-over spring at upper end of steering column, loosen clampscrew holding upper shifter housing to steering column. Lift upper housing with shifter tube and shaft attached from steering column. Pull inner (second-high) shaft out of outer tube, remove gear shift lever, pull outer (low-reverse) tube out of housing.

Reassembly—Reverse disassembly directions given above, making certain that lug on low-reverse shifting tube points away from center of housing and clamping bolt washer on lower steering column bracket engages slot in column on 39-50 and 61 cars. Install two anti-rattle spring washers between bracket and upper (low-reverse) lever, three washers between bracket and lower (second-high) lever (see Note below). Adjust connecting rods after installation completed.

NOTE—Some cars equipped with only one anti-rattle spring washer (between bracket and lower lever). To correct rattles on these cars, install four additional washers as directed above.

Control Shaft Lever Adjustment:—Use tool J-1204 (same tool used for 1938 models) installing tool on lower end of control shaft assembly. Tighten tool thumbscrew lightly, loosen clamping screws on both levers, turn down thumbscrew on tool until high gear shift is smooth and not too tight (test with shift lever, control shaft clamping screws may be left loose while making adjustment), tighten lever clamping screw when correct adjustment secured, remove tool. Push upper lever down on shaft until clearance between lever and upper face of support bracket is .005" (measure with feeler gauge), tighten clamping screw. If tool not used, pry lower lever up with screwdriver to secure tension on spring washers, tighten clampscrew, check setting. Repeat these trial settings until satisfactory operation secured. Adjust control rods as directed above.

TROUBLE SHOOTING:—Shifter Rattles—Adjust control shaft levers (above) to correct excessive clearance. See that correct number of anti-rattle spring washers used between bracket and levers (see Reassembly Note above).

Hard Shifting—Check control shaft lever adjustment (above) for insufficient clearance. Check shifter control lever and control tube and shaft lugs for chipped lugs, incorrect adjustment, or other interference preventing smooth operation of lever. IMPORTANT SERVICE NOTE—Detent springs on all first 1939 cars were .022" and were changed on later cars to .018" (except 39-90). To correct hard shifting complaints, install these later type detent springs on first cars (except 39-90).

SERVICING TRANSMISSION UNIT:—See Transmission article for data (shifter shafts and quadrants, and interlock mechanism can only be removed from within transmission case after transmission dismantled).

CHEVROLET 1939 TYPE

Optl. Equipment On:

MASTER DELUXE MODEL JA, MASTER JB (1939)

IMPORTANT SERVICE NOTE:—Anti-rattle bushing should be installed on control rod swivel in control shaft lever on lower end of steering column to correct rattles at this point on first cars (new type lever No. 3650931 with anti-rattle bushing is used in production on later cars). See installation directions below.

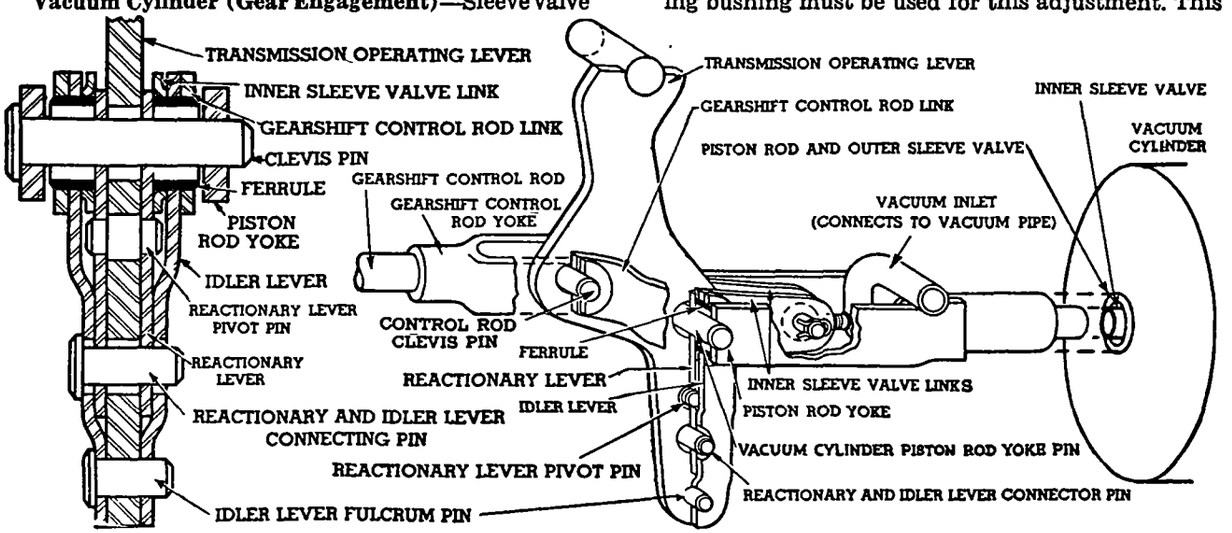
NOTE:—Transmission used with this control identical with standard model except for cover and shifter mechanism. See separate article on Chevrolet 3-speed Transmission for complete servicing data.

TYPE:—Remote control, vacuum assistor type with shift lever mounted on steering column under steering wheel and vacuum cylinder assembly mounted on bracket at left of transmission case. Steering column unit consists of an outer control shaft (linked to gear engagement lever on side of transmission case) and an inner selector rod (linked to selector or cross-shift bell crank on forward end of transmission case cover. Cross-shift mechanism is entirely mechanical and vacuum power is used only for gear engagement. Vacuum cylinder is new type with control valve located in piston rod with separate hose connections for vacuum (forward hose—connected to vacuum pipe from intake manifold) and air (rear hose—connected to air cleaner on frame). Valve control mechanism is mounted under protective boot on gear engagement lever and is designed to provide a 'follow-up' action (vacuum cylinder piston follows action of steering column gear shift lever exactly).

OPERATION:—Selector mechanism (mechanical linkage for cross-shift) and gear engagement mechanism (mechanical linkage with vacuum assistor) operate independently as follows:

Selector (Cross-shift)—Steering column gear shift lever is spring-loaded in lower (Second-High) position. Lifting up on lever in neutral position depresses push rod in control shaft and actuates selector bell crank on transmission cover through a lever on lower end of control shaft and selector rod connector.

Vacuum Cylinder (Gear Engagement)—Sleeve valve in vacuum cylinder piston rod is normally centered so that air is admitted to both ends of cylinder and piston has no tendency to move. When shift lever moved backward (for Low or High) or forward (for Reverse or Second), the clearance at the control rod clevis pin 'A' and the piston rod yoke pin 'B' allows an initial movement of the inner sleeve valve rod (before gear engagement lever begins to move) which admits vacuum to one end of the cylinder and causes the vacuum cylinder piston to follow-up the control rod. This piston movement sets up a reaction in the control valve lever mechanism (reactionary lever tip moves in one direction, idler lever in opposite direction) which results in a movement of the valve rod to cut off the vacuum port and stop the piston rod as soon as the steering column shift lever movement stops (whether in 'gear-engaged' position or at any intermediate point).



ADJUSTMENT:—If operation unsatisfactory, or if shift mechanism dismantled for servicing, adjust each unit as follows:

Steering Column Control Assembly—See Servicing directions below for dimensions to which parts should be set up when assembled (no service adjustments required).

Selector Rod—Pull selector control rod (attached to selector bell crank on transmission cover) forward firmly against its stop, loosen locknut and adjust swivel on forward end of rod until swivel pin is ⅛" to rear of hole in lever, tighten locknut. Pull lever toward rear and connect rod installing anti-rattle spring, flat washer and cotter pin on swivel pin. NOTE—Pulling lever back in this manner necessary to place selector linkage under spring tension to insure remaining normally in second-high position and to prevent rattles.

Control Rod (Gear Engagement) Linkage—Set shift lever on steering column in horizontal (neutral) position. See that clevis pin at rear end of control is exactly centered in hole in gear engagement lever on transmission case (remove boot on lever), adjust swivel on forward end of rod so that pin lines up with hole in control shaft lever, engage pin in lever, install anti-rattle spring and lock on pin.

Vacuum Cylinder Control Valve—A special adjusting bushing must be used for this adjustment. This

bushing should be made up to following dimensions: Inside Diameter—.373-.378", Outside Diameter—.685-.688". Length—1 1/32". To adjust, remove control rod clevis pin 'A' on lever on transmission case, remove boot on lever which covers valve lever assembly, remove vacuum cylinder piston rod yoke clevis pin 'B' which will disconnect piston rod and valve links from lever assembly, push piston into cylinder to provide clearance for adjustments, thread special adjusting bushing through valve link eyes, install clevis pin in piston rod yoke and bushing. Operate engine to provide vacuum (if adjustment made on bench, separate vacuum source must be provided). Move valve links out or away from cylinder until all clearance between bushing and clevis pin is toward front, Piston rod should move slowly out of cylinder. Move valve links toward cylinder until all clearance between bushing and clevis pin is toward rear. Piston rod should move slowly into cylinder. If piston rod moves out but does not move in, valve links are set too far in toward cylinder; if piston rod moves in but does not move out, valve links are set too far out from cylinder. To adjust, remove clevis pin, screw valve links in or out on valve rod ½ turn at a time and repeat test until correct operation is secured. Reassemble linkage as directed in Servicing section below.

SERVICING STEERING COLUMN UNIT:—Disassembly—Remove steering wheel (and spring retaining mast jacket bearing on Deluxe models), instrument panel bracket nuts and U clamp, raise toeboard grommet up about 12", disconnect selector rod and control rod from levers at lower end of control shaft, remove locknut and selector control lever guide at lower end of control shaft. Remove screws from lower support bracket, unscrew bracket from control shaft, loosen clamp on control shaft lever, remove lever and counter-balancing spring from end of control shaft, remove control shaft and gear shift lever (do not remove upper support bracket from mast jacket). To remove gear shift lever from control shaft, press in on pivot pin on each side of housing, remove lever. Then remove selector push rod assembly through top of control shaft.

Servicing—Remove all burrs from gear shaft lever housing in control shaft and push rod opening at top of shaft. See that selector pushrod is free in control shaft (if rubber bushing tight in tube, replace with #3651629 Neoprene bushing). Make certain that shift lever pivot pins are free in lever and in control shaft housing.

Reassambly—Install selector pushrod in control shaft, assembly pivot pins in shift lever (with spring between them and anti-rattle washer on one pin, shim on opposite pin), install lever in control shaft housing by compressing pin spring until pins enter housing and slipping open end of lever over end of push rod, check to see that shift lever and pushrod operate freely. Check upper support bracket by measuring from top of bracket to top of mast jacket (should be ⅜" Master Deluxe, 1 3/16" Master), see that mast jacket key enters keyway on bracket, tighten bracket screw securely. Install control shaft through instrument panel bracket and toeboard grommet, assemble counterbalancing spring and lever on lower end of shaft (slip up on D section as far as possible), screw lower support bracket on shaft so that shaft extends 3/16" through bracket, enter upper end of control shaft in upper support bracket, allowing end of counterbalancing spring to drop in behind mast jacket, install lower support bracket on mast jacket and make certain that key on jacket enters keyway on bracket, install bracket cap, tighten screws loosely. Check lever position on mast jacket by placing straightedge across top of jacket and measuring from straightedge to center of shift lever pivot pin (should be 1 1/32" Master Deluxe, 1 23/32" Master) and adjust by shifting lower support bracket up or down on mast jacket, then tighten lower bracket screws securely. Adjust shift lever on lower end of control shaft so that clearance between lever and upper face of lower support bracket is 3/16", tighten clamp bolt on lever securely and hook end of counterbalancing spring under lever. Engage end of selector lever bell crank in guide, screw guide on selector control rod until clearance between upper face of guide and lower end of control shaft is 1/16", install guide locknut and tighten securely. Check mast jacket height by measuring from top of jacket to shoulder on steering gear shaft (should be 1 17/64" Master Deluxe, 23/32" Master) and adjust by loosening mast jacket clamp at steering gear housing and moving mast jacket up or down. Turn mast jacket until control shaft is in center of instrument panel bracket hole, tighten instrument panel bracket nuts first and mast jacket clamp bolt last. Adjust selector rod and control rod as directed in Adjustment section above.

SERVICING TRANSMISSION LEVER LINKAGE:—Disassembly—Remove control rod clevis pin and wires around end of transmission operating lever rubber boot, remove boot. Remove clevis pin from vacuum cylinder piston rod yoke and lever system, remove two shift control rod links (with bushing sleeves on which vacuum cylinder control valve links are mounted), push piston rod back into cylinder and install clevis pin through piston rod yoke and valve links (this will prevent valve links turning and upsetting valve adjustment). Take out transmission case cover capscrews, remove cover, idler lever fulcrum pin, idler lever connecting pin, dismantle levers.

Servicing—Wash cover and levers in gasoline, inspect for wear at pin holes and any burrs or roughness preventing free movement. Check transmission shifter interlock for free movement of selector, and see that shifter mechanism operates freely.

Reassembly—Coat reactionary and idler levers lightly with graphite grease, install reactionary lever pivot pin in operating lever, assemble reactionary levers and idler levers, installing clevis pins and cotter pins. Install transmission cover on case, making certain that shifter interlock ends fit into slots in shifter yokes and that cover capscrews are tightened securely. Remove piston rod clevis pin, pull rubber boot forward on yoke so that valve links extend beyond yoke, connect valve links by pushing bushing sleeves (on control rod links) through eyes in idler levers and valve links. Push piston rod yoke forward over reactionary levers, line up link holes and install clevis pin and cotter pin. Coat inside of leather boot lightly with graphite grease, install boot over reactionary levers, install shift control rod, line up holes in control rod clevis, boot washers, and control links, install clevis pin and cotter pin. Secure forward end of rubber boot and operating lever boot with wires. Connect selector control rod. See Adjustment Section above for Selector rod, Control rod, and Vacuum cylinder valve adjustment.

ANTI-RATTLE BUSHING INSTALLATION (FIRST CARS):—To correct rattles at control rod swivel connection on lever, install new lever No. 3650931 or drill out swivel connection hole in lever to 9/16" (hole in old lever was 25/64"), install new anti-rattle bushing No. 3652244 and use new lock No. 3652249 to retain bushing (pinch ends of lock together securely).

SERVICING VACUUM CYLINDER:—Removal—Disconnect piston rod and valve links (see Transmission Control Linkage servicing above), disconnect vacuum and air hose lines at vacuum cylinder fittings, remove cotter pin and unscrew nut on cylinder mounting stud.

Installation—Install rubber cushion and steel retainer on mounting stud, thread stud through lower hole on mounting bracket, install steel retainer, rubber cushion, flat washer, and nut on stud in this order, tighten nut just enough to insert cotter pin. CAUTION—Washers and cushions must be assembled in this order and nut not tightened excessively in order to provide necessary flexibility in cylinder mounting. Connect valve links and piston rod yoke. When installing vacuum hose, make certain that clampscrew is toward rear and vertical (to provide clearance for speedometer cable).

Vacuum Cylinder Lubrication:—Disconnect vacuum hose at vacuum stack, shift transmission into second gear (to open vacuum port to forward end of cylinder), pour ½ oz. Shock Insulating Fluid into cylinder through stack, allow transmission to stand for several minutes (to allow fluid to drain into cylinder). Shift transmission into third gear (to open vacuum port to rear end of cylinder), repeat lubrication. After several minutes, shift transmission between second and third gears several times to work fluid into piston leather, then connect vacuum hose.

Air Cleaner Servicing:—At 10,000 mile intervals, remove cleaner, wash in gasoline, dip in engine oil before re-installing.

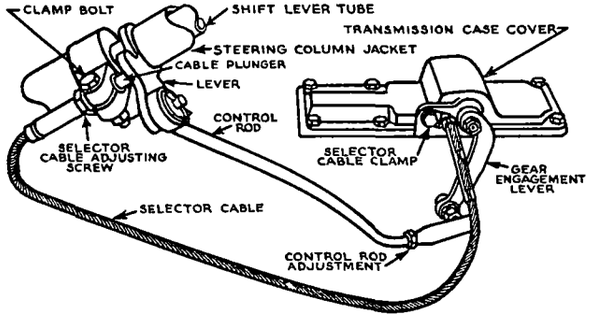
TROUBLE SHOOTING:—Sticky or sluggish Shift—Check shift lever for binding by disconnecting selector control rod and moving lever up and down. If lever does not return to lower position freely, check pivot pins for binding in housing, gear shift lever clearance in bracket, burrs or roughness in bracket, rubber anti-rattle bushing on selector push rod binding in control shaft, selector rod bell crank binding in lower support, incorrect clearance between selector rod guide and control shaft, bent selector push rod, selector lever binding in transmission cover. See Servicing Steering Column Unit above for assembling directions.

Hard Shifting—Check vacuum line for leaks (if shift hard in all gears), check vacuum hose clamp for interference with speedometer cable (if shift hard in high gear only), lubricate vacuum cylinder (see Vacuum Cylinder Servicing above), remove leather boot on lever system (transmission operating lever), clean out old grease and lubricate with graphite grease (see Transmission Control Linkage servicing above for lever assembly).

Creeping out of Gear—Check vacuum hose clamp for interference, check shift linkage and lever system for binding or sticking, adjust vacuum cylinder valve (see Adjustment above).

Blocking out of Gear—Check selector lever on transmission case for full stroke by disconnecting rod and moving lever and rod full distance in both directions. If selector rod too long (caused by bending), install new rod. If lever movement in forward direction insufficient, check steering column unit assembly (see Steering Column Servicing data above for dimensions). Check vacuum hose clamp for interference.

Excessive lash in Shift Lever—Tighten clamp bolt connecting shift control lever to control shaft. This lever must be firmly locked to shaft.



CHRYSLER 1939 TYPE

Std. Equipment On:

CHRYSLER ROYAL, MODEL C22 (1939)
CHRYSLER IMPERIAL, MODEL C23 (1939)
CHRYSLER CUSTOM IMPERIAL, C24 (1939)
DE SOTO, MODEL S6 (1939)
DODGE, MODEL D11 (1939)
PLYMOUTH, DELUXE MODEL P8 (1939)

NOTE:—This control not used on Plymouth Std. P7.

TYPE:—Remote control type with gear shift lever on steering column under steering wheel and gear shift tube (operating shaft) within steering column jacket. Special type steering column jacket is used which consists of two halves bolted together at a flanged joint (in front of the dash) which is slotted

for the lever attached to the lower end of the shift lever tube. This lever is linked to the shift lever on the transmission case by a control rod (for gear engagement) and also operates the selector cable (for cross-shift) through a plunger on the steering column below the lever. Plunger and cable assembly is spring-loaded by a spring behind the rail shift lever on the shift lever shaft in the transmission case so that selector cable and plunger assembly normally in second-high position (plunger up against control lever plate).

ADJUSTMENT:—Control Rod (Gear Engagement)—Remove nut and disconnect control rod from lever on side of transmission case. Make certain that transmission gears are in neutral and that steering column shift lever is in neutral position (mid-point of stroke where up-and-down movement for cross-shift is possible). Loosen locknut at adjustable joint on transmission end of control rod, turn joint on rod until ball joint stud freely enters hole in lever with lever moved back approximately ⅛" toward rear to take up all free movement (all models except Chrysler C23, C24), or exactly centered with free movement divided toward front and rear (Chrysler C23, C24), tighten locknut and connect rod.

Selector Cable (Cross-shift)—Make certain that steering column shift lever in neutral position, loosen clamp bolt locking adjusting nut in steering column jacket flange, back adjusting screw out until play or clearance is evident between end of plunger and steering column tube lever plate, then turn screw in just enough to take up this clearance, tighten clamp bolt. CAUTION—Do not turn adjusting screw in more than enough to eliminate plunger endplay. Excessive tightening will cause wear of plunger and plate.

SERVICING STEERING COLUMN UNIT:—Disassembly—Remove steering wheel. Remove screws holding draft pad to dash, pull pad 6" up on steering column jacket, remove screws holding steering column clamp to instrument panel bracket, free hand brake and overdrive control cables and overdrive control bracket from steering column. Loosen clamp bolt and remove selector cable adjusting nut from steering column jacket flange, disconnect control rod at steering column lever. Take out capscrews holding upper and lower sections of steering column jacket together, pull upper section with gear shifter tube assembly off at upper end of steering gear shaft. Remove screws on lower face of shift lever housing (hold housing in place by hand to prevent loss of shift lever ball and spring), lift housing off, remove spring and ball from under shift lever. Remove nut on upper end of shift lever tube, remove shift lever, withdraw tube from lower end of jacket.

Reassembly—Reverse disassembly directions above. Bushings are press fit in column jacket and should be removed with a puller. NOTE—If draft pad to be removed, coat lower end of column jacket with thin film of soft soap and work pad off.

SERVICING TRANSMISSION UNIT:—Disassembly—Take out selector cable mounting screw, pull cable assembly out of transmission cover, disconnect control rod at lever on transmission case. Remove transmission case cover. To remove shift lever and shaft, remove nut on **opposite end** of shaft from lever, pull shaft and lever assembly out, lift out rail shifter lever and spring.
CAUTION—Do not remove shift lever from shaft which will destroy alignment between lever and keyway in shaft which positions rail shifter lever (shifter finger). Lever and shaft serviced as an assembly only.

EVANS-GRAHAM VACUUM TYPE

Optional Equipment On:

GRAHAM STD. & SPEC., MODEL 96 (1938)
GRAHAM SUPERCHARGER, MODEL 97 (1938)

NOTE:—Transmission used with this type shift control is similar to standard model except for shifter mechanism. See Graham Transmission article for servicing data.

TYPE:—Remotely controlled, manually operated, mechanical gear shift with vacuum booster. Control unit on dash consists of miniature gear shift linked to selector lever on transmission (for cross-shift to engage Low-Reverse or Second-High shifter rails) and to valve operating lever (intermediate lever) on shift lever (for gear engagement). Gears can be engaged by dash shift lever when engine is not running (to start car by towing or coasting with gears engaged) although in normal operation dash shift lever merely operates cross-shift and Operating Valve and actual gear engagement effected by Vacuum Cylinder which is linked directly to shift lever. Operating Valve is combined piston and diaphragm type linked to intermediate lever on shift lever (to which dash shift lever also connected) and controls air and vacuum admission to each end of Vacuum Cylinder. When dash shift lever moved forward (Reverse or Second Gear), or backward (Low or High Gear), this motion first operates valve which admits air to one end of vacuum cylinder but without cutting off vacuum connection to opposite end (cylinder normally vacuum-suspended) so that piston moves toward vacuum end of cylinder and resultant shift lever movement engages gears. The intermediate lever moves with the shift lever and tends to balance the vacuum cylinder so that the piston follows the dash shift lever movement exactly. When shift is completed (or dash shift lever movement stopped), piston remains stationary in that position until new shift is made by the dash shift lever (or lever is returned to neutral).

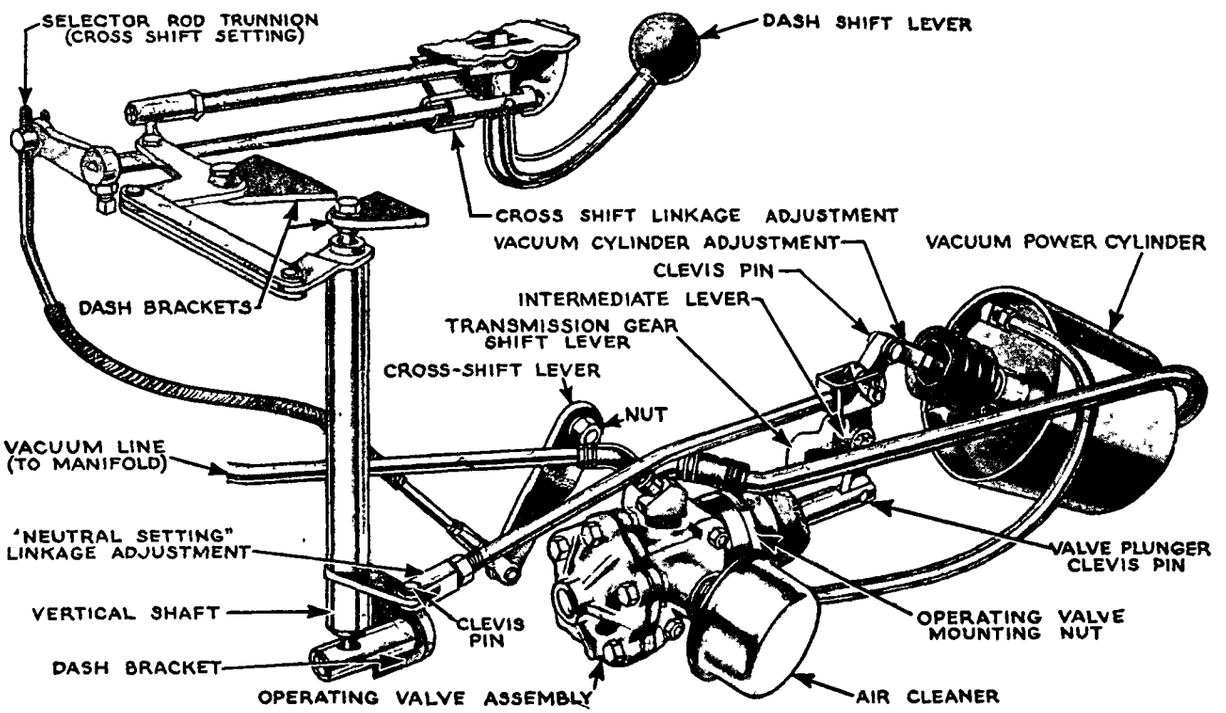
CHECKING & ADJUSTMENT:—Whenever adjustment required due to unsatisfactory operation, removal or replacement of units, or linkage being disconnected, check and adjust entire mechanism in order as given below.

Operating Valve Linkage:—Remove clevis pin in lever at lower end of vertical shaft on dash (to disconnect dash control unit). Check operation of shift cylinder and operating valve linkage (intermediate lever and shift lever). Free linkage if it is binding. Remove clevis pin at rear end of operating valve plunger, see that plunger moves freely and has maximum travel of 5/16". If plunger binds, loosen large mounting nut at rear of valve assembly, if this frees plunger, check gaskets between nut and bracket and between bracket and valve body (these gaskets installed to prevent misalignment of valve which might cause plunger to stick). If linkage and valve plunger operate freely, connect plunger to intermediate lever by installing clevis pin.

Dash Gear Shift Unit Linkage:—Disconnect selector rod at lever on forward side of dash (lower dash unit rod) by taking out wire 'hairpin' and freeing trunnion from lever. Tighten nut on selector lever on left side of transmission case (forward lever). Operate dash shift lever and make certain that linkage is free in all positions. Check for excessive play in lever, adjust by turning nut at shift lever end of lower connecting rod under instrument panel.

EVANS-GRAHAM TYPE CONT.

Linkage Neutral Setting:—With all linkage operating freely, and with rod at lower end of vertical shaft still disconnected, operate engine to furnish vacuum to shift mechanism. This will cause Operating Valve and linkage to automatically assume correct neutral position. Place dash shift lever in neutral position, adjust connecting rod at lower end of vertical shaft by loosening locknut and turning clevis at forward end of rod until rod can be connected to lever on shaft without disturbing position of shift lever or valve and vacuum cylinder linkage, tighten clevis locknut and install clevis pin. If this adjustment correctly made, selector rod and lever should move freely throughout entire travel (for cross-shift which is only possible at neutral position).



Selector Rod Setting:—Move dash gear shift lever to one side of slot at neutral as far as possible without springing lever, hold in this position and pull selector rod in same direction to limit of travel, adjust swivel block or trunnion on upper end of rod so that is can be installed in hole on dash unit lever without disturbing position of linkage, install trunnion and fasten with lock wire.

Checking Vacuumatic Shift Operation:—After making adjustments listed above, operate gear shift in all positions, watch linkage action and make certain that no interference exists at any point.

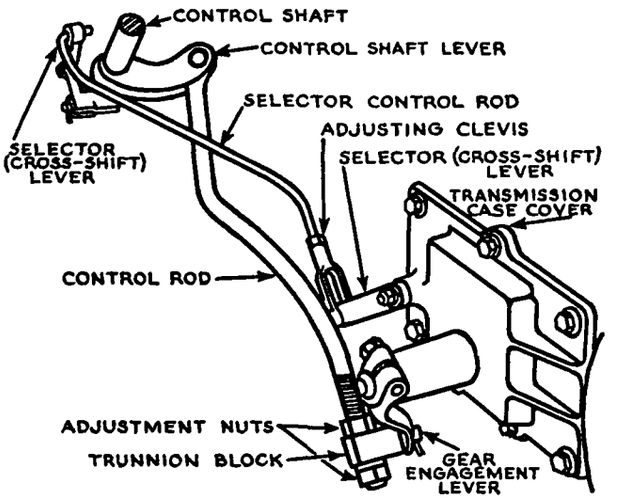
SERVICING:—Vacuum Cylinder. To remove cylinder, disconnect both vacuum lines at cylinder, take out clevis pin at forward end of piston rod, take out cotter pin and remove nut holding cylinder on attaching bracket, remove cylinder. Install cylinder in same manner, adjusting piston rod length before installing clevis pin as follows:

Vacuum Cylinder Adjustment—With vacuum cylinder piston rod disconnected, move transmission shift lever to extreme rear or reverse position, push piston into cylinder until it bottoms, loosen locknut and adjust piston rod length by turning clevis until rod is ⅛" too short to line up with hole in shift lever (one half of shift lever hole should be visible through piston rod clevis), pull piston out of cylinder until holes line up and install clevis pin.

Operating Valve:—To remove valve assembly, remove clevis pin at rear end of valve plunger, disconnect vacuum lines at valve by loosening hose clamps, take off large nut at rear end of valve body, remove valve assembly. If new valve being installed, remove air cleaner unit from top of old valve and install on new unit. When installing valve, make certain that gasket is in place between valve body and mounting bracket and also between bracket and large mounting nut, **leave nut slightly loose until all adjustments made.** Connect vacuum lines, align valve so that air cleaner points to left and vacuum line connection from engine manifold is on top, operate shift in all positions to make certain that linkage does not strike vacuum pipes or connections, then tighten the large mounting nut. Install clevis pin at rear end of valve plunger, make certain that there is no bind at this point, adjust selector and shift linkage as directed in 'Adjustment' section above.

GRAHAM 1939 TYPE

Used On:



GRAHAM, MODELS 96, 97 (1939)

NOTE:—Transmission used with this control similar to other 'Horizontal' types except for shift mechanism (two levers on cover on side of case—forward lever for cross-shift, rear lever for gear engagement). See separate article for complete Transmission servicing data.

TYPE:—Remote control type with shift lever mounted on steering column. Shift lever pivoted on bracket on steering column so that up-and-down motion of lever actuates selector (cross-shift) shaft and rod linked to forward lever on transmission case, while backward-and-forward motion of lever rotates control shaft and moves lever and rod linked to rear (gear engagement lever on transmission case).

ADJUSTMENT:—Adjust both control rods at transmission lever (rear end) as follows:

Cross-shift Linkage—See that steering column shift lever in normal neutral position, remove clevis pin linking rod to forward cross-shift lever on transmission, loosen locknut on clevis. Pull transmission lever up (forward) as far as possible, adjust clevis on control rod so that clevis pin can just be inserted without disturbing position of transmission lever or steering column shift lever, tighten clevis locknut.

Gear Engagement Linkage—Loosen both nuts on control rod at rear gear engagement lever on transmission. Place steering column shift lever in second gear position (push lever as far forward as possible). Move transmission case lever forward as far as possible, hold in this position and turn down top nut on control rod until lower face of nut is exactly 3/16" from face of square trunnion block on lever, then tighten lower nut securely.

Standard Equipment On:
CORD, MODELS 810 (1936), 812 (1937), SUPERCHARGED MODEL 812 (1937)

TRANSMISSION NOTE:—Transmission is unconventional in that drive in all four speeds is through transmission gears (no direct drive—pinion mounted directly on end of countershaft). Gears engaged through three shifter rails on right hand side of transmission case by forward-and-backward motion of shifter shaft lever (cross-shaft at front of case) and are selected by endwise motion of the shaft to engage one of the shifter rails. Shaft is normally engaged with center (Second-Third) rail and moves to the left to engage the Low-Reverse rail, or to the right to engage the Fourth Speed rail. Neutral position secured by centralizing shift lever (power piston centralized by neutral switch).

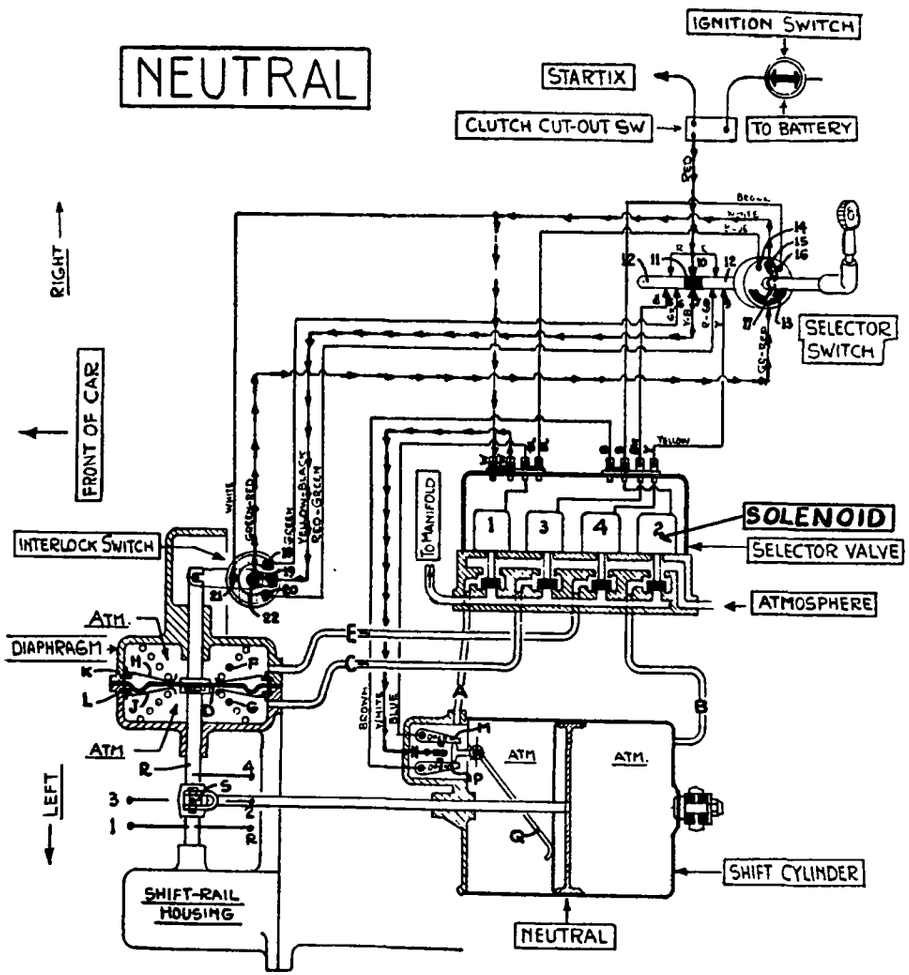
OPERATION:—Cord transmission control is of the pneumatic type (utilizing manifold vacuum) with electrical control of the vacuum cylinder valves. Transmission is not conventional and the control is not entirely similar to other Bendix types. Forward and backward motion of the shift lever to engage gears is effected by the double-acting 'Power Cylinder' mounted on the transmission case cover. Control of the vacuum connection to each end of the cylinder is effected by a solenoid operated valve in the Selector Valve Assembly (#1 solenoid for forward or First-Third engagement, #2 solenoid for backward or Reverse-Second-Fourth engagement). Power cylinder piston is normally centered in cylinder in neutral position (See Neutral Switch below).

Endwise movement of the shift lever shaft to engage shifter rails effected by Diaphragm Cylinder on shifter shaft on front of transmission case on right side. Diaphragm normally centered by springs within case so that shifter shaft engages center (Second-Third) shifter rail. Control of vacuum connection to each end of diaphragm cylinder effected by solenoid operated valves in Selector Valve Assembly (#3 solenoid for left hand or First-Reverse engagement, #4 solenoid for right hand or Fourth speed engagement).

All solenoid controlled valves are mounted as an assembly on the right side of the transmission case and have a common vacuum line connection (at front of unit) and air intake (at rear of unit). Valves are poppet type and are normally held down at lower end of stroke by spring at upper end of valve plunger when solenoid is not energized (vacuum cut off and cylinder open to atmosphere). Valves are pulled up when solenoid is energized (cutting off air and opening vacuum port so that air is evacuated from cylinder). Solenoid circuits are controlled by Selector Switch, Clutch Pedal Cutout Switch, Interlock Switch, and Neutral Switch (in Power Cylinder) as follows:

Selector Switch—Located on steering column below steering wheel. Consists of a gate type switch lever which duplicates conventional shift lever motion to pre-select gear position (or neutral) which is next desired (lever must be raised against spring tension before it can be shifted to 'Reverse' and is shifted to the right and forward to the 'Fourth' position from a point between Third and Neutral). This selection may be made at any time and no shift occurs until the clutch pedal cutout switch contacts are closed by depressing the clutch pedal.

Clutch Pedal Cutout Switch—Located on left side of engine and linked to clutch throw-out shaft so that circuit is open when clutch is engaged and is closed only when pedal depressed to disengage clutch. Acts as a main switch for transmission control circuits and shift will occur when clutch disengaged if new gear position has been set on selector switch since last previous clutch disengagement. Startix 'IGN' lead connected to cutout switch so that Startix operative only with clutch disengaged and Transmission Control operative.



Interlock Switch—This switch interrupts circuit from selector switch to power unit solenoid valves to insure a cross shift in neutral (from one shifter rail to another) if this is necessary in order to secure the gear engagement set on the selector switch. Interlock switch lever is linked to Diaphragm Cylinder shaft (shifting shaft) and will close a new set of circuits after Diaphragm Cylinder operates so that the shift to a different gear position will be completed. Interlock switch does not operate as long as shifts are confined to a single shifter rail (Reverse-low or second-third).

Neutral Switch—Located in end of Power Cylinder. Consists of central stationary contact and two movable contact arms each connected to one power cylinder solenoid valve. Neutral switch operating lever in cylinder is linked to contact arms so that both sets of contacts are open when piston is centralized in cylinder. Movement of cylinder in either direction from center allows one set of contacts to close and when stationary contact is 'live' (as will normally be the case with selector switch lever in neutral) solenoid valve will be energized and vacuum connection made at one end of cylinder so that piston will be drawn back toward center. At center position circuit will be broken by movement of operating lever.

ADJUSTMENT:—Mechanical adjustments provided for each unit of Transmission Control. Make these adjustments in order noted below. Check adjustments by jacking up front end of car, removing splash shield over driving unit, and running engine so that control can be operated and performance noted.

Clutch Pedal Cutout Switch Adjustment—With motor running, depress clutch pedal fully, note whether circuit through cutout switch completed (can be checked readily by moving selector lever back and forth in neutral from Reverse-First to Second-Third end of slot and noting if shifter cross shaft moves accordingly). If no action noted, connect test lamp between red wire terminal on cutout switch and ground. Lamp should light. If lamp does not light, adjust switch by removing clevis pin from operating rod and turn clevis rod until lamp lights. If adjustment cannot be secured check line from cutout switch to ignition switch, check cutout switch for open-circuit, replace if necessary. Release clutch pedal slowly until clutch begins to engage, then release pedal ⅛-¼" more, hold in this position, adjust cutout switch rod length by turning clevis so that switch contact just broken (lamp will go out at this point).

Power Cylinder Adjustment—With motor running, place selector switch in neutral, depress clutch pedal fully, see that transmission is in neutral. Remove clevis pin connecting shift lever and piston rod, adjust clevis on end of piston rod so that pin can be inserted freely in clevis and hole in shift lever. Insert pin, move piston backward and forward to point where considerable pressure back toward center is noted (neutral switch coming into action). Travel in each direction should be approximately equal and transmission should be in neutral when piston comes to rest in center position. This test checks Neutral Switch operation as well as power cylinder adjustment.

CORD REMOTE CONTROL GEAR SHIFT CONT.

Interlock Switch Adjustment—Remove green wire with red tracer on Interlock Switch, connect test lamp to this wire and ground lamp on transmission case. With motor running, place selector switch in neutral, depress clutch pedal fully, move transmission shift lever by hand to extreme left hand position, allow lever to come back slowly toward center neutral position, note point at which test lamp lights and travel from this point to center neutral position. Repeat test by moving lever to extreme right hand position and noting travel from point where lamp lights to center neutral position. Travel should be the same on each side. Adjust by loosening four screws mounting interlock switch on diaphragm housing, move switch sideways, tighten screws, repeat test. With correct adjustment lamp should light at approximate midpoint of travel between extreme right or left hand position and center or approximately ⅛-3/16" from center position.

SERVICING:—Repair operations to clutch cutout switch, interlock switch, and solenoid assembly are not recommended by manufacturer and entire unit should be replaced if satisfactory performance not secured by adjustment.

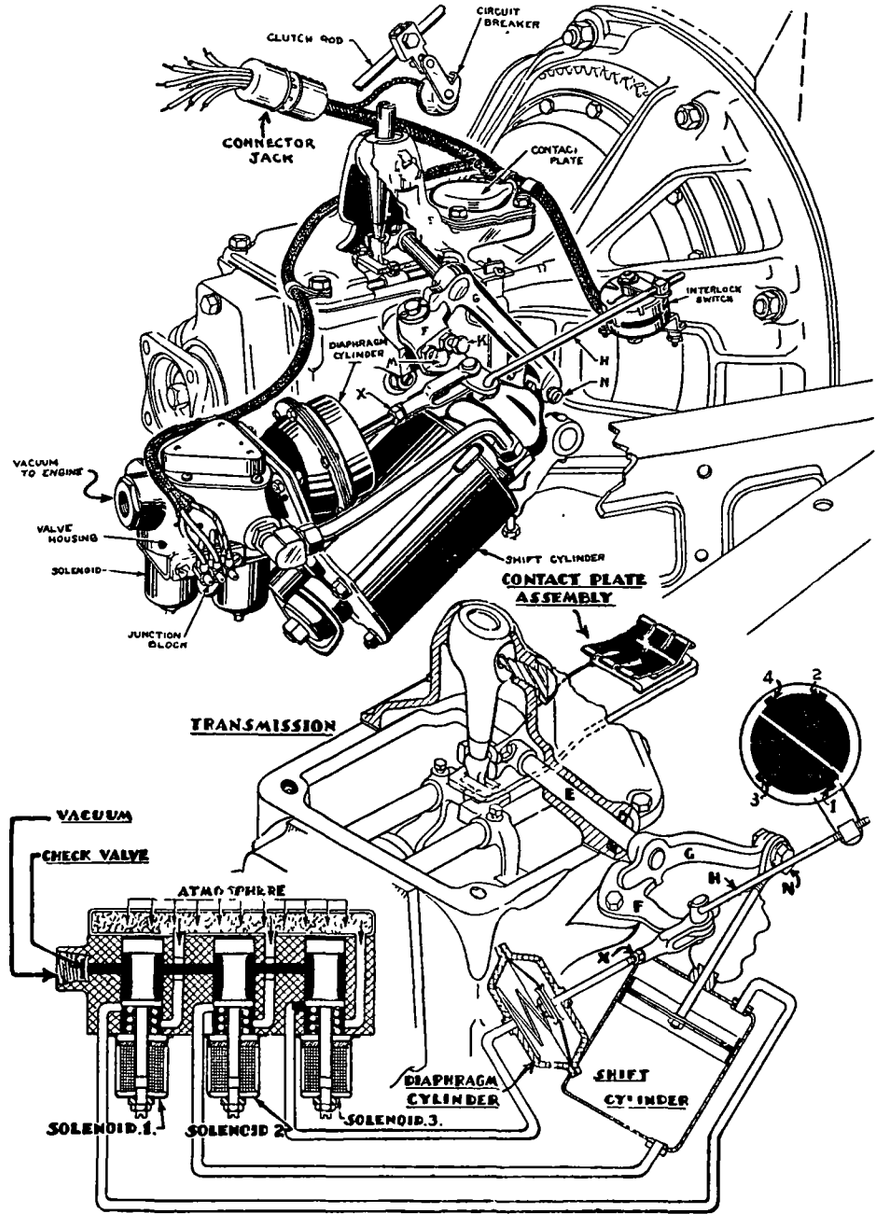
HUDSON & TERRAPLANE ELECTRIC HAND

Optional Equipment On:

HUDSON, SIX MODEL GH (1935), EIGHT MODELS HT, HU, HHU, (1935)
TERRAPLANE, MODELS G SPECIAL, GU DELUXE (1935)

DESCRIPTION:—The Electric Hand Automatic Transmission is of the pneumatic type (utilizing manifold vacuum) with electric control of the vacuum cylinder valves. The transmission is entirely conventional and shifting of gears is effected by the usual shift lever (a 'stubbed' lever is used but an extension for the lever is provided for hand shifting). The actual engagement of the gears is effected by the large 'Shift Cylinder' located on the left side of the transmission case (backward and forward movement of the shift lever). A smaller 'Diaphragm Cylinder' located above the Shift Cylinder controls the right and left movement of the shift lever necessary to engage Reverse-Low or Second-High shifter rails (this is similar to the right and left movement of the hand shift lever in 'neutral').

Both the forward and backward movement of the Shift Cylinder Piston (Reverse or Second gear engaged in forward position, Low or High gear engaged in rear position) are effected by admitting manifold vacuum to the rear or forward end of the Shift Cylinder. Two solenoid controlled valves are used for this purpose.



The gear shift lever is normally in the left hand position and is held there by the spring within the Diaphragm Cylinder. The shift lever is moved to the right-hand position at neutral so as to engage the Second-High shifter rail by admitting manifold vacuum to the Diaphragm Cylinder. An additional solenoid-controlled valve is used for this purpose.

The solenoid-controlled valves are combined in one assembly mounted directly behind the Shift Cylinder and have a common vacuum line connection (at the rear of the assembly) and air intake (through the air cleaner element on top of the assembly). They are spring-loaded piston type valves held normally in the upper position by the spring under the valve so that vacuum is cut off and the air passage through the valve is open. When the solenoid located below the valve is energized the valve is pulled down, cutting off the air intake port and connecting the vacuum and cylinder ports. The solenoid circuits are controlled by the Selector Switch, Clutch Pedal Circuit Breaker, Contact Plate Assembly, and Interlock Switch as follows:

Selector Switch—Located below steering wheel on steering column. Consists of a gate type switch lever which duplicates the conventional shift lever movements to pre-select the gear position (or neutral position) which is next desired. This selection may be made at any time as no action results until the clutch pedal circuit breaker is closed. A cutout switch is located on the Selector Switch housing. This switch is normally closed and is opened only to cut out automatic shift when hand shifting used.

Clutch Pedal Circuit Breaker—Located on left side of engine and connected to clutch pedal so that circuit is open with clutch engaged and is closed only when pedal is depressed to disengage clutch. Acts as a main switch for the Electric Hand circuits and shift will occur when circuit breaker is closed if new gear position has been chosen since last previous clutch disengagement (on cars with automatic clutch, clutch will be disengaged whenever accelerator pedal is fully released.

Contact Plate Assembly—This is a three-position switch mounted on the transmission cover directly in front of the shift lever. The five terminals on the terminal block are connected to five stationary contacts and circuits are completed through the switch by two sets of contact fingers mounted on a sliding plate which is moved backward and forward by the movement of the shift lever. With the transmission in gear, the Contact Plate Assembly completes the proper circuits to move the shift lever to neutral when a new gear position is set on the Selector Switch. As the shift lever

moves to neutral, the contact finger plate moves with it, completing a new set of circuits so that after a momentary pause the shift lever is moved to the new gear position. If the shift requires that the shift lever move from one side to the other at neutral (as in the shifting from Low to Second) the circuits are completed through the Interlock Switch and the shift lever cannot move out of the neutral position until the Diaphragm Cylinder has completed this cross motion.

Interlock Switch—Located on clutch housing and connected to the Diaphragm Cylinder lever. Does not operate as long as no cross motion of the shift lever is required (for example, in shifting from Low to Reverse, or Second to High). When this cross motion is required, the second set of circuits (to move shift lever from neutral to the new gear position) are completed by the rotation of the Interlock Switch spider as the Diaphragm Cylinder completes the cross motion of the shift lever.

ADJUSTMENT:—Mechanical adjustments are provided for each of the units comprising the Electric Hand. The adjustments are correctly made when the Electric Hand is installed and should not require resetting unless new units are installed or the setting is disturbed by removing the units from the car or when other work is done on the engine or transmission. Check settings and make adjustments in order noted below.

Clutch Pedal Circuit Breaker—Check adjustment with clutch fully engaged. Pointer on circuit breaker lever should line up with reference arrow on top of circuit breaker housing. This setting is important as contact must not be made with too little clutch pedal movement (shift will be made while engine is still driving car), or too much pedal movement (shift will not be made if gear teeth 'butt', requiring slight shaft rotation to mesh gears). The contact must not be broken until there is a slight clutch drag or partial engagement in order to turn transmission shaft and insure meshing of gears. If necessary the pointer on the circuit breaker lever can be set slightly ahead of the arrow to secure this action. Circuit Breaker adjustment is different on cars with and without automatic clutch.

(1) With Automatic Clutch Control. Loosen clamp bolt nut on bracket on vacuum clutch rod, slide clip on rod until pointer lines up with arrow, tighten locknut.

(2) Without Automatic Clutch Control. Take out cotter pin in circuit breaker lever pin, loosen locknut on operating rod, free rod end from lever pin, rotate circuit breaker lever until pointer lines up with arrow on cover, turn rod end in or out until it will slip on pin without disturbing position of lever, tighten locknut and replace cotter pin.

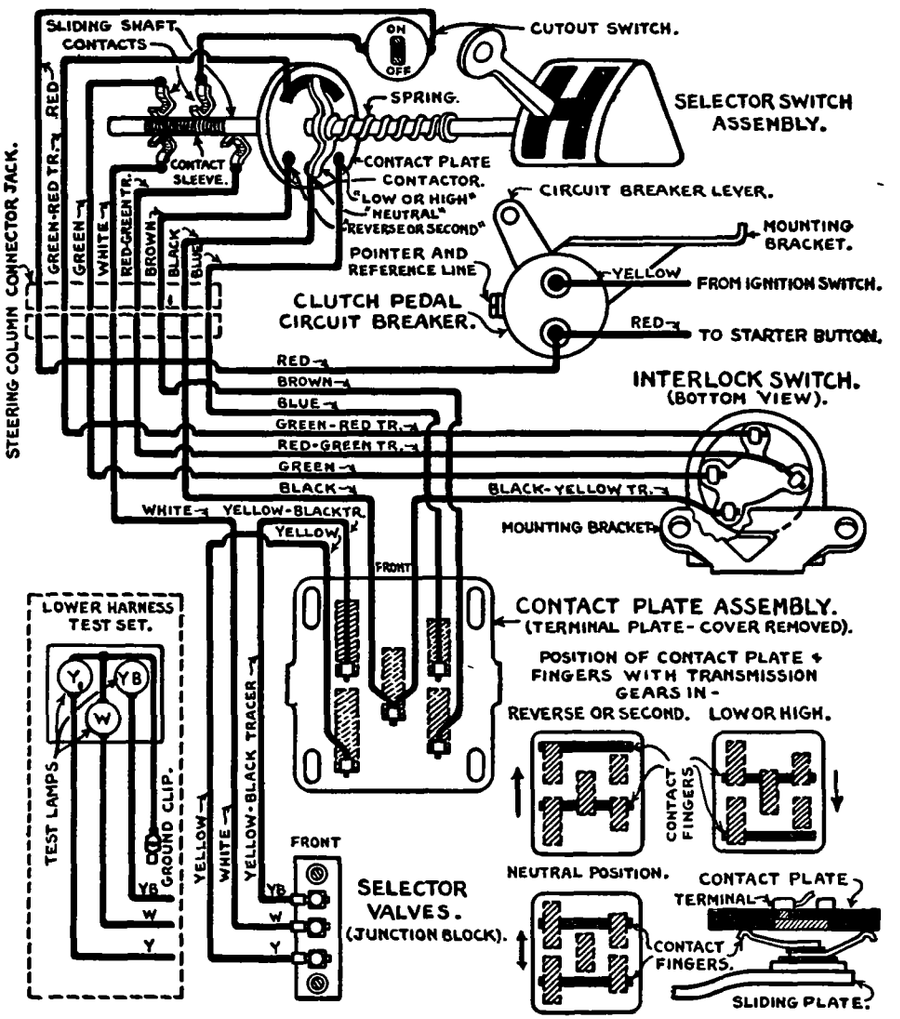
Shift Cylinder Piston Rod Length—Shift transmission into high gear, remove clevis pin linking piston rod to lever (G), push rubber piston guard on piston rod back and loosen locknut on piston rod. Turn rod end in or out until holes in rod and lever (G) line up with piston rod and piston in extreme forward position, then lengthen piston rod by backing off rod end four threads (four complete turns), tighten locknut, insert clevis pin.

Cross Shift Stopscrews (Diaphragm Cylinder Lever)—With transmission in high gear, loosen locknut and back off front stopscrew (K) until it does not touch the stop, then turn screw in until it just touches the stop (note when this occurs), turn screw in ¼ additional turn and tighten locknut. With this setting, clearance between outside face of Shift Cylinder lever (G) and outside finger of bellcrank (F) should be .004" (measure with a feeler gauge). Use Electric Hand to shift transmission into low. With transmission in low gear, loosen locknut and adjust rear stopscrew (M) in same manner, turning screw in ¼ turn after it contacts stop. With this setting, clearance between inner face of Shift Cylinder lever and inner finger of bellcrank should be .004" as measured by feeler gauge.

Diaphragm Cylinder Shaft Length—Take out clevis pin in forward end of Diaphragm Cylinder clevis, loosen locknut (X) at rear of clevis, push bellcrank (F) forward until front stopscrew (K) is against its stop, turn clevis in or out on rod until clevis pin hole is ¼" in front of or beyond the hole in the bellcrank lever with the Diaphragm Cylinder rod in the extreme forward position, tighten locknut, push rod back into Diaphragm Cylinder until holes line up and insert clevis pin.

Interlock Switch Adjustment—Check adjustment by using Electric Hand to shift transmission into low and then into high. See that pointer on Interlock Switch lever lines up with reference line on switch cover. If it does not, loosen front stop, turn rear stop until pointer and line register with switch lever held against rear stop, tighten front stop. Shift transmission into low and then back to high and recheck setting.

TROUBLE SHOOTING & TESTING:—For trouble shooting and testing (with and without special test equipment), see following article on 1936 Type.



SERVICING:—For complete directions in disassembling and servicing this equipment see following article on 1936 type. Selector Switch and contact plate assembly design has been changed and data on these units given below.

Contact Plate Assembly:—Sliding block design changed to new type using pivoted contact finger similar to 1936 type. Replace old block with new Part No. 74485. This can be distinguished from regular 1936 part by the fact that it has all contact fingers of equal thickness (two fingers on 1935 block are thicker than others).

Selector Switch:—To remove, disconnect cap and jack at base of steering column by lifting until lock lug is out of groove in base and twisting ¼ turn. Separate halves of jack, unsolder wires, remove loom from wires. Take out four screws in selector switch bracket cap, remove cap, draw wires out of steering column.

To Disassemble—Take out two screws in end of 'H' plate cap, remove cap. Turn selector lever ¼ turn clockwise, withdraw lever and shaft, remove washer retainer, washer, springs and lever from shaft. To remove cutout switch, take out two screws in switch plate, lift switch out, unsolder wires from switch terminals. To remove switch base and rotor, pry out switch base lock ring, withdraw base, rotor, and spring (cutout switch must be removed first).

To Install—Assemble in reverse order to disassembly directions given above. Install in same manner as 1936 type (see following article for complete directions and wire connecting chart for jack).

Optional Equipment On
HUDSON, SIX MODEL 63 (1936), EIGHT MODELS 64, 65, 66, 67 (1936)
TERRAPLANE, MODELS 61 DELUXE, 62 CUSTOM (1936)

NOTE:—See following article for improved type Electric Hand on late 1936 cars.

DESCRIPTION:—Similar to equipment used on 1935 models except for minor differences in design of units as follows:

Selector Switch—Housing design and mounting on steering column changed but internal circuits and operation identical with previous model.

Clutch Pedal Circuit Breaker—New type push-pull switch replacing rotary type used previously. Switch provides 'lost-motion' necessary for correct closing and opening of circuit and adjustment is not the same as 1935 type (see adjustment below).

Transmission Shifter Rail Lock Bars—New feature on 1936 type. Consists of spring loaded plunger and ball detent which engages notch in shifter rail and prevents shifter rail movement until clutch is disengaged which raises lock bar and releases ball plunger. One lock bar mounted on each side of transmission case and operated by adjustable linkage from clutch throw-out shaft. See adjustment below.

Contact Plate Assembly—Contact plate sliding block now operated by rod connected to plate at lower end of shift lever (first type sliding block mounted directly on this plate). Sliding block has been redesigned and consists of six contact fingers pivoted individually on block and held in contact with plate by coiled springs on pivot rod.

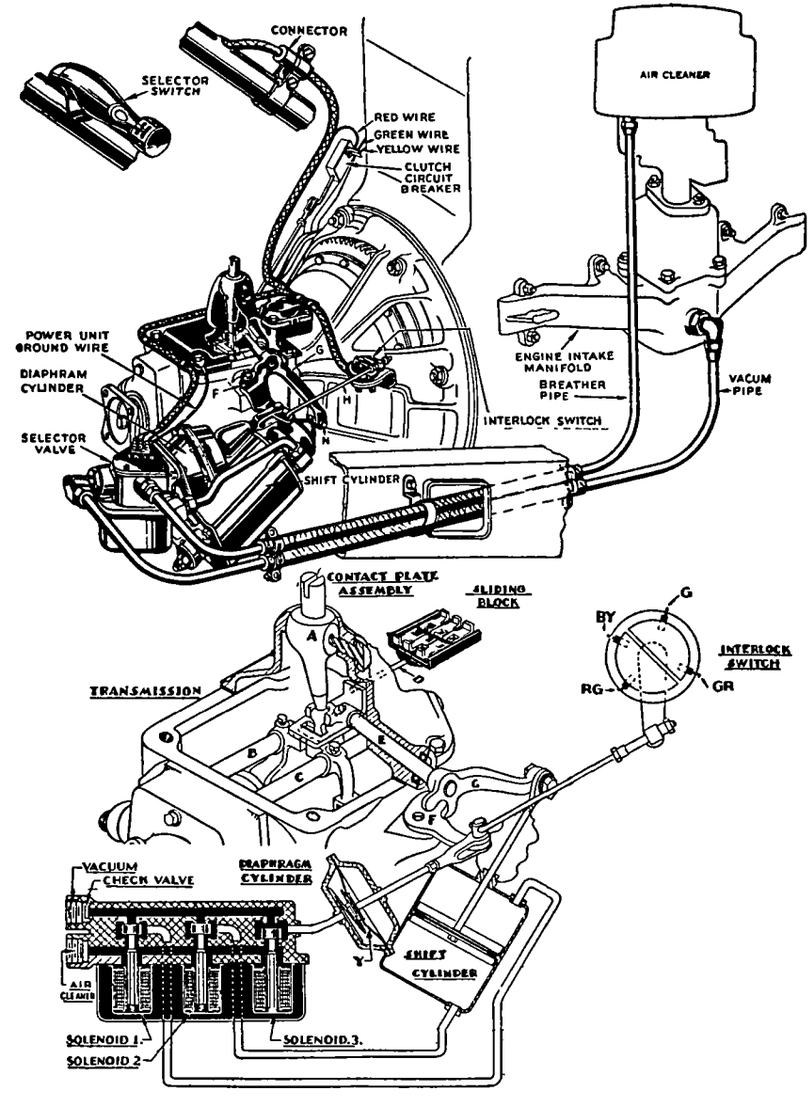
NOTE—Similar type sliding block (Part No. 48745) available for replacement on 1935 models equipped with first type block. Replacement block has all contact fingers of equal thickness and may be distinguished from 1936 standard type (Part No. 152197) which has two fingers which are thicker than the others.

Interlock Switch—Same as for 1935 models.

Diaphragm Cylinder Linkage—Cross shift stopscrews (K and M on 1935 illustration not used on 1936 model.

Power Unit Solenoid Valves—Valves have been redesigned and are now poppet type. Valves are held at upper end of stroke (cutting off vacuum and admitting air to cylinder) by spring at lower end of valve plunger when solenoid is not energized, and are pulled down (cutting off air and opening vacuum port) when solenoid is energized. Air cleaner element in valve assembly cover has been discontinued and air connection is by means of a separate tube connected to the lower end of the carburetor air cleaner.

ADJUSTMENT:—Mechanical adjustments provided for each unit. All adjustments should be checked, in order given below, whenever Electric Hand is serviced or when settings are disturbed by work on engine, clutch or transmission.



Clutch Pedal Circuit Breaker—Circuit through switch should not be completed until clutch is disengaged with pedal depressed half way to floor board (to avoid gear clash caused by engine driving car when shift is made). To adjust, take out clevis pin in linkage at circuit breaker, loosen locknut on rod, turn clevis. With correct setting, notch on forward end of circuit breaker rod should be flush with housing. Transmission shifter rail locks must be released when circuit breaker makes contact (see shifter rail lock adjustment below). Circuit breaker contact must not be broken until clutch has started to engage to insure gears meshing when car is not in motion and gear teeth strike). Check by running engine, shifting transmission into low or reverse, engaging clutch slowly. Car should start to move before 'click' of cross shift linkage, which indicates circuit breaker contact broken, is heard.

Transmission Shifter Rail Locks—Shifter rail locks (on each side of transmission case) must be released when circuit breaker contact made. Check by depressing clutch pedal to point where circuit completed through circuit breaker (halfway to floor—see paragraph above). Shifter rail lock bar link should be raised so that notch in link is opposite end of plunger in transmission case. Adjust by turning nut on link operating rod at lever on throw-out shaft (this adjustment provided at each lock link. Check to see that lock link drawn down so that plunger is held in when clutch is engaged. This is important to prevent transmission jumping out of gear. If lock links not drawn down with transmission in gear and clutch engaged, recheck lock setting (above), check power cylinder piston rod length, check circuit breaker contact opening point. If this does not correct lock action, use Lower Harness Test Lamp Set and check contact plate position to determine whether power cut off before shift completed (see Testing below).

Power Unit Mounting—Power unit must have sufficient clearance so that it does not strike frame 'X' member and must be lined up so that power cylinder piston rod enters fork of shifting lever freely with transmission in high (forward) or second (rearward) position. Maximum clearance secured by pushing up on unit while tightening nuts on studs which hold mounting bracket on transmission. Power unit cylinder mounting stud nut should be tightened just enough to insert cotter pin. This will insure maximum flexing of rubber mounting blocks for alignment.

Power Cylinder Piston Rod Adjustment—Piston rod movement must be sufficient to complete shifts in either direction. To adjust, place transmission in high gear, hold shift lever forward to take up all lash, take out pin linking piston rod to shift lever, pull piston all the way forward, loosen locknut on piston rod, turn rod eye out until it is ¼" farther forward than hole is in shift lever, tighten locknut. Check adjustment by placing transmission in second gear, hold shift lever backward to take up all lash, push piston all the way in, see that piston rod eye is ¼" farther back than hole in shift lever. Line up eye and shift lever hole by pulling piston out slightly, insert pin.

Diaphragm Cylinder (Cross Shift Control Mechanism) Adjustment—With transmission in high or second gear, remove clevis pin from diaphragm cylinder rod yoke at cross shift bell-crank. Spring in diaphragm cylinder should move rod and yoke ¼" farther forward. Loosen locknut and turn yoke until rod must be moved ¼" back in order to insert clevis pin. Hold clevis from turning while

tightening clevis locknut to avoid damaging diaphragm. Shift transmission to all gear positions, see that bell-crank contacts lobe on shift lever only at outer end of bell-crank fork and that mechanism does not bind. Check action of stub shift lever on transmission case cover to see that fulcrum dowel screw does not bind in lever ball groove. First type dowel screw (Part No. 35442) was 23/32" long and a 1/16" plain washer was assembled under the head in addition to the lock. Dowel screw later changed to Part No. 151787 which is 21/32" and washer omitted. Washers must be used with first type screw to prevent binding.

Interlock Switch Adjustment—Check by using Electric Hand to shift transmission into low and then into high or second. Interlock switch lever must line up with reference line on switch cover marked 'S/H' when these shifts completed. To adjust, loosen jam nut on forward end of switch rod, turn adjusting sleeve (head of sleeve directly behind switch lever), tighten jam nut. Shift transmission to low, back to high, recheck switch. Operation of switch can be checked with Lower Harness Test Lamp Set in Testing section below (circuit in switch should change at same distance from end of cross shift travel in each direction).

Contact Plate Adjustment—Lower Harness Test Lamp Set must be used to check operation of main contact plate. See directions in Testing section below.

TROUBLE SHOOTING:—Complete testing of the Electric Hand requires the use of a Master Selector Switch to check Selector Switch and upper wiring harness, a Power Unit Test Cable to check shift mechanism or Power Unit, and a Lower Harness Test Lamp set to check the lower wiring harness and switches (this must be used in conjunction with a Selector Switch which is known to be operating satisfactorily). Directions for use of this test equipment is given under 'Testing' below. Before making complete tests, check following points:

1. See that Cutout Switch on Selector Switch is closed or 'on'.

2. Check transmission by hand shifting in all positions. See that lever moves into each gear position freely with clutch pedal depressed to point where circuit breaker circuit is closed (starter will be operative). Adjust Interlock straps on transmission if necessary. See that correct lubricant is used in transmission case and that shifting is not being retarded by oil which is too heavy for prevailing temperatures.

3. Check vacuum line and fittings. If hard shifting experienced in cold weather, check power cylinder for gasoline condensation from manifold. If this trouble experienced, shift vacuum line connection from lower to upper hole on manifold (upper hole for automatic clutch connection, if clutch not used hole closed by plug, if clutch installed use tee connection. Use plug to close lower manifold hole.

4. Check wiring harness for breaks or damaged insulation, check connections on Interlock switch, Contact Plate Junction Block (check soldered connections, see that terminals are not shorted to cover, examine for broken parts, note condition of contacts), Selector Valve Junction Block, and Steering Column Jack (remove covers by twisting with jack assembled, check soldered connections within covers).

5. Check Circuit Breaker setting (see Adjustment above). Test for short-circuit by pressing starter button with clutch engaged. If starter operates, replace circuit breaker. Test for open-circuit by pressing starter button with clutch pedal depressed. If starter operates, circuit through circuit breaker is satisfactory. If starter does not operate, connect test lamp between yellow wire terminal on circuit breaker and ground. If lamp lights, circuit breaker is open and should be replaced. If lamp does not light, check wire from circuit breaker to ignition switch for open-circuit.

6. Check for short-circuits in Electric Hand by turning on instrument light and shifting into each gear position. If light dims noticeably, a short-circuit is indicated for that position (valve solenoids should draw approximately 2.5 amperes each).

If Electric Hand operation is unsatisfactory after completing these checks, use test equipment and make complete tests outlined below.

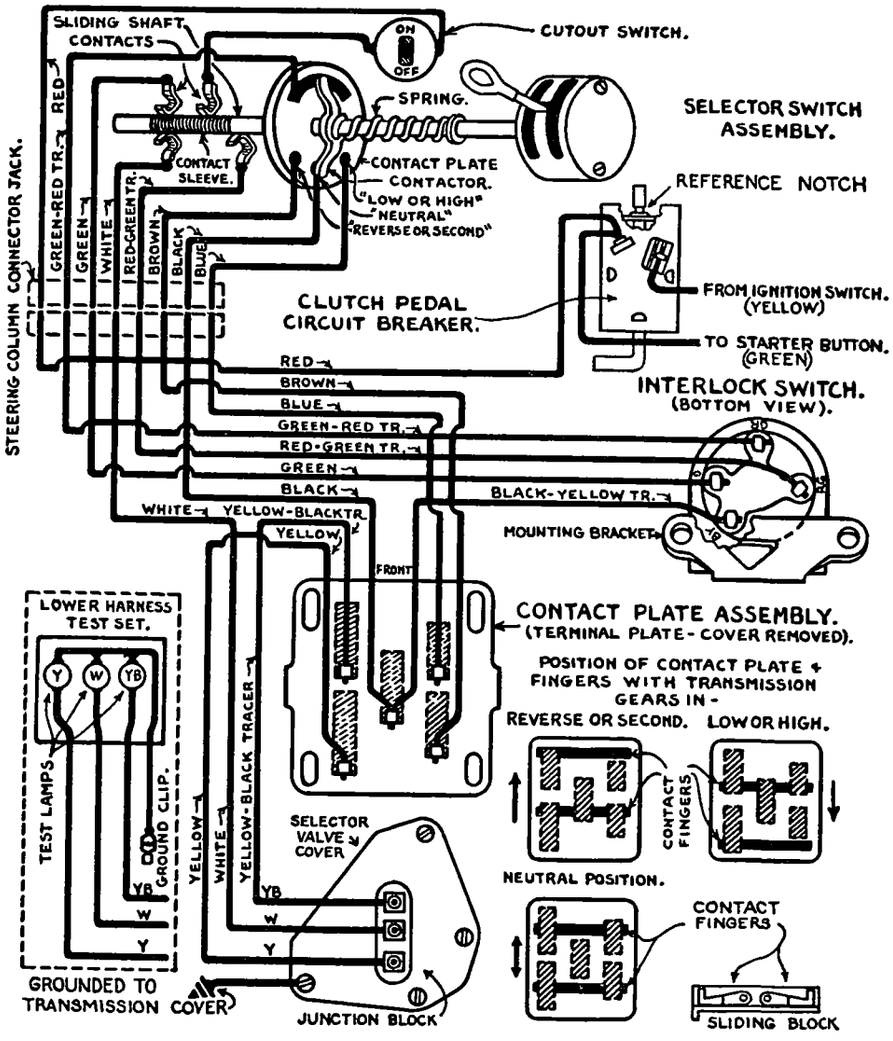
Trouble Shooting Table

If transmission fails to shift into or out of any of the gear positions noted below, check the wire indicated for open or short-circuits. A defective selector switch may cause any of the conditions noted and selector switch should first be checked by substituting a master selector switch or a selector switch known to be operating correctly and the Electric Hand operation noted.

1. In or out of any position—Check Red Wire (feed from circuit breaker). If transmission will shift into neutral by moving selector switch to opposite side at neutral, check Green Wire with Red Tracer.

2. Into Low or Reverse—Check White Wire and Green Wire. If transmission shifts to neutral instead of low, check Green Wire with Red Tracer. If cross-shift is still correctly made, check Green Wire.

3. Into Low or High—Check Blue Wire. If transmission also fails to shift out of Second or Reverse, check Yellow Wire with Black Tracer.



4. Into Second or Reverse—Check Brown Wire. If transmission also fails to shift out of Low or High, check Yellow Wire.

5. Into Second or High—Check Red Wire with Green Tracer.

6. Into Neutral—Check Black Wire. Transmission will shift to neutral from Second or High by moving selector switch to left at neutral for the cross-shift.

7. Into or out of some positions except when started by hand—Examine contact plate assembly and see that contact surfaces are clean.

8. Transmission is slow in making any shift involving a cross-shift—Check Black Wire with Yellow Tracer.

TESTING ELECTRIC HAND:—Selector Switch and Upper Wiring Assembly—Disconnect Selector Switch jack at lower end of steering column, plug in Master Selector Switch (no ground required). Operate Master Selector Switch to shift into all gear positions. If Electric Hand operates satisfactorily, replace complete Selector Switch and upper wiring assembly (all parts down to and including the upper half of the jack). Test lamp on Master Selector Switch (6-8 volts, 32 cp., must be single contact type) should burn at half - brilliance if circuits are normal. A short - circuit will cause fuse (7½ ampere) to blow and lamp to burn at full-brilliance. When this occurs leave Selector Switch in this position and check all circuits involved for short-circuits. Do not replace fuse until short-circuit has been located and corrected. Use only 7½ ampere fuse for replacement.

Shift Mechanism (Power Unit)—Connect power unit test cable to red wire terminal on circuit breaker. Operate engine with clutch disengaged and rear wheels jacked up so that shifts can be made. Touch the test prod of the test cable to the points indicated and note whether transmission shifts properly (some tests require contacting two terminals on the Selector Valve junction block at the same time). Terminals are designated by the color of the wires attached as follows: 'YB'—terminal toward front of car (yellow wire, black tracer), 'W'—center terminal (white wire, no tracer), 'Y'—terminal toward rear of car (yellow wire, no tracer).

1. Test Prod on YB—Transmission should shift into high gear.
2. Test Prod on Y—Transmission should shift into second gear.
3. Test Prod on W—With transmission in neutral, cross-shift or left-right movement of lever should be made.
4. Test Prod on W and YB—Transmission should shift into low gear.
5. Test Prod on W and Y—Transmission should shift into reverse gear.

If any of these shifts are not made, check valve solenoid by connecting accurate ammeter between terminal and circuit breaker lead (ammeter lead should be merely touched to terminal to avoid damage if solenoid dead short-circuited). Current draw should be approximately 2.5 amperes. Larger current indicates that solenoid is shorted, smaller current indicates an open-circuit. If current draw is satisfactory, examine valve to see that it is free and not sticking in upper position, check for vacuum leakage in valves, lines or shift units. Check units for mechanical drag by disconnecting shift cylinder from lever (G) and Diaphragm Cylinder from bellcrank (F). If units do not operate when disconnected, entire Power Unit (Shift Cylinder, Diaphragm Cylinder, Selector Valve Assembly) must be rebuilt or replaced.

Switches and Lower Wiring Harness—Disconnect wires on selector valve junction block and connect these wires to clips on Lower Harness Test Set in accordance with wire color (see illustration). Attach Test Set ground clip to clean place on engine for good ground connection. Make tests by manipulating selector switch (selector switch must be known to be OK) and shift lever and noting whether correct test lamps light (lamps designated by color of wire connected to leads as for shift mechanism test above). See that ignition is turned on, Cutout switch turned on, and clutch held completely disengaged and make following tests:

1. Place selector lever in neutral (right end of slot). Shift transmission to neutral manually. Lamp 'YB' should light when shift lever moved short distance toward second gear. Lamp 'Y' should light when shift lever moved equal distance toward high gear.

2. Place transmission shift lever in neutral. Move selector lever to low gear position. Lamp 'W' only should light.

3. Place transmission shift lever in neutral. Move selector lever to each gear position in turn. Lamps should light as follows: High gear—'Y', Second gear—'YB'. Low or Reverse—'W' only.

4. With selector lever in each gear position in turn as above (3), complete shift by moving shift lever to same position. Lamps should go out when shift completed except that lamp 'W' will remain lighted with transmission in low or reverse (lamp 'Y' will light momentarily when transmission shifted to low, and lamp 'YB' during shift to reverse—these lamps do not light during test (3) since no vacuum available to operate Diaphragm Cylinder and Interlock Switch which occurs when transmission shifted manually).

If above tests indicate that proper circuits are not being completed (correct lamps do not light or go out at the right time, or additional lamps light), replace Lower Harness. After replacing lower harness, check Contact Plate Assembly adjustment as directed below.

Contact Plate Assembly Adjustment—If lamp 'Y' or 'YB' are lighted with transmission shift lever in neutral (Test 1 above) or if lever movement forward to light lamp 'YB' and rearward to light lamp 'Y' are not equal, contact plate requires adjustment. To adjust, loosen four screws holding contact plate assembly, shift plate slightly to rear (if 'YB' lighted in neutral) or to front if (if 'Y' lighted in neutral) until lamp goes out, tighten screws. With correct adjustment, movement forward and backward to light each lamp should be equal. Screw holes in contact plate are slotted to permit this movement. If plate is not free to move, remove from transmission and carefully cut off locating dowel pins.

Transmission Shifter Rail Lock Action—If correct lock action cannot be secured, connect Lower Harness Test Lamp Set (as directed above), move selector lever to low gear position, depress clutch pedal. Lamps 'W' and 'YB' should be lighted. Shift transmission manually toward low gear until lamp 'YB' goes out, release clutch pedal. Shifter rail lock bars should both drop down. If right hand lock bar is not down, leave clutch engaged and pull shift lever to complete shift, noting movement necessary. If more than slight movement required before lock bar moves down, adjustment of contact plate, replacement of contact plate sliding block, or replacement of transmission cover linkage is required. To determine whether adjustment will correct condition, move selector lever to reverse, depress clutch pedal. Lamps 'W' and 'Y' will be lighted. Move shift lever toward reverse until lamp 'Y' just goes out. Release clutch. If lock bar at right of transmission goes down, contact plate can be moved back slightly for longer contact in low. If lock bar does not go down and considerable shifting lever movement necessary before lock bar goes down, sliding block or linkage in transmission cover must be replaced.

Interlock Switch Setting—Shift transmission to low gear manually, place selector lever in high gear, depress clutch pedal. Lamp 'Y' should light and remain lighted until transmission is shifted manually to neutral. Lamp 'YB' should light when cross shift to second-high side is completed. If lamp 'YB' lights before cross shift is practically completed, interlock switch adjustment is incorrect (see adjustment above). With correct adjustment shift lever travel in either direction at neutral to light lamp should be equal. To check, place selector lever in low, move shift lever to left in neutral, note travel before lamp 'YB' lights. Then place selector lever in high, and shifter lever at extreme left in neutral, move shifter lever to right, note travel before lamp 'YB' lights. Travel in either direction should be equal.

REMOVAL AND INSTALLATION:—Selector Switch Assembly—To remove, disconnect connector jack at lower end of steering column by lifting cap from jack until lug is out of groove in jack base, then turn cap ¼ turn. Separate jack halves, unsolder wires on upper half, pull off jack and loom on cable. Take off end cap and washer on selector switch, loosen selector housing mounting bolt nut inside housing, slide selector housing downward and remove, withdraw wires from steering column.

To Disassemble—Take out cutout switch cover screws, remove switch plate, lift switch up and unsolder wires, pull wires out of end of housing from which end cap previously removed, insert cotter pin puller through hole to right of cutout switch and press lock ring out of groove in switch base, pull wires and switch base out of housing, remove switch rotor and spring. Remove two screws in 'H' plate cap (selector lever segment), hold cap to right and remove washer retainer, washer, spring, and lever, turn selector switch shaft ¼ turn to right (clockwise facing selector lever end) and withdraw.

To Assemble—Assemble in reverse order as above. See that rotor is inserted with side with three contacts to left and that it slides over tongue on shaft. See that switch base tongue engages groove in bottom of housing, and that locking ring engages groove in housing.

To Install—See that eight wires of selector switch harness are laid out flat side-by-side and do not cross (clips can be used to hold wires). Feed wires down through steering column tube. Install selector switch on steering column so that head of mounting bolt enters wire hole in column, move selector up so that bolt shank engages slot, tighten nut inside selector housing. Pull wires down in steering column so they do not project through end cap hole on selector, install loom on lower end, solder wires to upper half of connector jack. In making connections, designated wire colors must be connected to marked terminals as follows: 'R'—red wire, 'BK'—black, 'G'—green, 'RG'—red with green tracer, 'W'—white, 'GR'—green with red tracer, 'B'—brown, 'BL'—blue.

Contact Plate Assembly:—To remove, take out four capscrews in cover, lift up cover and plate, remove sliding block. Unsolder wires on contact plate if plate to be removed from harness.

1936 TYPE CONTINUED

To Install—When soldering wires on contact plate lugs, designated wire colors must be connected to marked lugs as follows: 'YB'—yellow wire with black tracer, 'Y'—yellow, 'BY-BK'—black wire with yellow tracer and black wire, 'BL'—blue, 'B'—brown. When inserting sliding block into contact plate guides make certain that driving block on lug is to rear when assembled. Insert one ounce of contact plate grease (No. 48705) in cavity in transmission cover in which sliding block operates before installing assembly.

Power Cylinder:—To remove power cylinder from power unit assembly (with assembly off the car), disconnect vacuum lines, remove three end plate staybolts, remove cylinder from assembly.

To Disassemble—Use special tool HMO-12-1 to remove cylinder end plate, remove end plate inner seal, pull out piston and rod assembly, take off piston rod nut, disassemble pistons.

To Assemble—Put felt retainer and piston plate on rod, wrap packing ring around retainer with the felt ring over it, put leather cup packing and center plate on rod to hold felt and packing ring in place, then put second leather cup packing and second plate on rod. Wrap packing ring and felt around second felt retainer, install in place in packing on rod, install piston rod nut, tighten securely and stake in place.

To Install—Saturate leather packing cups and felts in Hudson shock absorber oil until leather is soft and pliable, then install piston assembly in cylinder being careful not to turn edges of packing cups back when inserting. Use new end-plate inner seal and end plate gasket, install end plate, draw down in to place by tightening stay bolt nuts evenly and securely when attaching cylinder to bracket. Test seal by holding thumb on front vacuum line connection and pulling on piston rod. Rod should move out only slightly and air compressed in cylinder should resist further movement.
NOTE—Vacuum line should be disconnected at front of cylinder and one ounce Hudson Shock Absorber Fluid injected in cylinder at 15000 mile intervals to maintain piston seal.

Diaphragm Cylinder:—Mounted on mounting bracket by mounting plug and washer at vacuum connection and can be disassembled without being removed from bracket.

To Disassemble—Remove rod yoke, locknut and rod guard, take out six bolts in flange, remove housing cover and diaphragm assembly. Take off rod nut and disassemble diaphragm.

To Assemble—Reverse operations above. See that spring is seated in flanged plate, and hold diaphragm rod in while tightening flange bolts to avoid distortion of diaphragm. Tighten all bolts evenly and securely to insure tight seal. Check by pushing rod in and then holding finger over vacuum connection in mounting bracket. The rod should not move out.

Selector Valve Unit:—Mounted on mounting bracket by four screws. Wash unit with gasoline (brush off only, do not dip in gasoline) before disassembling.

To Disassemble—Take out four screws in cover plate, lift cover slightly and unsolder wires from terminal block. Remove solenoid cover stud, washer and gasket, remove cover. Remove three screws in solenoid retainer, remove retainer and solenoid being careful not to loosen springs from bottom of valve plunger. Remove valve seats and valve assemblies from body (if necessary tap seats out with blunt bar inserted through center holes in housing, do not attempt to pull on valve plunger). Remove rubber valve heads from valve plunger washer. Take out check valve nut and check valve in vacuum connection.

Servicing—Wash all parts except solenoids and rubber valve heads in gasoline. See that all dirt removed from valve body passages.

To assemble—Reverse disassembly operations. Use new rubber valve heads if old heads swollen or spongy from gasoline, or worn or cut. When reassembled, valve travel up and down should be 1/32-1/16". Movement must not be less than 1/32" or performance will be sluggish. Use new cover gasket and solenoid retainer gasket and see that cover screws fastened securely to keep out water and dirt.

IMPROVED TYPE USED ON HUDSON-TERRAPLANE 1936-37 MODELS

Optional Equipment On:

Hudson Custom Six, Model 63 (1936) After No. 638319—See Note.
Hudson Deluxe Eight, Model 64 (1936) After No. 644398—See Note.
Hudson Custom Eight, Model 65 (1936) After No. 652078—See Note.
Hudson Deluxe Eight, Model 66 (1936) After No. 663201.
Hudson Custom Eight, Model 67 (1936) After No. 674296.
Terraplane Deluxe, Model 61 (1936) After No. 6151381—See Note.
Terraplane Custom, Model 62 (1936) After No. 6213759—See Note.
Hudson Six, Model 73 (1937)—All Cars.
Hudson Eight, Custom & Deluxe Models 74, 75, 76, 77 (1937) All Cars.
Terraplane, Models 70, 71, 72 (1937) All Cars.

NOTE:—Serial numbers for 1936 models apply with the following exceptions: (63) 638351 to 638470 inc., (64) 644439 to 644464 inc., (65) 652159 to 652160 inc., (61) 6151401 to 6151779 inc., (62) 6213901 to 6213963 inc.

DESCRIPTION:—Same as type used on previous models except for the following changes:

Selector Switch—Special high gear lock-out switch or solenoid gear ground strap added for Automatic Clutch control (see separate article for Automatic Clutch data). Extra wire (yellow) added in Selector switch harness and extra terminal (Y) provided on jack for this circuit. On cars without Automatic Clutch, extra wire not provided in lower harness and standard 8-wire harness used. This line and lock-out switch do not enter into Electric Hand operation.

Contact Plate Assembly—Discontinued. New 'Neutral Switch' mounted in end of power cylinder used to return piston to neutral position (see Power Cylinder). High Gear Ground Switch and Governor Switch on transmission case are part of Automatic Clutch Control and do not enter into Electric Hand operation (see article on Automatic Clutch).

Diaphragm Cylinder—Same as previous model but larger.

Power Cylinder—Same design as previous model except for larger size and new Neutral Switch located on rear end plate.

Neutral Switch—Consists of stationary central contact and two movable contact arms each connected to one of the power cylinder solenoid valves. Neutral switch operating lever in cylinder is linked to contact arms so that both sets of contacts are open when piston centralized in cylinder (transmission neutral position). Movement of piston in either direction from center allows one set of contacts to close and, whenever center contact is live (as will be the case with Selector Switch and Transmission in neutral) solenoid valve will be opened and vacuum connection completed to one end of cylinder so that piston will be drawn back toward center. At center neutral position, circuit will be broken by operating lever.

ADJUSTMENT:—Mechanical adjustments for Clutch Pedal Circuit Breaker, Transmission Shifter Rail Locks, Power Unit Mounting, and Diaphragm Cylinder same as for previous model (see 1936 article—disregard Contact Plate instructions). Power Cylinder Piston Rod adjustment is new.

Power Cylinder Piston Rod Adjustment—Run engine, hold clutch pedal depressed. See that all wiring in place and Selector Switch Cut-out Switch 'on'. Remove clevis from piston rod, loosen locknut, adjust piston rod length so that clevis pin can just be inserted with Selector Switch and Transmission in neutral. For more exact setting, use Lower Harness Test Set. Disconnect wires on terminals on solenoid valve cover, attach Lower Harness Test Set (YB clip to BL wire, W clip to W wire, Y clip to B wire, ground clip to chassis). Place Selector Switch in neutral, depress clutch, turn on ignition but do not start engine (engine must not be running for this test). Use manual shift lever, shift transmission toward high gear until 'Y' lamp lights, then toward second until 'YB' lamp lights. Movement in each direction must be equal and lamps should not be lighted in neutral position. Adjust by lengthening piston rod (Lamp YB will light sooner) or shortening rod (Lamp Y will light sooner).

TESTING:—All tests made in same manner as on previous model. Terminal markings and wire colors have been changed in some cases so that some test instructions are new as given below.

Selector Switch and Upper Wiring Harness:—Use Master Selector Switch plugged in at jack at lower end of steering column (adapter required for new 9 prong jack if old type 8 prong Selector Switch jack used). Make tests in same manner as previously (see 1936 data). To check switch circuits, disconnect jack at lower end of steering column, test by touching test lamp prods to prongs on upper half of jack as follows (test lamp should light in each case):

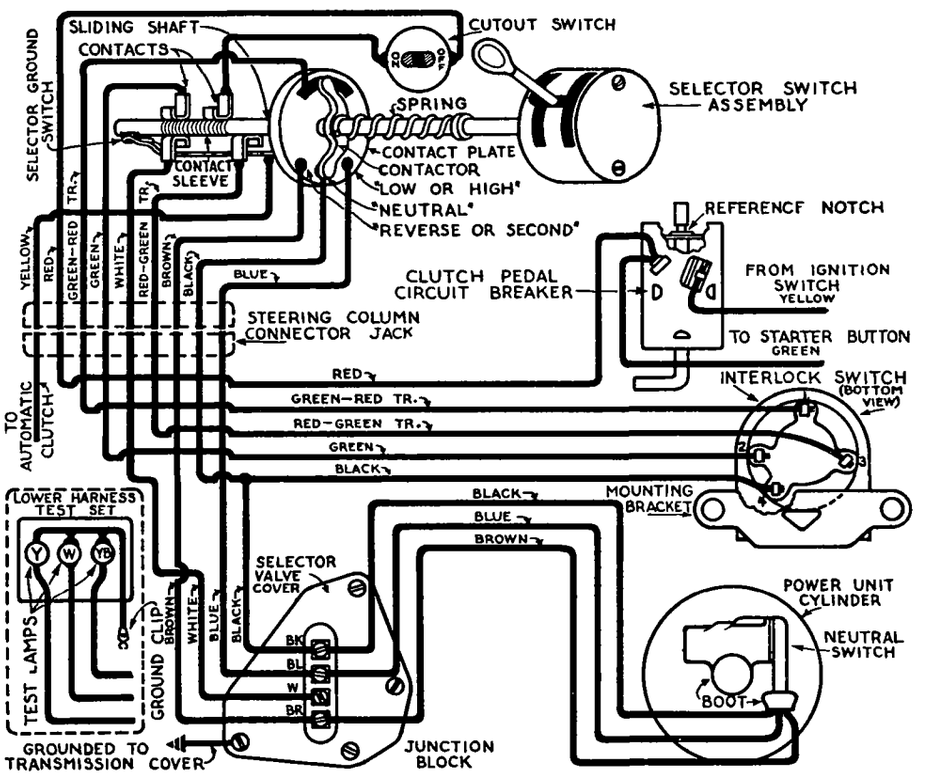
Selector Switch Position	Current Supply	Test Lamp Prod.
1. Neutral, High or Second	R	RG
2. Low or Reverse	R	G-W
3. Low or High	GR	BL
4. Second or Reverse	GR	B
5. Neutral	GR	BK

If lamp does not light for Test #1 or #2, check Selector Switch Cut-out Switch, red wires in harness, and contact in selector switch. If lamp lights for one test but not for the other, check wire to which lamp connected (see table) and contact in selector switch to which wire is connected. If lamp flickers as selector switch moved from one position to another in Test #2, check contact sleeve for roughness and check contact finger tension. If lamp does not light for Tests #3, 4, 5, check GR wire and connection at selector switch. If lamp does not light for one test only, check wire to which lamp connected (see table) and connection at Selector switch. If lamp lights when test prod touched to any other terminal than ones indicated, check for play in selector shaft rotor and short circuits.

Shift Mechanism (Power Unit):—Connect Power Unit Test Cable to Red Wire terminal on circuit breaker. Operate engine with clutch disengaged and rear wheels jacked up so that shifts may be made. Touch test prod of the test cable to points indicated (two points simultaneously in some cases) and note whether shifts made properly. Terminals on solenoid valve cover (at which tests made) are labeled as follows: #1 (front) BL, #2 W, #3 B, #4 BK, (rear—junction only, not used in making this test).

1. Test Prod on BL—Transmission should shift into High Gear.
2. Test Prod on B—Transmission should shift into Second Gear.
3. Test Prod on W—With transmission in neutral, cross-shift or left-right movement of lever should be made.
4. Test Prod on W & BL—Transmission should shift into Lower Gear.
5. Test Prod on W & B—Transmission should shift into Reverse Gear.

If any shifts not made, check valve solenoid by connecting accurate ammeter between terminal and circuit breaker lead (merely touch ammeter lead to terminal to avoid damage if solenoid dead short circuited). Current draw should be 2.5 amperes. Larger current indicates solenoid short-circuited, smaller draw open-circuits. If current draw satisfactory, examine valve to see that it is free and not sticking, check for vacuum leaks in valves, lines, or shift units. Check units for mechanical drag by disconnecting shift cylinder and diaphragm cylinder rods. If units do not operate when disconnected, Power Unit (Shift Cylinder, Diaphragm Cylinder, Selector Valve assembly) must be rebuilt or replaced.



Switches & Lower Wiring Harness:—Disconnect all wires (except those on BK terminal) on solenoid valve cover, connect these wires to clips on Lower Harness Test Set (YB clip to BL wire, W clip to W wire, Y clip to B wire, ground clip to chassis). Make tests by manipulating Selector Switch (Selector switch must be OK) and shift lever and noting if correct test lamps light. Turn on ignition, hold clutch disengaged, see that Selector switch Cut-out switch 'on'.

1. Place selector switch in neutral. Shift transmission to neutral manually. Lamp YB should light when shift lever moved short distance toward second gear, lamp Y when shift lever moved equal distance toward high gear (see Power Cylinder Piston Rod Adjustment above).
2. Place transmission shift lever in neutral. Move selector switch to low gear. Lamp W only should light.
3. Place transmission shift lever in neutral. Move selector switch to second gear, Lamp Y should light. Move selector switch to high. Lamp YB should light.
4. With selector switch in each gear position in turn, complete shift by moving transmission shift lever to same gear position. Lamps should light (and remain lighted until clutch pedal released) as follows: High Gear—YB. Second Gear—Y. Low & Reverse—W and when cross-shift completed, YB for low or Y for reverse.
5. With transmission in high or low gear, move selector switch to neutral. Lamp Y should light. With transmission in second move selector switch to neutral. Lamp YB should light.

If lamps do not light as indicated, or if additional lamps light, check or replace lower wiring harness and Interlock switch.

Lower Wiring Harness—Disconnect jack at lower end of steering column. Use test prod connected to hot lead to supply current to terminal designated on lower half of jack, ground one test lamp lead. Test lamp should light when other lead touched to designated terminal on Interlock Switch, Solenoid Valve Cover terminals, or Circuit Breaker.

Hot Prod on Jack	Lamp Connected to:
R	R on Clutch Circuit Breaker.
BK	BY Interlock Sw. & BK Solenoid Valve.
G	G on Interlock Switch.
RG	RG on Interlock Switch.
W	W on Solenoid Valve Cover.
GR	GR on Interlock Switch.
B	B on Solenoid Valve Cover.
BL	BL on Solenoid Valve Cover.

TROUBLE SHOOTING:—Same as for previous model (see 1936 article). Yellow wire, and Yellow wire with Black tracer are no longer used and need not be checked. If transmission is slow in making any shift involving a cross-shift, check the Black wire (was Black wire with Yellow tracer).

REMOVAL & INSTALLATION:—Same as for previous model (see 1936 article) with exception of Neutral Switch in Power Cylinder which is new.

Neutral Switch—Remove two screws in neutral switch cover and withdraw the switch before taking off power cylinder end plate. After end plate has been removed, take out two screws in neutral switch operating bracket and remove operating mechanism. When re-installing Neutral Switch, see that gasket is in good condition, and that the operating lever is between the two bakelite arms on which the movable contacts of the switch are mounted.

Optional Equipment On:
HUDSON 6, 83 ('38), 91, 92, 93, 98 ('39)
HUDSON 8, 85,86,87 ('38), 95,97 ('39)
TERRAPLANE, MODELS 80, 81, 82, 88 (1938)

NOTE:—Electric Hand not available for Hudson '112'.

TYPE:—Same design as type used on previous models except for new Interlock Switch design (incorporated in Diaphragm Cylinder), new Gear Abutment Indicator, and minor changes in other units as listed below.

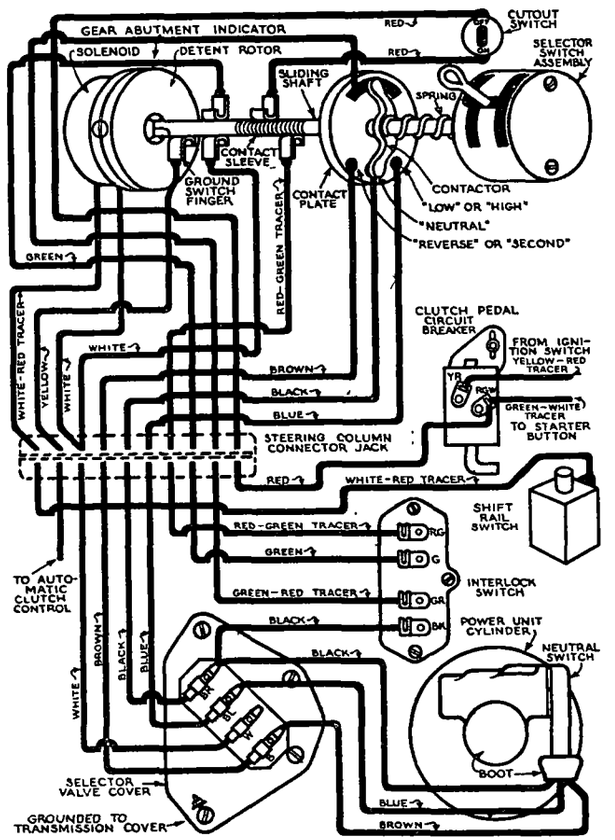
Interlock Switch—Breaker contact type mounted in housing which is integral with diaphragm cylinder cover and operated by spring-loaded camshaft linked to diaphragm rod by crank-and-lever mechanism (crank is mounted on floating sleeve on diaphragm rod, sleeve movement being limited by flange at diaphragm end of rod, stop pin at outer end, and provides slight 'lost' motion required for correct switch operation). No switch adjustment is required.

Gear Abutment Indicator—Consists of a rigidly mounted solenoid in the extreme left hand end of the selector switch housing and a detent rotor assembly mounted on the end or the selector switch shaft next to the solenoid. Solenoid is energized whenever selector lever moved to left end of neutral slot (lead taken from diaphragm solenoid contactor in selector and circuit completed to ground through right hand shift rail switch on top of transmission). When solenoid energized, detent rotor slides along flattened portion of selector shaft until detent balls engage slots in face of solenoid. This prevents rotor revolving with shaft as selector lever moved toward Reverse or Low Gear positions, flattened shaft acting as a cam to expand rotor plungers against tension of plunger spring on outer rim of rotor and spring sets up a back pressure against the selector shaft and lever. If gear abutment occurs within transmission, this spring pressure will cause selector lever to snap back to neutral as soon as it is released. However, if gears mesh properly, operating ball in shift rail switch will drop into notch in shifter rail as soon as gear meshing ¾ complete, opening switch and breaking solenoid circuit. This releases rotor which revolves to normal position on selector shaft so that there is no tendency of the selector lever to move from its position.

Clutch Pedal Circuit Breaker—New type mounting used which makes linkage adjustment unnecessary. Switch mounting bracket holes are slotted to permit limited up-and-down movement but switch is normally held in one positon by springs on mounting screws. Lug on clutch shaft operating lever engages slot in switch mounting bracket so that switch is pulled down to new position as required when clutch engagement point changes due to clutch facing wear.

Automatic Clutch Selector Switch Terminal—Automatic clutch high gear lock-out switch in Selector has been changed to same type contactor used for other circuits. See Automatic Clutch article for data on this switch as well as complete automatic clutch wiring.

ADJUSTMENT:—Make adjustments in order as listed below. No Clutch pedal circuit breaker or separate Interlock Switch adjustment required for 1938 equipment.



Diaphragm Cylinder (Cross-shift) Rod:—This adjustment also controls Interlock switch timing. Remove clevis pin at forward end of diaphragm rod (at cross-shift lever on transmission), push rubber boot back to expose clevis locknut, loosen locknut (clevis must be on lever when loosening or tightening this nut to prevent rod turning which would damage rubber diaphragm), turn clevis so that rod is 3/16" long, requiring diaphragm return spring to be compressed this amount to line up clevis and lever holes, with transmission in neutral. If clevis placed on lever to check this setting, only 1/16" width of lever hole should be visible through clevis pin hole. Install clevis pin, make certain that locknut tightened and rubber boot pulled forward over locknut onto clevis stem.

Power Cylinder Piston Rod:—Run engine, hold clutch pedal down, place selector lever in neutral position, remove clevis pin which links piston rod and shift lever on transmission, make certain that transmission in neutral, adjust piston rod length so that holes in rod and lever line up, install clevis pin.

Power Unit Mounting:—Power unit must be mounted more firmly than previous models (plain nut and additional 3/32" washer used instead of castellated nut). Make certain that both washers in place (one 1/16" washer, one 3/32" washer), turn nut down until cotter pin can just be installed behind nut.

TESTING:—All tests made in same manner as on 1937 model except as noted below.

Selector Switch & Upper Wiring Harness:—One additional wire (White with Red Tracer—for Gear Abutment Solenoid circuit) used in upper and lower wiring harness with new 10-prong jack. All other wire colors same as in 1937 and tests made in same manner as on previous model. If old type Electric Hand Test kit used, Adapter No. J-813-5 must be used.

Power Unit & Lower Wiring Harness:—New Test Lamp Kit available with five test lamps (3 lamps labeled Y-B, W-W, YB-BL correspond to same three lamps in old test kit). New Lamps are simple test lamps with double leads as follows: "Valve Solenoid" lamp—Leads G-87 and H-87—15 cp., Mazda No. 87 bulb; "Abutment Indicator" Lamp—Leads H-63 and G-63—3 cp., Mazda No. 63. If new test kit not available, test lamps with suitable leads can be made up for Valve Solenoid and Abutment Indicator testing. Old test lamp kit can be used to check lower wiring harness. Make tests in same manner as on 1937 type.

Valve Solenoids:—Use 'Valve Solenoid' Test lamp in new kit or make up test lamp using 15 cp. bulb to test solenoids (using lamp will eliminate possibility of burning out test meter if solenoid shorted). Disconnect leads on power unit, clip one test lamp lead (H87) to battery terminal, touch other lead (G87 prod) to each solenoid terminal in turn (see wiring diagram). Lamp should burn with dull red glow. If lamp does not light, solenoid is open. If lamp lights brightly, solenoid is short-circuited. When solenoids disassembled, make certain they are clean and free from dirt, oil or grease, that plungers have 1/16" minimum travel, and use new valve discs when reassembling.

Abutment Indicator:—If selector lever will not stay in Low or Reverse Gear after shift has been completed in transmission, disengage clutch and hold in this position, place selector lever in gear position and hold it in place while selector 'Off-On' switch moved to 'Off' position. If click is heard in selector when switch reaches off position, check for short-circuit in wiring or defective Shift Rail Switch (see tests below). If no click is heard, replace detent rotor assembly. With transmission in neutral, turn on ignition but do not start engine, depress clutch pedal and hold in this position, shift selector lever to Low or Reverse and release lever. If lever does not return to neutral when released, check for open-circuit or defective Shift Rail Switch. If lever returns to neutral from one position but not from the other, check for excessive friction in selector 'H' slot or bind or drag in selector switch shaft.

Abutment Indicator Solenoid—Ground 'WR' prong of upper wiring harness jack. Use 'Abutment Indicator' test lamp in new kit or make up test lamp using 3 cp. bulb, clip one test lamp lead (H63) to battery cable terminal, touch other lead (G63 prod) to 'W' prong of jack. Lamp should burn with dull red glow. If lamp does not light, solenoid is open. If lamp burns brightly, solenoid is short-circuited. If ohmmeter used to check solenoid circuit, meter reading should be 10 ohms between 'W' and 'WR' prongs in upper wiring harness jack.

Shift Rail Switch—Use 'Abutment Indicator' test lamp (or 3 cp. test lamp mentioned above for Abutment Indicator Solenoid testing), disconnect lead (WR wire) on Shift Rail switch (left hand switch on transmission), connect test lamp between battery cable terminal and shift rail terminal. Use manual shift lever to shift transmission into Low and then into Reverse. Test lamp should remain lighted until each shift ¾ completed and should then go out. If lamp indicates switch not operating correctly, examine switch ball and see that it is free in pilot hole, replace switch.

Abutment Indicator Wiring—With 'WR' wire disconnected from shift rail switch, clip one test lamp lead to battery cable terminal, other lead to this 'WR' wire. Place selector lever in neutral. Lamp

ELECTRIC HAND CONT.

should not light. If lamp is lighted, Abutment Indicator wiring is shorted. Separate wiring harness jack. If lamp goes out, short-circuit is in upper wiring harness. If lamp remains lighted, short-circuit is in lower wiring harness.

Interlock Switch:—Use new Test Lamp Kit (connect leads used for Power Unit testing to each of three Interlock Switch terminals, connect 'H63' Gear Abutment test lamp lead to fourth terminal, ground G63 lead and regular test kit ground lead to engine), or connect 3 cp. test lamps between each Interlock Switch terminal and ground. Turn ignition on (do not start engine—use hand shift lever to shift transmission as required in tests), depress clutch pedal and hold in this position while making following tests:

1. With transmission in neutral, and selector lever in neutral, all four lamps should be lighted.
2. Shift transmission and selector lever to Low Gear position. Lamps connected to 'G' and 'GR' terminal only should light.
3. Shift transmission and selector lever to High Gear position. Lamps attached to 'GR' and 'RG' terminals only should light.

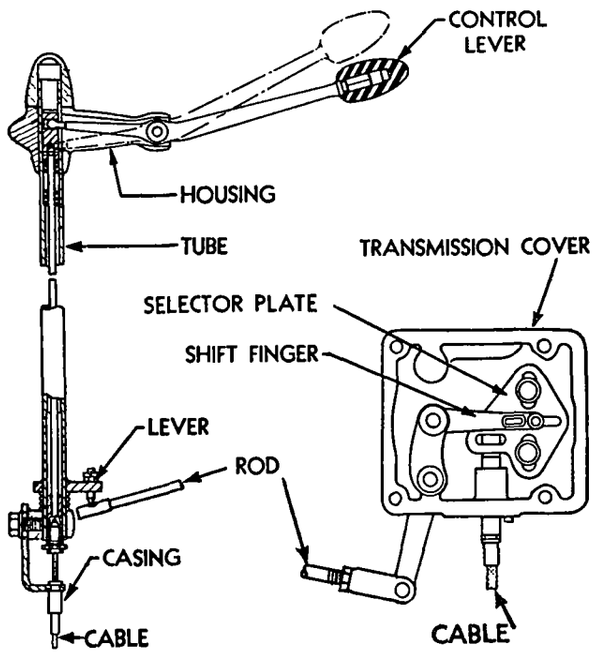
If lamps do not light in this order, or other lamps are lighted, remove and inspect or replace switch.

SERVICING:—Units serviced in same manner as previous model except for new units listed below.

Abutment Indicator:—To disassemble, take off end cap on left end of selector housing (turn cap counter-clockwise), pull solenoid out and rotate downward at same time being careful not to damage solenoid leads. Slide rotor out off shaft by using small bent wire or hook. When replacing rotor make certain that face with two steel detent balls is out (toward solenoid). To replace solenoid, part wiring harness jack at lower end of steering column, remove upper cover by bending back cover lugs, unsolder White and White-Red tracer wires, fasten length of small iron fish-wire to these wires and pull it into tube as other wires withdrawn. Use fish-wire to draw new solenoid leads into place (wires must be carefully straightened and laid parallel in tube), solder wires to correct jack prongs. When installing solenoid, make certain that leads not pinched, engage lug on solenoid in slot in housing, see that solenoid retaining spring in place in center of housing cap.

Interlock Switch:—To remove switch, take out three screws in cover, withdraw switch. To install switch, use manual shift lever to operate switch camshaft (swing lever from left to right) or push in on diaphragm rod until both cams are in line with center of shaft, slip switch into place. Make certain that switch gasket is in good condition, line up cover and gasket holes.

Diaphragm Replacement:—To disassemble Diaphragm Cylinder assembly, disconnect vacuum lines, take out four nuts and wire clip and remove valve assembly (valve assembly must be pulled away from cylinder endplate as nuts are turned off). Remove nut (bushing type) holding diaphragm housing to cylinder bracket, remove clevis, locknut and rod guard, take out six nuts in housing flange, remove rear half of housing and return spring. Pull diapragm and rod assembly out of front housing, unhooking camshaft operating link from camshaft arm by rotating floating sleeve as rod is pulled out. Remove diaphragm rod nut and diaphragm assembly. When reassembling, make certain that diaphragm rod nut is staked in place after installing diaphragm, hold diaphragm rod in (compressing return spring) so that spring will not distort housing halves while flange screws are being tightened. To check diaphragm seal, push diaphragm rod in, place finger over mounting hole. If seal is tight, rod will not move out.



HUDSON 1939 HANDY-SHIFT

Std. Equipment On:
ALL MODELS EXCEPT BUSINESS CARS (1939)

NOTE:—Handy shift control may be installed on Business Cars by dealers or secured from factory as option.

INSTALLATION ON EARLIER MODELS:—Field installation kits available for installation of Handy shift control on all 1937-38 Hudson and Terraplane models.

TYPE:—Handy shift remote control type with shift lever mounted on steering column beneath steering wheel. Shift lever linked to control rod and lever on transmission case (for gear engagement), selector

cable and selector plate in transmission cover (for cross-shift). Backward and forward movement of the shift lever rotates the control tube and actuates the lever on the transmission case which is linked to the shifter lug engaging the shifter shafts in the transmission. Up and down movement of the shift lever actuates the selector cable and moves the selector plate in the transmission sidewise so as to engage the shifter lug with the correct shifter shaft. Normal position of the lever is with the lug engaging the second-high shifter shaft (lever should be raised to engage low-reverse shifter shaft).

ADJUSTMENT:—Operating Rod (Gear Engagement)—Hand lever should be at right angles to center-line of car in neutral position. To adjust, disconnect operating rod by removing cotter pin and clevis pin in yoke at transmission end of rod. See that shift lever on steering wheel and lever on transmission case are in neutral position, loosen locknut and turn yoke on rod until clevis pin can just be inserted without disturbing position of either lever. Tighten locknut and connect rod.

Selector Cable (Cross-shift)—Place steering column shift lever in 'up' position (low-reverse) at neutral and block in this position while adjustment being made. Loosen selector cable conduit bracket capscrew at lower end of steering column and pull up on conduit bracket until all slack removed from cable and cross-shift shaft in transmission is fully over on low-reverse side. Tighten bracket capscrew. See that spring lock in cable has clearance at top and bottom of travel.

SERVICING:—Remove horn button and steering wheel to remove any part of handy shift steering column unit. See illustration for construction of transmission case end of unit.

HUPMOBILE TYPE

Used On:
ALL MODELS (1939)

NOTE:—Transmissions used with this type control are conventional except for shifter linkage in transmission case cover. See separate articles for Transmissin servicing data.

TYPE:—Remote control type with shift lever mounted on steering column beneath steering wheel. Shift lever linked by control rod to lever on side of transmission (for gear engagement) and by selector cable to small lever on transmission case cover (for cross-shift). Backward and forward movement of the shift lever actuates the control rod and gear engagement lever on the transmission case, up and down movement of the shift lever actuates the selector cable and small cross-shift lever on transmission cover. Normal position of the shift lever is in the lower (second-high) range and it must be lifted to engage low or reverse.

ADJUSTMENT:—Control Rod (Gear Engagement)—See that rods are properly connected at idler bell crank on frame side rail (bell crank short lever must point forward and be connected to steering column lever, bell crank long lever must point up and be connected to transmission lever). Disconnect forward control rod at lever on lower end of steering column. Set steering column shift lever in neutral position and parallel to dash. See that gear engagement lever on transmission case is in neutral position (determine by feel of detent engagement). Loosen locknut and adjust coupling on threaded end of control rod so that hole in rod coupling lines up with ball stud on steering column lever, tighten locknut and connect rod.

Selector Cable (Cross-shift)—See that cable conduit mounting bracket nuts on transmission cover are tight. Place steering column shift lever in neutral position of second-high range (lever mounted down away from steering wheel and parallel to dash). Disconnect cable from lever on transmission cover by removing nut on ball stud, place lever in second-high (forward position), loosen locknut and adjust coupling on threaded end of selector cable so that ball stud lines up with second hole from end of cross-shift lever, tighten nut and connect cable to lever.

EVANS-NASH (FIRST) VACUUM TYPE

Optional Equipment On:

NASH AMBASSADOR 6, MODEL 3820 (1938)
NASH AMBASSADOR 8, MODEL 3880 (1938)
NASH-LAFAYETTE, MODEL 3810 (1938)

NOTE:—Transmission used with this type shift control is similar to standard model except for special shifter mechanism. See Nash Transmission article for Transmission servicing data.

GEAR ENGAGEMENT WITH ENGINE NOT RUNNING:—Gears cannot be engaged by means of dash gear shift lever with engine not running (no vacuum). If engine is to be started by engaging gears and towing or coasting car, raise engine hood on right hand side, move connecting rod (between shift cylinder and transmission) slowly to the rear. This will engage high gear.

TYPE:—Consists of miniature gear shift control unit on instrument panel and power units mounted on engine (Diaphragm unit for cross-shift mounted on right side of transmission case, Shift Cylinder and Valve Assembly for gear engagement mounted on bracket on right side of crankcase). Units operated by vacuum (connection to manifold on left side of engine) and controlled by dash gear shift lever as follows:

Diaphragm Unit (Cross-shift)—Control valve for Diaphragm unit located on back of instrument panel control unit. When gear shift lever moved to left at neutral (for low or reverse engagement), valve opens vacuum line to diaphragm chamber, diaphragm moves out against spring pressure and shifts rear end of shift cylinder connecting rod and transmission actuating lever away from transmission case to enage the low-and-reverse shifter shaft in the transmission. When gear shift lever moved to right at neutral (for second or high engagement), the control valve cuts off the vacuum to the Diaphragm unit and vents the diaphragm chamber to the atmosphere. The spring then moves the connecting rod and actuating lever toward the transmission case to engage the second-and-high shifter shaft. This is the normal position of the actuating lever.

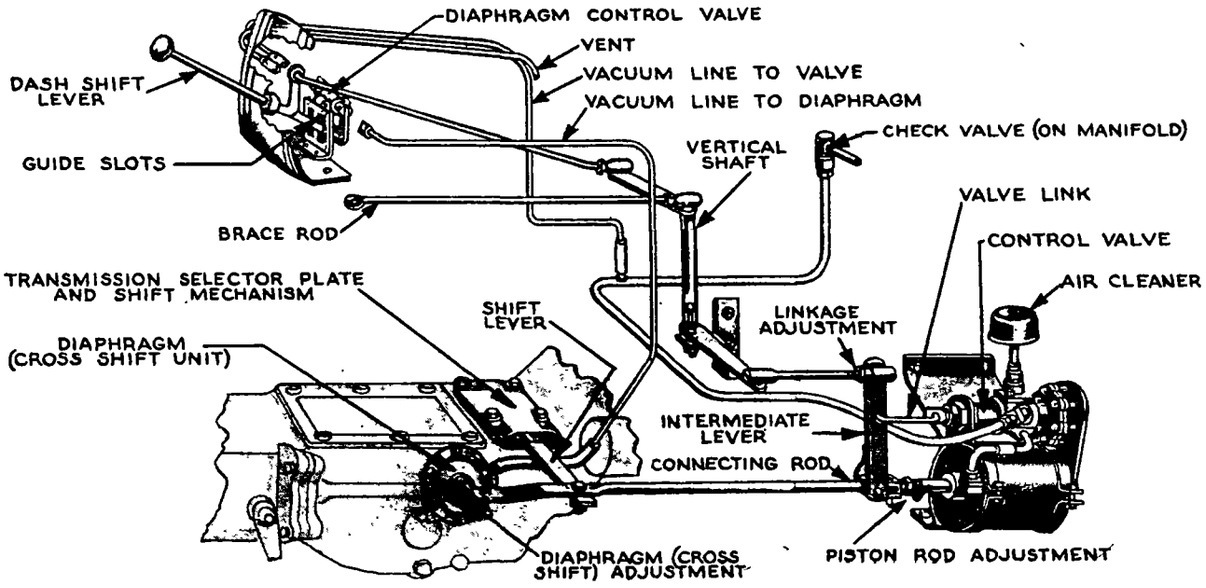
Shift Cylinder (Gear Engagement)—Selector valve for Shift Cylinder is combined piston and diaphragm type controlling air and vacuum admission to each end of cylinder. Valve is linked to dash gear shift lever through intermediate vertical lever pivoted on shift cylinder connecting rod at piston rod end. When gear shift lever moved either forward (reverse or second) or backward (low or high), valve stem movement admits air into one end of cylinder but without cutting off vacuum connection to opposite end (cylinder normally vacuum-suspended) so that piston moves toward vacuum end and resultant connecting rod and actuating lever movement engages gears. The vertical intermediate lever moves with the connecting rod and tends to balance the shift cylinder so that the piston movement follows the dash gear shift lever movement exactly. When shift is completed (or dash lever movement stopped), piston remains stationary in that position until a new shift is made by the dash gear shift lever (or lever is returned to neutral).

Clutch Pedal Vacuum Lock—Consists of a main control valve mounted on the vacuum cylinder and connected in vacuum line between manifold and vacuum power unit. This valve operated by clutch pedal (linked to lever on right hand end of clutch throwout shaft) so that vacuum shift operative only with clutch disengaged.

ADJUSTMENT:—Whenever linkage disconnected or disturbed by removal of other units, adjust in following order and then check operation as directed below.

Diaphragm (Cross-Shift) Unit:—With diaphragm link disconnected from connecting rod, adjust length of link (loosen locknut at swivel joint, turn swivel joint) or bend end of connecting rod so that diaphragm cross-shaft must be pulled out ⅛" before link can be connected to connecting rod. This will prevent cross-shaft bottoming in diaphragm in operation. See that linkage permits full right and left movement of transmission actuating lever (approximately 9/16" travel), adjust by bending connecting rod.

Transmission Selector Plate Alignment—Make certain that selector plate slot lines up with slots in shifter shafts in transmission cover. To adjust, loosen two screws on plate. Misalignment of plate will interfere with cross-shift operation.



Shift Cylinder Piston Rod Length:—With piston rod disconnected from forward end of connecting rod, make certain that connecting rod and actuating lever is in neutral position (check by moving lever back and forth for cross-shift), place piston in mid-position in cylinder (pull piston rod out until distance from extreme rear edge of cylinder packing gland to locknut seat on end of rod is exactly 2 5/16"), adjust piston rod clevis by loosening locknut and turning clevis until pin can just be inserted in clevis and connecting rod, tighten locknut.

Linkage Adjustment:—After adjusting Diaphragm and Shift Cylinder, place dash gear shift lever in neutral position, loosen nut on ball connector at top of intermediate lever, shift connector (hole is slotted) until center of connector is exactly 5 5/16" above pivot pin at lower end of intermediate lever, tighten ball connector nut. Adjust length of rod attached to this ball connector (rod links intermediate lever and lever on vertical shaft at left rear of engine) by loosening locknut at forward swivel joint and turning rod until selector valve is in neutral position (vacuum line open to both ends of cylinder) and distance from extreme outer end of valve housing to end of stem (end of cylindrical stem rod) is ¼". With correct setting, all pivot points on intermediate lever should be in nearly vertical line and end pins should be exactly 5 5/16" apart.

To Check Linkage Adjustment—Disconnect vacuum line from engine at selector valve, make certain that dash gear shift lever and transmission actuating lever are in neutral position, run engine, connect vacuum line momentarily. If shift cylinder piston tends to move to rear, rod at upper end of intermediate lever should be shortened slightly; if piston moves forward, rod should be lengthened slightly (adjust rod as directed in preceding paragraph).

Vacuum Lock Adjustment:—Should be adjusted so that valve opens just after clutch is definitely released. Check with car in gear and clutch pedal depressed to point where clutch is free. Vacuum lock valve should be closed but should open with slight additional pedal depression. To adjust, make certain that clutch pedal adjusted for correct 1" (max.) free pedal travel, loosen trunnion clamp bolt on clutch throw-out shaft lever, move trunnion toward flanged end (spring end) of trunnion sleeve on vacuum lock connector rod for earlier valve opening (move trunnion away from flange for later opening), tighten trunnion clamp bolt and check performance.

NOTE—When installing the trunnion sleeve and spring assembly on the vacuum lock connector rod, install forward lock block exactly 3¾" from end of operating rod, install spring, sleeve (with flanged end toward spring), engage throw-out shaft lever trunnion on sleeve, install rear lock block moving block on rod until sleeve compresses spring 1/16", hook return spring to hole in rear end of rod and to hole in frame X member, adjust trunnion on sleeve as directed above. With correct adjustment trunnion should be approximately centered on sleeve with clutch engaged.

EVANS-NASH (FIRST) TYPE CONT.

Checking Vacuum Shift:—Make following tests to determine if linkage adjustments correct and shift mechanism operating satisfactorily:

1. With engine running, disengage clutch, place dash shift lever in low gear position, engage clutch, check gear engagement. Then disengage clutch, shift dash lever to high gear, engage clutch. If transmission is still in low gear, rod at upper end of intermediate lever is too long and should be shortened slightly.
2. Repeat above test engaging Reverse and then Second gear. If transmission does not shift out of Reverse, intermediate lever rod is too short and should be lengthened slightly. See adjustment above.

TROUBLE SHOOTING:—If Transmission operation unsatisfactory, check following points:

1. **Does not shift into any gear.** Check all vacuum lines for leaks, tighten connections. Examine check-valve in vacuum line connection at engine (this valve designed to prevent pressure in manifold, caused by backfires, from entering lines). See that linkage operates freely, lubricate pivots and ball connectors.
2. **Does not shift into Low or Reverse.** Check vacuum line from main line to diaphragm valve on dash unit, vacuum line from dash unit to Diaphragm, tighten connections. Check Diaphragm adjustment and selector plate alignment in transmission cover, check connecting rod adjustment.
3. **Does not shift from Low-to-High or Reverse-to-Second.** Check linkage adjustment (intermediate lever rod too long or too short).
4. **Transmission slips out of gear.** See that rod linking dash gear shift lever and lever at top of vertical shaft is free from interference and not striking body in any position.

CONDITIONED-AIR CAR NOTE:—Transmission control dash unit can be removed on these cars without disturbing any part of air-conditioning unit by removing Glove Compartment and Ash Tray first.

EVANS-NASH (LATER) VACUUM TYPE

Optional Equipment On:

NASH LAFAYETTE, MODEL 3810 (LATE 1938)
NASH AMBASSADOR 6, 3820 (LATE 1938)
NASH AMBASSADOR 8, 3880 (LATE 1938)

NOTE:—This type control used on cars beginning with following serial numbers—(3810) LH-13214 & LR-70845, (3820) N6-19595, (3880) N8-8048.

TYPE:—Design similar to that used on early 1938 cars except that vacuum diaphragm not used, mechanical cross-shift linkage provided (with new type shifter mechanism in transmission) and clutch pedal operated Vacuum Lock used as follows:

Transmission Shift Mechanism—Gear engagement lever is linked to center of pivot plate which engages pin on each shifter shaft so that lever movement (to engage gears) causes pivot plate to pivot on one shifter shaft pin (locked in place by cross-shift lever cam) and actuate opposite shifter shaft (unlocked by cross-shift lever cam). No actual cross-shift movement of gear engagement lever occurs (shifter shaft movement depends on shaft lock being freed by cross-shift lever). Cross-shift lever cam has two recesses which permit interlock pins (below cam) to move out of engagement with notch in shifter shaft when cam recess aligns with pin. NOTE—In forward cross-shift lever position, left hand (Second & High) shifter shaft is free; in rear position, right hand (Low & Reverse) shifter shaft is free.

Cross-shift Linkage—Consists of a separate linkage between the instrument panel shift lever and a vertical shaft (within gear engagement vertical shaft on 3820, 3880, mounted separately on 3810) which is linked to a cross-shift lever and shaft on the transmission cover. Cross-shift is mechanical and does not employ vacuum power.

Clutch Pedal Vacuum Lock—Consists of a main control valve mounted on the vacuum cylinder and connected in vacuum line between manifold and vacuum power unit. This valve operated by clutch pedal (linked to lever on right hand end of clutch throwout shaft) so that vacuum shift operative only with clutch disengaged.

ADJUSTMENT:—Adjustments are made differently than on first type control. Make adjustments in order as follows:

Cross-Shift Linkage:—Disconnect adjustable rod (which links lever at lower end of vertical shaft to intermediate lever on piston rod connector link) at vertical shaft end. Place instrument panel gear shift lever in Reverse Gear position, move gear engagement lever on transmission case in neutral position, pull piston rod out of vacuum cylinder so that distance from outer face of piston rod boss on cylinder to inner face of piston rod locknut is exactly 2 5/16" and see that piston rod link pin is centered in elongated hole of connector. Disconnect cross-shift rod (which links instrument panel shift lever cross-shift shaft to lever on top end of vertical shaft) at vertical shaft lever end, move cross-shift cam lever on transmission case to extreme rear position, adjust trunnion on right hand end of cross-shift rod so that ball joint end slips freely into hole on vertical shaft lever, connect rod. Connect adjustable rod between vertical shaft and piston rod intermediate levers.

Gear Engagament Lever Adjustment:—Place instrument panel shift lever in Low Gear position. Adjust rod linking lever at lower end of vertical shaft to intermediate lever on piston rod connector (adjustable ball joint end and locknut at intermediate lever end of rod) so that when instrument panel shift lever moved from low gear to neutral position it is free to cross over to second-high side just before lever shank contacts reverse offset in shifter gate (guide plate on back of instrument panel unit).

Clutch Pedal Vacuum Lock:—Should be adjusted so that valve opens just after clutch is definitely released. Check with car in gear and clutch pedal depressed to point where clutch is free. Vacuum lock valve should be closed but should open with slight additional pedal depression. To adjust, make certain that clutch pedal adjusted for correct 1" (max.) free pedal travel, loosen trunnion clamp bolt on clutch throw-out shaft lever, move trunnion toward flanged end (spring end) of trunnion sleeve on vacuum lock connector rod for earlier valve opening (move trunnion away from flange for later opening), tighten trunnion clamp bolt and check performance.

NOTE—When installing the trunnion sleeve and spring assembly on the vacuum lock connector rod, install forward lock block exactly 3¾" from end of operating rod, install spring, sleeve (with flanged end toward spring), engage throw-out shaft lever trunnion on sleeve, install rear lock block moving block on rod until sleeve compresses spring 1/16", hook return spring to hole in rear end of rod and to hole in frame X member, adjust trunnion on sleeve as directed above. With correct adjustment, trunnion should be approximately centered on sleeve with clutch engaged.

NASH 1939 TYPE

Optional Equipment On:

NASH-LAFAYETTE, MODEL 3910 (1939)
NASH AMBASSADOR 6, MODEL 3920 (1939)
NASH AMBASSADOR 8, MODEL 3980 (1939)

NOTE:—This type control used in conjunction with special transmission with constant-mesh gears (all speeds). See separate article on Nash Transmission for Transmission servicing data.

TYPE:—Remote control tube with shift lever mounted on upper end of control tube under steering wheel. Control tube is mounted on bracket on steering column (upper end) and bracket on frame (lower end) to provide both forward-and-backward motion (for gear engagement), up-and-down motion (for cross-shift at neutral). Operating mechanism at lower end of steering column consists of a gear segment on the lower end of the control tube which meshes with one of two gear segments mounted on ends of two concentric cross-shafts. Levers at opposite ends of these shafts are connected to shift levers on transmission case by rods. Cross-shaft assembly is mounted on ball-and-socket type joints on frame bracket (left end), bracket on crankcase (right end) and outer shaft is mounted on ballbearings on inner shaft. A selector pin in the lower end of the shift lever control tube and a slotted selector plate on the bottom of the lower mounting bracket permits cross-shift to be made only in neutral position and also limits movement of shift lever in the various gear engaged positions. This cross-shift consists of lifting the shift lever and control tube assembly so that the control tube gear segment is lifted out of mesh with the cross-shaft lower gear segment (on inner shaft and connected to the forward or second-high shifter lever on the transmission case) and meshed with the cross-shaft upper gear segment (on outer shaft and connected to rear or low-reverse shifter lever on transmission). A centering spring on a rod connected between a bracket on the control tube lower mounting bracket and a lever on the lower end of the control tube assists in retaining shift lever in neutral or engaged positions and facilitates the lever return to neutral.

ADJUSTMENT:—See that clearance between upper edge of selector pin in lower end of control tube and lower face of selector plate is 1/64" with shift lever in lower or second-high position (adjusted by changing position of upper mounting bracket—see Servicing data below). Disconnect rods linking cross-shaft levers and shift levers on transmission case, place steering column shift lever in neutral (selector pin in line with notch in selector plate), see that forward shift lever on transmission case in neutral position (detent plunger engaging center notch on shifter shaft sector), loosen ball stud mounting nut on inner cross-shaft lever (long lever, nearest engine), adjust position of ball stud so that rod can be connected without disturbing shift lever or transmission case lever, tighten ball stud nut. Adjust outer cross-shaft lever (small lever, nearest frame) ball stud in same manner with rear transmission lever in neutral and shift lever engaging upper gear segment with selector pin in line with selector plate slot. Check operation to make certain

NASH 1939 TYPE CONT.

that cross-shafts operate freely and that levers and rods do not interfere with other parts in any position or during engine movement.

SERVICING:—Control Tube Upper Mounting Bracket—Mounted on steering column by clamp bolts. Adjust position of bracket on steering column so that clearance between upper edge of selector pin in lower end of control tube and lower face of selector plate is 1/64" with shift lever in lower or second-high position.

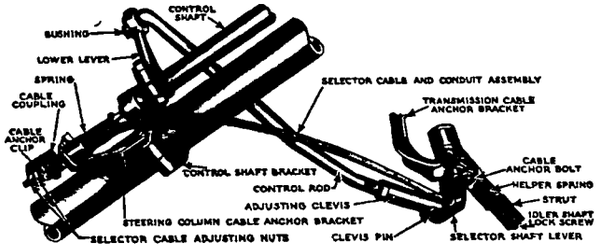
Cross-Shaft Assembly:—Outer shaft ball bearing cups are driven in ends of shaft and bearing cones are fitted on inner shaft. Bearings should be packed with adhesive oil and rubber seal installed at outer end. Adjust by positioning second-high lever on inner shaft to control bearing endplay (lever is keyed to shaft and locked by clamp bolt.

Cross-shaft Adjustment—Gear segment mesh controlled by left hand (frame bracket) shaft mounting stud. To adjust, loosen locknuts on stud, turn stud with screwdriver to position shaft assembly so that gear segments mesh freely with minimum clearance, tighten both locknuts. Shaft is spring-loaded on engine bracket mounting stud to keep shaft in contact with frame bracket stud.

OLDSMOBILE 1939 HANDI-SHIFT

Std. Equipment On:

SERIES 60 SIX, MODEL F-39 (1939)
SERIES 70 SIX, MODEL G-39 (1939)
SERIES 80 EIGHT, MODEL L-39 (1939)



NOTE:—Transmission used with this type control similar to that used on previous models except for shifter mechanism (selector shaft with two fingers which engage slots in shifter shafts—endwise movement of shaft for cross-shift at neutral insures that only one finger engaged at a time). See separate article for complete Transmission servicing data.

TYPE:—Handi-shift remote control with steering column mounted shift lever. Shift lever pivoted on bracket on upper end of control shaft on steering column so that up-and-down motion of lever actuates selector rod (within control shaft) and selector cable (for cross-shift) while backward-and-forward motion of lever rotates control shaft and actuates control rod (for gear engagement). Shift lever normally held down in Second-High position by spring on lower end of selector rod and must be raised against spring tension for Low-Reverse.

ADJUSTMENT:—Selector Cable—See that shift lever and transmission gears in neutral position, measure distance from lower edge of steering wheel rim to upper edge of shift lever. Distance should be 2 7/16-2 9/16". To adjust, back off one nut on cable coupling at lower end of selector rod (top nut to increase distance, lower nut to decrease distance), tighten opposite nut. Make certain that both nuts tight after making adjustment.

Control Shaft Rod—With shift lever and transmission gears in neutral, shift lever should be approximately 1½" above (forward) horizontal position. To adjust, take out clevis pin at selector shaft lever (transmission case) end of control rod, make certain that transmission gears and selector shaft lever in neutral position, place shift lever in neutral position, install J-1082 gauge on selector cable anchor bracket on steering column so that control rod end (extending through control shaft lever) engages slot in gauge. Loosen locknut and adjust clevis on transmission case end of control rod until clevis pin can be entered in clevis and selector shaft lever freely, tighten locknut. NOTE—This adjustment should be made whenever control rod is disconnected at either end.

SERVICING STEERING COLUMN UNIT:—To remove shift lever, use tool J-1044 to press in on both pivot pins and release lever. Use care not to lose pivot pins and spring or tension spring in socket on inner end of lever. Lever clearance in bracket controlled by shims assembled on pivot pins. Install shims as required to secure free fit but make certain that anti-rattle washer installed on one pin. When installing lever, make certain that tension spring in place in inner end of lever and that lever tip is inserted under plunger and plunger spring in upper end of control shaft.

SERVICING TRANSMISSION UNIT—Disassembly—Disconnect control rod from selector shaft lever, and selector cable clip from transmission case cable anchor bracket. Unscrew cable from selector shaft, remove cable, selector shaft lever and springs (selector cable connector locks lever on shaft). Remove transmission cover, use tool KMO-244 to take out setscrews in selector shaft shift fingers, withdraw shaft through side of case being careful not to drop shift fingers or cams into transmission case. Do not remove selector shaft oil seal unless new seal to be installed (seals cannot be re-installed).

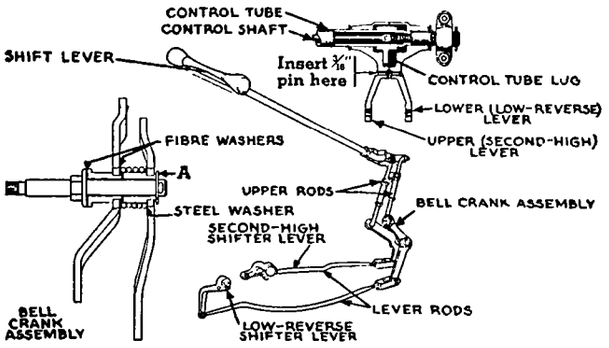
Reassembly—With selector shaft installed in transmission case, place special aligning tool J-1066 in end of shaft (where selector cable normally attached), position selector cable anchor bracket so that tool is centered in anchor bracket selector cable slot, tighten anchor bracket mounting bolt. This adjustment important to preserve selector cable alignment and prevent wire binding in cable conduit. Remove tool, install selector shaft lever, selector cable (make certain that cable screw tight in selector shaft and that cable clip tight on anchor bracket), control rod and lever spring.

NOTE—Selector shaft lever spring has over-center linkage (no tendency to rotate shaft in neutral position) and must be correctly installed. Spring link must be below selector shaft and hooked to pin on transmission side of lever.

TROUBLE SHOOTING:—If operation unsatisfactory, check selector cable and control rod adjustment as given above. If transmission shifts hard in all gears, check transmission oil and make certain that correct grade being used.

PACKARD 1939 HANDI-SHIFT

Used On:



PACKARD, ALL MODELS (1939)

SPECIAL SERVICE CAUTIONS:—Excessive vibration of shift lever or rattles at bellcranks may be caused by lubrication of bellcrank levers. See Bell Crank Friction Dampeners under Servicing (below) for adjustment and correction of this condition.

Control lever misalignment—When working on car in proximity to control rods or shift levers on transmission case, always install 3/16" lock pin through alignment holes in both levers on lower end of control tube on steering column to prevent accidental gear engagement (which can occur without movement of shift lever). **If this occurs, shift lever cannot be operated until gears and control rods reset in neutral position.**

TRANSMISSION SERVICING NOTE:—See separate articles for complete servicing data on transmission used with this type control.

TYPE:—Handi-shift, remote control type with shift lever mounted on steering column below steering wheel. Shift lever is mounted on control tube which has a lug at the lower end to engage the operating levers which are mounted loosely on the lower end of the tube (these levers connected by rods to shift levers on transmission case cover). The lug normally engages the upper (Second-High) lever and is

moved down to engage the lower (Low-Reverse) lever by lifting up on the shift lever which depresses the lug control shaft within the control tube (this shaft spring-loaded by spring at lower end). Each lever is connected to an individual lever on the transmission case by two adjustable rods and an intermediate bell crank (top lever on control shaft connected to left hand bell crank and forward lever on transmission, lower lever on control tube connected to right hand bell crank and rear lever on transmission). Interlock and detent balls and plunger are located in transmission cover and engage notches in sectors on the shifter lever shafts.

ADJUSTMENT:—See that steering column shift lever in neutral, insert 3/16" rod or drill through alignment holes in both levers at lower end of control tube and leave this pin in place while adjustment being made. Disconnect control rods at bell cranks, place shifter levers on transmission in neutral position (determine by feel when detent ball engages center

PACKARD 1939 HANDI-SHIFT CONT.

notch on shifter lever shaft sector within case). Adjust both control rods at each bell crank (adjust upper rod by loosening locknuts and turning adjusting sleeve, adjust lower rod by loosening locknut and turning clevis at bell crank end of rod) so that lengths are correct, connect rods, remove locking pin from alignment hole in steering column levers.

SERVICING:—Bell Crank Friction Dampeners—Bell crank levers are spring-loaded and assembled with special friction washers to provide dampening effect and prevent noise or rattles (see illustration). To check adjustment, disconnect all rods at bell cranks, connect spring scale at upper end of longest (left hand) bell crank. Force required to move lever should be 2-3 lbs. If adjustment not correct, remove cotter pin and add additional washers under end washer 'A' to increase friction.

CAUTION—Bell cranks must not be lubricated (bushings are oil-impregnated type and shaft is zinc-plated). Lubrication will reduce dampening effect and may cause rattles or excessive vibration at steering column shift lever. If bell cranks have been oiled, disassemble, wash in gasoline, and reassemble dry.

PONTIAC 1938 SAFETY-SHIFT

Optional Equipment On:

PONTIAC SIX, MODEL 38-26DA (1938)

PONTIAC EIGHT, MODEL 38-28DA (1938)

NOTE:—Transmission used with this control similar to standard model except for special shifter mechanism. See Pontiac Transmission article for Transmission servicing data.

TYPE:—Consists of special shift lever assembly mounted on steering column and linked by Shift Control Rod and Selector Control Cable to special type shift lever and selector plate and shift bar assembly in transmission case cover. Provides remote control with conventional cross and endwise movement of the shift lever. Shift lever under steering wheel is mounted on pivot which is integral with shifter shaft. Inner end of lever extends through pivot fulcrum to engage selector rod within shifter shaft. This selector rod linked to selector plate in transmission by selector cable so that movement of shift lever toward-or-away from steering wheel shifts selector plate sidewise to engage low-and-reverse or second-and-high shifter fork. Steering column shifter shaft (on which shift lever mounted) is linked to pivot shaft outer lever on transmission case so that forward-and-backward movement of the shift lever rotates the pivot shaft and the lever at the inner end engages the gears.

ADJUSTMENT:—Adjustments provided in both selector linkage (selector control cable) and engagement linkage (shift control rod) for correct position of shift lever in neutral position as follows:

Selector Control Cable—Clearance between shift lever and underside of steering wheel should be 2 11/16 - 2 13/16" with lever in normal position at neutral. To adjust, remove front floor center plate and inspection hole cover on transmission case cover, back off one locknut and tighten opposite nut on selector control cable end at selector plate hook (one nut at each side of hook, move both nuts toward end of flexible wire cable to move shift lever away from wheel, or in opposite direction to move lever toward wheel). Tighten nuts securely.

Shift Control Rod—Shift lever should be horizontal in neutral position. To adjust, loosen locknut at inner end of control rod ball stud on transmission case pivot shaft outer lever, turn stud (stud is eccentric), tighten locknut securely.

Shift Control Rod Endplug Assembly—Whenever rod is disconnected or endplug assemblies disturbed, make certain that parts are installed in correct order and adjust by turning plug tightly in seat assembly and then backing plug off ⅛-⅜ turn before installing cotter pin.

SERVICING:—Disassembly. Remove front compartment floor mat and center floor panel, steering wheel (Use Puller J-1143), shift lever (use Tool J-1140 to compress pivot fulcrums, be careful not to lose fulcrum cups, springs, shims, and anti-rattler washer when lever is pulled out). Disconnect steering column bracket mounting bolts and loosen bracket clamp bolt (Use #4 Phillips screwdriver), remove left hood side panel, disconnect horn button, remove pedal plates. Disconnect selector control cable at lower shift shaft support (use #2 Phillips screwdriver), remove support, disconnect control rod at upper end. Loosen upper support locking bolt (use #2 Phillips screwdriver), pull upper support and shaft assembly up on steering column, sliding rubber grommet up to steering column bracket and then removing both grommet and bracket off upper end of steering column jacket as shift shaft assembly is removed. Pull selector rod out through top of shift shaft. This completes disassembly of steering column unit. To disassemble transmission case unit, remove nut and pull out outer lever off pivot shaft, remove inspection hole cover, loosen locknut on selector cable end, lift cable out of selector plate hook, disconnect cable at side of transmission case and pull cable out being careful not to kink cable. Remove transmission cover screws and lift cover off.

Servicing—Whenever control disassembled, lubricate all threads, plugs, plungers, bearings, ball joints, and anti-rattle springs with Lubriplate. Do not apply lubricant to rubber anti-rattle sleeve on control rod (if sleeve not in place at approximate center of rod, wrap rod with tape to ⅜" maximum diameter).

Assembly—Reverse disassembly directions. Make certain that all springs and plungers replaced in same relative positions. Excessive looseness in shift lever can be corrected by installing extra shims on upper fulcrum cup. Selector control cable must be assembled so that it passes below brake tube.

PONTIAC 1939 SAFETY-SHIFT

Std. Equipment On:

QUALITY SIX, MODEL 39-25 (1939)

DELUXE SIX, MODEL 39-26 (1939)

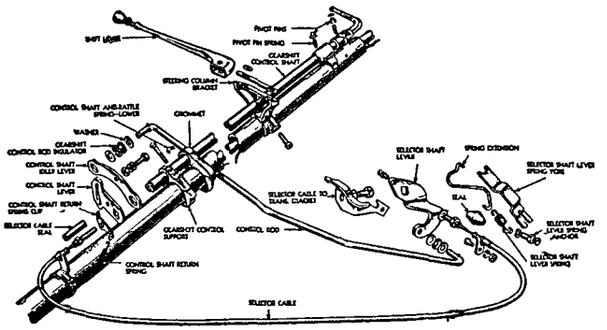
DELUXE EIGHT, MODEL 39-28 (1939)

NOTE:—Transmission used with this type control similar to that used on previous models except for shifter mechanism (selector shaft with two fingers which engage slots in shifter shafts—endwise movement of shaft for cross-shift at neutral insures that only one finger engaged at a time). See separate article for complete Transmission servicing data.

TYPE:—Safety-shift remote control with shift lever mounted on steering column under steering wheel. Shift lever pivoted on bracket on steering wheel and engages shank of steering column control shaft so that up-and-down movement actuates selector cable (for cross-shift) and forward-and-backward movement actuates control rod (for gear engagement). Control shaft and shift lever held down in Second-High position by spring hooked to clip on lever at lower end of control shaft and must be raised against spring tension for Low-Reverse.

ADJUSTMENT:—See that ⅛" clearance exists between control shaft upper bearing flange (shift lever pivot) and upper face of steering column support bracket (necessary for free movement of shift lever as bearing screws in and out of bracket as shaft rotates). Adjust by removing shift lever and screwing bearing in or out of bracket (see Servicing section below for directions). Adjust selector cable and control shaft lever as follows:

Selector Cable—Loosen locknut and turn selector cable screw in or out of control shaft lower end until distance from lower edge of steering wheel rim to upper edge of shift lever is 2⅞-3⅛" (turn screw in to raise lever, out to lower lever) in neutral position with control shaft retracting spring connected to hold shaft down in second-high position. Tighten locknut securely and replace rubber cable seal after making adjustment.



Control Rod Lever—With transmission selector shaft in neutral, steering column shift lever should be approximately horizontal. To adjust, loosen clamp bolt which locks idler lever and control shaft lever together (at lower end of control shaft), shift idler lever and control rod in relation to short shaft lever, tighten clamp bolt. NOTE—Shift lever can be lowered (moved toward driver) up to 1½" in neutral position if desired for less reach in shifting.

SERVICING STEERING COLUMN UNIT:—Disassembly. Remove steering wheel (use J-452 puller), remove shift lever (use J-1044 tool) by pressing in on pivot pin on either side of lever until pins clear holes in lever, being careful not to lose pivot pins and springs or anti-rattle spring in end of control shaft (within shift lever). Disconnect selector cable by unscrewing adjusting screw from lower end of control shaft, remove control rod and lever assembly (do not loosen clamp bolt locking both levers together—if this bolt loosened, levers must be adjusted when re-installed). Loosen clampscrews on control shaft lower support, remove support being careful not to lose flat anti-rattle spring which is in support keyway. Remove upper support screws from steering column mast jacket (use Phillips #2 screwdriver), pull upper support and control shaft upward parallel with steering column being careful not to lose anti-rattle spring and cup located in hole in underside of upper support.

PONTIAC 1939 TYPE CONT.

Servicing—Clean all parts and apply Lubriplate or Delco Brake Lubricant as follows: inner and outer faces of control shaft upper bearing, shift lever pivot pin holes, pivot pins and springs, control shaft ends and flat at top, shaft hole in lower control shaft support, threaded hole in upper control shaft support, anti-rattle springs and cups.

Reassembly—Reverse disassembly directions given above. Make certain that anti-rattle spring installed in end of control shaft within shift lever, on one shift lever pivot pin, in cup in upper support bracket, and in lower support bracket keyway. Adjust selector cable and control shaft levers as directed in Adjustment Section above.

IMPORTANT NOTE—When installing control shaft upper bearing in upper support bracket, see that clearance between bearing flange and bracket is ⅛" (bearing screws in and out of bracket as shaft is rotated). Turning bearing ½ turn will change clearance 1/32".

SERVICING TRANSMISSION UNIT:—Disassembly. Remove bolt in cable clip on transmission case bracket, back off cable screw in end of selector shaft, remove cable (this screw also holds selector shaft lever on shaft), remove selector lever and lever spring (spring is over-center type and has no tendency to rotate lever with shaft in neutral position). Remove transmission case cover, free shift fingers from selector shaft (use special J-1046 tool to back out setscrews locking fingers on shaft), withdraw shaft.

Servicing—Clean parts and apply Lubriplate to transmission end of control rod (do not lubricate steering column end of rod which would damage rubber insulator), over-center spring yoke anchor, and selector shaft lever pin groove.

Reassembly—Reverse disassembling directions. Make certain that selector shaft lever spring is correctly installed.

TROUBLE SHOOTING:—Shift Lever position incorrect—Adjust as directed in Adjustment section above.

Shift Lever rattles or has excessive play—Install extra washers on shift lever pivot pins (make certain that one anti-rattle washer always used).

Shift Lever travel excessive—See that threaded selector cable end tight in selector shaft at transmission, tighten selector cable anchor bracket mounting bolt.

Shift Lever sticks or does not return to Second-High side at Neutral—See that selector cable not kinked or bent at sharp angles and that return spring correctly hooked to control shaft lower end and to underside of selector cable clip on steering column.

Shift Lever vibrates on rough roads—See that control shaft return spring correctly connected (above).

Control Shaft, Rod, or Cable rattles—See that anti-rattle spring installed between control shaft and lower support on steering column. Install special anti-rattle spring, #501772, on selector cable to prevent rattling against steering column, wrap speedometer cable with tape to prevent contact with cable.

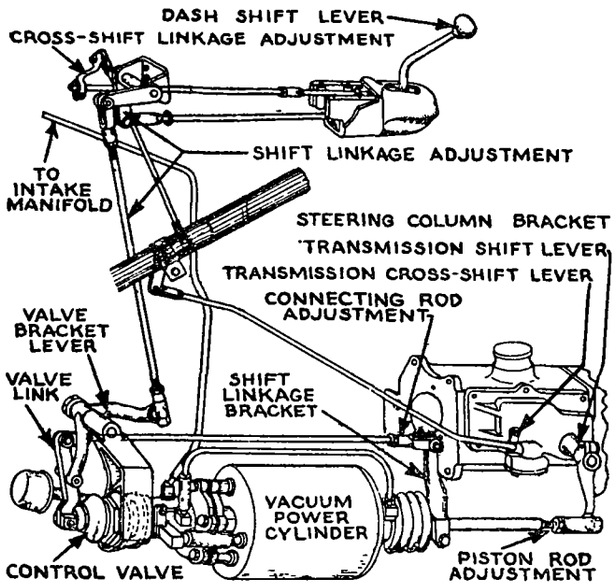
EVANS-STUDEBAKER VACUUM TYPE

Optional Equipment On:

STUDEBAKER COMMANDER (SIX), 7A (1938)
STUDEBAKER STATE COMMANDER (COMM.), 8A (1938)
STUDEBAKER PRESIDENT, MODEL 4C (1938)

NOTE:—Transmission used with this type shift control is similar to standard model except for special shifter mechanism. See Studebaker Transmission article for Transmission servicing data.

TYPE:—Remotely controlled, vacuum operated (see note), mechanical gear shift. Control unit on dash consists of miniature gear shift linked to selector lever on transmission case (for cross-shift to engage Low-Reverse or Second-High shifter rails) and to intermediate lever on valve-and-vacuum-cylinder linkage (for gear engagement). Dash shift lever operates selector lever for cross-shift at neutral mechanically without vacuum power, but when shift lever moved forward (Reverse or Second) or backward (low or High) this motion first operates valve which admits air to one end of vacuum cylinder but without cutting off vacuum connection to opposite end (cylinder normally vacuum suspended) so that piston moves toward vacuum end of cylinder and, as piston rod connected directly to shift lever on side of transmission case, this motion engages gears. The valve linkage moves with the piston rod and valve tends to balance the vacuum cylinder so that piston follows dash shift lever movement exactly. When shift is completed (or when dash shift lever is stopped in any position), piston remains stationary in that position until a new shift is made with the dash shift lever (or lever is returned to neutral).



NOTE—Gears can be engaged by dash shift lever when engine is not running (no vacuum) although additional effort required. This will allow engine to be started by engaging gears and towing or coasting car when necessary.

CHECKING & ADJUSTMENT:—Whenever linkage disconnected or disturbed by removal of other units, check and adjust entire mechanism in order as directed below.

Selector (Cross-shift) Linkage:—Move dash shift lever to extreme left hand side of cross-slot at neutral and hold in this position while adjustment being made. Disconnect connecting rod at lever on front of dash (upper right hand dash unit shaft), see that selector lever on transmission (front short lever) is in extreme forward position, adjust connecting rod length so that it can just be connected to lever without disturbing dash shift lever or selector lever.

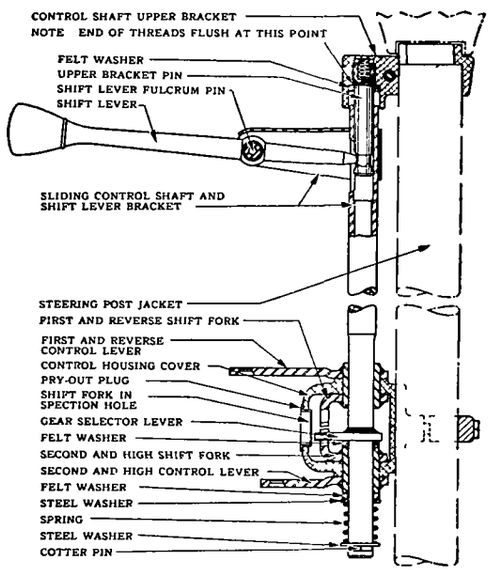
Dash Unit Shift Linkage:—With dash gear shift lever in neutral, adjust length of connecting rod (lower dash unit rod) between dash unit and lever on cross-shaft on front of dash so that this lever (to which rod attached) is parallel with front face of dash.

Vacuum Cylinder Piston Rod:—Make certain that shift lever on side of transmission case (rear lever) is in neutral position (check by moving lever back and forth for cross-shift which can be made only at neutral), measure distance from extreme rear end of vacuum cylinder to shoulder at rear end of piston rod. This distance should be exactly 10¾" and piston should be at mid-point in cylinder. Adjust by loosening locknut and turning clevis at rear end of piston rod.

Shift Linkage:—Check position of bracket mounted on piston rod (to which shift linkage connected). Bracket should be exactly 6 13/16" from shoulder at rear end of piston rod. Adjust by loosening clamp bolt at lower end of bracket and shifting bracket on rod. Connecting rod linked to upper end of this bracket should be exactly 14 1/16" long between clevis pin centers. To adjust, loosen locknut and turn clevis on rear end of rod.

Valve Linkage:—With all other adjustments correctly made and dash gear shift lever in neutral position, adjust length of vertical rod connecting lever on valve mounting bracket and cross-shaft lever on front of dash so that valve is in center (neutral) position and all pivot points on valve link are approximately vertical. Check this adjustment as directed below.

To Check Valve Setting—Disconnect vacuum line from engine at valve. Operate engine (to supply vacuum), make certain that dash gear shift lever and transmission shift lever are in neutral position, connect vacuum line momentarily. If piston rod tends to move to rear, connecting rod should be lengthened slightly, if piston rod moves forward, connecting rod should be shortened slightly. Repeat test until satisfactory valve setting secured.



STUDEBAKER CHAMPION TYPE

Used On:

STUDEBAKER, CHAMPION MODEL G (1939)

NOTE:—Transmission used with this type control is conventional except for shifter mechanism. See separate article for Transmission servicing data.

TYPE:—Remote control type with shift lever mounted on steering column below steering wheel. Shift lever is pivoted at inner end in pin screwed in upper bracket and is linked to control shaft by fulcrum pin so that up-and-down movement of the lever (for cross-shift) lifts the entire control shaft and backward-and-forward movement (for gear engagement) rotates the shaft. An integral lug or lever on the lower end of the control shaft (within control housing on steering column) engages a fork attached to the

lower control lever (second-high) and is lifted to engage the fork attached to the upper control lever (Low-reverse) when shift lever is lifted up toward steering wheel (lug normally held down in second-high position by spring on lower end of control shaft below control housing). Control levers are connected to shift levers on side of transmission case by adjustable rods (forward lever for second-high, rear lever for low-reverse). Control housing is entirely enclosed and provided with lubricant fitting so that it can be kept filled with chassis lubricant.

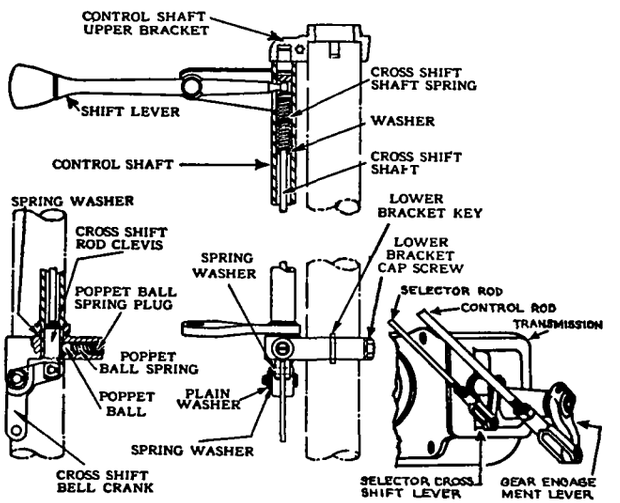
ADJUSTMENT:—See that clearance between lower edge of instrument panel and control shaft is 1/16-⅛" (loosen clamp bolts and rotate steering column slightly to secure this clearance). Use special plug type gauge J-1308 to align control housing forks and levers in neutral position. To install gauge, pry out inspection plug in control housing cover, insert forked end of gauge in inspection hole, press up on control shaft until gauge prongs can be pressed in so as to engage both control lever forks, leave gauge in place until adjustments completed. Disconnect both rods at shift levers on transmission case, place each shift lever in neutral position (determine by feel of detent plungers engaging notches in sectors on shift lever shafts). Loosen locknut and adjust clevis on transmission end of each control rod so that clevis pins can just be inserted, connect rods, remove gauge and replace control housing inspection plug.

SERVICING:—If control mechanism removed from steering column, coat upper bracket pin threads and shift lever ball with Lubriplate, turn pin into upper bracket so that end of thread on pin is flush with lower face of bracket. Make certain that key on lower control housing mounting bracket engages notch in steering column. Control housing lever and fork assembly cannot be dismantled.

STUDEBAKER 1939 COMMANDER & PRESIDENT TYPE

Optl. Equipment On:

COMMANDER, MODEL 9A (1939)



PRESIDENT, MODEL 5C (1939)

NOTE:—Transmission used with this type control similar to standard type except for shift mechanism (two levers on cover on side of transmission case—forward lever for cross-shift, rear lever for gear engagement). See separate article for complete Transmission servicing data.

TYPE:—Remote control type with shift lever mounted on steering column. Shift lever pivoted on bracket on steering column control shaft so that up-and-down motion of lever actuates selector (cross-shift) shaft within control shaft and forward (cross-shift) lever on transmission case. Backward-and-forward motion of shift lever rotates control shaft and actuates rear (gear engagement) lever on transmission case. Shift lever normally held down in Second-High position by spring in control shaft below lever and must be lifted against spring tension for Low-Reverse.

ADJUSTMENT:—Disconnect both control rods at transmission case levers by taking out clevis pins. Rotate shift lever to neutral position (can be determined by poppet ball at lower end of control shaft engaging shaft at this point). Disconnect cross-shift (inner) shaft from cross-shift bell crank at lower end of steering column assembly by taking out clevis pin. Set shift lever parallel with steering wheel and adjust cross-shift shaft length by turning clevis on lower end of shaft until upper edge of clevis slot lines up with lower face of lower bracket, install clevis pin connecting cross-shift shaft and bell crank. Without disturbing position of shift lever, move forward (cross-shift) lever on transmission case as far forward as possible, adjust length of control rod (loosen locknut and turn clevis on transmission end of rod) until clevis pin enters hole in rod clevis and cross-shift lever freely, install clevis pin. Set rear (gear engagement) lever on transmission case in neutral position (approximate center of travel—may be determined by detents engaging shift rails at this point), adjust length of control rod (loosen locknut and turn clevis at transmission end of rod) until clevis pin enters hole in clevis and lever freely, install clevis pin.

SERVICING:—**Disassembly**—Disconnect both control rods at lower end of steering column unit. Take out shift lever fulcrum pin screw and pin, remove shift lever being careful not to lose spring washer on fulcrum pin. Remove plug on poppet ball boss on lower support bracket, take out spring and poppet ball. Disconnect cross-shift shaft from bell crank at lower end of steering column by taking out clevis

pin. Remove lower support bracket capscrews, remove key from slot in steering column jacket, slide support bracket down on steering column until control shaft and bearing plug clear socket in upper support bracket, remove assembly. To remove inner cross-shift shaft, unscrew clevis from lower end of shaft, withdraw shaft, spring, washer, and insulator through upper end of control shaft.

Servicing—Apply Lubriplate to upper and lower ends of cross-shift shaft (these points packed with Lubriplate at assembly).

Reassembly—Reverse disassembly directions given above. When installing lower support bracket, slide bracket up on steering column until light tension placed on spring washer located between lower control lever and upper face of bracket (some tension required to prevent rattles, but bracket should not be pushed up so far as to cause excessive friction at this point). Key slot in steering column is elongated to permit this adjustment. Adjust both control rods as directed above.

DETROIT TRANSMISSION

Used On:

AUBURN EIGHT, MODELS 8-100, A ('32); 8-101, 5 ('33); 850X, Y ('34), 851 ('35), 852 ('36-37)
AUBURN SCHGD. EIGHT, MODELS 851 ('35), 852 ('36-37)
HUPMOBILE EIGHT, MODELS 226 ('32), 326 ('33), 426 ('34)

TYPE:—Constant-mesh, synchro-mesh (second and high), sliding spur gear (low and reverse). Clutch shaft and main drive gear mounted on ball bearing in case. Mainshaft mounted on roller bearing at forward end, ball bearing at rear. Countershaft mounted on bushings on stationary countershaft with thrust washer at each end. Gears are engaged by sliding clutch sleeve (outer member of synchronizing unit) which engages clutch teeth on main drive gear and second speed gear hubs.

Synchronizing Unit. Consists of synchronizing cones on gear hubs and drums on sliding sleeve splined to mainshaft. Synchronizing sleeve (inner) and clutch sleeve (outer) centered by spring-loaded detent balls and move as a unit until synchronizing drums and cones engage. When synchronization completed, outer clutch sleeve slides further to engage gears.

SERVICING:—Disassembly. Remove free wheel unit (see instructions under Free Wheel Unit below). Remove shift lever, cover, shifter shaft and fork assemblies, taking care not to lose lock balls and springs. Remove rear bearing retainer, take out rear bearing lock ring (at front end of bearing inside case). Pull mainshaft to rear as far as possible and tilt up so that second speed gear thrust washer locking plunger is accessible, depress plunger to free washer, withdraw synchronizing unit, washer, and gear from mainshaft, remove mainshaft. Remove main drive gear bearing retainer on front end of case. Drive out countershaft toward rear, allowing counter gear cluster to drop down in case. Remove main drive gear and bearing assembly. Lift out counter gear cluster, taking care not to damage thrust washers. To remove reverse idler, take out cotter pins and drive shaft forward in case.

Main Drive Gear & Bearing Assembly:—See that bearing lock ring is in place in bearing hole in case, install shims under bearing retainer so that bearing outer race is held in case without any endplay.

Mainshaft & Bearing Assembly:—Installed in same manner as main drive gear bearing (bearing lock ring in case, shims under rear retainer so that outer race held snugly without endplay).

Counter Gear Assembly:—Install rotating thrust washer (pinned to end of gear cluster) before inserting gears in case, then install stationary bronze thrust washers and insert countershaft. Make certain that reverse idler shaft and countershaft are locked in place.

DETROIT FREE WHEEL UNIT

Used On:

HUPMOBILE EIGHT, 226 ('32), 326 ('33), 426 ('34)
NASH, ALL MODELS (1932-33)

DESCRIPTION & OPERATION:—Cam and roller type. Cam splined on mainshaft with rollers in cam pockets. Outer sleeve is splined on driving flange which is integral with stub drive shaft. Entire free wheel assembly (cam, roller and sleeve assembly) is shifted on mainshaft so that clutch teeth on cam hub engage clutch teeth within driving flange at rear to lock free wheeling out. Free wheel unit is positioned on mainshaft by spring loaded detent balls within shaft which engage grooves in cam in each position. Snap ring on shaft acts as stop for cam in forward or free wheel position.

SERVICING:—Disassembly. Remove shift lever assembly. Take out mounting screws in rear cover plate (drive shaft bearing housing), withdraw cover plate and stub drive shaft as an assembly. Withdraw free wheel assembly through rear of case, being careful not to lose detent balls and springs.

Free Wheel Unit Assembly:—To dismantle unit, take out snap ring in sleeve at forward end, remove retainer washer, cam and rollers.

Drive Shaft Bearing Assembly:—Shaft mounted on double row ball bearing (Hupmobile), taper roller bearings (Nash) in rear cover plate. To remove shaft, take off nut or capscrews in universal joint flange at rear end of shaft, pull flange, press shaft out of bearing (Hupmobile), take off rear bearing cap (Nash).

Transmission Bearing Assembly (Nash Models):—Free wheel housing serves as mainshaft rear bearing retainer. If housing removed from transmission case, see that gasket and shims which control mainshaft bearing adjustment are replaced between free wheel case and transmission case when reassembled.

L.G.S. FREE WHEEL UNIT

Used On:

AUBURN, 8-100, A ('32), 8-105 ('33), 850Y ('34)
CHEVROLET, BA (1932), CA, CC (1933)
DUESENBERG, J (1932-35)

NOTE:—Free wheel unit on Auburn 850Y and Chevrolet CA, CC models is new design 'single pocket' type. Chevrolet recommends that no attempt be made to dismantle or service this unit.

DESCRIPTION & OPERATION:—Consists of a coil spring mounted in a pocket formed between the outer driving flange sleeve (splined to transmission mainshaft), and an inner spline shaft assembly sleeve (integral with stub drive shaft). Rotation of the driving flange sleeve (when engine is pulling car) tends to unwind the spring so that power is transmitted through the free wheel unit to the rear wheels. When car coasts, faster rotation of spline shaft assembly sleeve tends to wind up the spring allowing the rear wheels to overrun the engine.

Lockout Device.—Consists of a sliding clutch sleeve splined on the outside of the driving flange which is shifted to the rear to engage clutch teeth on the spline shaft so that they are locked together. Clutch sleeve operated by conventional shift lever on top of unit, or by cable (single pocket type).

SERVICING:—Disassembly. Remove cover, shift lever and shift fork assembly, remove speedometer cable and pinion. Take out capscrews mounting free wheel case on transmission, pull case and spline shaft assembly to rear and remove. If spring remains in pocket in driving flange, remove by rotating in one direction. Remove sliding clutch sleeve by pulling to rear, taking care not to lose detent ball and spring which will fall out. To remove driving flange from transmission mainshaft, take off nut on rear end of shaft, pull driving flange, being careful not to lose shims on shaft behind flange (these shims control end clearance and must be replaced). To remove driven flange assembly from housing, remove universal joint flange nut, pull flange, press shaft out (bearing retained by snap ring at front).

Assembly. Reverse disassembly directions. See that locknut plunger is in place in rear of transmission case before installing. When installing spring in spline shaft assembly, see that pilot or prong on end is inserted in hole in base of spring pocket. Make certain that washer is in place behind pilot bearing in driving flange. If new parts installed, check clearance between driving flange and spline flange assembly by assembling unit on transmission with gasket in place on transmission case but with sliding clutch sleeve omitted, drawing up mounting screws finger-tight. Clearance should be .005-.010". Adjust by adding or removing shims on transmission mainshaft in front of driving flange. Shims furnished .003", .005", .010", .015", .030", .060" thick.

WARNER FREE WHEEL UNIT

Used On:

GRAHAM SIX, 58 ('32), 65 ('33), 68 ('34)

HUPMOBILE EIGHT, 222 ('32), 322 ('33), 422 ('34)
PIERCE ARROW 8, ALL MODELS (1933-35)
PIERCE ARROW 12, ALL MODELS (1933-35)
STUDEBAKER DICT., 56 ('33), A ('34)
STUDEBAKER COMM., 73 ('33), B ('34), 1B ('35)
STUDEBAKER PRES., 82, 92 ('33), C ('34)

DESCRIPTION & OPERATION:—Cam and roller type. Cam splined on sleeve on mainshaft (first type), directly on mainshaft (later type). Outer sleeve integral with stub drive shaft (first type), splined on mounting ring on stub drive shaft (later type). Rollers are located in pockets in cam and wedge between cam and sleeve when engine is driving rear wheels. When car coasts, rollers shift in cam pockets allowing sleeve to rotate faster than cam (free wheeling). On the later type units, stub drive shaft extends through free wheel unit and is mounted on bearing in pocket in mainshaft.

Locking Device. Consists of a sliding clutch gear splined on the mainshaft which can be shifted to the rear to engage clutch teeth in the free wheel sleeve, locking the shaft and sleeve together. Clutch gear is controlled by a conventional shift lever (first type), shifter shaft linked to dash control button (later type). Locking plunger provided on all types so free wheel locked out when reverse is engaged.

SERVICING:—First Type. Remove shift lever. Take out mounting screws in rear cover plate on free wheel housing, withdraw entire free wheel unit as an assembly through rear of case (sliding clutch gear will remain within case on driving sleeve, spring ring within gear hub engages notches in shaft to limit gear travel). To dismantle cam and rollers, take out snap ring in sleeve, remove retaining washer. To remove shaft and sleeve assembly from rear retainer, remove universal joint flange nut on rear end of shaft, pull flange, press shaft out of bearing. Bearing held in retainer by snap ring at forward end.

Later Type. Remove housing cover and shift lever assembly. Take out free wheel housing mounting screws on rear of transmission case, withdraw unit to rear. Dismantle shifter shaft mechanism to free sliding clutch gear and fork. To dismantle cam and rollers, take out snap ring in sleeve at forward end, remove retainer washer, jar assembly on bench to remove rollers. When reassembling, make certain that cam is correctly installed (if cam reversed, engine will not drive car).

WILLYS, MODEL 37 (1937)

NOTE:—Free-wheeling used as standard or optional equipment on some models. See separate articles for data on Free wheeling and instructions for removal from transmission.

Chrysler C1, C9, DeSoto SG. These models have splined shaft extension at rear of case. Can be removed by taking out housing capscrews and withdrawing to rear to disengage extension shaft from mainshaft splines.

TYPE:—Constant-mesh, synchro-mesh, helical gear (second and high), sliding spur or helical gear (low and reverse). Main drive gear and shaft mounted on ball bearing in front of transmission case. Mainshaft mounted on roller bearing (front), ball bearing (rear). Counter gear cluster mounted on bronze bushings, or roller bearings (caged type or loose rollers) on stationary countershaft. Reverse idler mounted on bronze bushing (loose roller bearing on some Chrysler models) on stationary shaft. Second speed and high gears engaged by sliding clutch sleeve (splined on synchronizing unit spline sleeve) which engages clutch teeth on second speed and main drive gear hubs.

Synchronizing Unit. Consists of synchronizing cones on main drive gear and second speed gear and drums on ends of sliding sleeve splined to mainshaft within sliding clutch sleeve. These two sleeves are centered by spring-loaded detent balls which engage a groove in the outer clutch sleeve and move as a unit when the clutch sleeve is shifted to engage second or high until the synchronizing drum and cone engage. When synchronization is completed, clutch sleeve slides further to engage clutch teeth on gears.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assemblies, being careful not to lose lock balls and springs. Remove universal joint flange nut, pull flange. Take out rear bearing retainer screws, withdraw rear bearing retainer, mainshaft, second speed gear and synchronizing unit as an assembly, being careful not to allow clutch sleeve to move on inner synchronizing sleeve which will allow detent balls and springs to jump out. See note below for types where rear bearing mounted directly in case so that mainshaft assembly cannot be withdrawn through rear of case. Take out screw in countershaft and reverse idler locking plate screw and remove plate, drive out countershaft toward the rear (on types where loose roller bearings used, use dummy shaft or arbor to drive out countershaft leaving the arbor in the gear cluster until it is re-installed, arbor will prevent rollers falling out). Take out screws in bearing retainer on front of case, pull clutch shaft main drive gear and bearing assembly out toward front. Lift out counter gear cluster, being careful not to lose thrust washers and spacers. To remove reverse idler, drive shaft out toward rear (on types with loose roller bearings, rollers will fall out and care should be taken that they are not lost).

NOTE—When rear mainshaft bearing mounted directly in case, pull mainshaft assembly to rear until bearing is free of case, tip shaft up and remove synchronizing unit, and if necessary second speed gear (see dismantling instructions below). Remove bearing snap ring, push shaft forward and remove through top of case.

Countershaft Locking Key Note. On models where locking plate not used, countershaft and reverse idler shaft retained by key in recess in rear face of case which engages slot in shaft. On these models, drive countershaft out to the rear (with rear bearing adapter free) until key is exposed, remove key and drive shaft out (use dummy shaft or arbor for types with loose roller bearings).

Mainshaft & Bearing Assembly:—Bearing is press fit on mainshaft (press bearing on and off shaft). Bearing is retained in case by snap ring at rear, or by snap ring at forward end (where bearing mounted in rear retainer or adapter).

Synchronizing Unit:—Mark outer clutch sleeve and inner synchronizing sleeve before dismantling and assemble in same positions. Use care not to lose detent balls and springs (wrap in cloth when pushing clutch sleeve off so that balls will be caught when they spring out). Use special assembling clips when reassembling. Install on mainshaft with longer hub on both sleeves toward front (see illustration).

Second Speed Gear Assembly:—See Note and special instructions below for removal of early type with thrust washers locked in place by key. On types with front thrust washer locked by plunger in shaft under washer, use a wire to depress plunger and free washer, turn washer so that prongs on inner edge line up with splineways on shaft, pull washer and gear off, taking care not to lose lock plunger and spring. When installing thrust washer, see that it is turned so that prongs engage slots in splines and that it is locked in place by plunger. Gear endplay controlled by thrust washer thickness (furnished in various thicknesses) and should be .003-.008".

NOTE—On some models, additional thrust washer used at rear of gear against shoulder on shaft. This washer locked in place by pin or by locking plunger and spring in same manner as front washer.

Locking Key (Early type). Gear positioned by thrust washer at each end which is locked on shaft by key within gear bushing. To remove gear, insert wire in oil hole at center of gear between teeth, rotate gear until wire can be pushed through hole in bushing, depress plunger under locking key, use wire or flat tool to push key forward until it clears rear thrust washer, rotate washer until prongs on inner edge line up with shaft splineways, move washer to rear slightly. Move key back to free front washer (plunger will engage key at center position and must be depressed again to allow key to be shifted further), withdraw wire and move second speed gear back to expose front thrust washer, rotate washer until prongs are freed from splines, remove washer and gear. When installing gear, make certain that prongs on both washers engage slots in splines, that key engages both washers to prevent any rotation which would allow them to disengage, and that key is locked in place by plunger. When replacing gear bushing see that omitted spline in which key is installed is directly over plunger.

Counter Gear Assembly:—See that bearing spacer installed in gear cluster between bearings. On types with loose rollers, see that rollers installed around arbor, coat end of gear with cup grease to hold rollers in place. Install steel spacers or thrust washers next to gear at each end (not used at front end on some models), bronze washers between steel spacers and case. Install countershaft from rear, driving out arbor toward front (when used). Gear endplay is adjusted by selecting thrust washers of correct thickness and should be .002-.008".

WARNER 1938-39 TYPES (WITHOUT OVERDRIVE)

Used On:

BANTAM, MODEL 60 (1938-39)

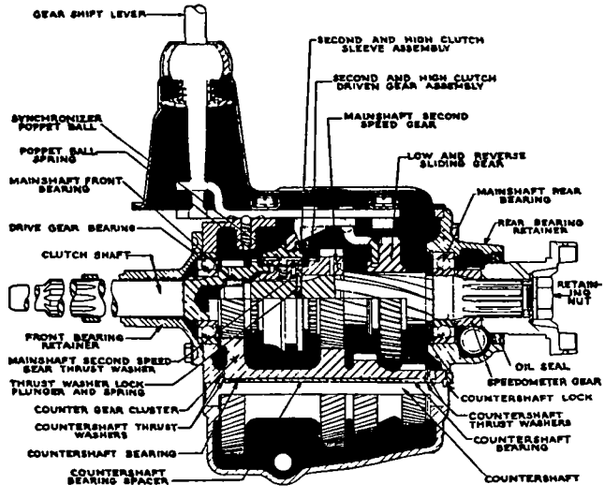
WILLYS-OVERLAND, MODEL 39 (1939)

NOTE:—Steering Column Gear Shifts—Optional on all 1939 car models except Bantam and Willys. See separate "Transmission Control" articles for servicing and adjustment data on each car.

Overdrive Transmissions—Optional on all models except Bantam, Dodge, Plymouth and Willys. See separate articles on Transmissions with Overdrives for data on these types.

TYPE:—Same design as used on earlier car models except for Synchronizer design on some car models as follows:



Blocking Type Synchronizer (Chrysler C18, DeSoto S5)—Synchronizing rings are loose in inner synchronizing sleeve and have cam lugs on inner end which engage slots in clutch sleeve. Rings are actuated by inner clutch sleeve (inner and outer sleeves centralized by poppet balls and springs and move as a unit during synchronization) and have teeth on outer rim which engage the clutch teeth on the outer sleeve and block or prevent engagement until synchronization completed. The final movement of the outer clutch sleeve causes the teeth on the rim of the sleeve to slide past the teeth on the synchronizer ring and engage the clutch teeth on the gear hub.

Drag Ring Type Blocking Synchronizer (Chrysler C22, De Soto, Dodge, Plymouth P8)—Synchronizer rings are loose in ends of inner clutch sleeve and are actuated by a drag or friction ring within the outer clutch sleeve which contacts lugs on the synchronizer rings (initial movement of outer clutch sleeve carries drag ring with it and forces synchronizer rings in contact with cones on gear hubs). Teeth on synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes clutch teeth on rim of sleeve to slide past teeth on synchronizer ring and engage clutch teeth on gear hub. Inner clutch sleeve is stationary on mainshaft and does not move during synchronization and gear engagement.

Lug Type Blocking Synchronizer (Chrysler C19, C23)—Synchronizer rings loosely mounted in ends of inner clutch sleeve and retained by snap rings. Rings are actuated in usual manner by the inner clutch sleeve (inner and outer clutch sleeves centralized by poppet balls and springs and move as a unit for synchronization). Three lugs on synchronizer rings (in recesses in inner clutch sleeve) block or prevent gear engagement until synchronization has been completed when the final movement of the outer clutch sleeve engages the clutch teeth on the gear hubs.

Synchronizer (Other Models)—Conventional type with inner and outer sleeves centered by poppet balls and springs (synchronizer rings or cones fixed in inner sleeve).

SERVICING:—These models disassembled and serviced in same manner as earlier types (see preceding article for complete directions) except for new Synchronizers and Second Speed Gears used with these synchronizers which are serviced as follows:

Disassembly:—Mark both synchronizer rings as well as inner and outer clutch sleeves of synchronizer unit before removal to insure reassembly in same relative positions (on some types synchronizer rings are loose and can be lifted off directly). On Chrysler, DeSoto, Dodge, Plymouth models, note that Synchronizer Ring Spreader Spring installed back of high speed (front) synchronizer ring only.

NOTE—Spreader spring must be installed with three raised fingers toward the synchronizer ring.

Bantam, Willys Disassembly Note—Mainshaft assembly cannot be removed through rear of case and must be dismantled and removed as follows: Pull shaft back until rear bearing is clear of case, tip forward end up and remove synchronizer as a unit (use care not to allow outer clutch sleeve to move on inner sleeve which will release poppet balls and springs), remove second speed gear and low speed gear, then remove shaft.

Synchronizer Assembly (Drag Ring Type):—Install drag ring on inner clutch sleeve so that depressions on spring are directly in line with synchronizer ring lug holes in sleeve and retain in position with three pins inserted through holes so as to pass over spring in slot at center of sleeve while sleeve is being inserted in outer clutch sleeve. Make certain that open ends of drag ring straddle a tooth on the outer sleeve and line up marks on inner and outer sleeves, then remove assembling pins and install synchronizer rings (with spreader spring installed behind high speed ring with three raised fingers toward ring). See second speed gear assembly for installation instructions.

Lug Type Synchronizers—Synchronizer rings are retained in inner clutch sleeve snap rings. With snap rings installed, synchronizer rings should be free to rotate. Backlash between inner and outer sleeves should be .000-.001 (sleeves are selective fit). On Chrysler models, pressure required to break poppets (so that outer sleeve moves on inner sleeve) should be 26-34 lbs.

Other Type Synchronizers—Inner and outer clutch sleeves marked by etched line to maintain alignment and must be reassembled with these lines together (if synchronizer not marked, mark both sleeves before disassembling and assemble in same relative position). On Bantam and Willys models, pressure required to break poppets (so that outer sleeve moves on inner sleeve) should be 45-58 lbs.

Second Speed Gear Assembly (Locking Plate Type on Chrysler C18, DeSoto S5, Dodge D8, Plymouth P5,6) Gear retained by thrust washer and special locking plate on forward end. To disassemble, for gear removal, bend up three fingers on lock plate which engage groove in thrust washer, slide lock plate off shaft and discard (do not re-use lock plates). Rotate washer to line up notches and splines on shaft, remove washer and gear. To reassemble, use new lock plate, make certain that thrust washer turned so that it engages shaft splines and that lock plate fingers locked firmly in washer grooves to prevent loosening in service.

Second Speed Gear Assembly (Drag Ring & Wire Bound Strut Type Synchronizers):—Second speed gear and inner sleeve or hub of synchronizer mounted as an assembly on mainshaft and retained by snap ring on forward end of shaft. To disassemble, remove snap ring in front of synchronizer inner sleeve, withdraw synchronizer assembly and second speed gear. When reassembling, make certain that second speed gear endplay is .003-.008" (Chrysler, DeSoto, Dodge, Plymouth), .003-.014" (others) with synchronizer inner sleeve pressed forward against snap ring.

Second Speed Gear Assembly (Lug Type & Conventional Synchronizers):—Synchronizer assembly is free on shaft and can be removed as an assembly. Second speed gear is retained by a snap ring locked by a spring-loaded plunger in the shaft. To remove gear, depress plunger (under washer on front of gear), rotate washer to line up notches with splines on shaft, withdraw washer, remove gear being careful not to lose plunger and spring. Install gear in same manner, make certain that washer turned so that lugs engage notches in shaft splines and that plunger engages washer to prevent turning and loosening in service.

Counter Gear Endplay Adjustment (Chrysler, DeSoto, Dodge, Plymouth Models):—Thrust washers furnished in three thicknesses for endplay adjustment and marked as follows: A—thinnest, B, C—thickest. Select washers so that endplay is .002-.008" (check with feeler gauge).

WARNER 1935-39 TYPES (WITH TYPE R1 SEPARATE OVERDRIVE)

Used On:

CHRYSLER AIRFLOW, MODEL C1 (1935)—OPTL.
CHRYSLER IMPERIAL, C2 (1935), C10 (1936)
CHRYSLER CUST. IMP. CW* ('35), C3 ('35), C11 ('36), C15 ('37)
CHRYSLER AIRFLOW, MODEL C17 (1937)
DE SOTO, MODEL SG (1935)—OPTL.
HUPMOBILE EIGHT, MODEL 621-N (1936)
NASH, ALL MODELS (1935-38)—SOME CARS.
PIERCE ARROW EIGHT, 1601 ('36), 1701 ('37)
PIERCE ARROW TWELVE, 1602,3 ('36), 1702,3 ('37)
STUDEBAKER PRES., 1C (1935), 2C (1936)—OPTL.

Model AS18-T85.

CHRYSLER CUSTOM IMPERIAL, C20 (1938)

Model AS1-T82A.

PIERCE ARROW EIGHT, MODEL 1801 (1938)
PIERCE ARROW TWELVE, MODELS 1802, 3 (1938)

Model AS11-T85

HUPMOBILE 8, 825-H (1938), 925-H (1939)

NOTE:—These models fitted with Model R1 Overdrive unit in separate case bolted on rear face of transmission case and driven from transmission mainshaft through splined coupling. See separate article (following) for Overdrive servicing data.

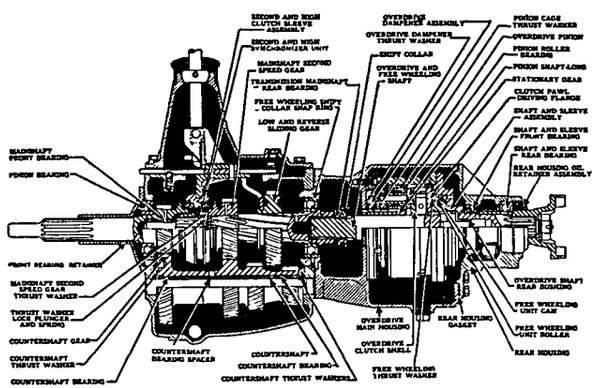
TYPE:—Constant-mesh, synchro-mesh (second and high), all helical gear type. Similar in design to regular transmission without overdrive and serviced in same manner (see preceding article).

Chrysler C20 (1938). This model fitted with new 'Blocker' type synchronizing unit. See Chrysler C19 data (preceding article).

Nash Note. Other types of Warner Transmissions and Overdrive units also used. See separate articles for data.

SERVICING:—Disassembly. To remove Overdrive unit, take out mounting screws in overdrive case flange on rear face of transmission case flange, pull unit straight back to disengage shaft from splined coupling of transmission mainshaft. Overdrive case clamps rear bearing retainer in place in transmission case (Chrysler), retains rear bearing (Pierce Arrow models) when bolted in place. With overdrive unit removed, transmission serviced in same manner as other types without overdrive. See preceding article for complete data.

WARNER TYPE R1 OVERDRIVE



Used On:

CHRYSLER AIRFLOW, C1 (1935), C17 (1937)
CHRYSLER IMPERIAL, C2 (1935), C10 (1936)
CHRYSLER CUST. IMP., CV (1934), C3 (1935), C11 (1936), C15 (1937), C20 (1938)
DE SOTO AIRFLOW, MODEL SG (1935)—OPTL.
HUPMOBILE 8, 621N ('36), 825H ('38) 925H ('39)
NASH, ALL MODELS (1935-38)—SOME CARS.
PIERCE ARROW 8, 1601 ('36), 1701 ('37), 1801 ('38)
PIERCE ARROW 12, 1602,3 ('36), 1702,3 ('37), 1802,3 ('38)
STUDEBAKER PRESIDENT, 1C (1935), 2C (1936)

DESCRIPTION & OPERATION:—Overdrive consists of a planetary gear system with a centrifugally operated actuating clutch and a free wheel unit built in the overdrive case. The outer ring or internal gear of the planetary system is part of the 'sleeve and shaft assembly' permanently connected to the rear axle, while the small central 'sun' gear is stationary (bolted directly to the front face of the overdrive case—spring loaded dampener built in sun gear mounting on some models). The planet gears (pinion assembly) are driven by the engine when overdrive is operative and revolve freely at other times. Overdrive is driven by a sliding shaft splined to the transmission mainshaft which can be shifted backward and forward by means of the dash control button.

Direct Drive Position. Shaft shifted to rear so that clutch teeth at rear end engage free wheel cam and sleeve and shaft assembly. Drive transmitted directly to rear axle. Free wheeling locked out and overdrive inoperative (centrifugal clutch assembly free and not positively driven).

Free wheel & Overdrive Position. Shaft shifted forward to engage free wheel cam and clutch pawl driving flange. Drive transmitted to rear axle through free wheel cam and rollers (free wheel operative at speeds below overdrive cut-in point). Clutch assembly is rotated at engine speed and as speed increases to cut-in point, weights tend to fly out and engage clutch shell which is part of planetary pinion assembly (pinned together by pinion shafts). However pinions and clutch shell rotate at less than engine speed (being driven by ring gear which is part of sleeve and shaft assembly) so that clutch pawls cannot engage. When car is allowed to free wheel (accelerator pedal released momentarily), speed of clutch drops down to pinion speed and pawls engage in notches in shell. Engine then drives pinion assembly and, as pinions rotate on their shafts as the assembly is rotated, ring gear is

rotated at more than engine speed so that sleeve and shaft assembly drive rear axle at greater than engine speed (overdrive). When engine speed decreases to a point approximately 8-10 M.P.H. below cut-in point, clutch pawl springs withdraw pawls from engagement with shell (car must free wheel momentarily to allow this disengagement to occur) and engine again drives car through free wheel cam and rollers.

ADJUSTMENT:—Cut-in point for overdrive is set at factory and should not require adjustment. To adjust, remove the adjusting hole plug on top of case), drain lubricant, place transmission gears in neutral, rotate propeller shaft until holes in free wheel case and clutch shell line up with hole in case. Then engage high gear, depress clutch pedal so that slight drag placed on shaft, rock propeller shaft back and forth to rotate clutch pawl flange until adjusting screw head is visible in hole. Turn screw clockwise or in to increase cut-in speed, counter-clockwise or out to decrease cut-in speed) (two full turns will change cut-in speed 6 M.P.H.). Rock shaft again to bring second adjusting screw in line with hole, repeat adjustment. Adjust both screws equally. NOTE—one screw has double slot in head so that they can be distinguished to avoid possibility of adjusting same screw twice. Check to see that screws have not been turned so far that they interfere with the clutch shell.

First Type (Without Adjusting Plug). On these models, remove drain plug at bottom of case, drain lubricant, adjust through drain plug hole in same manner as directed above.

SERVICING:—Disassembly. Take out rear housing cap-screws, withdraw rear housing and shaft and sleeve assembly, and free wheel assembly. Remove clutch shaft shifting collar snap ring, withdraw clutch pawl assembly, pinion assembly, and shaft through rear of case. To remove stationary sun gear, turn down lockwasher lips, mark mounting flange and case to insure reassembly in same position, remove mounting screws. Damper assembly cannot be serviced and should not be dismantled. Sun gear can be removed by taking out lock ring and pressing gear out of damper member.

Overdrive Shaft & Sleeve Assembly:—Sleeve is riveted to shaft flange and should not be removed. To remove assembly from rear housing, remove propeller shaft flange and speedometer drive pinion, press shaft out of housing toward front, remove oil seal from rear. When reassembling, see that rear ball bearing seated against shoulder in housing and snap ring at rear engaged in slot, front roller bearing seated against snap ring in housing at rear, and that speedometer drive gear snap ring at forward end of gear installed with open end at oil escape hole in shaft.

Pinion Gear Assembly:—Helical type gears can be disengaged and engaged with sun and ring gear by rotating assembly slightly. When spring-loaded spur gears used, line up gear halves against spring tension when meshing these gears (springs tend to rotate gear sections to take up backlash, insuring quiet operation).

Overdrive Assembly:—Install sun gear and damper assembly using new lock washers under screw heads and turning lips up against screws to prevent loosening. See that oil holes in damper plate and case line up to insure lubricant circulation. Install damper thrust washer, overdrive shift rail fork and spring, shift rail (compress spring and install horseshoe lock), planet pinion cage, pawl core, pawl core shell, clutch shaft (from rear of case), shift collar and lock ring, free wheeling cam. Install free wheeling roller springs, compress springs and install rollers. Install free wheeling cam thrust washer and lock in place with cotter pins. Install rear retainer and shaft and sleeve (annulus gear) assembly, adjust endplay as directed below.

Overdrive Endplay Adjustment. See that all gaskets previously used between overdrive housing and rear housing flange are replaced (these gaskets control endplay). To determine correct gasket when new parts have been installed, assemble rear housing (omitting all gaskets), using two screws drawing up finger tight. Use feeler gauge to check clearance between main housing flange and rear housing flange. Assemble gaskets equal in thickness to this clearance plus .015-.025" for endplay (use micrometer to check gasket thickness) and install this gasket pack under rear housing flange.

WARNER 1936 TYPE (WITH INTEGRAL OVERDRIVE)

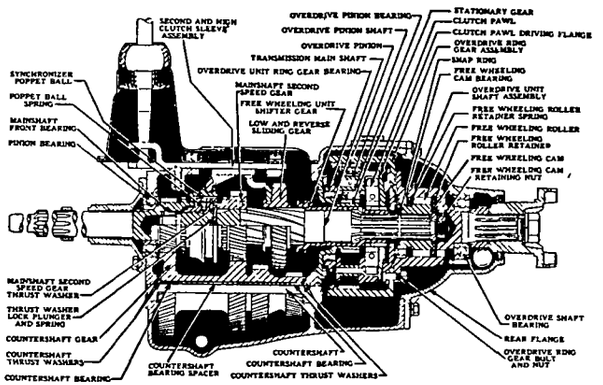
Used On:

CHRYSLER, MODELS C7, C8 (1936)
DE SOTO, MODELS S1, S2 (1936)—SEE NOTE
GRAHAM, MODELS 90, 110 (1936)
HUPMOBILE SIX, MODEL 618-G (1936)
NASH, ALL MODELS (1935-38)—SOME CARS.
REO FLYING CLOUD, MODEL 6-D (1936)
STUDEBAKER DICTATOR, 3A, 4A (1936)

NOTE:—DeSoto S2 (1936) standard transmission not equipped with Overdrive unit but similar in all other respects (including case). When servicing this type transmission, follow instructions below, disregarding Overdrive data.

Nash Note. Other types of Warner Transmissions and Overdrive units also used. See separate articles for data.

NOTE:—Overdrive unit on these models is mounted on an extension of the transmission mainshaft within the transmission case and must be disassembled in order to remove it from the shaft.



TYPE:—Constant-mesh, synchro-mesh (second and high), all helical gear type. Similar to regular transmissions without overdrive except that overdrive is an integral unit with the transmission and located within the transmission case.

SERVICING:—Disassembly. Remove gear shift, cover, shifter shaft and fork assemblies, taking care not to lose lock balls and springs. Remove universal joint flange nut, pull flange. Take out transmission rear cover flange screws, pull flange (two tapped holes provided in flange, screw 5/16" capscrews in these holes to pull flange). Take off nuts on six overdrive ring gear bolts at rear of unit, remove overdrive shaft assembly. Take off free-wheeling cam retaining nut on rear end of mainshaft, remove free-wheeling cam and roller assembly. Remove oil baffle, overdrive ring gear assembly, overdrive ring gear bearing. Take out capscrews mounting stationary sun gear on case, remove gear. Take out lubricant equalizing trough through top of case. Take off nut on side of case, remove free-wheel shift lever, remove control shaft lock setscrew, move shaft in to disengage shifter gear notch, move sleeve forward at rear end of shaft and remove horseshoe lock, tap shaft forward out of shifter fork and case (shaft will drive out plug at forward end of case), remove shifter fork through top of case. Remove transmission mainshaft gear and synchronizing unit assembly through rear of case. Remove reverse drive countershaft out toward rear of case, using an arbor or dummy shaft and leaving this arbor in the counter gear assembly until it is re-installed (this will retain loose roller bearings). Remove bearing retainer on front end of case, take out clutch shaft main drive gear and bearing assembly at front end. Remove counter gear assembly through rear of case, being careful not to lose bearing rollers or thrust washers.

Synchronizing Unit:—Serviced in same manner as on other Warner models. Mark parts before dismantling and assemble in same positions. Use extreme care not to lose detent balls and springs.

Second Speed Gear Assembly. Retained on shaft by thrust washer locked in place by plunger and spring in shaft. Use a wire to depress plunger, turn washer until prongs line up with splineways on shaft, remove washer and gear. When reassembling see that plunger engages thrust washer and that washer prongs are turned into notches in splines.

Counter Gear Assembly. When installing, see that loose rollers are in place in each end. Install steel thrust washer next to gear, bronze washer next to case at each end (steel washer omitted at forward end on some models). Install counter shaft from rear, driving dummy shaft out at forward end.

OVERDRIVE UNIT

SERVICING:—Ring Gear & Clutch Assembly. To dismantle, take out snap ring, tap out forward plate, remove pinion gears and clutch plate. If clutch pawl adjusting screws are removed, count the number of 'clicks' (half-turns) when turning screws out and turn screws in exactly the same amount when re-installing so that cut-in speed will not be changed (both screws should be adjusted alike).

Pinion Gear Assembly. Pinions are made in two halves and spring loaded (spring tends to rotate halves and take up backlash, one pinion of each set has spring reversed). Assembly will be easier if pinions meshed on stationary sun gear first and then installed in ring gear assembly (withdraw sun gear and install separately in case).

Free-wheeling Roller Assembly. Rubber band can be used to hold free-wheeling rollers in position and wire threaded through overdrive unit shaft assembly to hold cage in released position while assembling overdrive unit shaft assembly. Withdraw wire and remove rubber band as assembly goes into place.

ADJUSTMENT:—Cut-in point should not require adjustment. To adjust, remove large adjusting hole plug on top of case, jack up rear end of car, turn propeller shaft until one hole in clutch shell lines up with adjusting hole. Engage high gear, rotate propeller shaft until one adjusting screw head lines up with hole in shell. Turn screw in to increase cut-in speed, out to decrease cut-in speed. Two full turns will change cut-in speed approximately 6 MPH. Turn screws only in half-turns so that locking washer is engaged to prevent screw turning in service. After adjusting one screw, turn propeller shaft ¾ revolution so that second adjusting screw is lined up, adjust this screw equally. **Important**—both screws must be adjusted equally. One screw has single slot, opposite screw has double slot so that they may be distinguished (use care not to adjust same screw twice). Check adjustment and make certain that screws not turned out so as to strike clutch shell.

WARNER 1937-38 TYPES (WITH R6 OVERDRIVE)

Used On:

CHRYSLER SIX, MODEL C16 (1937)
CHRYSLER IMPERIAL, MODEL C14 (1937)
DE SOTO, MODEL S3 (1937)
GRAHAM CAVALIER, MODEL 95 (1937)
GRAHAM SUPERCHARGER, MODELS 116,120('37)
HUPMOBILE SIX, 822-E (1938), 922-E (1939)
HUPMOBILE SKYLARK, MODEL R (1939)
NASH, ALL MODELS (1935-38)—SOME CARS
STUDEBAKER DICTATOR, 5A, 6A (1937)
STUDEBAKER PRESIDENT, MODEL 3C (1937)

Model AS1-T86A.

CHRYSLER ROYAL, MODEL C18 (1938)
DE SOTO, MODEL S5 (1938)
DODGE, EXPORT MODELS (1938)
PLYMOUTH, EXPORT MODELS (1938)

Model AS2-T85A.

CHRYSLER IMPERIAL, MODEL C19 (1938)

NOTE:—All models fitted with Overdrive unit in separate case bolted on rear end of transmission case. Transmission mainshaft extends into Overdrive case with overdrive planetary gear and clutch pawl assembly mounted on it so that overdrive unit must be dismantled in order to disassemble transmission. Complete instructions given below.

Nash Note. Other types of Warner Transmissions and Overdrive units also used. See separate articles for data.

Studebaker Pres. 3C ('37). Overdrive used on this model is special automatic type. See separate article (following) for data on this type.

TYPE:—Constant-mesh, synchro-mesh (second and high), all helical gear type. Similar in design to regular transmission (see preceding article) except for mainshaft extension and overdrive unit which require special disassembling directions (below).

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assemblies, being careful not to lose lock balls and springs. Lock transmission by shifting into two gears at once, remove drive shaft nut at universal joint flange, pull flange. Remove speedometer drive pinion. Take out screws mounting overdrive unit on transmission case, withdraw overdrive housing (free wheeling rollers will fall out, take care not to lose rollers). Remove free wheeling cam locking screw on rear end of shaft, withdraw free wheeling cam and cage assembly, remove ring or annulus gear and bushing assembly. This completes overdrive removal (stationary sun gear integral with adapter which serves as mainshaft rear bearing retainer). See preceding article for transmission disassembly and servicing directions.

TYPE R6 OVERDRIVE CONT.

OVERDRIVE UNIT

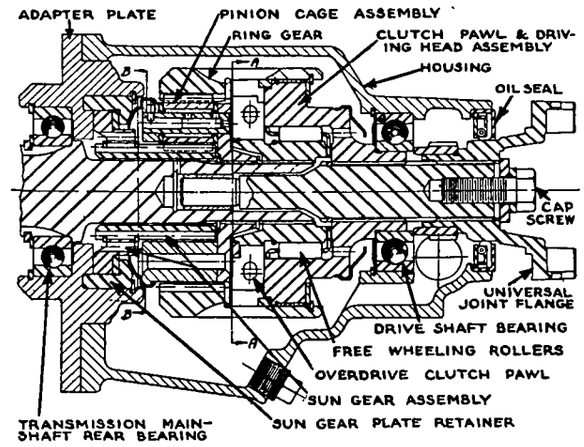
ADJUSTMENT:—Cut-in point should not require adjustment. To adjust, remove large adjusting hole plug on top of case, jack up rear end of car, turn propeller shaft until one hole in clutch shell lines up with adjusting hole. Engage high gear, rotate propeller shaft until one adjusting screw head lines up with hole in shell. Turn screw in to increase cut-in speed, out to decrease cut-in speed. Two full turns will change cut-in speed approximately 6 MPH. Turn screws only in half-turns so that locking washer is engaged to prevent screw turning in service. After adjusting one screw, turn propeller shaft ¾ revolution so that second adjusting screw is lined up, adjust this screw equally. **Important**—both screws must be adjusted equally. One screw has single slot, opposite screw has double slot so that they may be distinguished (use care not to adjust same screw twice). Check adjustment and make certain that screws not turned out so as to strike clutch shell.

SERVICING:—Housing & Driveshaft Assembly. Use a brass drift to drive mainshaft out of housing. Operate shifting arm while removing shifting sleeve from housing. See that shifter collar engages groove in sleeve when sleeve replaced in housing. Install shifter sleeve and housing after overdrive has been assembled on transmission case, starting housing upside down until lockout rod touches adapter plate and then rotating housing into correct position (manipulation of lockout lever may assist assembly).

Free wheeling Cam & Roller Assembly:—Fill cage openings with cup grease to hold rollers in place while assembling, rotate cage assembly counterclockwise on cam (viewed from rear) while installing overdrive mainshaft (drive shaft). Make certain that oilite thrust washer on face of free wheel cam is installed with chamfered side toward front of car.

Ring Gear & Clutch Assembly:—To remove clutch assembly, take out snap ring in rim at rear, lift clutch out. Press out overdrive clutch plain bearing using a plug of correct size, take out clutch pawl adjusting screws taking care to measure distance from top of each screw to marks on clutch core first, and counting the number of 'clicks' (half-turns) while removing the screws. When installing, turn screws in exactly this same number of clicks so that the original cut-in speed setting will not be disturbed. When installing clutch pawl sleeve, lock pawls in engaged position, press sleeve in flush with forward face of overdrive clutch, free pawls.

Stationary Sun Gear & Pinion Assembly:—Pinion assembly can be removed by rotating gears off sun gear (gears are helical type). When installing sun gear (adapter plate) see that paper gaskets are in place on each side. Oilite thrust washer should be installed on pinion gear hub at rear.



WARNER 1937 STUDEBAKER PRESIDENT AUTOMATIC OVERDRIVE

Used On:

STUDEBAKER PRESIDENT, MODEL 3C (1937)

NOTE:—Overdrive unit is mounted in separate case bolted to rear of transmission case but transmission mainshaft extends through into overdrive unit (with pinion cage assembly and clutch pawl assembly splined on the shaft) so that overdrive must be dismantled before mainshaft can be moved. See overdrive data below and previous article on Warner Transmissions without overdrive for all other transmission servicing data.

DESCRIPTION & OPERATION:—Overdrive is similar to previous designs except for new type sun gear and new type clutch pawl and driving head assembly which allow overdrive to be cut in or out at the will of the operator at speeds above the cut-in point

of 35 M.P.H. Free wheel operates only momentarily during change from direct drive to overdrive and car coasts against engine compression at all speeds. Sun gear is mounted freely on mainshaft and is prevented from rotating by a stationary pawl in the sun gear plate retainer which is free to oscillate between spring bumpers in the adapter plate lugs (pawl is forced out of engagement permitting sun gear to rotate freely for 'conventional overdrive' as described below. Clutch pawls are spring loaded and in the inner position two of the pawls lock the clutch hub or free wheel cam (which is splined on the mainshaft) to the driving head assembly (integral with drive shaft for 'direct drive.' At speeds above 35 M.P.H. pawls move out and engage slots in ring gear for 'overdrive.' Pawl springs are of unequal tension, so that one pawl tends to disengage and engage first (engagement taking place as soon as the second pawl disengages) so that the disengaged period is very short. The third pawl with very light spring tension (single spring) is not used for direct drive and tends to engage the overdrive at lower speed but does not actually transmit drive (pawl contour such that it merely maintains drive connection when driving pawls disengage from ring gear).

Direct Drive. Effective at speeds below 35 M.P.H. Engine drives rear wheels directly through clutch hub splined to mainshaft and driving head assembly (these parts locked together by clutch pawls being in inner position). Pinion cage assembly rotates at engine speed but ring gear is free to revolve on bushing on driving head assembly.

Overdrive. At speeds above 35 M.P.H. Cut in by releasing accelerator pedal momentarily and then gradually accelerating engine which allows clutch pawls to engage ring gear slots. Sun gear plate retainer is rotated clockwise against spring buffer allowing stationary pawl to engage sun gear slot holding gear stationary. Engine drives pinion cage assembly causing ring gear to revolve at faster than engine speed (overdrive). Ring gear locked to driving head assembly by clutch pawls which transmit power to rear axle. Clutch hub (free wheel cam) also rotating at engine speed, this rotation being allowed by the free wheel action.

Conventional Overdrive. At speeds above 35 M.P.H. Cut in by releasing accelerator pedal momentarily and then quickly accelerating engine. Coasting causes reversal of drive reaction on sun gear, rotating sun gear plate retainer counter-clockwise so that stationary pawl is partly disengaged from slot (inclined surface of pawl pressed against stationary pin), and subsequent sun gear rotation (when engine quickly accelerated) forces pawl out of engagement permitting sun gear to rotate. Engine then drives through clutch hub and free wheel rollers to rear axle. Clutch pawls remain in outer position (locking ring gear to driving head assembly) but engine power is not transmitted through planetary gear system since sun gear is free to revolve. Overdrive can be engaged again by releasing accelerator pedal somewhat and then accelerating engine gradually.

ADJUSTMENT:—Hairpin type springs used on clutch pawls (except sun gear pawl) and no adjustment provided. Do not change adjustment of sun gear pawl.

SERVICING:—Disassembly. Remove universal joint flange capscrew, pull flange. Remove stationary pawl adjusting screw and spring from boss at forward end of case (mark screw or note number of turns required to turn screw out so that original setting can be restored when overdrive reassembled). Take out capscrews mounting overdrive on transmission case, slide overdrive case and rear bearing off toward rear (bearing retained in case by snap ring at front). Use pointed tools and pry lock ring out of groove at rear end of ring gear. Withdraw overrunning clutch (free wheel) and pawl assembly. Remove lock ring on mainshaft holding pinion cage in place, withdraw pinion cage assembly and ring gear. Remove lock ring in adapter plate at rear of sun gear plate retainer, withdraw sun gear assembly.

Transmission Disassembly & Servicing. See preceding article on Warner Transmission with R6 Overdrive for complete data.

Overdrive Assembly. Reverse disassembly instructions above. See that all thrust washers and shims are replaced. Use special pusher to install universal joint flange (must not be driven on shaft). Turn stationary pawl adjusting screw in to exactly same position as originally to secure same setting.

WARNER 1939 ELECTRICAL 'KICK-DOWN' OVERDRIVE CONTROL

Standard or Optional Equipment On:

CHRYSLER ROYAL, MODEL C22 (1939)
CHRYSLER IMPERIAL, MODEL C23 (1939)
CHRYSLER CUST. IMPERIAL, MODEL C24 (1939)
DE SOTO, MODEL S6 (1939)
GRAHAM, STD. & SPEC. MODEL 96 (1939)
GRAHAM SUPERCHARGER, MODEL 97 (1939)
PACKARD SIX, MODEL 1700 (1939)
PACKARD '120' EIGHT, MODELS 1701, 1A, 2 (1939)
PACKARD SUPER EIGHT, MODS. 1703, 3A, 5 (1939)
STUDEBAKER, CHAMPION MODEL (1939)
STUDEBAKER COMMANDER, MODEL 9A (1939)
STUDEBAKER PRESIDENT, MODEL 5C (1939)

NOTE:—This electrical control system is used in conjunction with a new type Overdrive in which the sun gear is held stationary (in conventional Overdrive) by the solenoid controlled pawl. See separate article on Warner Overdrive for complete Overdrive disassembling and servicing data.

PACKARD PRODUCTION CHANGE NOTE:—On all cars without Reverse Switch (original equipment on later cars), manufacturer recommends that this switch and new type relay (with extra terminal for switch connection) be installed. See illustration for wiring connections for this new type equipment.

DESCRIPTION:—Control system consists of an operating solenoid (on overdrive case), control relay, and accelerator pedal operated throttle 'kick-down' switch which makes it possible to return to Direct Drive (from Overdrive) at speeds above the overdrive cut-in point, at the will of the operator, simply by depressing the accelerator pedal beyond the wide open throttle position so as to close the throttle switch contacts.

OPERATION:—With the car operating in overdrive (for all accelerator pedal positions between idle and wide-open throttle) the solenoid pawl is held in the 'in' position by a spring on the solenoid plunger stem to engage the sun gear blocker plate and prevent rotation of the sun gear. When the accelerator pedal is fully depressed (for return to Direct Drive), the closing of the throttle switch completes the relay circuit, closing the relay contacts so that the overdrive solenoid is energized. Current flows through both solenoid coils (solenoid main contacts which control 'starting coil' are normally closed) and the solenoid operates in successive steps as follows: 1) small plunger 'B' is drawn in so that contactor 'C' completes circuit from 'IGN' terminal to ground, cutting out the ignition momentarily by shorting out the breaker contacts and grounding the coil directly, causing the engine to miss several firing impulses; 2) As soon as pressure on gear teeth removed (by engine not firing), the solenoid plunger 'F', to which the sun gear pawl is attached, is drawn in so that the sun gear blocker plate and sun gear are released and allowed to rotate for direct drive. 3) This movement of the large plunger 'F' forces the small plunger 'B' out, first opening the ignition contacts and restoring the ignition, and then opening the main solenoid contacts so that the current flow through the 'starting coil' is interrupted. Current continues to flow through the fine 'holding coil' winding and this is sufficient to hold the pawl out of engagement (see specifications below for relative starting and holding coil current draw). When the accelerator pedal is returned to any position below wide open throttle, the opening of the throttle switch contacts opens the relay and solenoid circuits. The sun gear pawl spring then engages the pawl in the sun gear blocker plate and the car returns to Overdrive.

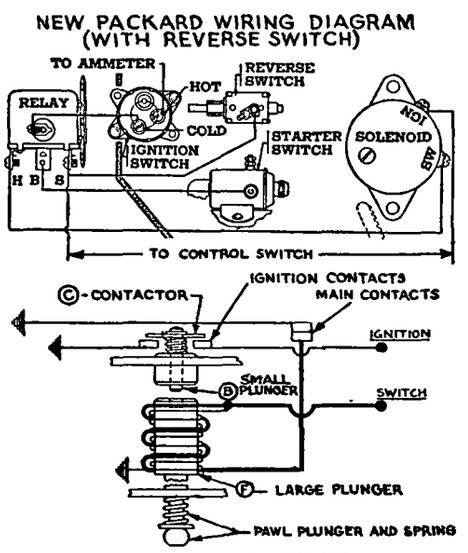
NOTE—The entire solenoid operation is so rapid and the ignition is cut out for so short an interval that it is not apparent to the operator. If for any reason the solenoid is unable to withdraw the pawl, the combined current draw of the starting and holding coils will cause the relay fuse (in ammeter lead at relay) to blow, restoring the ignition. The car will then operate in a normal manner except that it will not be possible to return to direct drive from overdrive.

CAUTION—Do not use any other capacity than 14 ampere fuse in relay circuit (this fuse not used on Graham or Packard Models).

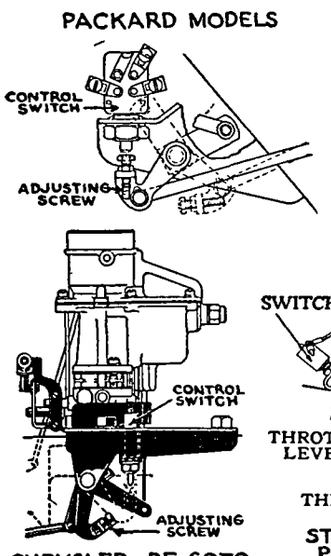
ADJUSTMENT:—Check and adjust throttle switch linkage on each car model as directed below whenever linkage is disconnected or disturbed by carburetor linkage adjustment, removal of units, etc.

Chrysler, DeSoto Models—Depress accelerator pedal until throttle valve just reaches wide open position (remove air cleaner and sight down carburetor barrel to determine this position), hold in this position while making adjustment. Loosen locknut and turn switch plunger contact screw until clearance between contact screw head and switch plunger is exactly 3/32", tighten locknut.

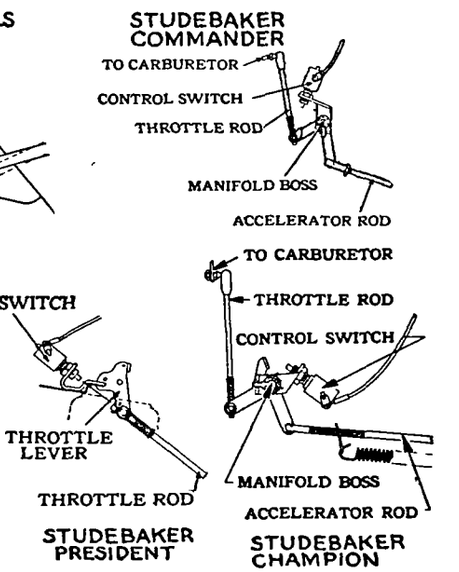
Graham Models—Adjust position of operating block (on connector rod linking bell crank and throttle valve lever) so that throttle kick-down switch plunger is depressed not more than 1/32" with wide open throttle. See that linkage over-travel insures closing of switch contacts before accelerator pedal bottoms on toeboard. NOTE—Carburetor throttle lever should be set so that end is approximately 7/16" above center of shaft when throttle closed and accelerator pedal rod should be connected in top hole on bell crank.



Packard Six, Eight, Super Eight—Depress accelerator pedal until throttle valve is just wide open, hold in this position, loosen locknut on switch plunger tappet screw (on accelerator cross-shaft lever) and adjust screw so that clearance between face of screw and end of switch plunger is exactly .046", tighten locknut. See that accelerator pedal has sufficient over-travel to close switch contacts before bottoming on floor boards.



Studebaker Champion, Commander, President—Depress accelerator pedal until throttle valve is just wide open and throttle lever contacts wide open throttle stop, hold in this position, loosen locknut on switch mounting stud, turn switch in or out of mounting bracket until small shoe on idler lever (Commander), end of accelerator rod (President), just contacts switch plunger, tighten locknut.



SERVICING OVERDRIVE SOLENOID:—**Removal**—To remove solenoid (for transmission and overdrive removal or for servicing), take out two capscrews in mounting flange, withdraw solenoid case without disturbing base plate and plunger assembly.

CAUTION—Do not lose gaskets under solenoid assembly. These gaskets control pawl mesh and must be replaced when solenoid installed.

Servicing—No servicing required other than to keep contacts clean and parallel so as to make good electrical contact. To remove cover for contact inspection, disconnect wires, take out flat headed screw, pull cover off base. See that lower face of contact disc on plunger 'B' and contact plates (which short out ignition) are clean and smooth. Resurface main contacts (which control 'starting coil' circuit) with a file, if necessary, to secure smooth parallel contact surfaces. Check contact gaps and solenoid performance (see specifications below).

WARNER 1939 ELECTRICAL OVERDRIVE CONTROL CONT.

SPECIFICATIONS:—Control system units for each car model are of various makes as follows:

	Solenoid Relay	Solenoid
Chrysler, DeSoto	Auto-Lite HR-4201	Auto-Lite
Graham 96, 97	R-B-M Model 4740	Delco-Remy
Packard	R-B-M Model 4780	Delco-Remy
Studebaker Comm.	Auto-Lite HR-4201S	Delco-Remy
Studebaker Pres.	Auto-Lite HR-4201	Delco-Remy

Specifications for each type of equipment are as follows:

AUTO-LITE SOLENOIDS

Small Plunger 'B'—Should close with 2.5 volts min., 4 volts max. (6 volt units), 5 volts min., 8 volts max. (12 volt units) with large plunger 'F' 3/8" from bottom.

Large Plunger 'F'—Should exert pull of 21 lbs. min. (70° F.), 15 lbs. min. (210° F.) when 3/8" from bottomed position.

Contact Gap (main contacts)—.047" plus or minus .015" with large plunger 'F' bottomed in coil.

Current Draw (At 70° F.)—'Both coils' figure is for both Holding and Starting coils together (main contacts closed). 'Holding Coil' figure is for Holding coil only (main contacts open—plunger bottomed in coil).

Six Volt Units

	Min. — Amperes — Max.	Volts
Both Coils	29.0 — 31.0	3
Holding Coil	1.2 — 1.3	6

Twelve Volt Units

Both Coils	14	15	6
Holding Coil	.55	.65	12

AUTO-LITE RELAYS

Contact Gap—.026". **Air Gap**—.012-.017" (closed).

Closing Voltage—2.5-3.5 volts (6 volt units), 5.0-7.0 volts (12 volt units).

Current Draw—Measure between 'TH.SW' and 'IGN.SW' terminals at 75° F. Current should be 1.0-1.2 amperes at 6.0 volts (6 volt units—winding resistance 5-6 ohms), .8-.92 amperes at 12.0 volts (12 volt units—winding resistance 13-15 ohms).

Fuse—14 ampere capacity. Mounted on relay.
CAUTION—Do not use any other capacity fuse.

R-B-M RELAYS

Contacts Close—3.5-4.5 volts.
Current Draw—3/4 ampere.
NOTE—No fuse used with this relay on Graham and Packard models.

DELCO-REMY SOLENOIDS

Model 1569 (Six Volt), 1573 (Twelve Volt)
Small Plunger 'B'—Should close at 5.0 volts (1569), 6-10 volts (1573) with 3/8" air gap of large plunger.
Large Plunger 'F'—Should close against 16 lb. pull with 3/8" plunger air gap at 6.0-6.38 volts (1569), 12.0-12.75 volts (1573) with both coils operating, and should hold against 18 lb. pull when bottomed in coil at 6.0-6.35 volts (1569), 12.0-12.75 volts (1573).
Contact Gap (main contacts)—.020-.060" with large plunger 'F' bottomed in coil.
Contact Spring Tension—10-13 ounces.
Current Draw—'Both Coil' figure is for both starting coil and holding coil together (main contacts closed), 'Holding Coil' figure for holding coil only (main contacts open—plunger bottomed in coil).

Six Volt—Model 1569

	Amperes	Volts
Both Coils	28-34	6.0-6.38
Holding Coil	9-1.1	6.0-6.35

Twelve Volt—Model 1573

Both Coils	24.5-27.5	12.0-12.75
Holding Coil	.66-.72	12.0-12.75

TROUBLE SHOOTING:—If overdrive does not operate, check for blown fuse on relay. This fuse will blow if control system does not operate properly. If fuse blows continuously, check wiring circuits for grounds or shorts, make certain that ignition circuit is shorted out momentarily when solenoid first energized (necessary to relieve gear load so that solenoid can withdraw pawl), see that pawl plunger operates freely without binding.
CAUTION—Do not install fuse of any other capacity than 14 ampere. This size fuse designed to protect control circuit from overload and to prevent car stalling if transmission control does not operate for any reason (ignition will be restored and car can be driven after fuse blows. NOTE—No fuse used on Graham and Packard models.

PACKARD SIX, MODEL 1700 (1939)
PACKARD '120' EIGHT, 1701, 1A, 2 (1939)
PACKARD SUPER EIGHT, 1703, 3A, 5 (1939)

NOTE:—**Graham Models.** This type used on later cars only. See separate article for data on first type Horizontal Transmission with R6 Overdrive.
Packard Models—This Overdrive unit used in conjunction with the regular Packard Transmission. See Packard Transmission article for data on Transmission. Complete data on Overdrive unit is given below.

Models AS7-T88, AS9-T88—These models are 'Horizontal Type'. Serviced in same manner as other models except that transmission case cover is located on side of case.

TYPE:—Constant-mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse), all helical gear type. Main drive gear mounted on ball bearing in front end of case. Mainshaft mounted on pilot roller bearing in main drive gear hub (front end), ball bearing in bearing retainer or overdrive adapter bolted to rear of case (rear end) and extends through into overdrive unit. Counter gear cluster mounted on roller bearings on stationary countershaft with spacer between bearings and thrust washer at each end. Reverse idler gear mounted on plain bushing on short shaft which is retained by key which engages slot in case at rear end.

Overdrive Unit:—Similar in design to other Type R6 overdrive units except for sun gear mounting and control as follows: Sun gear is free to revolve on transmission mainshaft and is held stationary (for overdrive) by a spring-loaded, solenoid controlled clutch pawl mounted on the overdrive adapter plate. The pawl slides between two guide plates and in the inner position engages the sun gear blocker plate so as to prevent rotation of the sun gear. When the pawl is withdrawn by the solenoid to free the sun gear, a balk ring (assembled loosely on blocker plate) is dragged around sufficiently to block the pawl in the withdrawn position (when torque reversed by accelerator pedal release, balk ring returned to original position so that pawl can engage), but is prevented from further rotation by lugs on the rim of the ring.

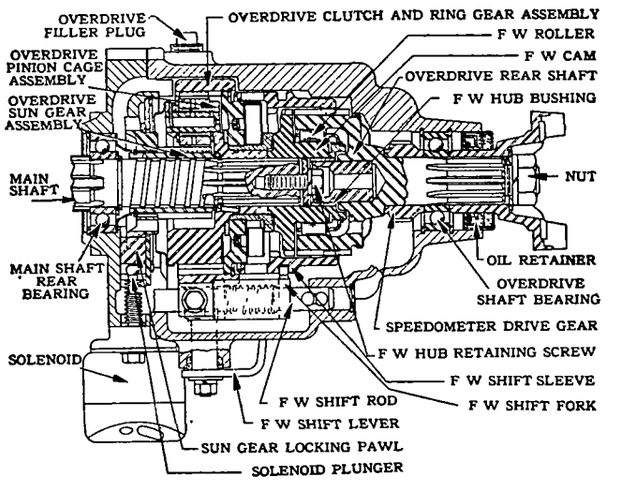
Synchronizing Units:—Various types used as follows:
Drag Ring Blocking Type (Chrysler C22, DeSoto)—Synchronizer rings are loose in ends of inner clutch sleeve and are actuated by a drag or friction ring within the outer clutch sleeve which contacts lugs on the synchronizer rings (initial movement of outer clutch sleeve carries drag ring with it and forces synchronizer rings in contact with cones on gear hubs). Teeth on synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes clutch teeth on rim of sleeve to slide past teeth on synchronizer ring and engage clutch teeth on gear hubs. Inner clutch sleeve is stationary on shaft and does not move during synchronization and gear engagement.

Blocking Lug Type (Chrysler C23, C24)—Synchronizer rings mounted loosely in ends of inner clutch sleeve (retained by snap rings) and are actuated in usual manner by inner clutch sleeve (inner and outer sleeves centered by poppet balls and springs and move as a unit during synchronization). Three lugs on synchronizer rings block or prevent gear engagement until synchronization completed when the final movement of the outer clutch sleeve engages the clutch teeth on the gear hubs.

Wire Bound Strut Blocking Type (Graham, Studebaker)—Synchronizer rings are free in ends of inner clutch sleeve and are actuated by three struts which fit in slots in inner clutch sleeve and engage notches in the rings. Struts are centered in outer clutch sleeve by a locking wire or ring engaging

WARNER 1939 TYPE (ELECTRIC CONTROL) OVERDRIVE CONT.

notches in the struts and move with the clutch sleeve to force the synchronizer rings against the cones on the gear hubs for synchronization. Teeth on the outer rim of the synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes clutch teeth on rim of sleeve to slide past teeth on rings and engage clutch teeth on gear hubs. Inner clutch sleeve is stationary on shaft and does not move during synchronization and gear engagement.



SERVICING:—Disassembly (Overdrive Unit)—Remove speedometer driven gear assembly. Take out five screws mounting overdrive on transmission case, pull case and rear shaft assembly to rear using extreme care not to lose free-wheeling rollers which will be free to drop out and to prevent adapter plate moving away from transmission case (if transmission not being dismantled also). On all models except Packard, nut on universal joint companion flange can be removed, flange removed with puller, and shaft held in place while case is withdrawn without disturbing overdrive free-wheeling cam and roller assembly if desired, rear shaft assembly should then be removed. Take out capscrew in free-wheeling hub (on rear end of mainshaft), remove washer, bushing, and free-wheeling cam and roller assembly. Remove overdrive clutch pawl, ring gear, and pinions as an assembly (do not pull ring gear off pinions unless servicing required—pinions are split type on some models and must be wound up before being meshed in ring gear). Take out two screws and remove overdrive solenoid. Remove snap ring on mainshaft at rear of sun gear, and sun gear retaining plate snap ring (in adapter plate recess), remove sun gear assembly. Remove solenoid base and plunger (tilt base to disengage plunger from pawl), spring, pawl, and pawl guide plates.

Transmission Disassembly—Take out screws and remove transmission case cover. Remove shift rails being careful not to lose interlock ball and poppet balls and springs which are located under rails. Withdraw overdrive adapter plate and mainshaft assembly through rear of transmission case (On Chrysler C23, C24 models see that synchronizer unit does not fall off shaft—if removed from front end of shaft first, do not allow inner and outer clutch sleeves to come apart which will allow poppet balls and springs to fly out). Take out capscrews and remove front bearing retainer on front end of case. Use arbor or dummy shaft and drive countershaft out of case to rear, removing key from slot in rear end of shaft as soon as it is exposed, and leaving arbor in counter gear cluster to retain bearings until re-installed, allow counter gear cluster to drop down in case. Remove drive gear bearing snap ring (on bearing outer race at front end of case), push gear and bearing assembly through into case and remove at rear end. Remove counter gear cluster and thrust washers. To remove reverse idler gear, drive shaft out to rear, remove key from slot at rear end of shaft, lift out gear and bushing assembly.

Mainshaft & Bearing Assembly:—Shaft and bearing can be removed from adapter plate by removing snap ring in adapter at front of bearing, and pulling shaft and bearing forward. To remove bearing, take out snap ring on shaft at rear of bearing, remove thrust washer, press bearing off shaft. Reassemble in same manner.

Second Speed Gear Assembly (With Drag Ring and Wire Bound Strut Type Synchronizers):—Gear and inner clutch sleeve of synchronizer unit retained on shaft as an assembly by a snap ring in front of the synchronizer unit. To remove, take out snap ring, withdraw synchronizer unit and gear from shaft. Do not remove bushing from gear (serviced as an assembly). When reassembled, second speed gear endplay should be .003-.008" (Chrysler models), .003-.014" (others) with synchronizer pressed forward against snap ring.

(With Blocking Lug Type Synchronizer)—Gear retained by thrust washer and locking plunger at forward end. To remove gear (with synchronizer unit off shaft), press down on locking plunger to release washer, rotate washer until notches on inner rim line up with splines on shaft, withdraw washer and gear, being careful not to lose locking plunger and spring which will fly out when gear removed. Install in same manner, making certain that washer turned so it engages shaft splines and that locking plunger engages washer to prevent turning and loosening in service.

Synchronizer Assembly:—Mark inner and outer clutch sleeves and both synchronizer rings to insure reassembly in same relative positions (on some types synchronizer rings are loose and can be lifted off directly). Service each type as follows:

Drag Ring Type—Install drag ring on inner clutch sleeve so that depressions on ring are directly in line with synchronizer ring lug holes in sleeve and retain in this position with three pins inserted through lug holes so as to pass over ring in slot at center of sleeve while sleeve being inserted in outer clutch sleeve. Make certain that open ends of drag ring straddle a tooth on the outer clutch sleeve and line up marks on inner and outer sleeves, then remove assembling pins and install synchronizer rings with spreader spring behind high speed synchronizer ring installed so that three raised fingers on spring are toward ring (spreader spring not used for second speed synchronizer ring). See Second Speed Gear data for installation instructions.

Lug Type—Synchronizer rings retained by snap rings and can be lifted out when snap ring removed. See that rings are free to turn with snap ring in place. Backlash between inner and outer clutch sleeves should be .000-.001" (sleeves are selective fit). Pressure required to break poppets so that outer sleeve slides on inner sleeve should be 26-34 lbs. (Chrysler C23, C24).

Wire Bound Strut Type—Install struts on inner sleeve, install lock wire so that it engages notches on struts with open end of wire midway between two struts. When installing inner sleeve and strut assembly in outer sleeve, narrow strips of .003" shim stock can be installed directly over each strut to prevent wire disengaging from strut notch when it is contracted to enter outer sleeve. CAUTION—See that hook on end of lock wire is engaged between two clutch teeth on outer sleeve. Remove feeler strips used for assembly. See Second Speed Gear data for installation instructions.

Main Drive Gear & Bearing Assembly:—To remove bearing, remove snap ring on shaft in front of bearing, take off thrust washer, press bearing off shaft. Install bearing with shielded side toward gear, use new snap ring and make certain that it is snug fit in groove. When installing gear and bearing assembly in transmission see that retainer fits properly on case and that bearing snap ring is held snugly between retainer and case so that gear has no endplay.

Counter Gear Assembly:—If bearings removed from counter gear, use grease to hold rollers in place and install rollers on dummy shaft or arbor in gear cluster. Install steel washer next to gear and bronze thrust washer between steel washer and case at each end (steel washer not used at front end on Chrysler C23, C24). Drive countershaft in from rear end (displacing arbor at front) and make certain that locking key installed in notch at rear end of shaft so as to engage slot in case. Check endplay with feeler gauge. Endplay should be .002-.008" (On Chrysler models, adjust by selecting thrust washers of correct thickness—washers furnished in three thicknesses, A—thinnest, B, C—thickest).

OVERDRIVE UNIT

SERVICING:—See Transmission Disassembly (above) for overdrive removal and disassembly directions.

Overdrive Mainshaft & Bearing Assembly (except Packard):—Bearing is retained in overdrive case by snap ring installed at each side of outer race and is positioned on shaft by speedometer gear hub (front), universal joint yoke hub (rear). Oil seal is assembled in end of case and can be removed with a puller after universal joint yoke has been removed. Do not remove oil slinger which is spun on rear end of free-wheeling sleeve.

Overdrive Mainshaft & Rear Bearing Assembly (Packard Models):—Two types of rear bearings used as noted below. On cars with first type bearing, universal joint flange nut (at rear end of shaft) controls bearing pre-load, **do not loosen this nut which will disturb bearing adjustment.** See bearing pre-load adjustment instructions below if bearings dismantled or adjustment disturbed. On later cars (may be identified by letter 'M' stamped on side of universal joint flange), this nut does not control bearing adjustment and should be kept tight.

IMPORTANT SERVICE NOTE—This second type bearing adjustment (Solid Spacer No. 341264, Belleville Spring Washer No. 341266) should be installed on all first cars (with compressible spacer type adjustment) whenever overdrive disassembled or bearings removed.

WARNER 1939 TYPE CONT.

Overdrive Unit Rear Bearing (First Type)—Consists of two ball bearings with compressible spacer on shaft between inner races. Bearing adjustment controlled by tension of universal joint flange nut on rear end of shaft. If bearings dismantled or bearing adjustment lost by loosening of universal flange nut, install bearings with snap rings in place in housing between bearing outer races, use new spacer on shaft between bearings and adjust as follows: Clamp universal flange in vise with overdrive case vertical, tighten flange nut slightly, check force required to spin overdrive case on shaft using spring scale hooked in mounting hole on boss at rear of case (first reading should be oil seal drag only), tighten nut a little at a time and repeat check until 3¼-4¼ lbs. additional pull required to spin case. NOTE—If nut tightened so that bearing pre-load of 5 lbs. or more (net after subtracting oil seal drag), new spacer sleeve must be installed and adjustment repeated.

Overdrive Unit Rear Bearing (Later Type)—Solid spacer used on shaft between bearings and bearings pre-loaded by Belleville spring washer assembly between bearings (spring washer rims engage bearing snap rings in housing). With this type assembly, universal flange nut should be tightened securely (does not adjust bearings). NOTE—Cars with this type bearing adjustment assembly may be identified by letter 'M' stamped on side of universal joint flange yoke.

Sun Gear & Plate Assembly:—To remove sun gear from plate, remove snap ring at end of sun gear, slide plate off gear. Check balk ring friction on sun gear plate, 8-10 lb. pull should be required to rotate ring clockwise on plate. When installing sun gear, make certain that oil slots in plate and gear line up.

Overdrive Solenoid:—See separate article on Warner Overdrive Control for complete solenoid specifications and servicing data.

ASSEMBLY & INSTALLATION:—Reverse disassembly directions and note following points: Make certain that snap ring installed on mainshaft in back of sun gear assembly (this ring limits sun gear and planet pinion gear assembly endplay); see that planet pinions are correctly wound up before being meshed in ring gear (split type only); make certain that two pawl guide plates are in position, turn sun gear so that lobe on plate is in line with pawl slot, install pawl with relief notch toward rear. Pack free-wheel rollers in cage with grease to retain rollers while rear shaft being installed. Install case by placing shaft assembly in vertical position, invert case (with clutch collar in case and engaging control fork) and lower on shaft so that collar engages teeth on free-wheel sleeve and cam. When installing overdrive unit on transmission, make certain that reverse lock-out pin in place and install mounting screw with star washer in lower right hand hole of transmission case (necessary to prevent oil leaks).

ADJUSTMENT:—**Cut-in Speed.** Should not require adjustment but can be adjusted in same manner as on previous models by removing plug on top of overdrive case, turning shaft until hole in clutch shell and adjusting screw in clutch pawl assembly (two screws—adjust in succession) line up with hole in case, and turning adjusting screw in to increase cut-in speed, out to decrease cut-in speed. Make certain that screws not turned so far as to cause interference. With standard setting, cut-in speed should be as follows:

Car Model	Cut-in Speed
Chrysler, De Soto (all models)	23-28 MPH.
Packard (all models)	30 MPH. (25-30)
Studebaker (all models)	30 MPH.

CAUTION—Both adjusting screws must be adjusted exactly alike. One screw marked by single slot, opposite screw has double slot, to avoid possibility of adjusting same screw twice.

Overdrive Control (Chrysler, De Soto):—To adjust, loosen screw which holds control wire on lever at overdrive case, push hand control button at instrument panel in as far as possible and then pull button out ⅛" (to insure full travel of lever), move control lever on overdrive case to extreme rear position (Overdrive position), tighten control wire screw and locknut securely.

GRAHAM STD. & SPEC. MODEL 96 (1939)
GRAHAM SUPERCHARGER, MODEL 97 (1939)
STUDEBAKER CHAMPION, MODEL G (1939)
STUDEBAKER COMMANDER, MODEL 9A (1939)
STUDEBAKER PRESIDENT, MODEL 5C (1939)

NOTE:—**1938 Models.** Transmission with Overdrive (R6 Type) optional on these car models. See following article for Overdrive servicing data and special Disassembly Directions for Transmission and Overdrive.

1939 Models. Transmissions with new type Overdrive (electrically operated 'kick-down' control) are optional on these models. See separate article (preceding) for data on this type.

Model AS4-T88. This model used on Graham and Studebaker cars with Evans Vacuum Gear Shift. Similar to standard transmission except for shifter mechanism and serviced in same manner. See articles on Evans Vacuum Gear Shift for adjustment and servicing data on this equipment.

Transmission Controls. Remote steering column mounted types optional on all car models. See separate articles on "Transmission Controls" for complete data on each type.

TYPE:—Constant-mesh, synchro-mesh, helical gear type (second and high), sliding helical gear (low and reverse). Clutch shaft and main drive gear mounted on ball bearing in front end of transmission case. Mainshaft mounted on roller bearing (in main drive gear hub) at front end and ball bearing (in bearing retainer) at rear end. Counter gear cluster mounted on roller bearings on stationary shaft with thrust washers at each end. Reverse idler gear mounted on bronze bushing on stationary shaft (countershaft and reverse idler shaft retained by locking plate on rear face of case). Second and high gears engaged by sliding clutch sleeve (splined on clutch gear which is splined on mainshaft) which engages clutch teeth cut on the main drive gear and second speed gear hubs.

Lug Type Blocking Synchronizer (Graham, Studebaker with conventional shift lever)—Synchronizer rings loosely mounted in ends of inner clutch sleeve and retained by snap rings. Rings actuated in usual manner by inner clutch sleeve (inner and outer clutch sleeves centralized by poppet balls and springs and move as a unit for synchronization). Three lugs on the synchronizer rings block or prevent gear engagement until synchronization is completed when the outer clutch sleeve slides on the inner sleeve to engage clutch teeth on gear hub.

1939 Wire Bound Strut Blocking Synchronizer (Graham, Studebaker Models with Steering-column Gear Shift):—Synchronizer rings are free in ends of inner clutch sleeve and are actuated by three struts which fit in slots in inner clutch sleeve and engage notches in the rings. Struts are centered in outer clutch sleeve by a locking wire or ring (engaging notches in the struts) and move with the outer clutch sleeve to force the synchronizer rings against the cones on the gear hub for synchronization. Teeth on the outer rim of the synchronizer rings block or prevent gear engagement until synchronization completed when the final movement of the outer clutch sleeve causes the clutch teeth on the rim of the sleeve to slide past the synchronizer ring teeth and engage the clutch teeth on the gear hub. Inner clutch sleeve is stationary on mainshaft and does not move during synchronization and gear engagement.

SERVICING:—**Disassembly.** Remove gear shift lever, take out cover screws (on side of case on Graham and Studebaker models) and remove cover, remove shifter rods or rails and forks taking care not to lose interlock balls and springs. Lock transmission by shifting into two gears at once, remove nut on rear end of mainshaft, pull rear companion flange and brake drum (on models using shaft type parking brake). Remove capscrews on rear bearing retainer, take out screw and remove countershaft locking plate, use dummy shaft or arbor and drive countershaft out to rear leaving arbor in counter gear cluster to retain loose bearing rollers (see note below for removal of countershafts with locking keys). Pull rear bearing retainer and mainshaft assembly through rear of case as a unit (if synchronizing unit allowed to slide off shaft and removed separately, see that sleeve not allowed to come off clutch gear which will cause detent balls and springs to fly out). Take out front bearing retainer capscrews (on front of the case) and withdraw the retainer. Main drive gear must be removed at rear (tap gear forward slightly, remove bearing snap ring at bearing hole in case, drive gear back into case and remove through rear end. Lift out counter gear assembly taking care not to lose the loose bearing rollers at each end or the thrust washrs. To remove reverse idler gear, drive shaft out to rear using a brass drift.

Countershaft Locking Key Note. On models where locking plate not used, countershaft (and reverse idler shaft) retained by key in recess in rear face of case which engages slot in shaft. On these models, drive countershaft out to rear (with rear bearing adapter removed) until key is exposed, remove key and drive shaft out (use dummy shaft or arbor and leave arbor in counter gear cluster to retain bearing rollers until shaft is reinstalled).

Mainshaft & Bearing Assembly:—Bearing is press fit on mainshaft and is held in place by companion flange and nut at rear end of shaft (speedometer drive gear acts as spacer on shaft). Bearing is retained in recess in rear retainer by snap ring at forward end (remove snap ring to remove bearing).

WARNER HORIZONTAL TYPE CONT.

When installing bearing, select snap ring for tight fit in groove.

Synchronizing Unit (Lug Type):—Mark inner and outer sleeves to assure assembling in same position. Use extreme care not to lose detent balls and springs (wrap assembly in cloth when pushing sleeve off so that balls will be caught when they fly out). Rings retained by snap ring in clutch gear hub. Use special assembling clips to install synchronizer balls and springs. Install synchronizing unit on mainshaft with longer hub of clutch gear and sleeve toward front (see illustration).

Wire-Bound Strut Type Synchronizers—Install struts in inner sleeve, install lock wire so that it engages notches in struts with open end of wire midway between two struts (synchronizer will not operate if wire installed with open end at strut so that strut free to move endwise). When installing inner sleeve and strut assembly in outer sleeve, narrow strips of .003" feeler stock can be installed directly over each strut to prevent wire disengaging from strut slot when it is contracted to enter sleeve. CAUTION—Make certain that hook on open end of lock wire is engaged between two clutch teeth in outer sleeve. Remove feeler strips used for assembly before installing synchronizer on mainshaft. See Second Speed Gear Assembly for installation instructions.

Second Speed Gear Assembly (with Lug Type Synchronizer):—Retained by thrust washer and lock plunger or locking plate at forward end (see directions below for dismantling each type). When installing gear, check endplay which should be .002" minimum, .008" maximum. Adjust by installing thrust washer of correct thickness.

Disassembly of Locking Plunger Type—Use wire or pointed tool to depress plunger in shaft (under thrust washer at forward end of gear), rotate washer until notches on inner edge line up with splines on shaft, withdraw gear and washer from forward end of shaft. When installing gear, see that washer is turned so that it is retained by shaft splines and that plunger engages notch in washer to prevent it rotating in service.

Disassembly of Locking Plate Type—Bend up three fingers on lock plate which engage groove in thrust washer, slide lock plate off shaft. Rotate washer to line up notches and splines on shaft, remove washer and gear. Use new lock plate when installing gear, make certain that thrust washer turned so that it engages shaft splines and that lock plate fingers locked firmly in thrust washer grooves to prevent washer turning in service.

Second Speed Gear Assembly (with Wire Bound Strut type Synchronizer):—Second speed gear and inner sleeve or hub of synchronizer mounted as an assembly on the mainshaft and retained by snap ring on forward end of shaft. To disassemble, remove snap ring in front of synchronizer inner sleeve, withdraw synchronizer assembly and second speed gear. When reassembling, make certain that second speed gear endplay is .003-.014" with synchronizer inner sleeve pressed forward against snap ring.

Main Drive Gear & Bearing:—Bearing retained on clutch shaft by thrust washer and snap ring at forward end (within bearing retainer). If bearing removed, use new snap ring selected for tight fit in groove (furnished in various thicknesses). Front bearing for mainshaft (roller type) located within drive gear hub and rollers are retained by snap ring at rear end of gear hub.

Counter Gear Assembly:—See that bearing spacer installed in gear cluster between bearings and that rollers are in place around dummy shaft or arbor (end of gear can be coated with grease to retain rollers during assembly). Install gears with steel and bronze thrust washer at each end (steel washer toward gears, bronze washer toward case), insert countershaft from rear end, pushing out arbor as shaft is installed. Check endplay with feeler gauge between bronze thrust washer and rear of case with gear cluster forced toward front. Endplay should be .002" minimum, .008" maximum. Adjust by changing thrust washers (furnished in three thicknesses). Make certain that locking plate and screw installed to retain countershaft and reverse idler shaft.

WARNER 1938-39 HORIZONTAL TYPE (WITH R6 OVERDRIVE)

Optional Equipment on:
Model AS1-T88

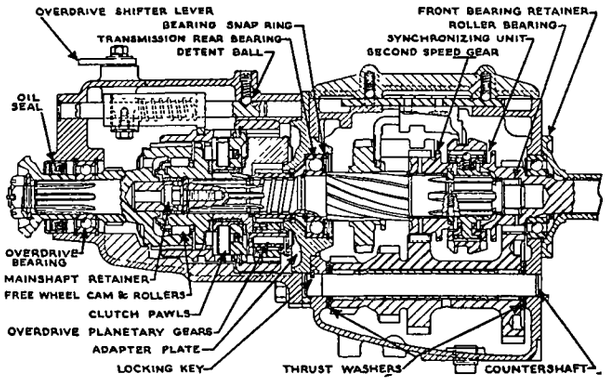
GRAHAM, MODELS 96, 97 (1939) FIRST CARS
STUDEBAKER, SIX & COMM. 7A (1938)
STUDEBAKER, COMM. STATE COMM. 8A (1938)
STUDEBAKER, PRESIDENT MODEL 4C (1938)
Model AS3-T88—See Note.
GRAHAM, MODELS 96, 97 (1938)
STUDEBAKER, MODELS 7A, 8A, 4C (1938)

NOTE:—Model AS3-T88. This model used on Graham, Studebaker cars with Evans Vacuum Gear Shift. Similar to standard transmission except for shifter mechanism and serviced in same manner. See articles on Evans Vacuum Gear Shift for adjustment and servicing data on this equipment.

Transmission Controls. Remote steering column mounted types optional on all car models. See separate articles on "Transmission Controls" for complete data on each type.

1939 Graham Models. This type Overdrive used on first cars only. See separate article on new type Overdrive with electrical "kick-down" control for data on later cars.



TYPE:—Constant-mesh, synchro-mesh, helical gear type (second and high), sliding helical gear (low and reverse). Synchronizing unit is new 'blocker type'. Design similar to transmission used on these same car models as standard equipment (see preceding article).

Overdrive Unit. Type R6. Mounted in separate case bolted on rear face of transmission case. Transmission mainshaft extends through into overdrive case serving as mounting shaft for Planetary Pinion, Annulus Gear and Pawl, and Free Wheeling Cam assemblies.

SERVICING:—Transmission & Overdrive Disassembly. Remove gear shift lever, take out cover screws (on side of case on Graham and Studebaker models), remove cover, shifter rods or rails and forks taking care not to lose interlock balls and springs. Remove universal joint flange nut and flange (use puller). Remove speedometer drive pinion. Take out mounting screws in overdrive mounting flange on rear face of transmission case, hold mainshaft in forward position, withdraw overdrive housing and rear shaft assembly (take care not to lose free-wheeling rollers which will be free to fall out). Take out capscrew in rear end of transmission mainshaft, withdraw free-wheeling cam and cage assembly, overdrive clutch pawl core and annulus gear assembly, and planetary pinion cage assembly. Remove snap ring on mainshaft at rear end of stationary sun gear. Remainder of transmission disassembly is same as for standard type (see preceding article) except as noted below. See Overdrive section (following) for complete Overdrive servicing data.

Transmission Mainshaft Rear Bearing. Bearing retained in adapter plate by snap ring in bearing recess on forward side. Bearing positioned on mainshaft by thrust washer and snap ring at rear (accessible after removing bearing and shaft assembly from adapter). When reassembling, select snap ring for tight fit in groove (furnished in four thicknesses).

Countershaft and Reverse Idler Shaft Locks. Shafts are locked in place by woodruff key in recess in rear face of transmission case (under adapter plate) which engages notch in shaft. To remove shaft (on models with hole in adapter plate in line with countershaft hole in case), tap adapter plate to rear about ¼", drive countershaft to rear until key clears case, use long screwdriver inserted between case and adapter plate and remove key, then drive countershaft out through adapter plate hole. On other models, adapter plate and mainshaft assembly must be removed before countershaft can be driven out.

Counter Gear Endplay. Should be .002" minimum, .011" maximum. Adjusted by installing thrust washers of correct thickness.

SERVICING:—Disassembly. To dismantle housing and drive shaft assembly, use brass drift to drive shaft out toward front end, lift out clutch pawl core. Bearing retained in housing by snap ring at each end. When installing bearing, select snap ring at rear end of correct thickness to prevent any bearing sideplay in housing (snap ring furnished in four thicknesses).

Clutch Pawl Core Assembly. To dismantle, use plug of correct size and press out steel bushing in pawl core. Mark or note position of clutch pawl adjusting screws (to insure correct adjustment when installed), remove these screws and take out pawls, lock plate and spring. When assembling these parts turn adjusting screws in until screw heads are flush with counterbore in screw holes (see adjustment instructions below).

Stationary Sun Gear. This gear press fit in adapter plate and retained by snap ring at forward end. To remove sun gear (with transmission mainshaft and rear bearing removed from adapter plate), take out oil baffle, remove snap ring on end of sun gear, drive gear out of plate toward rear. Install gear in same manner.

WARNER HORIZONTAL TYPE (WITH R6 OVERDRIVE) CONT.

Planetary Pinion Gears. Pinion gears are split type (gear sections linked by spring within gear which rotate each half in opposite direction to take up backlash and insure quiet operation). Gear teeth in each section will rotate out of line when pinions unmeshed from annulus gear and sun gear and must be rotated back into correct position (marked teeth in each section together) when installed. See *assembling directions* below.

OVERDRIVE UNIT

Overdrive Assembly:—Place clutch pawl core and annulus gear assembly in position on planetary pinion cage hub so that annulus gear meshes with narrow section of pinions only. Install pinion cage on transmission mainshaft so that sun gear meshes with wider section of pinions only. Rotate annulus gear clockwise (to wind up pinion gear springs) until marked tooth on each section of each pinion lines up with marked tooth on adjoining section, then push entire assembly forward so that both annulus gear and sun gear are fully meshed with pinions (force of approximately 11-16 inch lbs. required to wind up these split pinions so that marks line up). Assemble free wheeling cam and cage on mainshaft, install retaining screw and lockwasher on rear end of shaft, tighten screw securely and make certain that bushing is in place in recess in shaft (this bushing engages plug on forward end of overdrive drive shaft). Insert free wheeling rollers (use cup grease to retain rollers while installing hub, or hold rollers in place with rubber band which can be removed after hub started in place). Rotate free wheeling roller cage counter-clockwise (viewed from rear end), slide overdrive drive shaft in place, install speedometer gear on shaft. Install clutch pawl shell in overdrive housing and engage shifter collar in groove. Hold overdrive housing upside down and work it into place on drive shaft until lockout bar contacts adapter plate, rotate housing into correct position (manipulate lockout lever if housing does not slide into position freely).

ADJUSTMENT:—Overdrive clutch pawl adjusting screws correctly set at factory for cut-in speed as noted below and should not be disturbed. If overdrive disassembled or adjustment required for other reasons, adjust as follows: Drive car until lubricant in case is warm, jack up rear wheels, drain overdrive case. Remove adjusting hold plug on top of case. With transmission gears in neutral, line up pawl slots in clutch gear with adjustment opening in pawl shell and overdrive housing by turning the propeller shaft. Engage high gear, place control button in Overdrive position, hold clutch pedal down so that slight drag placed on propeller shaft, rock shaft back and forth until one adjusting screw head is visible through holes. Turn screw in (clockwise) to increase cut-in speed, out to decrease cut-in speed. Two full turns of the screw will change cut-in speed approximately 6 M.P.H. Repeat adjustment at second adjusting screw (rotate screw into line in same manner as used for first screw) using extreme care to adjust both screws exactly alike. One screw has single screwdriver slot, opposite screw has double slot so that screws can be identified, make certain that same screw is not adjusted twice.

Car Model	Overdrive Cut-in Speed
Graham (all models)	43 M.P.H.
Studebaker (all models)	40-45 M.P.H.

BUICK (FIRST TYPE)

Used On:
SERIES 50, 80 (1932-33)
SERIES 60, 90 (1932-33-34-35)

TYPE:—Constant-mesh, synchro-mesh (second and high), sliding spur gear (1932-33) helical gear (1934-35) for low and reverse. Clutch shaft mounted on shielded ball bearing in transmission case which takes gear thrust. Mainshaft mounted on roller bearing (front), ball bearing which takes gear thrust (rear). Second speed gear positioned by shoulder on mainshaft at rear, thrust washer and lock ring at front. Counter gear cluster mounted on roller bearings on stationary shaft with thrust washer at each end. Reverse idler mounted on bronze bushings on a stationary shaft. Gears are engaged by a clutch sleeve splined to the mainshaft between the main drive gear and second speed gear (within synchronizing unit). Clutch sleeve is bolted to shift ring (shifter fork connection) at three arms which extend out through slots in synchronizer sleeve. Clutch teeth at either end of clutch sleeve engage internal clutch teeth on gear hubs when sleeve is moved on shaft.

Synchronizing Unit:—Consists of a 'Cam Sleeve Assembly' encircling clutch sleeve and centralized on it by spring loaded poppets which engage groove in cam sleeve. Synchronizing cones are mounted in each end of cam sleeve and engage similar cones on gears to effect synchronization. Cam sleeve is actuated by the spring poppets (moves as an assembly with the clutch sleeve until the cones engage) and is driven by the engagement of the beveled clutch sleeve arms with the 'V' shaped cam surfaces at the center of the cam sleeve slots.

SERVICING:—Disassembly. Remove gear shift housing, transmission cover (gears must be in neutral). Remove countershaft cover (1932), oil seal (1933 on) at front end of countershaft and cotterpin at rear, drive countershaft out toward rear, lower counter gear cluster in case. Remove main drive gear bearing retainer on front of case, take out clutch shaft and bearing assembly. Take out rear bearing retainer screws, raise front end of mainshaft (rotate retainer 90° on 1934-35 models), remove synchronizing clutch assembly from mainshaft. Use special tool to free second speed gear lock ring, remove thrust washer, gear, rear thrust washer, low speed gear, then remove bearing retainer and mainshaft through rear of case.

Mainshaft & Bearing Assembly:—Rear bearing should be .0005" loose to .0005" tight on shaft and .0005" loose to .0011" tight in retainer. Bearing locked in retainer by snap ring which engages slot.

Main Drive Gear & Clutch Shaft Bearing:—Bearing should be .0007" loose to .0003" tight on shaft, and .0013" loose to .0005" tight in adapter.

Synchronizing Unit (Cam Sleeve Assembly:—Cannot be serviced and should be replaced as an assembly. Endplay when assembled should be ⅛" min., 3/16" max. (total movement from cone-to-cone engagement).

NOTE—Less than ⅛" endplay may cause cone drag and noise in neutral, more than 3/16" may cause gear clash during engagement.

Counter Gear Assembly:—When installing countershaft ,see that bronze and steel thrust washer in place at each end of shaft (1932), bronze washer at front end, steel washer at rear (1933-35). Endplay should be .002-.014".

Reverse Idler Gear:—Clearance on shaft should be .005-.0025".

BUICK 60, 80, 90 TYPE

Used On:
MODELS 60, 80, 90 (1936-37-38-39)

NOTE:—Transmission used on these models similar except that Second Speed Gear mounted on roller bearings (1936), bronze bushing (1937-38). On 1937-38 models, larger second speed synchronizing drum used on synchronizing unit.

1939 Type:—Design changed from 1938 as follows:
Shifter Mechanism—New type cable and rod actuated shifter shafts for 'Handi-shift' steering column mounted gear shift lever. See service directions below for disassembling data and separate article on Buick Handi-Shift Transmission control for adjustment directions.

Synchronizing Unit—Both synchronizing drums are same size (second speed drum reduced in size and made of bronze).

Rear Bearing Retainer—Model 60 retainer new type (similar to 40) with flanged end for front torque tube mounting. Mainshaft splined for front propeller shaft engagement and bearing inner race positioned on shaft by snap ring. Model 80, 90 retainer same design as for 1938 but is not interchangeable.

TYPE:—Constant-mesh, synchro-mesh, all helical gear type (sliding gear for low and reverse). Clutch shaft and main drive gear mounted on shielded ball bearing at front of transmission case (bearing takes gear thrust). Mainshaft mounted on roller bearing (front), ball bearing (rear) which takes gear thrust. Second speed gear positioned by shoulder on shaft at rear, thrust washer and locking ring at front end. Counter gears mounted on roller bearings (cageless type) on stationary shaft with thrust washers at each end. Reverse idler mounted on bronze bushing on stationary shaft with bronze thrust washer at each end. Gears are engaged by a sliding clutch sleeve splined to the shaft which engages clutch teeth inside synchronizing cones on second speed and main drive gears.

Synchronizing Unit:—Consists of two synchr nizing drums mounted on the ends of three pin cams which extend through holes in the sliding clutch ring. Synchronizing drum assembly is centered on the clutch sleeve by detent springs which engage the notches in the pin cams. The entire assembly moves as a unit when the clutch sleeve is shifted until the synchronizing drums and cones engage, synchronizing unit then rotates (relative to clutch sleeve) until cam surfaces on clutch ring engage pin cams. Synchronizing drums are driven through this engagement until synchronization is completed.

SERVICING:—Disassembly. Remove transmission cover, retainer springs and balls, shifter forks and shafts. Remove torque ball retainer and torque ball at rear of transmission, remove universal joint (use puller). Take out mounting screws and remove rear bearing retainer. Remove mainshaft rear bearing from case and shaft. Pull main shaft assembly (including low speed sliding gear, second speed gear, and synchronizing unit) to rear to disengage forward end of shaft from roller bearing in main drive gear, then remove assembly through top of case. Remove main drive gear bearing snap ring (on front case of case), tap main drive gear and bearing assembly back into case and remove through top opening. Remove countershaft lockscrew (at rear end of shaft), drive countershaft out toward rear using special dummy

BUICK 60, 80, 90 TYPE CONT.

shaft or arbor J-101 (.935" diameter, 7.700" long) and allow this arbor to remain within counter gear cluster until replaced in transmission (arbor will retain loose rollers), remove counter gear cluster through top of case being careful not to lose bronze and steel thrust washers. To remove reverse idler, take out shaft retaining screw, drive out shaft, lift out gear and bronze thrust washers.

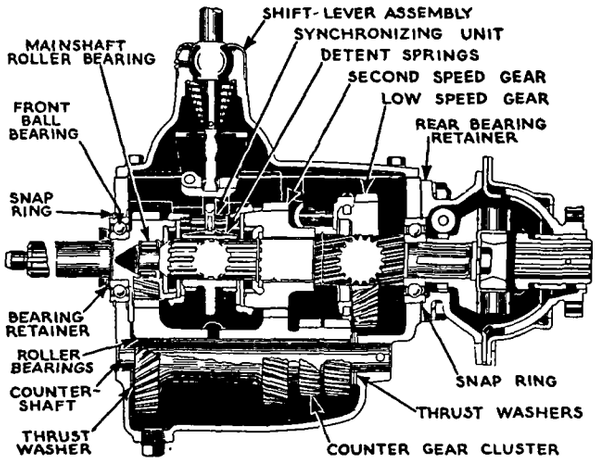
39-60 Note—Shift rails and selector shaft need not be removed to take out transmission mainshaft if they are properly positioned as follows: Shift transmission into high gear, loosen shifter fork on low-and-reverse rail by removing lockscrew, remove rear bearing retainer, pull speedometer gear (press fit on shaft), remove gear spacer and horseshoe shaped rear bearing retainer ring, pull rear bearing, then remove mainshaft assembly through top of case.

1939 Selector Shaft Disassembly—Remove both shift rails, take out self-locking setscrews in selector shaft cams, move right cam toward center of case and remove horseshoe lock holding shaft, remove shaft by driving it out through right hand side of case (plug which closes opening will be driven out with shaft). IMPORTANT—Shaft must not be removed from left side which will damage oil seal. Always remove shaft from right and install on left side. Seal plug hole on right side of case with sealing compound after installing shaft.

Mainshaft & Second Speed Gear Assembly:—Mainshaft rear bearing should be .0004" tight to .0005" loose on shaft, .0002" tight to .001" loose in case. Shaft should have no perceptible endplay. Low and reverse sliding gear backlash should be .003" maximum. Snap ring on main shaft limits gear movement on shaft in low gear position.

Mainshaft Bearings (60 '39). Rear bearing inner race held on shaft by snap ring with spacer between snap ring and speedometer gear which is press fit on shaft (instead of on universal joint yoke as on 80, 90 models). Mainshaft is splined to engage end of front propeller shaft.

Second Speed Gear (1936). To remove second speed gear assembly, remove snap ring at front end, slide complete assembly off shaft. To dismantle bearing assembly, remove snap ring at rear, pull out roller bearing sleeve and bearings. When installing gear, see that rear thrust washer correctly assembled (this acts as oil feed for roller bearings).



Second Speed Gear (1937-39). Bronze-bushed. Clearance between bushing and shaft should be .0005-.0025". Endplay should be .003-.013". To remove gear, remove snap ring at forward end, remove thrust washer, withdraw gear from shaft. Thrust washer tongue must be engaged in slot in shaft (elongated spline). NOTE—Do not engage thrust washer tongue in slot which extends entire length of shaft (this is an oil lead).

Second Speed Gear Snap Ring ('39). Groove for snap ring which retains gear is rounded at bottom and a second snap ring is installed in this groove to position the gear retaining snap ring.

Synchronizing Unit and Clutch Sleeve:—Cannot be dismantled or serviced (except for detent springs which are furnished separately) and should be replaced as an assembly. Endplay when assembled should be ⅛" min., 3/16" max. (cone-to-cone engagement). Less than ⅛" endplay may cause cone drag and noise in neutral, more than 3/16" endplay may cause gear clash during engagement. To check action (with transmission cover off), press down on retainer ball of second and third speed shaft to determine neutral position, note that forward motion (to engage high) is less than rearward motion (to engage second speed cone). This setting necessary to prevent drag between second speed gears which would cause noise in neutral. Clutch sleeve clearance on mainshaft should be .001-.003" backlash between clutch sleeve and mainshaft splines should be .001-.003".

1939 Type—Both drums are same size. Use extreme care to install **bronze** drum toward second speed gear and inner clutch sleeve with end marked 'S' toward second speed gear.

Main Drive Gear & Clutch Shaft Bearing:—Bearing is held on shaft by snap ring. Bearing should be .0003" tight to .0007" loose on shaft and .0002" tight to .001" loose in case. Shaft endplay should be .013" tight to .002" loose. Pilot bearing for forward end of main shaft (in main drive gear) is loose roller type. Rollers prevented from moving by snap ring.

Counter Gear Cluster:—On all models, do not remove dummy shaft used to retain loose roller bearings in gear until assembly has been installed in transmission, then drive out dummy shaft with regular shaft as it is installed. Steel thrust washer used at outer ends of roller bearings, steel spacer between rollers in gear cluster. Bearing clearance on shaft should be .0002-.0021". Endplay should be .010-.024". Make certain that bronze thrust washer installed at front end of gear cluster, bronze and steel washers at rear end with steel washer next to case.

Reverse Idler Gear:—Bushing clearance on shaft should be .0027-.0042". Endplay should be .004-.016". Make certain that bronze thrust washer installed at each end of gear.

Speedometer Gear Assembly ('38-39):—New type (without rear bearing in retainer—not interchangeable with 1937 type). Driven gear is carried in sleeve which is screwed in transmission rear bearing retainer. Driven gear and shaft is retained in sleeve by washer at outer end. Shaft endplay should be .005-.010".

BUICK-OLDS-PONTIAC TYPES

BUICK MODELS

SERIES 40 (1934 to 1939)
SERIES 50 (1934-35)

OLDSMOBILE MODELS

SIX, F-33 ('33), F-34 ('34), F-35 ('35), F-36 ('36), F-37 ('37); F-38 ('38); '60' F-39, '70' G-39 ('39)
EIGHT, L-33 ('33), L-34 ('34), L-35 ('35), L-36 ('36), L-37 ('37), L-38 ('38), '80' L-39 ('39)

PONTIAC MODELS

SIX, 701A, B (LATE '35), 36-26A, B ('36), 37-26CA ('37); 38-26DA ('38); 39-25, 39-26 ('39)
EIGHT, 605 (LATE '35), 36-28 ('36), 37-28CA ('37) 38-28DA ('38), 39-28 ('39)

NOTE:—This type transmission used on Pontiac 1935 models beginning with serial numbers as follows: 701A-6AA-19858, 701B-6AB-23423, 605-8AA-26175. **Buick 1938, Oldsmobile 1938-39.** Special automatic Self-shifting Transmission optional on these models. See separate article for data on this type.

TYPE:—Constant-mesh, synchro-mesh type with all helical gears. Main drive gear integral with clutch shaft and mounted on ball bearing which takes gear thrust. Mainshaft mounted on roller bearing (front), ball bearing (rear) which takes gear thrust. Second speed gear positioned on rear of mainshaft by locking ring at front and thrust washer at rear between gear and bearing. Sliding sleeve, which engages gears, is splined on shaft. Low speed sliding gear is splined on this sleeve at the center and is held stationary when the sleeve is shifted to engage second or high. Counter gear cluster and reverse idler gear mounted on bronze bushings on stationary shaft with thrust washer at each end.

1939 Type:—Design changed from 1938 as follows:

Shifter Mechanism—New type cable and rod actuated shifter shafts for steering column mounted gear shift lever. See Service directions below for disassembling data and separate articles on Buick, Oldsmobile, and Pontiac Transmission controls for adjustment directions.

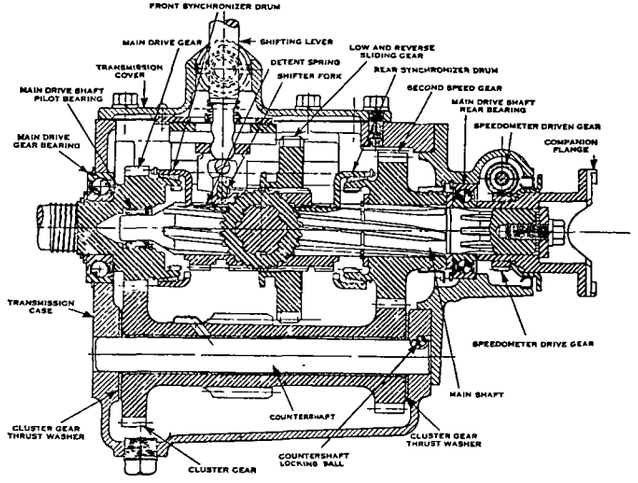
Synchronizing Unit—Same design as for 1938 except that no detent springs are used. On Buick, aluminum synchronizing cones used for high gear end on some cars.

Rear Bearing Retainer—Rear bearing inner race positioned on shaft by snap ring with spacer between snap ring and speedometer gear which is press fit on shaft. On Oldsmobile (except 6-60) and Pontiac (except Quality 6 39-25), additional Durex bronze bushing located in bearing retainer extension housing. On Buick Model, retainer is flanged to engage front torque tube and mainshaft is splined to engage front propeller shaft.

Countershaft Bushing Spacer—Spacer not used on 1939 models (bushing oiled by lubricant openings in case at ends of counter gear).

Reverse Idler Lockpin (Buick Only)—New type locking pin used which is driven in case. Pin must be driven completely into shaft to remove gear.

Synchronizing Unit:—Consists of synchronizing cones formed integrally with main drive gear and second speed gear and drums assembled loosely on cones by snap rings. Drums engaged by detent springs assembled in splines on mainshaft (under sliding sleeve) and cams formed on ends of sliding sleeve and are driven by prongs on the drum which engage slots in the sliding sleeve. An anti-rattle spring is located within the second speed synchronizing drums (not used on 1938-39 models).



NOTE—Design similar on all models except that on models before 1938, synchronizing drums had

BUICK-OLDS-PONTIAC CONT.

three prongs and drum for second speed gear was larger (not interchangeable as on 1938-39 model). Detent springs not used on 1939 models.

SERVICING:—Disassembly (1934-38). Remove cover, interlock plates, shifter rails and forks. On Oldsmobile models, loosen universal joint flange capscrew. Take out rear retainer screws, rotate retainer clockwise to uncover rear end of countershaft, drive countershaft out to rear (do not lose locking ball in slot in rear end of shaft on 1938 models) and allow counter gear cluster to drop down in case. Pull bearing retainer and mainshaft assembly out through rear of case (slide low speed gear off sleeve and remove through top). Remove main drive gear bearing snap ring (on front end of case—see note), tap main drive gear and bearing assembly out and remove through rear end of case. Lift out counter gear cluster and thrust washers. To remove reverse idler gear, take out locking screw in lower left hand corner of case, drive shaft out, lift out gear and thrust washers.

NOTE—On Buick 1936-37 models, snap ring located under front bearing retainer which must be removed first. On 1935 and earlier models, snap ring is located in front of drive gear inside case and is removed by pinching ends of ring together to free it from slot in housing.

Disassembly (1939):—Remove transmission cover, shift rails (being careful not to lose poppet balls and springs which are under rails, shift forks and selector shaft (use tool KMO-244—Oldsmobile, J-1044—Pontiac, to remove lockscrews in shifter forks and selector shaft cams) being careful not to lose cams when selector shaft withdrawn. **Buick Note**—Selector shaft must be driven out through right side of case (with plug which seals hole)—withdrawing shaft from left side of case will damage oil seal. Remove rear bearing retainer screws, withdraw bearing retainer and mainshaft through rear of case as an assembly with the rear bearing and second speed gear, allowing the low speed gear and sliding clutch sleeve to slide off and remain in the transmission case. Lift sliding clutch and low speed gear out through top of case. Push countershaft out of case toward rear being careful not to lose locking ball in groove in shaft and case at rear end. Remove main drive gear bearing snap ring (in bearing outer race on front of case), remove main drive gear through case. Lift out counter gear cluster and thrust washers. To remove reverse idler gear, take out locking screw (Oldsmobile, Pontiac), drive locking pin in so that it is completely within shaft (Buick), remove shaft, lift gear and thrust washers out. On Buick models, remove pin from shaft and use new pin when reassembling (drive pin in so that outer end ⅝-¾" past flush surface of transmission case.

Buick Selector Shaft Installation—Install shaft through oil seal on left side of transmission case and seal hole on right side of case (originally closed by plug) with sealing compound.

Mainshaft & Bearing Assembly:—To dismantle, remove sliding sleeve and detent springs (not used on 1939 models), disengage second speed gear synchronizing drum snap ring and remove drum. On models with universal joint companion flange bolted on rear end of shaft, remove nut and companion flange. Take out second speed gear snap ring at forward end of gear, remove thrust washer and gear. Take out snap ring in bearing retainer in front of bearing, remove shaft and bearing from retainer by tapping end of shaft on wooden block. When replacing bearing, see that shielded side of bearing is toward front (next to gear) on 1939 cars without oil collector.

Mainshaft Rear Bushing (Oldsmobile 70, 80)—Durex type bronze bushing installed in rear end of rear bearing housing. Bushings cannot be reamed and new bushing should be installed whenever old bushing removed from housing. Use tool J-1060-1 to press old bushing out and driver J-1050 to install new bushing.

Mainshaft Rear Bushing (Pontiac Deluxe 6 & 8)—Durex type installed in rear end rear bearing retainer. Cannot be serviced in the field (replace rear bearing retainer if bushing worn—new bushings are line-reamed in production). Oil seal at rear of retainer can be removed by prying out with a screwdriver, use wood block as driver when installing seal. NOTE—These Durex bronze bushings must not be cleaned with degreasing compound. Oil bushing with transmission oil when reassembling.

Buick Specifications—Mainshaft rear bearing should be .0004" tight to .0005" loose (before '39), .0007" tight to .0002" loose ('39) on shaft and should be .0011" tight to .0005" loose in case (all models). Mainshaft should have no perceptible endplay. Clutch sleeve clearance and backlash on mainshaft should be .001-.003". Low and reverse sliding gear backlash should be .003" max.

Pontiac Specifications—Mainshaft rear bearing should be .0004-.0005" on shaft, .0005-.0011" in case (before '39), .0007" tight to .0002" loose on shaft and .0011" tight to .0005" loose in case ('39). Clutch sleeve clearance on shaft and backlash should be .001-.003". Low and reverse gear backlash in splines should be .003".

Synchronizing Unit:—Both synchronizing drums same size and interchangeable beginning with 1938 (see Buick '39 Note below). Drums retained on gear cones by snap ring and may be removed by expanding ring. On 1937 and previous models, make certain that anti-rattle spring installed in second speed drum.

Buick 1939 Note—Synchronizing drum installed on second speed gear must always be **bronze.** Aluminum drums used for high speed gear on some 1939 cars.

Second Speed Gear:—Held in place on shaft by steel thrust washer and snap ring at forward end, steel thrust washer (between gear and bearing) at rear end. Make certain that oil sleeve is in place on gear hub at rear end (not used on 1939 models).

Buick Specifications—Second speed gear clearance on shaft should be .0005-.0025" (before '39), .001-.0026" ('39). Gear endplay should be .005-.007" (all models).

Pontiac Specifications—Second speed gear clearance on shaft should be .0015-.0026" (before '39), .0005-.0027" ('39). Gear endplay should be .002-.006" (before '39), .000-.010" ('39).

Main Drive Gear & Clutch Shaft Bearing:—Remove high speed synchronizing drum (disengage snap ring), remove bearing retainer snap ring, washer, and bearing. On models with bearing retainer nut, remove snap ring and then back off nut (left hand thread). Where shielded type bearing used, install bearing with shielded side toward gear. Press bearing on shaft using tube against inner race, drill new hole for bearing nut lock ring if old hole does not line up.

Buick Specifications—Drive gear bearing should be .0003" tight to .0007" loose on gear, .0002" tight to .001" loose in case. Shaft endplay should be .013" tight to .002" loose. Pilot bearing for forward end of mainshaft (in drive gear hub) is loose roller type. Rollers retained by snap ring.

Pontiac Specifications—Drive gear bearing clearance should be .0003-.0007" on gear and .0002-.001" in case (before '39), .0003" tight to .0007" loose on gear and .0002" tight to .001" loose in case ('39).

Counter Gear Cluster:—When replacing this assembly, see that thrust washers installed at each end. Endplay with washers in place should be .016-.028" and clearance on shaft .0033-.005" (Buick), endplay should be .011-.019" (Pontiac). See that lock ball is in place in end of shaft and that it engages slot in case when shaft installed, use new gasket under bearing retainer (if old gasket damaged by removal).

Reverse Idler:—Clearance on shaft should be .0027-.0042" (Buick), .002-.004" (Pontiac). Endplay should be .004-.016" (Buick).

Buick 1939 Note—Shaft locked by new type pin which must be driven completely into shaft before shaft can be removed. Remove pin from shaft before reinstalling shaft in case. Use new pin and drive pin in so that outer end is ⅝-¾" past flush surface of transmission case.

BUICK-OLDSMOBILE 1938 SELF-SHIFTING TYPE

Optional Equipment On:
BUICK SPECIAL EIGHT, MODEL 38-40 (1938)
OLDSMOBILE SIX, MODEL F-38 (1938)
OLDSMOBILE EIGHT, L-37 (1937), L-38 (1938)

NOTE:—Oil Pump Change. New type single unit oil pump (same as 1939 type) used on all transmissions after Serial No. 14039. See article on 1939 type Self-shifting Transmission (following) for data on this new type oil pump.

IMPORTANT NOTE FOR TOWING CAR:—These instructions supersede previous recommendations:

To Tow Car—Disengage clutch and block in this position. Do not operate engine. Move control lever to second forward or 'high' range.

To Start Car by Towing or Pushing—Disengage clutch, place control lever in second forward or 'high' range. When car speed of 10 MPH. is reached, turn on ignition and engage clutch (engine will be driven through third gear).

1938 SELF-SHIFTING TYPE CONT.

DESCRIPTION:—Consists of an entirely self-contained unit mounted on clutch housing in place of regular transmission and made up of two separate gear systems: (1) Head Set controlled manually by shift lever under steering wheel, (2) Automatic Planetary system operated by oil pressure, controlled by shift lever, throttle lever and speed governor.

Head Set—Similar to conventional transmission and provides Reverse (Shift lever in 'R' position), Neutral (lever in 'N' or 'Off' position), Forward or Direct Drive (one speed only, head set engagement same for both 'F' positions on Buick, 'L' and 'H' positions on Oldsmobile).

Planetary System—Consists of two planetary gear reduction units (rear unit has double set of planetary gears but operates as a unit) providing four forward speeds automatically. Each planetary unit has a multiple disc clutch (engaged by oil pressure, disengaged by springs) and a brake band perated by a Servo in the bottom of the case (bands applied by springs, released by oil pressure). When the brake band is engaged and the clutch disengaged, planetary unit affords a speed reduction; when the band is released and the clutch engaged, the planetary unit is locked and affords a direct drive. All four gear ratios are secured by combinations of the two planetary units as follows:

Low—Both planetary units operating in tandem.

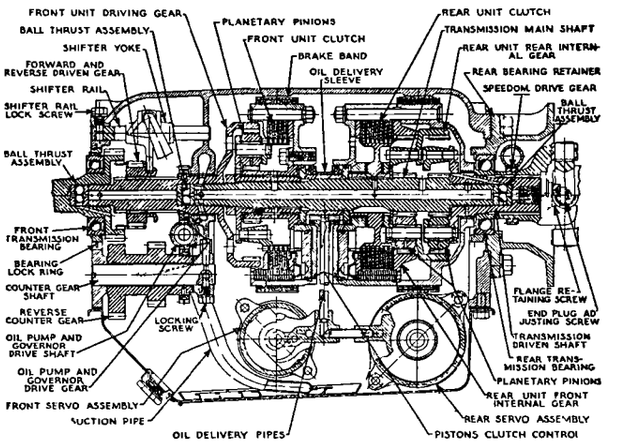
Second—Front unit locked, rear unit operating.

Third—Front unit operating, rear unit locked out.

Fourth—Both units locked out, straight drive.

First and second speeds are available with shift lever in first 'F' position on Buick, 'L' position on Oldsmobile (car will start in first with control lever in second 'F" or 'H' position and quickly shift to third but this practise not recommended by manufacturer). Third and Fourth or Direct Drive are available with shift lever in second 'F" position on Buick, 'H' position on Oldsmobile. Particular gear ratio engaged depends on shift lever position, car speed (governor control), and throttle position (accelerator pedal interconnected with governor linkage) so that while the transmission gear ratios normally shift up from first through second and third to fourth automatically as the car speed increases, the shifts can be delayed by a more-than-normal throttle opening and it is possible to shift back from fourth to third at will for acceleration by depressing the accelerator pedal to a position beyond the wide open throttle position (at car speeds below 58-62 MPH., above this speed throttle is locked out so that fourth or direct drive is operative regardless of throttle position).

LUBRICATION:—Check oil level in transmission case every 1000 miles. Keep oil up to full mark on oil level indicator stick (low oil level will allow air to be sucked into system). Add oil through indicator stick hole in top of case (accessible by removing one screw and lifting off inspection hole cover in center panel of front compartment floor.



2000 Mile & 10,000 Mile Interval Servicing—At end of first 2000 miles, factory schedule calls for removal of oil pan, thorough cleaning to remove all sediment, adjustment of Servo Unit bands, refilling with new oil. Use new cork gasket when replacing pan (do not shellac gasket or use any type of sealer). Repeat at 10000 mile intervals thereafter.

Oil Recommendations:—Oil should be selected on basis of minimum temperature expected as indicated below. Drain old oil by removing plug at lower front end of case and elevating rear of car.

Capacity—3 qts. refill, 3½ qts. with pan dry.

Recommended Oil	Minimum Temperature
SAE #30	40°F. & above
SAE #20 or 20W	32°F.
SAE #20W	10°F.
SAE #10W	Minus 10°F.
SAE #10W plus 10% Kerosene	Below Minus 10°F.

ADJUSTMENT:—**Servo unit bands** should be checked and adjusted, if necessary, at end of first 2000 miles and at 10,000 mile intervals thereafter. **Throttle Control Lever** should be reset whenever transmission is removed, linkage disturbed, or when carburetor throttle linkage is changed. **Manual Control Lever** should be reset when removed and installed.

Servo Band Adjustment:—Remove floor mat and front center panel, raise car on lift or jacks, remove transmission case drain plug, drain old oil and remove oil pan. Install special gauge J-1127 on rear servo unit so that prong on gauge hooks over shoulder on servo housing and fork on gauge rests on servo plunger rod. If end of plunger rod extends less than ⅛" beyond gauge, no adjustment is required. If more than ⅛", band should be adjusted (requires two men). Use Servo Cam Release Bar J-1122 and force servo plunger into servo so that end is beyond gauge and, at the same time, loosen locknut and turn down adjusting screw on top of case to take up all slack in servo band. Remove cam release bar, re-install gauge, back off adjusting screw until rear of crown on outer end of plunger rod is flush with outer edge of gauge (plus or minus 1/32"), tighten lockscrew. **Important**—Final adjustment must be made by backing off screw, not by turning screw down (if correct position of screw is overrun when making adjustment, repeat entire procedure, do not merely turn screw down). Adjust front servo unit in same manner.

Throttle Control Lever Adjustment (Buick Models)—Revolve Cold Idle Cam on carburetor to 'hot' position. Set throttle lever stopscrew (idle speed adjustment) for 5-6 M.P.H. idling speed in third gear, close throttle against cold idle cam. Disconnect trunnion at end of throttle control lever on transmission case, move throttle control lever up until it is against stop in case, hold lever in this position, adjust trunnion on rod until pin will just enter hole in lever, lengthen rod by turning trunnion down an additional two complete turns, lock trunnion by tightening locknut on rod, connect trunnion to lever and check to see that detent spring on rod above carburetor throttle lever is at right angles to lever. Depress accelerator pedal fully (stop on lower side contacts floor mat) and note whether overtravel of detent spring on trunnion at carburetor throttle lever is ⅛". Adjust by loosening clip attaching accelerator pedal link to accelerator rod and moving clip up on rod. With correct setting, throttle control lever on transmission will reach limit of downward travel when accelerator pedal touches floor board.

(Oldsmobile Models)—Disconnect throttle control rod from throttle control lever on transmission by removing clevis pin. Depress accelerator pedal fully and block firmly against floor while adjustments are made (do not use hand throttle). Disconnect trunnion on carburetor throttle valve lever, hold throttle lever in wide open position, push accelerator rod back toward dash to limit permitted by overrun mechanism on throttle cross-shaft, hold rod in this position and adjust trunnion so that pin will just enter hole in throttle lever with light finger pressure, tighten trunnion locknut and connect accelerator rod. NOTE—Throttle cracking linkage (starter connection) must be reset after making this adjustment—see directions in Carburetor tune up data on car model page. Release accelerator pedal, rotate fast idle cam to slow or hot idle position and see that it remains in this position while remainder of adjustments are made. Install clevis pin in end of throttle control rod (for use in checking, do not connect rod to transmission throttle control lever). Move throttle control lever to rear against stop, adjust clevis on rod so that pin just rubs against rear face of lug on top of throttle control lever, lock clevis by tightening locknut, assemble rod and lever. Check by noting that slight increase in resistance felt when accelerator pedal depressed to point where throttle is wide open (if car operated, transmission will remain in fourth gear at car speeds above 15 MPH. if pedal not depressed further, but will shift immediately into third gear if pedal depressed to floor).

Manual Control Lever Adjustment (All models):—Move shift lever under steering wheel to 'N' position (Buick), 'Off' (Oldsmobile), disconnect shift lever control rod from forward-and-reverse lever (front lever on left side of transmission case). Make certain that forward-and-reverse lever is in neutral position by moving lever forward as far as possible and then back to point where one notch (detent) is felt. Adjust clevis at forward end of control rod (Buick), rear end (Oldsmobile) until clevis pin will enter hole in forward-and-revere lever without disturbing position of lever or shift lever on steering wheel, lock clevis by tightening locknut ,assemble control rod to lever. Check setting by operating shift lever on steering wheel with button held in depressed position (to cut out action of detents in lever). Move lever up and down from 'N' or 'Off' position and note point where resistance of detents in transmission is felt (resistance to motion will increase when detent leaves 'off' notch). These points should be equally distant from center off position. Move lever down until transmission click is felt indicating that it is in either forward position. Arrow on shift lever should coincide with mark on shift lever box.

SERVICING (ON THE CAR):—Servo units, Governor, Oil Pump, and Oil Pressure Regulator can be adjusted or removed and serviced without removing transmission from the car or otherwise disturbing the transmission assembly.

Servo Units:—Rear Servo can be removed without disturbing Front Servo, but whenever Front Servo

1938 SELF-SHIFTING TYPE CONT.

is taken out, the Rear Servo must be taken out first. To remove Rear Servo, with oil pan off, remove oil pressure line from pump to Front Servo, remove oil suction pipe, loosen locknuts and back off both servo band adjusting screws until bands are loose. Loosen attaching bolts to transmission case on both Servo units, remove bolts at rear Servo only. Slide rear unit toward rear of case until connecting oil pipe between units is free, lower Servo from case. When removing Front Servo, use extreme care to avoid damage to the two oil delivery pipes which enter this unit. Install Servos in same manner making certain that oil delivery pipes are in place and that brake band struts engage actuating levers properly. Adjust brake bands.

Governor Assembly:—To remove Governor, loosen clamp bolts in rear unit cam operating lever (rear lever on left side of case) and throttle control lever (lower lever). pry levers off shafts (not necessary to disconnect rods or to remove front forward-and-reverse lever). Take out bolts and remove transmission side cover. Pull out governor relay shaft upper pivot pin through top of case (pin is free fit in case and locked by side cover screws, lower pivot pin is light press fit in case but need not be removed), move shaft toward rear of transmission to disconnect linkage and clear governor. Take out attaching screws in governor flange, pull governor out of case. NOTE—Do not dismantle governor (serviced as an assembly only). Install Governor in same manner and adjust as follows:

Adjustment (Buick):—Set up dial indicator to measure governor travel (contact point on outer end of governor shaft). Set indicator at zero with governor at rest. Slowly spread governor weights by hand and note point where governor controlled valve throws to open position. Travel at this point (indicator reading) should be .200-.220". Slowly release weights and note point where valve closes. Travel should be .040-.030" from opening point (closing point more important, adjust to this dimension, compromising slightly on opening point if necessary). Adjust by changing position of inner nut on shaft (shaft slotted for screwdriver).

Adjustment (Oldsmobile):—Use dial indicator and check governor travel in same manner as on Buick (above). Travel from point where control valve opens to end of first stage (end point can be determined by decided increase in resistance felt at this point) must be equal to travel from point where control valve closes to the 'at rest' end. Adjust in same manner as on Buick. To adjust without using dial indicator, pry open lock plate fingers under outer locknut, hold inner nut with wrench, turn slotted shaft with a screwdriver in clockwise direction until control valve clicks open, then turn screw counter-clockwise until valve just clicks closed, finally turn screw additional ⅞ turn. Tighten locknut and secure lock plate. With this setting opening and closing of valve should occur near center of governor travel.

Oil Pressure Regulator Valve:—Use tool J-1125, remove oil pressure regulator valve plug and spring (spring should remain on plug as top coil is tight fit on plug body, if spring removed, replace with this tight coil up). Use tool HMO-65-6 to remove pressure regulator valve assembly from case.

Oil Pump:—To remove, take out oil pressure regulator valve (see above), remove oil pump attaching screws (six screws around edge of oil pump cover flange on right side of case, two inner screws attach pump cover to pump body and need not be disturbed), remove pump. NOTE—Pump is doweled to case and may need to be pried free, after pump is off dowel do not use excessive force which may damage bronze drive gears, if pump sticks turn propeller shaft slightly to line up double drive gears. To dismantle pump, remove two pump cover attaching screws, take off cover, invert pump and remove internal parts. To dismantle double pump driving gear assembly, press shaft out of outer drive gear (which drives small pump section). Take out pressure regulator valve body attaching bolts, remove regulator body and bronze separator plate. Reassemble in reverse order. When pressing drive gear on shaft, place .010" feeler between two gears on outer end of pump shaft, press gear on shaft until drag is felt on feeler. Make certain that both sections of pump turn freely and that pump cover gasket is in good condition. Oil pressure can be checked with gauge and should be 85 lbs. at 1000 R.P.M. (oil leaks and low pressure will cause faulty transmission operation).

REMOVAL & INSTALLATION:—Special precautions should be taken and special tools used (aligner studs J-1126, Hoist and Saddle J-1129).

Transmission Removal (Buick):—Remove rear axle (see car model 'M' page for directions), push front seat back, remove floor mat and center floor panel, disconnect speedometer cable at transmission, remove two upper transmission-to-flywheel housing bolts. Jack up car slightly at front end. Remove clutch housing underpan and clutch release yoke, disconnect rod on throttle control lever on left side of case and manual shift rod at clevis connection. Install transmission lifting tool J-1129 in front compartment, engage lifting cradle securely under transmission case and hook cables on hoist hook. Tighten hoist cable just enough to support transmission, make certain that hoist is locked, take out two remaining transmission mounting bolts, slide transmission to rear and work clutch release bearing retainer out with transmission assembly.

Transmission Removal (Oldsmobile):—Remove foot accelerator pad, floor mat and center floor pan. Disconnect speedometer cable, front propeller shaft at rear of transmission, take out two upper transmission mounting bolts. Jack up car approximately 20" at front end, 4" at rear. Free center propeller shaft bearing bracket from frame and allow bracket to drop down as far as possible (not necessary to disconnect rear universal). Remove clutch housing underpan and clutch negative return spring bracket. Disconnect throttle linkage at throttle control lever and manual shift rod at forward-and-reverse shift lever on left side of transmission case. Install hoist in front compartment, engage saddle securely under transmission, hook saddle cable to hoist making certain that front cable are looped in front of oil pump (right side), shifter shaft (left side), raise transmission slightly, make certain that hoist is locked, take out lower mounting bolts moving transmission back as left hand bolt strikes clutch throwout yoke (not necessary to remove yoke). Move transmission to rear (turn universal flange horiztonal to clear shaft).

Installation (All Models):—Shellac new gasket on front of housing, aligning oil return hole in gasket with drain hole in transmission, install aligner studs in two upper mounting bolt holes in flywheel housing. On Buick models, install clutch release bearing on retainer and place assembly in flywheel housing with gasket and spring washer (special 'waved' type No. 1304037 used instead of regular 'cupped' type). Use hoist to raise transmission and slide it forward on aligner studs being careful that weight is not allowed to rest on driven member hub.

SERVICING (ON THE BENCH):—Disassembly. Use transmission stand to hold transmission in inverted position on bench, remove oil pan (if studs replaced, use new studs of same length and use white lead on threads to prevent oil leaks). Remove control levers on side of case, remove side plate and gasket. On Buick models, remove valve body and linkage leaving capscrew in body to retain dampening valves (take out upper governor shaft pivot pin to free shaft). On Oldsmobile models, manufacturer recommends that valve control bracket and oil control unit not be disturbed under any circumstances. Remove oil pressure regulator, oil pump, and governor (see directions in first servicing section above). Disconnect oil line between pump and servo body, remove pump intake pipe and gasket. Loosen locknuts and back off servo adjusting screws on top of case until screws are free (use pry bar J-1122 to take strain while turning screws). Remove both servo mounting screws evenly and remove servos together being careful not to bend connecting tubes. Remove head set reverse idler and countershaft lockscrews, take out shafts (if shafts stick, use screwdriver in slot at forward end to turn shaft while applying pressure at rear end), mark shafts and replace in same position (shafts are same dimension but are selective fit in case and should not be interchanged). Remove reverse idler gear and counter gear cluster being careful not to lose bronze thrust washer at rear end. Use special tool J-1149 to expand snap ring on clutch gear bearing (insert tool in recess in front end of case), withdraw clutch gear and bearing assembly at front end keeping forward end tilted down to prevent loss of ball thrust bearing in gear hub. Move shifter shaft to reverse position, take out shifter shaft lockscrew, remove shaft (being careful not to lose detent ball), shifter fork, and sliding gear. On Buick, remove ball joint and universal joint (light press fit, no puller required). On Oldsmobile, loosen locknut and remove endplay adjusting screw (in center of shaft at universal yoke), remove joint flange retaining screw (use ⅞" socket holding flange with tool J-1123 meanwhile), remove flange by tapping lightly with hammer. Remove center bearing cap (reverse counter gear bracket) and rear bearing retainer (rear endplate). Rotate servo bands so that ends are at bottom of case and clamp on drums (use modified brake cylinder clamp). To lift planetary unit assembly out of case, use J-1148 (Buick), handle of J-1123 (Oldsmobile) inserted in end of driven shaft to lift assembly up slightly and to rear until driving gear shaft clears front of case, tilt front end up and lift assembly out. NOTE—Front planetary unit driving gear is free on planetary assembly and will pull off if any lifting force applied. All lifting must be at tool on rear end.

Transmission Assembly:—Reverse disassembly directions given above. When installing clutch gear make certain that ball thrust bearing is in place in hub. On Buick models, four snap ring widths are furnished to control end play at front bearing. Select widest snap ring which can be tapped into groove as follows:

Part Number	Width	Color Marking
1304060	.063"	White
1304061	.067"	Yellow
1304062	.071"	Green
1304063	.058"	Red

1938 SELF-SHIFTING TYPE CONT.

Adjust main shaft endplay after all units are installed in place with universal joint flange on and retaining screw tightened (on Oldsmobile make certain that cork oil seal on screw is in good condition) by turning adjusting screw in as far as possible and then backing screw off ⅓ turn and lock with locknut. See that clutch gear turns freely.

TROUBLE SHOOTING:—Causes of transmission troubles may be determined from following table.

Transmission Fails to Shift:

1. **From High to Low (or shift is delayed) with cold oil**—Oil is too heavy, change to lighter oil.
2. **From Fourth to Third (or pedal pressure excessive)**—Throttle control lever adjustment wrong (rod too long). See Adjustment section above.
3. **From Low (shift lever in either low or high position)**—No oil, Pressure Regulator sticking, oil pump not working, oil leaking inside case. Check oil level, see that pressure regulator valve is free in body. Check oil pump pressure.
4. **No Automatic Shift (1st to 2nd, 3rd to 4th)**—High unit or valve not working properly. Valve sticking. Governor defective or linkage binding.

Transmission Shifts incorrectly:

1. **Automatic shifts (1st to 2nd, 3rd to 4th) are erratic or occur at wrong speeds.** Governor out of adjustment. See Adjustment section above.
2. **Shift from First to Third is severe or violent**—Throttle control lever adjustment incorrect (see Adjustment section), clutch plates defective or scored. If this action noted at low speeds after high speed driving, oil may be too light.
3. **Transmission slips when shifting from First to Third. Pressure downshift (3rd to 1st) is below 4 M.P.H. with hot oil.** Throttle control lever adjustment incorrect. Clutch plates worn.
4. Same as No. 3 except that downshift is too high (10 M.P.H.). Transmission may hunt or shift rapidly between first and third. Internal oil leak in transmission allowing oil pressure to drop at high speeds.

Shift Lever will not move between High and Low while car is operating.

1. Detents in shift lever and transmission not aligned. See Manual control lever adjustment.

Transmission is Noisy:

1. **Loud chatter or rattle in transmission** with excessive accelerator pedal vibration. Air in system caused by low oil level. Check oil level.
2. **Slight buzzing noise in transmission** with light pedal vibration. Caused by oil pressure regulator when oil is cold. Not serious. May be corrected by replacing oil pressure regulator or spring, or oil pump assembly.

OLDSMOBILE 1939 SELF-SHIFTING TYPE

Optional Equipment On:

ALL MODELS (1939)

SERIAL NUMBER:—First No. 18000. All transmissions with serial numbers above 18000 are new 1939 type NOTE—New type single unit oil pump (described below) used also on 1938 units after No. 14039.

SPECIAL TOWING INSTRUCTIONS:—To tow or push cars equipped with automatic transmission, proceed as follows: Move manual shift lever to neutral position, keep ignition key turned off (clutch pedal need not be disengaged). If car will operate only in 1st speed and must be towed, rear wheels must be raised clear or drive shaft disconnected.

DESCRIPTION:—Design same as type used on 1938 cars except as follows:

Steering Column Shift Lever—New design used in conjunction with redesigned forward-and-reverse lever. All control adjustments same as for 1938.

Rear Unit Accumulator—Designed to eliminate noise or jerk when transmission shifts from third back to first gear (high range) with hot oil. Accumulator assembled in rear servo and special one way ball check valve installed in oil control unit valve body. When downshift from third to first occurs, oil in compensator system is trapped by check valve (while oil in clutch system allowed to escape freely) so that rear brake band engages gradually until clutch is disengaged. Oil pressure in compensator system is held to 100 lbs. maximum (exhausts through accumulator bleed slot when pressure exceeds 100 lbs.).

New Single Unit Oil Pump—Mounted in same manner as 1938 type, driven by gear on headset mainshaft (operates whenever rear wheels revolving). NOTE—This oil pump used on 1938 transmissions beginning with Serial No. 14039 and interchangeable with two-unit pump used on earlier models.

Oil Control Unit (Valve Assembly)—New type with check valve for Rear Accumulator control. Interchangeable with 1938 type by removing check valve

Governor—Three stage type driven by oil pump gear (in tandem with oil pump).

Mainshaft Front Pilot Bearing—New needle bearing type (changed from plain bushing).

Clutch Brake Washer—Used on all cars with single unit oil pump to prevent clutch spin. Consists of dished bronze friction washer assembled on forward end of front unit drive gear shaft within main drive gear (clutch shaft gear). See servicing data below for washer installation.

LUBRICATION:—Capacity 3 qts. (refill), 3½ qts. (dry—when pan removed and cleaned). Recommended lubricant (engine oil) for all seasons as follows:

Summer	SAE #30
Winter (Below 45° F.)	SAE #20W
Winter (Below 0° F)	SAE #10W

See preceding article for checking, cleaning, and refilling directions.

ADJUSTMENT & SERVICING:—All adjustments and servicing operations same as for 1938 cars except as noted below. *See preceding article for data.*

Governor Adjustment:—Governor controls automatic upshift from 1st to 2nd (10 MPH., 1300 RPM) and 3rd to 4th (1350 RPM., 22 MPH. with minimum throttle) at part throttle and should be adjusted so that these shifts occur at the correct speed in the first stage of the governor travel. To adjust (with transmission side cover removed to expose governor), hold inner shaft with screwdriver and turn nut on outer end of governor shaft counter-clockwise until front unit valve just clicks open, then turn nut clockwise until valve just clicks closed, finally turn nut additional ⅞ turn clockwise. This will bring shift at center of governor travel. Replace lockplate and nut and lock securely.

Oil Pump Servicing:—To remove pump, remove Pressure Regulator Valve, remove oil pump to transmission case attaching bolts (two bolts near center of cover hold pump cover on pump body and need not be removed), remove pump. NOTE—Pump is doweled on case and may need to be pried off dowel pin. With pump free of dowel, do not use force to remove pump which will damage drive gear (use bar or screwdriver to turn front universal joint slightly to line up gears which will allow pump to be pulled out easily).

Oil Pump Disassembly—Remove two pump cover to body screws, lift off cover and gasket. Press oil pump driven gear off shaft (serrated fit on shaft), remove thrust washer and snap ring, invert pump and remove gears and shaft. To disassemble relief valve, remove plug on side of pump cover, remove regulator spring and plunger, take out capscrews mounting regulator valve body on pump, valve body and bronze separator plate.

Oil Pump Assembly—Assemble pressure regulator (tighten mounting screws evenly to prevent distorting valve body) and make certain that regulator valve is free in body after installation. Insert shaft through pump body, assemble snap ring and thrust washer on shaft making certain that snap ring indexed in washer undercut, press driven gear on shaft so that it seats firmly against thrust washer, install pump idler gear on shaft, install plunger, regulator spring and plug in pump cover and make certain that brass sealing gasket in good condition. Use new cover gasket and install pump cover, check gear endplay (should be .001-.003". NOTE—Cover gaskets available in two thicknesses (.005" thick—has 1 notch in edge, .007" thick—no notch), use .005" gasket first and if shaft does not turn freely, install .007" gasket. If shaft still does not turn freely, it is out of alignment (do not use more than .007" gasket thickness under cover).

Oil Pump Pressure Test—Pump pressure should be tested before dismantling transmission when trouble experienced (such as hunting or slipping particularly in 1st to 3rd shift). To check pump pressure, use 200 lb. gauge connected to plug opening in oil pump cover and operate car as follows: With transmission oil hot, shift transmission into high range and slow car speed down until transmission shifts into 3rd speed. In 3rd gear at car speed of 15 MPH., oil pressure should not be less than 78 lbs. If pressure below this figure, check for oil leaks or weak pressure regulator valve spring (see servicing data below). If pressure is above 78 lbs. after replacing spring but transmission performance is unsatisfactory, clutch plates are worn

Pressure Regulator Valve:—Valve serviced separately (Part No. 1305224) and main and bumper springs available in package sets as follows: No. 1394616 (for Transmissions before Serial No. 18000), 1394617 (Serial No. 18000 up). Bumper (cushion) spring should be installed with tight coil on top (this end coil engages valve stem and spring should be removed from valve only for replacement). NOTE—Wrong spring will cause downshift from 3rd to 1st. to occur at higher than normal speed.

Clutch Brake Washer:—Must be used on all cars with single unit oil pump to prevent excessive clutch spin. Install washer on front unit drive gear shaft (tangs or lugs on washer engage slots in shaft) with dished and pointed face forward toward main drive gear (clutch shaft gear).

Rear Unit Accumulator:—Serviced as an assembly only (Part No. 1396935). Mounted as part of rear servo and removed and installed as an assembly

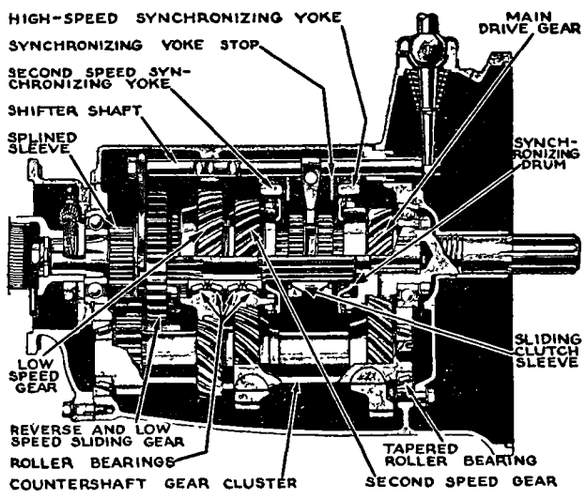
Transmission Disassembly:—Disassembled in same manner as 1938 type. Ball thrust washer in clutch shaft drive gear is retained by pilot needle bearing and snap ring (Transmission Serial No. 18000 up) and will not drop out as gear removed as on earlier models. Brake washer is used on shaft at rear of clutch shaft drive gear on all units with single unit oil pump (see Clutch Brake Washer data above). Reverse idler gear should be installed with pointed side of teeth toward front of transmission.

CADILLAC—LA SALLE FIRST TYPE TRANSMISSION

Used On:

CADILLAC V8, 355B (1932), 355C (1933), 355D (1934), SERIES 10, 20, 30 (1935), 70, 75 (1936)
CADILLAC V12, 370B (1932), 370C (1933), 370D (1934), SERIES 40 (1935), 80, 85 (1936)
CADILLAC V16, 452B (1932), 452C (1933), 452D (1934), SERIES 60 (1935), 90 (1936-37)
LA SALLE V8, 345B (1932), 345C (1933)

TYPE:—Constant-mesh, synchro-mesh type. Low speed gear is constant-mesh, reverse gear is sliding spur (low gear clutch integral with this gear). Clutch shaft mounted on ball bearing in transmission case which takes gear thrust. Mainshaft mounted on roller bearing (front), ball bearing (rear) which takes gear thrust. Second speed gear and low speed gear mounted on taper roller bearings on mainshaft as an assembly. Counter gear cluster mounted on ball bearings (1932-35), taper roller bearings (1936-37) at each end (no countershaft or thrust washers used). Gear engagement (second and high) consists of a sliding clutch sleeve splined to mainshaft which engages clutch teeth cut on inside of synchronizing cones on second speed and main drive gear.



Synchronizing Units. Independent unit used for each speed (second and high). Consists of a synchronizing drum splined to the mainshaft which engages cone on gear. Drum actuated by synchronizing yoke pivoted in case. Roller on yoke contacts cam surface on shifter shaft so that yoke is rocked to engage drum and cones when shifter shaft moved to engage gear (roller mounted on plunger in oil filled dashpot and released from contact with cam by escape of oil from cylinder after synchronization completed, yoke then returned to disengaged position by return spring). Yoke pivot pins mounted on pins with eccentric adjustment in transmission case (adjusting quadrants located on outside of case).

SERVICING:—Disassembly. Remove shift lever assembly, transmission cover and shifter shaft assembly. Take out synchronizing yoke quadrant screws, remove quadrants, disconnect yoke return spring, take out yoke stop screws and stop, lift yokes out. Remove propeller shaft extension housing and shaft assembly, take out capscrew in rear end of mainshaft, remove coupling, take out mounting screws and remove speedometer drive housing (rear bearing retainer) and countershaft rear bearing washer. Remove cover on side of case over reverse idler gear, take out locking screw, pull shaft out to rear, remove reverse idler. Take out screws and remove bearing retainer on front end of transmission case. Remove capscrew and retainer on each end of countershaft, tap front end of shaft to remove rear bearing race, rear end to remove front race (roller bearing type) allowing countershaft assembly to drop down in case and unmesh gears. Remove snap ring and pull out rear mainshaft bearing. Remove snap ring and pull out clutch shaft and bearing assembly toward front (do not lose mainshaft front bearing). Pull mainshaft and gear assembly forward and remove through top of case.

Mainshaft & Gear Assembly:—To dismantle mainshaft, remove synchronizing drums and clutch sleeve at forward end, remove reverse gear and splined sleeve at rear. Low and second speed gears and bearings can then be removed from rear end of shaft.

Low & Second Speed Gear Bearing Adjustment:—Controlled by spacer washers between inner and outer bearing cups in each gear (splined sleeve acts as spacer on shaft to clamp bearings in place when assembled in case with rear coupling nut tight). Gears should turn with slight drag when installed. Adjust by dressing down both spacers slightly with emery cloth on a surface plate (if bearings loose), replace spacers (if bearings tight).

Synchronizing Yoke Assembly:—Dashpot plunger assembly can be removed from yoke cylinder. To dismantle assembly, take out piston pin linking piston and valve assembly to plunger, and valve spring retainer at lower end of valve stem.

Adjustment:—When installing yokes, install adjusting quadrants (yoke pivots) with center-line of scale on quadrant in line with reference mark on housing. To check yoke travel, remove dashpot plunger assembly, install special bar (with locating shoulder to avoid burring oil hole) in yoke cylinder, operate yoke by hand. Adjust quadrants so that yoke travel, from disengaged position against stops to engaged position of synchronizing cones is 3/32-5/32".

Main Drive Gear & Clutch Shaft Bearing:—Bearing held on clutch shaft by retainer nut and locking washer.

Reverse Idler Gear:—Clearance on shaft should be .002-.0023" (new), .004" (worn limit). Endplay .025" max. When installing new bushings, ream to diameter of .938-.939".

CADILLAC—LA SALLE SECOND TYPE TRANSMISSION

Used On:

CADILLAC, SERIES 36-60 (1936)
LA SALLE, 350 SERIES 50 ('34-35), 35-50 ('35), 36-50 ('36)

TYPE:—Constant-mesh, synchro-mesh (second and high), all helical gear type (sliding gear for low and reverse). Clutch shaft and main drive gear mounted on ball bearing which takes gear thrust. Mainshaft mounted on roller bearing (front), ball bearing (rear) which takes gear thrust. Second speed gear positioned on shaft by shoulder at rear, locking ring at front. Counter gear cluster mounted on roller bearings on stationary shaft with thrust washers at each end. Gears are engaged by sliding clutch splined to mainshaft which engages clutch teeth on inner surface of synchronizing cones on second speed and main drive gear.

Synchronizing Unit. Synchronizing drums assembled loosely on cones by snap rings in groove on cones which engage lugs on drums (waved anti-rattle spring used between drum and cone on second speed gear only). Drums are engaged by detent springs in the mainshaft splines under the sliding clutch and are driven by prongs or cams which engage the slots between the clutch teeth banks on the sliding clutch.

SERVICING:—Disassembly. Remove cover assembly, shifter shaft locking springs, interlock plates (first 1935 cars only), shifter shaft assemblies and lock balls and springs. Take off universal joint flange nut, remove flange. Remove rear bearing retainer (on 36-60 with shaft extension, additional bearing located at rear of shaft in housing). Remove countershaft toward rear allowing counter gear cluster to drop down and unmesh gears. Remove front (high speed) synchronizing drum snap ring, push main drive gear forward as much as possible, push mainshaft assembly back to disengage forward end (remove rear bearing), then remove shaft through top of case. Remove clutch shaft bearing snap ring, push assembly back and remove through top of case. To remove reverse idler gear, take out locking screw on left side of case, drive shaft out toward rear.

Mainshaft & Second Speed Gear Assembly:—Remove low speed gear at rear end of shaft, remove sliding clutch at forward end (do not lose six detent springs under clutch, note location and reassemble in same position), free second speed gear synchronizing drum snap ring, remove drum and anti-rattle spring. Remove snap ring in front of second speed gear, remove thrust washers and gear.
NOTE—When installing detent springs, see that long and short springs alternated in splines around mainshaft. Install short springs with shoulder and turned up end toward rear to engage second speed synchronizing drum, long spring in reversed direction to engage high speed drum.

Main Drive Gear & Clutch Shaft Bearing:—Bearing retained on shaft by retainer nut and lock ring. Install bearing with shielded side toward gear.
NOTE—When installing transmission, engage high gear to maintain alignment of high speed synchronizing drum in mainshaft splines (with transmission out of car, clutch sleeve is free to move sufficiently to disengage synchronizing drum cams). Check synchronizing drum before installing cover to see that cams are meshed in same splineways as the high speed detent springs.

Counter Gear Assembly:—Counter Gear roller bearings are fitted in pockets in each end of countershaft bore. When installing counter gear cluster, see that bronze thrust washer installed at front end, bronze and steel washers at rear end.

Reverse Idler Gear:—Clearance on shaft should be .002-.0035" (new), .006" (worn limit). When new bushings installed, ream to inside diameter of .877-.879". Endplay should be .019" (350), .025" (others) maximum. See that thrust washer installed at each end of gear.

CADILLAC—LA SALLE. 1937-39 TYPE

Used On:
CADILLAC V8, ALL SERIES (1937-38-39)
CADILLAC V12, SERIES 85 (1937)
CADILLAC V16, SERIES 90 (1938-39)
LA SALLE V8, SERIES 50 (1937-38-39)

IMPORTANT SERVICE NOTE:—Detent springs on first 1939 cars were .022" thick and were changed on later cars to new type .018" thick (except 39-90). To correct hard shifting complaints on first cars, install the new .018" thick springs (all cars except 39-90).

NOTE:—Transmissions on all models similar except that different length mainshaft and extension housing used on some models. Remove control gear shift (mounted on steering column below steering wheel) used on 1938-39 cars. With this type control, gears are engaged by two short shaft-and-lever assemblies on the side of the case. See separate article for complete Gear Shift Control servicing and adjusting directions.

Interlock Assembly (1939)—New type with ball seat tube installed in interlock boss in transmission case (spring located within tube, interlock ball in tube at each end). When a gear is engaged, shoulder on shifter shaft quadrant forces tube toward opposite quadrant so that lock ball seated in end of tube and prevented from releasing this shifter shaft to permit engagement of another gear.

TYPE:—Constant-mesh, synchro-mesh, all helical gear type (sliding gear for low and reverse). Main drive gear and clutch shaft mounted on ball bearing in front of case which takes gear thrust. Mainshaft mounted on roller bearing at front end and roller bearing at rear end which takes gear thrust (shaft extension integral with mainshaft with additional ball bearing at rear end of extension housing). Second speed gear positioned on mainshaft by shoulder at rear, thrust washer and snap ring at front. Counter gear cluster mounted on needle bearings on stationary countershaft with thrust washers at each end. Gears are engaged by a sliding clutch sleeve which is splined to the shaft and engages clutch teeth inside the synchronizing cones on the second speed and main drive gears.

Synchronizing Unit. Consists of two synchronizing drums mounted on the ends of three pin cams which extend through cam holes in the center ring of the clutch sleeve. Synchronizing drum assembly is centered on the clutch sleeve by detent springs which engage the notches in the pin cams. The entire assembly moves as a unit when the clutch sleeve is shifted until the synchronizing drums and cones engage, synchronizing unit then rotates (relative to clutch sleeve) until cam surfaces on clutch ring engage pin cams. Drums are driven through this engagement until synchronization is completed.

SERVICING:—Disassembly. Remove two screws in the shifter lever cap, remove shift lever (1937 models). Remove universal joint flange at the rear end of shaft extension. Take out screws in extension housing flange, remove extension housing and bearing (bearing can be tapped out with soft hammer). Remove speedometer drive gear locking ring, remove gear, take out ball in shaft which acts as gear key (ball will drop out when shaft is tapped). Remove transmission bottom cover. Pull countershaft out toward rear (coverscrew locks shaft in place), remove counter gear cluster and thrust washers. On 1937 models, use puller J-806 to remove low and reverse shifter fork pin out through filler hole in side of case, pull shifter shaft out toward front (turn shaft while withdrawing to free lock ball). Use special punch J-1051 and drive out tapered pin connecting second-and-high shifter shaft and fork. Remove ¼" pipe plug on side of case and take out shifter shaft locking balls, rod and springs. Rotate second-and-high shifter fork ½ turn and remove. Remove locking ring on clutch shaft bearing at front of case. Pull mainshaft assembly to rear and clutch shaft to front as far as possible to free mainshaft at front bearing in main drive gear. Maneuver main drive gear and clutch shaft assembly around mainshaft and withdraw through bottom of case. (1937), withdraw shaft and bearing assembly through front of case (1938-39). On 1939 models two lockscrews in front face of transmission case retaining shaft and bearing assembly must be removed first. Remove clutch sleeve and synchronizing assembly and lift out. Take off mainshaft rear bearing lock ring, push mainshaft as far forward in case as possible, use special tool J-1007 to free second speed gear lock ring, remove gear and washer, slide low and reverse gear and shifter fork off front end of mainshaft, remove mainshaft and bearing at rear. To remove reverse idler, pull shaft out toward rear (locked by cover screw), remove gear and thrust washers. On 1938-39 models, remove shifter levers on side of case, tap shifter shafts in through shifter quadrants and remove from case being careful not to lose interlock springs, balls and pins.

Mainshaft & Second Speed Gear Assembly. Cannot be installed as an assembly (to install, reverse disassembly directions above). Use new locking ring for second speed gear. Rear bearing is press fit on shaft and should be removed and installed on an arbor press. Install ball key in shaft before installing speedometer drive gear.

Shifter Shaft Assembly (1937). Install 2nd & high shifter shaft first, line up shifter fork locking pin hole, use tool J-1005 and install pin (work through shift lever hole on top of case). Use magnetic tool J-1009 and insert second-and-high shifter shaft locking ball, rod and spring, place low-and-reverse locking ball on spring, use special tool J-1008 to hold ball down and install low and reverse shifter shaft. Use tool J-1005 to install pin in low-and-reverse shifter shaft and fork. Install pipe plug in locking ball hole.

NOTE—On first transmissions, shifter lever pin (which engages notch in shifter shaft) had a square head and the notch had square sides. Second type has a tapered screw and slot. All replacement transmissions fitted with new type second-and-high shifter shaft. When installing these transmissions, check shifter lever and install new taper pin Part No.1422051 if necessary. Transmission shifter lever rattle may be corrected by installing new spring No. 1420183 and pin No. 1420200 (50, 60, 85), No. 1422110 (65, 70, 75). Install pin with hollow end under one spring coil (larger pin used on first 65, 70, 75 shifter lever must be serviced by same type).

Shifter Shaft Assembly ('38-39):—Install 2nd & high lever and shaft in neutral position making certain that shoe is properly located. Install interlock ball, pin and spring assembly in case, compress spring and locking balls with tool J-1168, install low-and-reverse shaft with sector in neutral position making certain that shoe is in place. Install new cork seals on outer ends of shafts (use tool J-1169), tap shifter levers into place on shafts while bracing inner end of sector. NOTE—Levers can be installed in two positions (10° apart) and should be placed in upper position on both shafts.

Synchronizing Unit:—Should not be dismantled and cannot be serviced except for removal of detent springs (installed directly below each pin cam and accessible without dismantling unit).

NOTE—Two types of synchronizing unit used in 1937 (second type had chamfer on high speed end of pin cams). To correct gear clash when shifting into second or high on 1937 cars, install new detent springs, Part No. 1419424.

Main Drive Gear & Clutch Shaft Bearing:—Bearing is press fit on clutch shaft. Use arbor press to remove or install (remove lock ring on shaft in front of bearing first).

Counter Gear Cluster:—Bearings are loose needle type and will fall out when shaft is removed. Use special loading tool J-1006 ('37-38), J-1184 ('39) and assemble bearings (26 rollers and retaining washer at each end) before installing counter gear. Leave tool in gear until it is pushed out by countershaft when shaft inserted. Install thrust washer at each end with steel spacer between thrust washer and case at rear. See that locking screw hole in countershaft lines up with cover screw hole so that shaft will be locked in place when cover screws installed and that gasket is in place in groove at rear end of shaft to prevent oil leaks.

Reverse Idler Gear:—Clearance on shaft should be .002-.0035" (new), .0045-.0055" (worn). When installing new bushing, ream to inside diameter of .877-.878". Endplay should be .006-.018" max.. Use special tool J-1010 to align front thrust washer when installing shaft, see that thrust washers installed at each end of gear, gasket in place in groove at rear end of shaft to prevent oil leaks, and that locking screw hole lines up with cover screw hole (shaft locked by cover screw when installed).

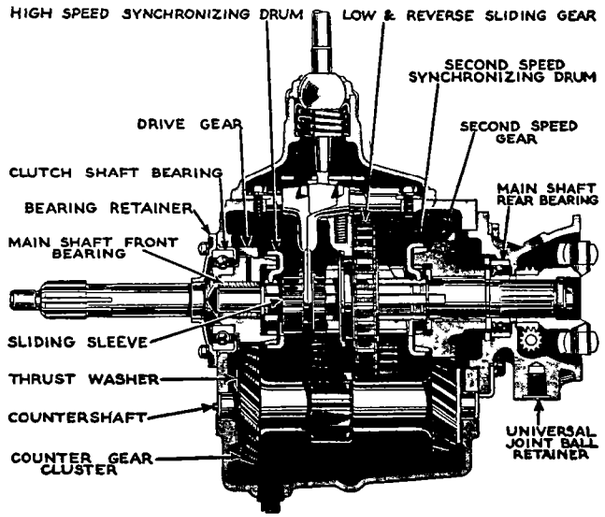
1939 Type—Gear mounted on steel-backed, babbitt lined bushings with steel-backed, babbitt faced thrust washers at each end.

CHEVROLET—PONTIAC TRANSMISSION

CONSTANT-MESH TYPE
CHEVROLET STANDARD, CC ('33), DC ('34), EC ('35), FC ('36)

CONSTANT-MESH, SYNCHRO-MESH TYPE
CHEVROLET MASTER, CA (1933), DA (1934), EA, ED (1935), FA, FD (1936)
CHEVROLET COMM., CB ('33), DB ('34), EB ('35), FB ('36)
PONTIAC SIX, MODELS 701A, B (EARLY 1935)
PONTIAC EIGHT, 601 ('33), 603 ('34), 605 (EARLY '35)

NOTE:—This type transmission used only on Pontiac 1935 models before these serial numbers: 701A—6AA-19858, 701B—6AB-23423, 605—8AA-26175.



TYPE:—Constant mesh (all models), synchro-mesh (some models only), with helical gears for second speed, sliding spur gear for low and reverse. Main drive gear integral with clutch shaft and mounted on ball bearing which takes gear thrust. Mainshaft mounted on cageless roller bearing (front), ball bearing (rear) which takes gear thrust. Second speed gear positioned on shaft at rear of transmission case by washer and locking ring (front), thrust washer in front of bearing (rear). Sliding

CHEVROLET-PONTIAC CONT.

sleeve, which engages gears, is splined on shaft between drive gear at front and second speed gear at rear. Low speed sliding gear is splined on this sleeve at the center and is held stationery when the sleeve is shifted to engage second or high. Counter gear cluster and reverse idler gear mounted on bronze bushings on stationery shaft with thrust washer at each end.

Synchronizing Unit (Synchro-mesh type):—Consists of synchronizing cones formed integrally with main drive gear and second speed gear and drums positioned loosely on mainshaft by synchronizing springs. Drums are engaged by these cylindrical springs and cams formed on the ends of the sliding sleeve and are driven by prongs which engage slots in sleeve.

SERVICING:—Disassembly. Remove cover, interlock and shifter fork assemblies, speedometer driven gear and shaft. Take off universal joint capscrew and

washer, slide universal yoke off shaft. Remove universal joint ball retainer screws, turn retainer to free countershaft, drive countershaft out toward front end to permit counter gear cluster to drop down and unmesh gears. Pull mainshaft and universal joint retainer assembly out at rear disengaging front synchronizing cone, synchronizing spring, and low speed gear (remove these from above). Take out main drive gear bearing retainer screws (on front of case), remove main drive gear and bearing assembly. To remove reverse idler gear, drive out expansion plug behind shaft, remove shaft lock screw on case at rear shaft boss, drive shaft out toward rear.

Mainshaft & Bearing Assembly:—Remove sliding sleeve and press shaft out of rear bearing in universal joint ball retainer, remove gear and thrust washer. To remove bearing from retainer housing, remove lock ring at front of bearing (on Standard model, expand lock ring with wedge shaped tool). Use special tool HM-520 to remove and install synchronizing springs and second speed gear thrust washer lock ring. Thrust washer behind second speed gear should be installed with oil grooves toward gear.

Synchronizing Springs:—Not interchangeable front and rear (rear springs 1/16" wider in slots). Should be selected so that clearance between spring and spline shaft shoulder is .025" min., .035" max., when installed. Furnished in following sizes and marked for identification:

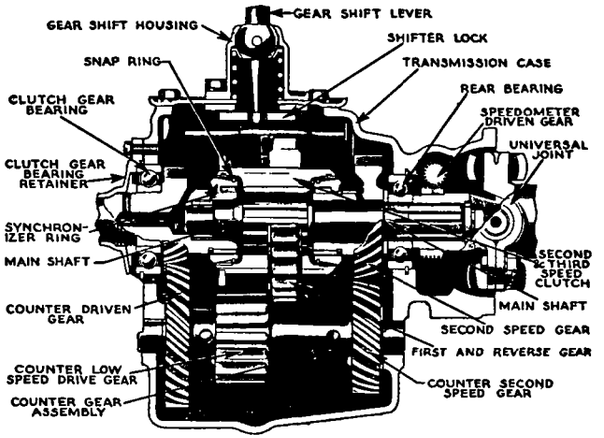
Type	Size	Marking
Rear	.282"	White
Rear	.292"	Black
Front	.173"	Red
Front	.183"	Yellow
Front	.193"	Green
Front	.203"	Blue
Front	.213"	Brown

Main Drive Gear & Clutch Shaft Bearing:—Bearing is press fit on shaft and is retained by lock ring. When installing assembly in case, tap on outer bearing race only (tapping on shaft will drive shaft through bearing, loosening oil deflector and causing a rattle). Install bearing retainer with mark 'TOP' up.

Counter Gear Cluster:—When installing new bushings, see that longer bushing placed at rear.
NOTE—On Chevrolet, bushings are diamond-bored after installation and are not furnished separately. Clearance on shaft should be .002-.004". Thrust washers formed with tang which must be aligned in case. Install shaft from front. Endplay should be .005-.025" (replace thrust washers if excessive).

CHEVROLET THREE SPEED TYPE

Used On:



MASTER MODEL GB ('37), HB ('38), JB ('39)
MASTER DELUXE GA ('37), HA ('38), JA ('39)
HALF TON GC ('37), HC ('38), JC ('39)
¾ TON HD ('38), JD, JE ('39)
1 TON MODEL HE (1938)

NOTE:—Transmissions used on all models same except as follows:
Master Deluxe JA with Steering Column Gearshift—This transmission identical with that used on other models except for shifter mechanism in transmission case cover. See separate article on Chevrolet Transmission Control for complete adjustment and servicing data.
Half-Ton Models—Same as passenger car type except for extension on case at rear end (to make transmission interchangeable with 4 speed truck type), longer mainshaft and spacer on shaft between rear bearing and universal joint.
¾ & 1 Ton Models—Identical with half ton model except that carburized gears used which have special tooth contour. These gears must not be used with passenger car gears and may be identified as follows: **Reverse Idler Gear**—5/32" blind hole in hub between the two gears, **Counter Gear Cluster**—5/32" blind hole in hub between 15 and 22 tooth gears, **Second Speed & First-and-Reverse Sliding Gears**—5/32" blind hole on side of gears, **Clutch (Main Drive) Gear**—5/32" blind hole on shaft between gear and threaded portion (bearing must be removed to see hole).
NOTE—Transmissions with carburized gears may be identified by 'Y' or 'Z' prefix on transmission assembly number (on boss at rear of cover).

TYPE:—Constant mesh, synchro-mesh, with helical gears for second speed, sliding spur gear for low and reverse.

Synchronizing Unit:—Bronze synchronizing cones are staked in ends of sliding clutch with synchronizing rings assembled loosely within them (held by locking rings on inner ends within clutch). Synchronizing rings have prongs which engage slots on gears (between banks of clutch teeth) and revolve with gears. When clutch shifted to engage gears, ring moves toward gear until prongs strike energizing spring (in groove in gear hub) and spring resistance then engages ring with cone to effect synchronization, cone prongs then slide over spring and enter narrow wedge slots and sliding clutch engages clutch teeth on gear.

SERVICING:—Disassembly. Remove gear shift lever housing (back screws off evenly to relieve shift lever spring tension), transmission cover, interlock. Drive shifter shafts out toward front (front end of shafts .003" larger), remove shifter yokes, lock balls and springs. Remove universal joint capscrew and washer, slide joint off shaft. Remove drive gear bearing retainer screws on front of case, take off retainer. Mark main drive gear, second speed gear, and both synchronizing rings to insure reassembly in same relative positions. Use special puller, J-937,

to remove clutch shaft and main drive gear bearing, take out 14 loose rollers (mainshaft front bearing). Use special tool, J-938, installed on back of transmission case and push mainshaft out toward front (IMPORTANT—front synchronizer ring must be turned so that lug lines up between land and spline on mainshaft to avoid damage to lugs and splines), remove mainshaft from front end. Engage second speed gear and clutch sleeve, remove clutch sleeve assembly, low and reverse gear, second speed gear from case as a unit, remove second speed gear thrust washer. Expand rear bearing lock ring into case (use tool J-935), tap bearing out toward front (bearing must be removed before countershaft can be removed). Drive countershaft out toward front. To remove reverse idler, drive idler shaft lockpin into shaft (pin shorter than shaft diameter), drive out expansion plug at rear of case, remove idler shaft through this hole.

Main Gear Drive & Clutch Shaft Bearing:—Bearing retaining nut and oil-slinger are single unit with left hand thread and are staked in hole in shaft. Use special press-plate J-936 to press bearing on or off shaft. Bearing retainer mounting holes on front of case spaced irregularly to insure assembly in correct position (to align oil return holes).

CHEVROLET THREE SPEED TYPE CONT.

Clutch Sleeve & Synchronizing Rings:—To disassemble rings, turn ring until ends of ring retainer is visible through slot in sleeve, insert special pliers J-932 in slot, expand retainer to free ring, pull ring out. See that synchronizing cones are tight in sleeve (replace clutch sleeve and cone assembly if cones loose or worn). Check rings to see that they do not rock in cones.

Energizing Springs:—Use new spring whenever spring is removed. When installing springs, do not expand more than necessary to clear clutch teeth. Install springs with offset end between second and third teeth of any bank of the clutch teeth (offset prevents spring rotation).

Counter Gear Cluster:—Bushings staked in place and diamond-bored after installation. Not sold separately. Clearance on shaft .002-.004". When installing countershaft, see that thrust washers are in place at each end of counter gear cluster and that flat on forward end of shaft is horizontal and on top (flat engages clutch housing to prevent shaft turning, transmission cannot be installed unless flat properly located).

Reverse Idler Gear:—Remove old lockpin from shaft before installing, line up holes in case and shaft, use new lockpin and drive pin in so that head is approximately 1/16" beyond surface of case, peen hole to prevent pin coming out. Pin must be tight in hole to prevent oil leaks.

CHEVROLET FOUR SPEED TRUCK TYPE

Used On:

1½ TON TRUCK MODELS (1933 to 1939)
CAB OVER ENGINE MODELS VE to VH (1939)

NOTE:—This transmission optional equipment on ½ ton, ¾ ton, and 1 ton truck models.

TYPE:—Four speed, sliding spur gear type. Clutch shaft and main drive gear mounted on ball bearing at front end of transmission case. Mainshaft mounted on roller bearing at front, ball bearing at rear. Countershaft mounted on roller bearing at each end. Reverse idler gears mounted on bronze bushing on stationary shaft.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assemblies. Lock transmission by engaging two gears at once, remove speedometer pinion, remove capscrew at rear end of shaft holding universal joint yoke on shaft, pull yoke. Take out universal joint ball retainer mounting screws, remove retainer. Take out mounting screws in main drive gear bearing retainer on front of case, drive out main drive gear and bearing toward front (use soft steel drift to avoid damage to gear teeth). Remove mainshaft front bearing, drive mainshaft and rear bearing out through rear of case, slipping off sliding gears and removing these through top of case. Drive out reverse idler gear shaft toward rear, lift out gears. Drive counter gear to rear until rear bearing clears case, remove bearing and retainer, remove counter gear assembly. Remove front bearing and plug type retainer from case by tapping on outer race.

Main Drive Gear & Mainshaft Ball Bearings:—Bearings are press fit on shaft and should be removed and installed in an arbor press (remove snap ring on clutch shaft in front of bearing before removing main drive gear bearing). When reassembling transmission see that snap rings are in place in case at either end to retain bearings.

Counter Gear Assembly:—Countershaft is integral with low speed gear and press fit in counter gear cluster. Remove and install countershaft in an arbor press.

Reverse Idler Gear:—When replacing bushings use special tool and press new bushings in, using an arbor press. Ream new bushings after installation to inside diameter of .876-.877" which will provide required clearance of .002" minimum on shaft.

CORD DRIVING UNIT (TRANSMISSION & AXLE)

Used On:

FRONT DRIVE MODEL 810 (1936), 812 (1937)

NOTE:—Driving Unit consists of a combination transmission and differential assembly in a single case (each unit in a separate compartment, must be lubricated and drained individually). Drive pinion shaft serves as countershaft (counter gear cluster splined on this shaft) and differential adjustments are disturbed by transmission disassembly. Servicing directions for both units given below.

DIFFERENTIAL UNIT.

TYPE:—Spiral bevel type. Drive from differential assembly transmitted directly to universal joint mounted on each side of driving unit by short spline shaft which is integral part of universal joint assembly (these shafts withdrawn when universals removed). Differential assembly mounted on taper roller bearings and adjusted by nuts or sleeves extending through side of case. Pinion shaft (transmission countershaft) mounted on ball bearings in transmission case.

SERVICING:—Gear Adjustment. Backlash should be .004-.008". See Differential Bearing Adjustment and Pinion Setting below.

Axle Shaft Replacement. Shafts removed with wheel assembly by driving out grooved pin at outer end of inner universal and pulling shaft out to free splined end from inner universal. Wheel bearings are double row ball type and do not require adjustment.

Inner Universal Joints. To remove (necessary when dismantling differential), take out 8 capscrews in mounting flange on side of driving unit case, withdraw universal as an assembly to free spline shaft on inner end from differential side gear. Do not lose spacer located between shafts in differential.

OVERHAUL:—Pinion Bearings. In Transmission case. See Transmission servicing directions below.

Pinion Setting:—Controlled by shims between oil pump housing and front end of driving unit case. Add shims to move pinion out or away from ring gear, remove shims to move pinion in toward ring gear.

Differential Bearing Adjustment:—Mark bearing sleeves before dismantling differential assembly, turn sleeves in to same point when reassembling. Tighten bearing cap bolts securely.

Ring Gear Backlash Adjustment:—Loosen bearing cap bolts slightly, back off one differential bearing adjusting sleeve, tighten opposite sleeve exactly same amount to avoid disturbing bearing adjustment. Backlash should be .004-.008".

TRANSMISSION UNIT.

NOTE:—Bendix electro-pneumatic transmission control is standard equipment. See separate article (Transmission Controls) for data and adjustment directions on this unit.

TYPE:—Four speed, constant mesh, synchro-mesh, helical gear type (except low and reverse), sliding spur gear (low and reverse). No direct drive, drive for each speed is from driving gear on mainshaft to driven gear of counter gear cluster splined on pinion shaft (pinion shaft takes place of conventional countershaft). Mainshaft and pinion shaft (counter gear mounting) mounted on double row ball bearing (front), single row ball bearing (rear). Gears are engaged by the sliding clutch of the synchronizing unit on the mainshaft engaging clutch teeth on the driving gear hubs (synchro-mesh gears).

Synchronizing Units. Two similar units used, front unit for second and third speeds (shifts in both directions), rear unit for fourth speed (shifts backward only). Consist of inner sleeve carrying synchronizing cups and splined to mainshaft, outer clutch unit splined to inner sleeve. Inner and outer sleeves move as a unit (spring loaded detent balls in inner sleeve engage groove in outer sleeve) until synchronizing cups engage cones on gears, when synchronization completed, outer sleeve slides on inner sleeve to engage clutch teeth on gear.

Transmission Oil Pump. Oil pump mounted in housing on front end of case and driven by countershaft. Forces oil through hollow mainshaft to gears. Shims under oil pump housing control pinion mesh. NOTE—Oil pump does not operate when transmission in neutral and engine should not be idled in neutral for long periods particularly when new (may cause mainshaft gear bushings to seize).

SERVICING:—Disassembly. Remove differential assembly (back off differential bearing adjusting sleeves to remove bearing tension before removing assembly). Place shifting mechanism in 'neutral'. Remove housing on front end of case containing shifting mechanism, and oil pump housing (do not lose shims between oil pump housing and case which control pinion mesh). Remove transmission case cover. Remove three shifter rails, interlock plungers, lock balls and springs (lock ball and spring for one lower shaft and interlock plunger between this shaft and upper shaft located at front of transmission and inserted in hole at top of case, lock ball and spring for other lower shaft and interlock ball for lower shafts at rear of transmission and inserted through hole on side of case closed by ¼" pipe plug, lock ball and spring for top shaft at rear of transmission and inserted through hole closed by hexagonal headed plug; replace these in same positions when reassembling). Mark all gears, synchronizing units, and shafts with paint to insure reassembling in same positions and meshed with same splines. Remove mainshaft locknut at forward end of case, use copper drift and drive shaft out toward rear end of case, remove mainshaft gear assembly through top of case (gears assembled on sleeve and not disturbed by removal of shaft). Remove locking nut on forward end of pinion shaft, remove speedometer and oil pump drive gear and key, use copper drift and drive shaft out toward rear of case, lift out cluster gear and sliding gear assemblies.

Reassembling:—Remove mainshaft rear bearing by tapping it out of the case and assemble on the mainshaft before installing mainshaft in case. Make certain that all parts are assembled in accordance with paint marks made before disassembly. Thrust washer on end of mainshaft gear assembly next to rear bearing should be installed with taper face toward bearing. Install shims between oil pump housing and case as required for correct pinion mesh with ring gear.

CHRYSLER—DE SOTO—DODGE FIRST TYPE TRANSMISSION

Used On:

CHRYSLER SIX CI (1932), CO (1933)
CHRYSLER EIGHT, CP (1932), CT (1933)
CHRYSLER IMP. EIGHT, CH (1932), CQ (1933)
CHRYSLER CUST. IMP., CL (1932), CL* (1933)
CHRYSLER IMP. CV ('34), CST. IMP. CW ('34) SEE NOTE
DE SOTO SIX, SC (1932), SD (1933)
DODGE SIX, DL (1932)
DODGE EIGHT, DK (1932), DO (1933)

NOTE:—All cars except CV, CW '34. Free wheeling unit mounted in a separate case bolted on the rear of the transmission case. See special Free-wheel instructions below.

Chrysler CV, CW '34. These models fitted with an Overdrive Unit bolted on the back of the transmission unit. Driven by a splined coupling from the rear of the mainshaft (unit can be removed by taking out mounting screws and withdrawing to rear to disengage splined coupling). See separate article for complete data on Overdrive Unit.

TYPE:—Constant mesh, helical gear (second and high), sliding spur gear for low and reverse (1932), helical gear (1933-34). Clutch shaft and main drive gear mounted on ball bearing. Mainshaft mounted on roller bearing (front), ball bearing (rear) and has splined extension at rear for free-wheeling unit drive. Second speed gear positioned on mainshaft by sliding clutch sleeve, adjusting washer and snap ring. Counter gear cluster mounted on roller bearings on stationary countershaft. Gears are engaged by a sliding clutch splined on the clutch sleeve which engages clutch teeth on the main drive gear and second speed gear hubs. No synchronizing unit is used.

Free-wheel Unit. Cam and roller overrunning clutch type. Inner member (cam) splined on mainshaft, outer case is integral with drive shaft and mounted on roller bearing (1932), ball bearing (1933-34) on cam at front and ball bearing in housing at rear. Free-wheeling locked out by clutch gear splined on mainshaft which engages clutch teeth cut on inner rim of case.

SERVICING:—Disassembly. Remove shifter lever and housing, transmission cover, shifter shaft and fork assemblies, free-wheeling control. Take out free-wheeling housing screws, remove unit by disengaging shaft splines from cam. Take out screw and remove countershaft and reverse idler lock plate on rear of case. Drive countershaft out toward rear to unmesh gears. Remove front bearing retainer, pull out clutch shaft, main drive gear and bearing assembly. Remove mainshaft rear bearing snap ring, shims, and washer, remove rear main bearing, then take out mainshaft assembly through top of case. Lift out counter gear cluster, being careful not to lose loose roller bearings (some models only) and thrust washers. To remove reverse idler gear, drive shaft out toward rear.

Second Speed Gear Assembly:—To remove gear, take off snap ring in front of clutch sleeves, remove shims, sleeve and gear. When assembling gear, install shims between sleeve and snap ring so that gear endplay is .002" maximum.

Mainshaft Assembly:—Endplay on mainshaft controlled by shims between main drive gear bearing outer race and bearing retainer and also between bearing inner race and snap ring on clutch shaft (forward end), spacer washer behind mainshaft front roller bearing, shims between mainshaft rear bearing inner race and snap ring and between rear bearing outer race and case (rear end). These shims must be re-installed when assembling transmission.

Counter Gear Assembly:—See that spacer installed in cluster between bearings (see note for loose roller type bearings), install bronze thrust washers at each end of shaft with spacer washer (when used) between gear cluster and rear thrust washer. Endplay should be .002".
NOTE—To assemble loose roller bearings, install arbor or dummy shaft in gear cluster, coat ends of gear with medium cup grease, install rollers (grease will hold rollers in place). Leave dummy shaft in place until gear cluster installed in transmission, then push out dummy shaft with countershaft as it is installed.

NEW PROCESS FREE WHEEL UNIT

FREE-WHEEL UNIT:—Disassembly. To remove unit from housing, take off nut on universal joint flange, pull flange and brake drum. Take off rear bearing retainer (do not lose gaskets), remove bearing snap ring, remove free-wheel unit and bearing. To disassemble unit, take out retainer ring and adjusting plate in outer case, withdraw bearing, cam, and roller assembly.

Assembly. See that roller bearing assembly installed on cam so that rotation of bearing against energizing spring pressure will locate rollers over release notches on cam lobe flats (roller assembly consists of two rollers at each cam shoe, larger roller nearest shoe, smaller roller away from shoe). Spring must be in closed channel in retainer.

Adjustment. When assembling free-wheel unit on transmission case, install gaskets between rear bearing retainer and free-wheel housing as required so that rear bearing endplay is .002".

CHRYSLER - DE SOTO - DODGE - PLYMOUTH SECOND TYPE TRANSMISSION

Used On:

CHRYSLER SIX, MODELS CA, CB (1934)
DE SOTO SIX, MODEL SE (1934) SEE NOTE
DODGE SIX, DP (1933), DR, DS (1934)
PLYMOUTH STD. 6, PC ('33), PF, PG ('34) SEE NOTE
PLYMOUTH DELUXE 6, PD (1933), PE (1934)

NOTE:—All Models. Free-wheeling unit used which is mounted on rear end of mainshaft within transmission case. See special Free-wheeling instructions below.

DeSoto Model SE. This model has a shaft extension at the rear end of the transmission case and an additional bearing in the extension housing. Serviced in the same manner as other models.

Plymouth Std. Models. Free-wheeling not used but transmission case identical with other free-wheeling models. Serviced in same manner except that free-wheeling instructions may be disregarded.

1935 & Later Models—Equipped with Warner Transmissions. See Warner Transmission articles for complete data.

TYPE:—Constant-mesh (second and high), all helical gear type. Same as type used on earlier models (see preceding article) except that free-wheeling unit mounted with transmission case.

SERVICING:—Disassembly. Remove shift lever and housing, transmission cover, shifter shaft and fork assemblies, free-wheel clutch fork (remove plug and spring in case). Take out free-wheeling drive shaft bearing retainer screws on rear end of case, withdraw entire free-wheel unit and mainshaft assembly. Take out front bearing retainer screws on front end of case, withdraw clutch shaft and main drive gear assembly. Remove countershaft lock plate screw, take off lock plate, drive countershaft out at the rear of the case using special arbor (dummy shaft) which will retain loose rollers used on shaft. Lift counter gear cluster out, taking care not to lose the loose rollers or thrust washers. To remove reverse idler gear, drive shaft out toward rear.

Mainshaft Assembly:—Free-wheeling unit must be dismantled before removing from mainshaft (see instructions below). Mainshaft endplay controlled by adjusting washer between free-wheeling cam and snap ring at rear end of shaft (mainshaft mounted on roller bearing in free-wheeling case at rear end). When installing mainshaft see that front bearing rollers are in place in main drive gear (use cup grease to hold these loose rollers in place while installing shaft).

Second Speed Gear Assembly:—To remove gear, take off snap ring, thrust washer, and shims in front of sliding clutch sleeve, remove sleeve and gear. When assembling gear, install shims between washer and sleeve so that gear endplay is .002" maximum.

Counter Gear Assembly:—See that rollers are in place in gear cluster, coat gear end with cup grease to retain rollers while installing (arbor or dummy shaft must be installed in cluster, see that spacer in place between bearings). Install thrust plate (next to gear cluster), thrust washer (next to case) at each end of gear cluster. Drive arbor out with regular countershaft, installing shaft at rear of case. Gear endplay must not exceed .005".

Gear Shift Lever Adjustment:—Check clearance between lower end of shift lever and each end of slot in shifter rail with lever in high gear position. Should be equal. Adjust by loosening locknut on adjusting screw in side of shift lever housing and turning screw.

NEW PROCESS FREE WHEEL UNIT

FREE-WHEEL UNIT:—Disassembly. To remove unit from housing, take off universal joint flange nut, pull flange, remove snap ring on bearing inside housing, pull unit out of housing. To disassemble, take out retainer ring and adjusting plate in outer case, withdraw case. To remove cam from mainshaft, remove snap ring, adjusting washer, and shims at rear end of shaft, pull cam off.

Assembly. See that shims replaced between adjusting washer and cam at rear of mainshaft (these control mainshaft endplay), and between rear bearing and snap ring in rear retainer (these control free-wheel unit endplay).

FORD, LINCOLN ZEPHYR, MERCURY TYPE

Used On:

FORD V8, PASS. & COMM'L. (1932 to 1939)
LINCOLN-ZEPHYR, ALL MODELS (1936 to 1939)
MERCURY V8, MODEL 99A (1939)

NOTE:—Ford '60' Models. Beginning with engine No. 395343 (10-11-37), tooth pitch of intermediate gears changed from 11 to 9¼. When replacing old type intermediate (second speed) gear and countergear, use new type 74-7103-B (18 tooth) Intermediate Gear and 74-7113-D (19 tooth) Countergear with new type floating bushings. Floating bushings used in countergear assembly beginning with Engine No. 460104 (12-3-37). See Counter gear Assembly below.

Ford '85' Models. Transmissions with sliding spur low-and-reverse gear used on some models. This transmission serviced in same manner as others.

Lincoln-Zephyr '38-39. Shifter shafts and lever assembly mounted in cover on side of transmission case (no opening in top of case). Serviced in same way as Ford transmissions.

TYPE:—Constant-mesh, synchro-mesh, helical gear (second & high), sliding gear (low & reverse. Clutch shaft and main drive gear mounted on ball bearing at front of case. Mainshaft mounted on roller bearing (front), ball bearing (rear). Countershaft mounted on roller bearings on stationary countershaft with thrust washer at each end. Gears are engaged by a sliding clutch sleeve (outer sleeve of synchronizing unit) which engages clutch teeth on the main drive gear and second speed gear hubs.

NOTE—Countershaft on '60' model mounted on bushings pressed in gear assembly (first cars), floating bushings (later cars). See Countergear data below.

Synchronizing Unit:—This unit consists of an inner hub splined on the mainshaft with synchronizing rings at each end and outer clutch sleeve splined on this hub. Sleeve is centered on hub by spring-loaded detent balls (mounted in holes in hub, engage groove in sleeve) so that entire synchronizing assembly moves as a unit, when clutch sleeve shifted to engage gears, until synchronizing rings engage synchronizing cones on gear hubs. Clutch sleeve then slides further to engage clutch teeth on gears (synchronizing rings prevent this engagement until synchronization completed).

Strut Type Blocking Synchronizer—Synchronizer rings are loose in ends of clutch sleeve and are actuated by struts assembled in slots in inner clutch sleeve and engaging notches in synchronizer rings. Struts are centralized in clutch sleeve assembly by the regular poppet balls and springs so that struts move with the clutch sleeves during the initial movement to engage the synchronizer rings with the cones on the gear hubs. Teeth on outer rim of synchronizer rings block or prevent gear engagement until synchronization completed when the final movement of the outer clutch sleeve causes the clutch teeth on the inner rim of the sleeve to slide through the synchronizer ring teeth to engage clutch teeth on gear hubs.

Wire Bound Strut Type Blocking Synchronizer—Same design as Strut Type (above) except that poppet balls and springs not used. A lock ring or wire is installed in outer clutch sleeve and engages notches on struts to centralize struts in sleeve.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assembly. Take out capscrews in universal joint front yoke, remove yoke from shaft. Take out capscrews mounting universal joint housing on rear of case, remove housing. Remove locking pin and drive out countershaft. Take out bearing retainer screws on front of case, withdraw clutch shaft main drive gear and bearing assembly. Remove mainshaft rear bearing, withdraw mainshaft assembly through top of case.

Synchronizing Unit:—Can be removed from front end of mainshaft without being dismantled. If clutch sleeve is to be removed from the inner clutch hub mark both parts and reassemble in same positions, use extreme care not to lose detent balls and springs which will jump out when parts are separated.

Strut Type Synchronizer Assembly—Mark rings as well as inner and outer clutch sleeves before disassembly to insure reassembling in same relative positions. When installing struts, make certain that they engage poppet balls (Strut Type) or that locking wire engages notches in struts and is installed with hook on open end engaged between two clutch teeth on outer sleeve midway between struts (Wire Bound Strut Type). Wire Bound Strut Type Synchronizer is mounted on mainshaft as an assembly with the second speed gear as shown below.

Second Speed Gear Assembly:—Positioned on mainshaft by thrust washers at front and rear. To remove gear, insert wire through oil hole at center of gear between teeth, rotate gear until wire can be pushed through hole in bushing, depress plunger until locking key is freed, push key forward to release rear thrust washer, turn washer until prongs (engaged in slot in splines) line up with shaft splines, move washer to rear slightly. Move key back to free front washer (plunger will engage key at center position and must be depressed again to allow key to be shifted further), withdraw wire and move second speed gear back to expose front thrust washer, turn washer until prongs are freed from splines, remove washer and gear. When installing gear, make certain that both thrust washers are turned so that prongs engage slots in splines (to prevent endwise movement) and that key engages both washers (to prevent rotation). See that plunger locks key in place.

Second Speed Gear Assembly (with Wire Bound Strut Type Synchronizer):—Second speed gear and inner sleeve of synchronizer are mounted as an assembly (retained on mainshaft by snap ring at forward end of synchronizer clutch sleeve). To dismantle assembly, remove snap ring, pull clutch sleeve and gear off shaft. When reassembling, make certain that second speed gear turns freely with synchronizer assembled and snap ring installed.

Counter Gear Assembly:—When installing, see that spacer is in place in gear cluster between roller bearings (See '60' note below). Install small thrust washer at forward end with tongue engaging slot in case, large thrust washer at rear.

NOTE—On '60' models, floating bushings are used. Spacer (74-7115) must be installed on shaft between bushings.

Reverse Idler Gear:—Shaft retained by countershaft locking pin and may be removed after pin driven out.

FORD FOUR-SPEED TRUCK TYPE

Used On:

1½ TON TRUCK MODELS (1932 to 1939)
1 TON TRUCK MODELS 81U, 81T (1938)

NOTE:—This transmission optional equipment on all Commercial or half-ton models.

TYPE:—Four Speed, sliding spur gear type. Clutch shaft and main drive gear mounted on ball bearing at front end of transmission case. Mainshaft mounted on roller bearing in main drive gear at front end, ball bearing in case at rear. Counter gear cluster mounted on roller bearings on stationary countershaft. Reverse idler gears mounted on bronze bushing on stationary shaft.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assembly. Remove universal joint cover, take out capscrew on end of shaft within universal joint yoke, pull yoke. Take out mounting screws within rear bearing retainer, remove retainer. Take out screws in bearing retainer on front end of case, remove retainer, withdraw clutch shaft main drive gear and bearing assembly. Remove mainshaft front bearing. Withdraw mainshaft and bearing assembly through rear of case, removing sliding gears through top of case. Remove countershaft and reverse idler shaft lock plate, drive out countershaft, lift out counter gear cluster. Drive out reverse idler shaft, lift out reverse idler gears.

Main Drive Gear Bearing Assembly:—Bearing locked on shaft by snap ring. See that oil baffle assembled on shaft between bearing and drive gear. When installing see that snap ring which locates bearing in case is in place in bearing hole.

Mainshaft & Rear Bearing Assembly:—Assembled in same manner as main drive gear bearing (oil baffle at inner end, located in case by snap ring in bearing hole).

Counter Gear Assembly:—Bearings positioned on shaft by spacer within gear cluster. See that locking plate installed on rear face of case to prevent countershaft movement.

LINCOLN TRANSMISSION

Used On:

ALL V12 MODELS (1932 to 1939)

TYPE:—Constant-mesh, synchro-mesh (Second and High) helical gear type with sliding helical gear for Low and Reverse. Clutch shaft and main drive gear mounted on ball bearing in front end of case. Mainshaft mounted on roller bearing at front, ball bearing at rear. Shaft extends through into free wheel case with integral free wheel cam on the rear end (cars with free wheeling). Counter gear cluster mounted on roller bearings on stationary countershaft with ball thrust washer at each end. Gears are engaged by sliding clutch sleeve (outer member of synchronizing unit) which engages clutch teeth cut on main drive gear and second speed gear hubs.

Synchronizing Unit:—This unit consists of an inner hub splined on the mainshaft with synchronizing rings at each end and outer clutch sleeve splined on this hub. Sleeve is centered on hub by spring-loaded detent balls (mounted in holes in hub, engage groove in sleeve) so that entire synchronizing assembly moves as a unit, when clutch sleeve shifted to engage gears, until synchronizing rings engage

LINCOLN CONT.

synchronizing cones on gear hubs. Clutch sleeve then slides further to engage clutch teeth on gears **Strut Type Blocking Synchronizer.** Synchronizer rings are loose and are actuated by three struts assembled in slots in inner clutch sleeve which engage notches in the rings. Struts are centered in the synchronizer assembly by the regular poppet balls and springs (ball and spring entered through hole in center of strut). Struts move with sleeves during initial movement to engage synchronizer rings. Teeth on rings block or prevent gear engagement until synchronization completed when clutch teeth on inner rim of outer clutch sleeve slide through the synchronizer ring teeth to engage clutch teeth on gear hubs.

SERVICING:—Main Drive Gear & Bearing Assembly. To remove, take off bearing retainer on front of case, withdraw assembly. Bearing retained on shaft by locking nut and locking ring. Oil baffle is assembled in front of bearing (inner ring clamped between bearing inner race and locknut on shaft, outer ring clamped between outer race and retainer).

Synchronizing Unit:—Should be removed from shaft as a unit and dismantled in special fixture, Part No. 16Z-58861. Fixture allows detent balls and springs to be removed one at a time and lessens chance of losing these parts. When installing unit, see that internal groove in inner sleeve (at end), and extended hub of outer clutch sleeve are toward front NOTE—Detent balls engage this groove in clutch hub when second speed is engaged and assist in keeping gears in mesh.

Strut Type Synchronizer. Inner and outer clutch sleeves marked by etched line. Make certain that these marks lined up when reassembling and that synchronizer rings replaced in same relative positions. See that struts engage poppet balls and springs and that balls are free in struts so that they engage groove in outer clutch sleeve. Backlash between inner and outer sleeves should be .000-.001" (selective fit). Force required to break poppets (so that outer sleeve slides on inner sleeve) should be 6-8 lbs. with struts held stationary on inner sleeve.

Second Speed Gear Assembly:—Gear mounted on taper roller bearings on mainshaft and is locked in place on bearing cup (single unit for both bearings) by locking ring screwed in gear hub at rear. Bearing cones are held in position on mainshaft by locking ring at forward end. Spacer between cones controls bearing endplay.

Counter Gear Assembly:—Countershaft retained by locking plate at rear end. Counter gear roller bearings located in gear cluster by bushing at inner end of each bearing.

LINCOLN FREE WHEEL UNIT

DESCRIPTION:—Cam and roller type. Cam or hub is integral with transmission mainshaft. Outer ring or sleeve is unit with drive shaft. Eight single rollers located in pockets in hub. Locking device consists of a sliding gear or clutch splined on the mainshaft which can be shifted to engage clutch teeth on the inner rim of the free wheel sleeve so that the drive is directly through the sleeve to the drive shaft.

OPERATION:—Similar to other roller type free wheel designs. Rollers are wedged between cam and sleeve when engine is driving rear wheels. When car is coasting, rollers move in cam pockets to clear sleeve so that drive shaft and sleeve can overrun or rotate faster than the cam which always rotates at transmission mainshaft speed.

Control Mechanism:—Consists of a control fork (which engages locking gear) positioned on free wheel shifter shaft by a spring. Free wheel control lever is linked to forward end of shaft. Locking plunger for shifting shaft is located within transmission case. Automatic lock-out for reverse consists of a pin on the control fork directly behind the low and reverse shifter rail. This pin is forced back when transmission shifted into reverse, moving the shifter fork on the shifter shaft (against spring tension) to engage the locking gear, the spring returning the shifter fork and gear to free wheeling position when transmission shifted out of reverse.

HUDSON & TERRAPLANE TYPE

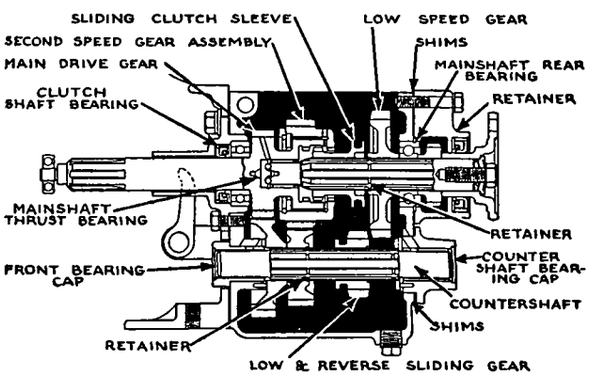
Used On:

HUDSON 6 & 8, ALL MODELS (1934 to 1939)
TERRAPLANE, ALL MODELS (1932-38)

NOTE:—Transmission used with Electric Hand (optional on all models except '112') similar to standard model except for special shifter mechanism and mounting of Electric Hand units on transmission case (Power Unit, Gear Abutment Shift Rail Switch, Clutch Pedal Circuit Breaker). See article on Electric Hand for servicing and adjustment of these units. Transmission serviced in same manner as standard model below.

Handy-Shift (1939). Transmission cover has been modified to include a selector plate (sliding on two guide pins in cover) and actuated by the selector cable to shift the gear engagement shift finger back and forth between the low-reverse and second-high shifter forks at neutral, and a gear engagement lever to which the shift finger is linked. See separate article for Handy-Shift Transmission Control service data.

Electric Hand:—Bendix type transmission control optional on all models beginning with 1935. See separate article (Transmission Controls) for complete data and adjustments for this Electric Hand.



Hudson 1932-33 Models. Warner transmission used on these models. See Warner Transmission article for data.

1932-33 Terraplane Models. Transmission similar in design to later type except that Interlock Bars and Sliding Reverse Idler Gear not used (countershaft sliding gear shifted forward to engage reverse).

Hudson '112' Model. Shifter rail lock bars not used on Model 89 (1938). Single lock bar used for Second-High only on Models 90, 98 (1939).

TYPE:—Constant-mesh, helical gear (second and high), sliding spur gear (low and reverse). Main drive gear and clutch shaft mounted on ball bearing in transmission case. Mainshaft mounted on bushings (1932-33), needle bearings (1934 on) at forward end, ball bearing at rear end. Mainshaft end thrust taken by a ball thrust bearing at the forward end of the shaft. Second speed gear mounted on the main drive gear clutch hub and positioned by thrust washer at each end. Low speed gear is fixed on mainshaft by a lock ring (this gear does not move, low engaged by shifting gear on countershaft). Counter gears splined to countershaft which revolves in bushings in bearing cap at each end of transmission case. Reverse idler assembly consists of stationary gear mounted on bushings on stationary shaft and sliding gear splined to stationary gear sleeve (this gear shifted in conjunction with low speed sliding gear to engage reverse). Second and high speeds engaged by sliding clutch sleeve splined to mainshaft which engages main drive gear or second speed gear clutch teeth (within second speed gear assembly).

SERVICING:—Disassembly. Remove transmission cover and shift lever assembly. Disconnect shift rail lock bar links, remove links and lock bars. Remove clutch housing (if taken off car as assembly with transmission). Use puller J-820 and remove universal joint flange. Remove speedometer drive gear housing and gear. Remove lock ball spring caps (on shifter rail lock brackets), take out lock ball springs, balls, plungers, remove brackets (do not lose shims). Take out shifter lock screws and remove shifter rails and forks. Remove three capscrews in main drive gear bearing retainer in front of case, remove retainer (tap with soft hammer if necessary). Drive low and reverse gear on mainshaft back slightly (rear bearing will move with gear) to expose locking ring, remove locking ring using special drift J-786. Use special puller J-352 and remove main-

shaft and rear bearing through rear of case, lift low speed gear and clutch sleeve out through top of case. Remove main drive gear and second speed gear assembly out through top of case.

Reverse Gear Removal (1934-35). Take out two capscrews in shaft cap at rear of case, remove cap. Remove shift rail lock strap pivot screw on side of case (this screw locks shaft), drive shaft out toward rear, lift out gear assembly.

Reverse Gear Removal (1936-39). Take out two capscrews in reverse shaft cap on rear of case, remove cap and shaft (shaft pinned in cap). Lift out gear assembly.

Counter Gear Removal. Take out capscrews in rear bearing cap, remove bearing cap, spacer and thrust washer (do not lose shims under bearing cap flange). Use special drift J-786, insert beveled edge between countershaft drive and second gears (at front of case), separate gears, forcing countershaft back until drive gear slips off splines at forward end of shaft. Turn gear until splines butt against shaft splines (to hold shaft), insert drift through rear bearing hole in case, drive second speed driving gear forward on shaft (do not drive gear entirely off shaft). Move countershaft to one side, move low and reverse shifter lever to neutral position. Hold countershaft gears together and remove countershaft from case at the rear. Remove low and reverse intermediate shift lever stud and take out lever.

HUDSON & TERRAPLANE CONT.

Take out small Allen setscrew on right hand side of case, drive low and reverse shifter fork shaft out of case. Remove cotter pin and castellated nut on bottom of case, take out reverse gear shifter lever fulcrum, pickup lever, shifter lever, shifter, pickup plunger and plunger spring.

Main Drive Gear, Second Speed Gear & Clutch Shaft Bearing:—Mainshaft front bearing loose in main drive gear and can be lifted out (26 needle rollers for main bearing, 7 balls for thrust bearing), after mainshaft has been removed. To disassemble second speed gear, insert one jaw of lock ring remover J-449 through milled opening in gear to grip lock ring, place opposite jaw just above lock ring. Compress lock ring and lift one side out of groove, use blunt punch to tap other side out. Remove second speed gear and thrust washers. Use bearing puller J-782 to remove clutch shaft bearing from shaft, tool J-779 to re-install bearing. When replacing needle roller retaining ring use tool J-780. Second speed gear bushing (steel-backed, babbitt-lined) diamond bored and gear should be replaced if clearance excessive. Clearance should be .0005". Endplay .009". When installing this gear, place the bakelite thrust washer on first, install gear, then install outer thrust washer with babbitt face in, install retainer with gap in ring ¼ turn away from second speed gear slots, use tool J-448-5 to seat snap ring in groove. Use cup grease to hold mainshaft thrust balls and needle rollers in place until mainshaft can be entered.

Mainshaft & Low Speed Gear:—To install, assemble bearing loosely on rear of shaft, install low speed gear and sliding clutch (collar to rear) on shaft inside case, place low speed gear locking ring in groove using cup grease to hold parts in place, hold shaft firmly against thrust bearing balls, use tool J-779 to drive bearing forward on shaft (this will drive gear in place against lock ring). When installing bearing retainer, install shims between retainer and transmission case as required so that mainshaft endplay is .008-.012" (use dial indicator to check).

Counter Gear Assembly:—Use tool J-450 to remove old bushings, J-780 to install new bushings and line ream with bearing caps in place in case (expansion plugs removed). Use tool J-781 to install second gear retainer in groove. Install thrust washer on rear end of shaft, bronze spacer between thrust washer and case. Install shims between rear bearing cap and case as required so that endplay in countershaft is .005-.009" (use a dial indicator to check). Shaft clearance in bushings should be .0005".

Reverse Gear Assembly:—Remove and install bushings in an arbor press or with J-488 hand bushing press. New bushings finished to size and do not require reaming. Clearance should be .003". Install sliding gear on stationary gear sleeve with collar toward rear (1934-35), toward front (1936 on). See that locking dowel screw installed to lock shaft (1934-35) or that shaft pinned to bearing cap before cap installed on case (1936 on).

Shifter Rail Lock Bar Adjustment. Use second type with bar stock lock bars to service first type with stamped lock bars (used in 1934, early 1935 cars). When installing lock bar guides, shim between guides and case to secure .005" clearance between lock bars and outer ends of plungers. Adjust links so that bar is drawn down sufficiently to release plunger (bar slot aligned with plunger) with clutch pedal depressed one half.

NASH & LAFAYETTE 1932-38 TYPE

Used On:

LAFAYETTE, 110 ('34), 3510 ('35), 3610 ('36)
NASH, ALL MODELS (1932-38)
NASH-LAFAYETTE, 3710 (1937), 3810 (1938)

NOTE:—Warner Transmission and Warner Overdrives used on some models. See Warner Transmission articles for data on these cars.

1938 Models. Evans Vacuum type Gear Shift Control is optional. See separate article (Transmission Controls for data on this equipment). Transmissions are same design as those used on other models

TYPE:—Constant-mesh, synchro-mesh, helical gear (second and high), sliding spur gear (low and reverse). Mainshaft mounted on roller bearing in main drive gear with thrust balls in bearing recess ahead of shaft. Entire assembly mounted on taper roller bearing at each end of transmission case with bearing adjustment at rear end (shims under rear bearing retainer flange) or on ball bearings (no adjustment). Countershaft mounted on bronze or babbitted bushings on stationary shaft with thrust washers at each end.

Synchronizing Unit. Consists of synchronizing cones on hubs of main drive gear and second speed gear and drums on ends of sleeve splined to mainshaft. This sleeve is centered within the outer clutch sleeve by spring-loaded detent balls so that they slide as a unit when outer clutch sleeve is shifted to engage gears until synchronizing drums and cones engage. After synchronization completed, clutch sleeve slides further to engage gear.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assemblies, taking care not to lose balls and springs. Remove gear bearing retainer, being careful not to lose bearing adjusting shims. Take off nut on end of countershaft, drive countershaft out. Remove bearing retainer on front end of case, withdraw clutch shaft main drive gear and bearing assembly. Withdraw mainshaft assembly.

Synchronizing Unit:—Can be removed from mainshaft without being dismantled. If unit is disassembled, mark both sleeves (to insure reassembly in same positions), and use extreme care not to lose detent balls and springs which will spring out when inner synchronizing sleeve is freed from outer clutch sleeve.

Second Speed Gear Assembly:—Gear positioned by thrust washer bearing against shoulder on mainshaft at rear (not used on all models), thrust washer turned so that prongs on inner edge engage slots in splines (locked by locking plunger and spring) at front. To remove gear, depress plunger with wire (hole provided in gear hub through which to insert wire on some models), turn front thrust washer so that prongs line up with splineways on mainshaft, remove washer and gear. When installing gear, see that washer is turned so that prongs are engaged in notches in splines and securely locked by plunger. Gear endplay controlled by thrust washer (furnished in various thicknesses).

Mainshaft & Bearing Assembly:—When installing, see that thrust plate and thrust balls are in place in mainshaft bearing pocket in main drive gear, tighten front bearing retainer screws securely and adjust taper roller bearings by installing shims as required under rear bearing retainer.

Counter Gear Assembly:—See that thrust washers are in place at each end of counter gear cluster to control endplay.

NASH 1939 TYPE

Used On:

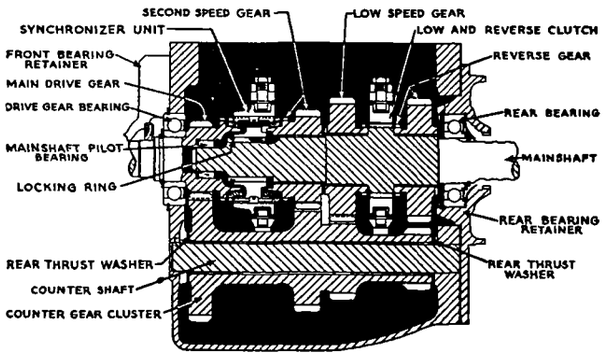
NASH-LAFAYETTE, MODEL 3910 (1939)
NASH AMBASSADOR SIX, 3920 (1939)
NASH AMBASSADOR EIGHT, 3980 (1939)

NOTE:—Steering Column Gear Shift—See separate 'Nash Transmission Control' article for complete adjustment and servicing data for the control used with this type transmission.

Overdrive—Warner Model R6 Overdrive unit is optional equipment. Disassembly data given below for this overdrive unit. See also Warner Model R6 Overdrive service article.

TYPE:—Constant-mesh (all speeds), synchro-mesh (second and high) all helical gear type. Low and reverse gears are free to revolve on mainshaft (these gears always in mesh with countershaft gears) and are engaged by a sliding clutch sleeve splined on the mainshaft which engages clutch teeth on the gear hubs. Main drive gear (clutch shaft gear) mounted on ballbearing in front end of case. Mainshaft is mounted on pilot roller bearing in drive gear hub (at front), ball bearing in case (rear) and extends through into overdrive case. Shifter mechanism consists of a yoke on a vertical shaft within the transmission case on the right side which controls the sliding clutch sleeve (rear shaft of low-and-reverse, forward shaft for second-and-high). Detents consist of spring loaded plungers on underside of shifter plate which engage sectors on the shafts. A two-plunger interlock is located in a boss between the two shafts. Adjustment screws which serve as stops for the front (second-and-high) shaft are located in front and right sides of transmission case. A reverse lockout lever for the overdrive unit is located at the rear of the transmission case and is operated by a lever on the low-and-reverse shaft.

Synchronizing Unit (Second-and-High)—Wire-bound Strut Type Blocking design. Synchronizer rings are loose in ends of inner clutch sleeve and are actuated by struts assembled in slots in inner clutch sleeve and engaging recesses in synchronizer rings. Struts are centralized by locking wire or ring within outer clutch sleeve so that struts move with outer sleeve to engage synchronizer rings during initial movement of sleeve (inner sleeve is stationary on shaft and has no part in synchronizing operation). Teeth on outer rim of synchronizer rings block or prevent gear engagement until synchronization completed when the final movement of the outer clutch sleeve causes the clutch teeth on the inner rim of the sleeve to slide through teeth on synchronizer rings and engage clutch teeth on gear hubs.



SERVICING:—Disassembly Note—Overdrive can be dismantled and removed (for work on overdrive unit only **without disturbing transmission assembly** or transmission can be disassembled (for work on transmission only) **without disturbing overdrive assembly** if disassembly directions given below are followed closely.

Overdrive Disassembly (without disturbing Transmission)—Remove companion flange at rear of overdrive case, loosen screws holding overdrive unit on rear of transmission case, move overdrive toward rear and drive shaft toward front (into overdrive case) to prevent free-wheeling unit pulling apart and use extreme care to prevent adapter

NASH 1939 TYPE CONT.

plate (rear bearing retainer) from moving away from transmission case—**if bearing retainer allowed to move ¼" toward rear, synchronizer will come apart requiring complete dismantling of transmission.** As soon as overdrive has been separated from transmission sufficiently, install one bolt to retain adapter on transmission case, remove overdrive case, pull out reverse release pin. Pull rear shaft off, using rubber band to retain free-wheel rollers, remove retaining screw and washer (in recess in free-wheel cam), remove cam and front thrust washer. Remove clutch and planet gear assembly (do not disassemble unless required—planet gears are split type and must be properly meshed in clutch gear). Sun gear is retained by snap ring on forward side of rear bearing retainer and cannot be removed without dismantling transmission.

Transmission Disassembly (without disturbing Overdrive unit):—Remove shift levers on top of transmission case, transmission cover and gasket. Install spacer or large nut on each shifter shaft, re-install shaft nuts and washers (this will prevent dis-assembly of shafts and detent and interlock plungers).

Straighten locks on fork stud nuts (on top of shaft lugs above forks), remove nuts. Lift both shafts and mounting plate out through top of case as an assembly leaving forks in case. Remove forks being careful not to drop the two fork shoes on each fork in case (remove overdrive oil trough before taking out rear fork). Remove countershaft (use mandrel SE-568 inserted through front end of case) and allow counter gear cluster to drop down in case. Remove overdrive mounting bolts on rear of transmission case, separate adapter plate (rear bearing retainer) from transmission case and withdraw complete overdrive assembly, adapter plate, and mainshaft assembly through rear of case as a unit (use bolt to hold adapter plate and overdrive case together to prevent overdrive coming apart). Disassemble mainshaft units as directed below. Take out front bearing cap mounting screws on front of case, withdraw bearing cap, main drive gear, and bearing assembly through front of case. Lift out counter gear cluster and thrust washers. To remove reverse idler gear, drive shaft out toward rear being careful not to lose key in shaft which engages transmission case.

Transmission Disassembly (Models without Overdrive):—Proceed in exactly the same manner as directed above for transmissions with overdrive and disregard all overdrive data.

Mainshaft Assembly:—Parts are assembled on each end of shaft in distinct groups (serviced separately as directed below) as follows: Reverse Gear, Rear Main Bearing, and Bearing Retainer (Rear End); Low Speed Gear, Second Speed Gear, and Synchronizer (Front End).

Reverse Gear & Rear Main Bearing—To disassemble (with overdrive removed from shaft), free snap ring on front face of retainer at bearing outer race, press shaft and bearing out of retainer toward front (retainer has oil seal or oil shedder in bearing recess and sun gear is mounted on rear face—see note below). Remove snap ring on shaft at rear of bearing, press speedometer gear (plain type transmission only) and bearing off shaft, remove snap ring (this ring holds bearing in retainer and cannot be taken off until after bearing removed from shaft), remove thrust washer and reverse gear. Assemble parts in same order and make certain that one end of bearing snap ring coincides with notch in retainer, use pry bars or screwdrivers to seat snap ring firmly in groove.
NOTE—Sun gear is splined in bearing retainer and retained by snap ring at forward end (under oil shedder). If necessary to remove sun gear, take out snap ring and pull sun gear out.

Second Speed & Low Speed Gears and Synchronizer Assembly—Entire assembly retained by snap ring on shaft in front of synchronizer unit inner sleeve. To disassemble, remove snap ring, remove synchronizer unit parts (mark rings, outer sleeve, inner sleeve to insure reassembling in same relative positions), thrust washer and key, second speed gear, thrust washer, low speed gear, low-and-reverse clutch sleeve. Reassemble in same manner and note particularly the following points: low speed gear thrust washer lug must be located in gear slot, second speed gear thrust washer must be installed with oil groove toward gear and key installed to retain washer, second speed synchronizer ring must be installed first and synchronizer assembly then driven on shaft and retained by snap ring (use sleeve No. SE-589 to install synchronizer). CAUTION—Synchronizer ring must be positioned so that notches align with struts in synchronizer sleeve or assembly will be damaged when driven on shaft. Synchronizer strut lock ring must be installed with hook on end midway between two struts and engaged between two teeth on outer clutch sleeve (synchronizer will not operate if gap in ring placed at strut so that strut is free to move endwise).
NOTE—Synchronizer assembly will be facilitated if three 2" lengths of .003" shim stock (tapered to ¾" at ends) are inserted directly above struts to retain lock wire in strut notches while spring is compressed to allow assembly of outer clutch sleeve on inner hub.

Mainshaft Installation & Endplay Adjustment—Mainshaft assembly should be installed in transmission with main drive gear (and pilot bearing) in place and counter gear cluster in case but suspended on assembling mandrel (see Counter Gear Assembly below). With high speed gear synchronizing ring in place (struts engaging notches in ring), insert mainshaft through rear of case so that forward end enters pilot bearing in main drive gear. Hold mainshaft so that rear bearing retainer is tight against rear face of case, check endplay of synchronizer bronze clutch ring. Total endplay should be .020". Adjust by installing steel shims between rear bearing retainer and transmission case (1-3 shims used normally, additional shim may be installed if necessary).

Main Drive Gear & Bearing Assembly:—Bearing retained on shaft by washer and snap ring and can be removed after snap ring has been freed. When assembling drive gear, make certain that oil seal in retainer is in good condition and saturate with engine oil, see that snap ring in place on bearing outer race, assemble in transmission case and install sufficient gaskets between retainer and case so that snap ring held firmly in place without any clearance between retainer and face of case. Mainshaft pilot bearing is retained in drive gear hub by a lock ring.

Counter Gear Assembly:—Install gears in case with thrust washers at each end (washer tongues must engage notches in case above shaft hole) using assembling mandrel SE-568 inserted through front end of case. After mainshaft assembly installed, drive countershaft in through front of case so that mandrel driven out at rear (use wire loop to lift counter gear, if necessary for shaft alignment). Shaft prevented from rotating by setscrew in forward end which engages notch in case.

Reverse Gear:—To assemble, lubricate gear, install with shoulder on gear toward front, drive shaft in from rear end so that key in shaft lines up with notch in case.

Shifter Assembly Installation & Adjustment:—Lubricate fork shoes before installing, make certain that lower ends of vertical shafts engage pivot plugs in bottom of transmission case and that shift fork stud nuts are securely locked after being tightened. Use sealing compound on gasket under shift plate and see that plate is located by two dowels on transmission case (dowel pins must not project above top surface of plate). Adjust mechanism as follows:

Low-and-Reverse Clutch—Install operating lever on upper end of shaft and check operation. With lever in neutral position (detent plunger engaging center notch on sector), outer clutch sleeve should be centered on shaft gear and fork shoes should be free in clutch groove. To adjust, loosen fork stud nut, shift position of fork in relation to lever on shaft. Tighten nut securely and lock with lock plate after adjustment completed.

Synchronizer (Second-and-High) Clutch—Install lever on forward shaft, place lever in neutral position (detent plunger engaging center notch in sector), check to see that outer clutch sleeve centered so that both synchronizer rings free and that play is equal. Adjust in same manner as low-reverse clutch by loosening fork stud nut and shifting fork in relation to shaft. Operate lever to engage second speed and check gear engagement and detent and interlock operation. Detent plunger should engage second speed notch in shaft sector and interlock plunger should be seated fully in notch with low-reverse shaft sector with slight clearance and should prevent operation of this shaft. Adjust by loosening locknut and turning limit adjustment screw on side of transmission case which limits front shaft travel. Engage high speed and check in same manner (adjusted by turning limit adjustment screw on front of case in same manner).

NASH 1939 TYPE CONT.

Overdrive lockout (Reverse release)—Lever at rear of case pivots on pivot pin which is mounted on fulcrum stud in rear of case. To check operation, place transmission in reverse gear and overdrive in conventional position. When rear shaft lever is moved, lockout pin should have slight (.005") movement.

OVERDRIVE UNIT

SERVICING:—**Assembly**—Lubricate all bearings and thrust washers with engine oil before assembling. If clutch and ring gear have been taken off ring gear, install thrust ring on front face of clutch and bronze bearing within clutch hub, wind up split half of each pinion gear 1 turn and mesh in ring gear (pinion halves are spring-loaded and this amount of tension required to eliminate backlash and insure quiet running). Use extreme care not to bend clutch pawl lock (sheet metal plate which retains pawls in position when shift collar in conventional drive position—plate must release pawls when shift collar moved to overdrive position). Install clutch and gear assembly on mainshaft, meshing planet gears with sun gear (see that snap ring in place on mainshaft at rear of sun gear to limit clutch hub movement on shaft). Install clutch pawl rear thrust washer, free-wheel cam, retaining washer, lockwasher and screw (use new lockwasher and, if necessary, new retaining washer and screw to avoid any possibility of this screw loosening in service). Install free-wheel rollers in cage (retain temporarily with rubber band), rear shaft and gear (rotate roller cage to facilitate assembly, remove rubber band as shaft cup slides over rollers), install speedometer gear on shaft. To install overdrive case, place shift collar in case so that it engages shift fork, invert transmission, install reverse lockout pin so that it engages notch in lockout lever in transmission case, install case and shift collar on overdrive shaft assembly and manipulate case so that collar engages gear teeth on rear shaft and case slides forward so that it rests on rear face of transmission case, install mounting screws. Make certain that oil seal in rear of overdrive case is in good condition and install universal joint companion flange. NOTE—Flange must be pressed on shaft and not driven in place which may damage rear bearing retainer or distort rear bearing snap ring.

ADJUSTMENT:—Manufacturer recommends that no attempt be made to adjust overdrive cut-in speed (pawl adjustment) unless accurate spring scale used to measure pawl spring tension and assure equal and correct adjustment of both pawls. Pawls are adjusted by removing plug on top of overdrive case and turning shaft so that holes in clutch collar and pawl in which adjusting screws located line up. Each screw (two screws—one for each pawl) should be adjusted equally. Turn screws in to raise cut-in point, out to lower cut-in point, being certain that both screws are adjusted equally and turned so that they interfere with the clutch collar. Cut-in speed with standard adjustment is 38-42 M.P.H.

NOTE—One pawl adjusting screw has single slot in head, opposite screw has double slot to avoid any possibility of adjusting same screw twice—shaft should be turned one-half revolution after adjusting first screw to bring second screw into line with adjusting hole).

PACKARD 'SENIOR LINE'

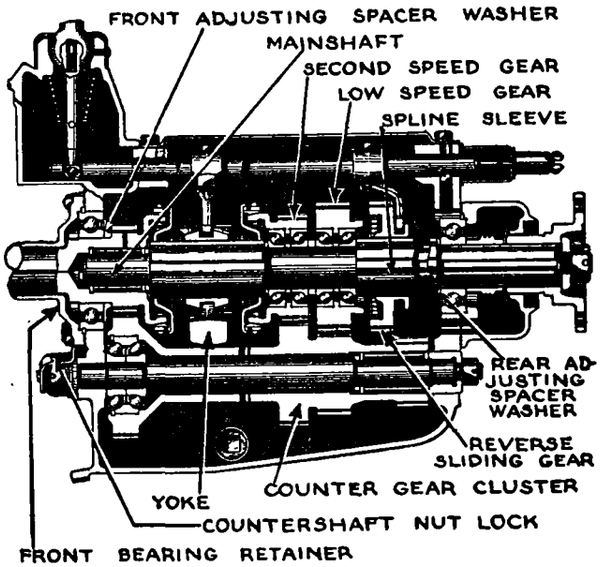
Used On:

EIGHT, 901, 2 ('32), 1001, 2 ('33), 1100, 1, 2 ('34) 1200, 1, 2 ('35), 1400, 1, 2 ('36)

SUPER 8, 903, 4 ('32), 1003, 4 ('33), 1103, 4, 5 ('34), 1203, 4, 5 ('35), 1403, 4, 5, ('36), 1500, 1, 2, ('37) 1603, 4, 5 ('38)

TWELVE, 905, 6 ('32), 1005, 6 ('33), 1107, 8 ('34), 1207, 8 ('35), 1407, 8 ('36), 1506, 7, 8 ('37) 1607, 8 ('38), 1707, 8 ('39)

NOTE:—**Steering Column Gear Shaft (1939).** Used on some cars. See separate article on "Transmission Control" for adjustment and servicing data. Transmission used with this type control same as on other cars except for shift mechanism.



TYPE:—Constant-mesh (except reverse), synchro-mesh (second and high), sliding spur gear for reverse (this gear acts as low speed engaging clutch when shifted forward). Main drive gear mounted on ball bearing. Mainshaft mounted on roller bearing (front), ball bearing (rear). Low and second speed gears mounted on double row ball bearings on mainshaft. Counter gear cluster mounted on double row ball bearing (front), roller bearing (rear). Low gear is engaged by shifting reverse gear on mainshaft forward to engage internal clutch teeth on gear with clutch teeth on low speed gear hub. Second and high engaged by sliding clutch sleeve splined on mainshaft which engages clutch teeth on inside of synchronizing cones on gears.

Synchronizing Unit. Consists of synchronizing drums splined on mainshaft which engage synchronizing cones on gears. Drums actuated by synchronizing yoke pivoted in case. Plunger in dashpot on yoke contacts cam on shifter shaft so that yoke is rocked to engage drum and cones when shifter shaft moved to engage gear (escape of oil from dashpot allows plunger to disengage from cam after synchronization completed, yoke then returned to disengaged position by centralizing springs so that drum drawn out of engagement).

SERVICING:—Check synchronizing yoke travel (see Yoke Adjustment below) before dismantling transmission, and note this figure for yoke adjustment when assembling transmission (adjusted by installing shim of proper thickness at each end of mainshaft).

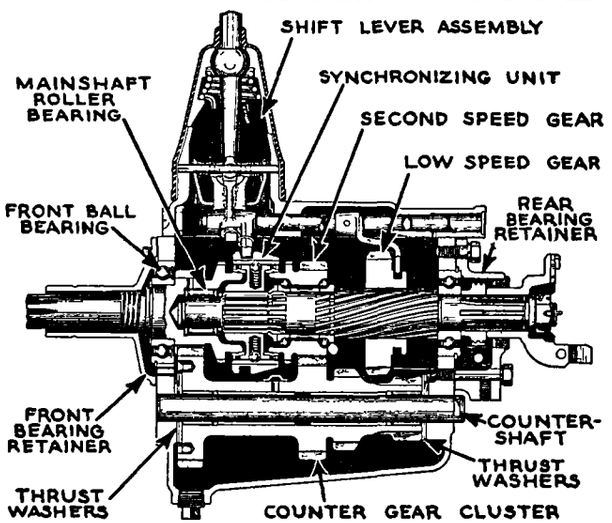
Disassembly. Remove shift lever and cover, backing switch on rear end of case, shifter shaft and fork assemblies, lock balls and springs. Take off front bearing retainer and countershaft front nut (inside clutch housing). Take off universal joint flange nut, remove flange, take out screws and remove rear bearing retainer. Remove synchronizing yoke lock plates and screws (one on each side of case), and centralizing pin (left side). Remove main drive gear bearing nut. Drive countershaft out toward rear. Remove clutch shaft and main drive gear assembly out toward front. Pull mainshaft assembly to rear until bearing clears case, align slots in sliding clutch sleeve and synchronizing yoke, remove front synchronizing drum, yoke, bronze yoke links, sliding clutch sleeve and rear synchronizing drum through top of case. Move shaft forward and remove reverse sliding gear, spline sleeve (on which reverse gear slides) through top of case. Remove mainshaft and low and second speed gear assembly through top of case. Remove counter gear cluster through top of case. To remove reverse idler gear, take out shaft lockscrew on left side of case, drive shaft out toward rear.

Mainshaft Assembly:—Low and second speed gear bearing adjustment controlled by spacer washers on shaft between inner races of bearings in each gear. These spacers furnished .1875", .1885", .1895" thick. Bearing assemblies retained by reverse sliding gear spline sleeve which acts as spacer when universal flange nut is tightened. Install thrust washer on mainshaft front bearing shoulder with taper face toward rear. Shim on mainshaft between reverse sliding gear spline sleeve and rear bearing (these spacers furnished .0725 to .1105" thick in .002" steps) used to control yoke travel in conjunction with spacer between main drive gear and front bearing furnished .222" to .256" thick in .002" steps.

Synchronizing Yoke Assembly:—Install synchronizing yoke bronze links (drum connection) on each side with relieved side up (latest type has word 'Top' cast in link at this point). See that centralizing screw is engaged between springs in yoke.

Yoke Travel & Adjustment. To check yoke travel, set up dial indicator so that finger contacts yoke at point adjacent to centralizing screw and measure yoke travel in either direction from center disengaged position. Shift transmission into second and high and note yoke travel in each case back to center. Should be .140" minimum, .160" maximum. This travel will provide correct clearance of .018" between synchronizing drums and cones. Adjust by adding or removing spacers between reverse sliding gear spline shaft and rear bearing on mainshaft, or between main drive gear and bearing at front of case (see mainshaft assembly directions above). A .006" change in spacer thickness will change yoke travel .040".

Counter Gear Cluster Assembly:—Backlash at 19 and 29 teeth gears should be .003-.004". Install countershaft with mark 'L' on flat at front end toward reverse idler.



PACKARD SIX & EIGHT 1935-38 TYPE

Used On:

SIX, MODELS 115C (1937), 1600 (1938)
'120' MODELS, 120 ('35), 120B ('36), 120C ('37)
EIGHT, MODELS 1601, 1A, 2 (1938)

TYPE:—Constant-mesh, synchro-mesh, all helical gear type (sliding gear for low and reverse). Main drive gear mounted on shielded ball bearing. Mainshaft mounted on roller bearing (front), ball bearing (rear). Second speed gear mounted on double row ball bearing on mainshaft. Counter gear cluster mounted on roller bearings on stationary countershaft with thrust washer at each end. Gears are engaged by sliding clutch sleeve (outer member of synchronizing unit) which engages clutch teeth cut on main drive gear and second speed gear hubs.

Synchronizing Unit. Consists of inner sleeve with bronze synchronizing cups and splined to mainshaft, outer clutch sleeve splined on the inner sleeve. Inner and outer sleeves move as a unit

(spring loaded detent balls in inner sleeve engage groove in outer sleeve) until synchronizing cups engage cones on gears. When synchronization completed, outer clutch sleeve slides on inner sleeve to engage clutch teeth on gears.

SERVICING:—Disassembly. Remove cover, shift lever, shifter shaft and fork assembly. Mark gears, sliding clutch and synchronizing sleeves to insure reinstalling in same position on shaft. Take off universal joint flange nut, pull flange, remove speedometer pinion, rear bearing retainer, and lock plate on rear of case. Remove main drive gear bearing retainer on front of case. Drive out countershaft toward rear allowing cluster gears to drop down in case and unmesh gears. Pull main drive gear and bearing assembly out toward front. Pull mainshaft to rear until bearing is freed from case, then remove mainshaft assembly through top of case, lift out counter gear cluster.

NOTE—Gears should not be shifted with cover removed (synchro-mesh balls and springs will jump out). If this occurs, use clamp band type ring compressor or Packard Clamp ST-5014 to reinstall.

Mainshaft & Second Speed Gear:—Do not disassemble (serviced as an assembly only).

Synchronizing Unit:—Serviced as an assembly with sliding clutch sleeve. Do not disassemble. See note above for re-installing detent balls and springs.

Counter Gear Cluster:—Use tapered dummy shaft or arbor (Packard ST 5015 and 5043) to align roller bearings when installing countershaft. See that cluster gear has no perceptible endplay in case and that lugs on bronze thrust washers at each end line up with slots in case.

PACKARD SIX & EIGHT 1939 TYPE

Used On:

SIX, MODEL 1700 (1939)
'120' EIGHT, MODELS 1701, 1A, 2 (1939)
SUPER EIGHT, MODELS 1703, 3A, 5 (1939)

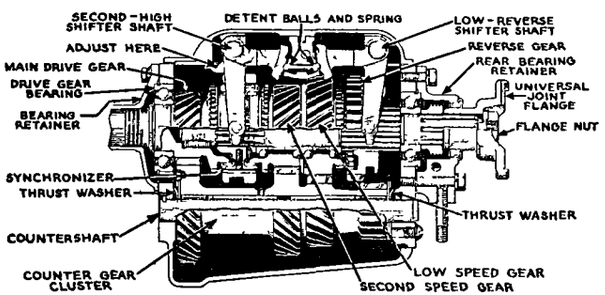
TYPE:—Design same as for 1938 Six and Eight except as follows:

Steering Column Gear Shift—Used on all models. See separate article on Packard Transmission Controls for complete adjusting and servicing data.

Econo-Drive (Overdrive)—Warner type overdrive unit mounted on rear of transmission case. Optional equipment on all models. ***See separate article on Warner Overdrive with Electrical Control for complete adjusting and servicing data on this unit.***

Constant-Mesh Low Gear—New type helical gear mounted on double ball bearings on main shaft (same type mounting as for second speed gear) and engaged by clutch teeth cut on inner rim of sliding spur type reverse gear (this gear acts as clutch only in engaging low speed gear).

SERVICING:—Disassembly (without Overdrive). Take off nut on rear end of mainshaft, remove universal joint flange. Take out mounting screws in rear bearing retainer, remove retainer and lockplate. Take out mounting screws and remove front bearing retainer. Drive countershaft out (see Note below), remove main drive gear and bearing through front of case. Move mainshaft assembly to rear until rear bearing free of case, tap bearing off shaft, then remove mainshaft through top of case. Lift counter gear cluster and thrust washer out. To remove reverse idler gear, drive shaft out to rear.



Overdrive Models. Drive countershaft out toward front (see Note below). Take out mounting screws and remove front bearing retainer, remove main drive gear and bearing through front of case. Slide synchronizer assembly off front end of mainshaft. Take out mounting screws in overdrive adapter plate. Pull entire overdrive, adapter, and mainshaft assembly out through rear of case using extreme care not to allow overdrive case to separate from adapter plate (if these parts separate, overdrive unit must be dismantled and reassembled).

Countershaft Note—Shaft must be driven out toward front (key in forward end of shaft engages slot in front end of transmission case). Use S.T. 5043 Roller bearing assembly bar to drive shaft out and leave tool in counter gear cluster to retain bearing rollers until re-installed. **Overdrive Model**—Remove overdrive case drain plug (on rear end of case at bottom) and insert S.T. 5043 tool through this hole to drive countershaft out, remove main drive gear and synchronizer unit, then pull overdrive assembly and transmission mainshaft and gears out through rear of transmission case as a unit.

Low & Second Speed Gear Assembly:—Mounted as an assembly on mainshaft (same inner race used for adjacent ball bearings in each gear) with inner races for end bearings positioned by spacers on shaft. Do not dismantle these gear assemblies.

Shifter Mechanism:—Yokes on horizontal shafts in cover engage synchronizer clutch sleeve (front shaft), low speed gear clutch and reverse gear (rear shaft) directly without intermediate linkage. Spring-loaded ball type detents are located in bracket on side of cover and engage sectors on shafts. Entire shifter mechanism located in cover and need not be dismantled when cover removed.

High-Gear Shifter Lever Travel—Clearance between lug on shifter lever and transmission case cover must be correctly set to prevent excessive lever travel which will allow synchronizer poppet balls and springs to jump out in high gear position. To adjust, shift into high gear, remove transmission cover and measure clearance between lug on forward side of lever and cover. Clearance should be .005" min., .010" max. If greater than .010", bend lug up.

OVERDRIVE UNIT

See separate article on 'Warner Type R6 Overdrive with Electrical Control' for complete servicing and adjustment data and note following points:

Transmission Mainshaft Endplay—Mainshaft should fit in overdrive adapter plate without perceptible endplay. Endplay controlled by mainshaft rear bearing front snap ring (which engages groove in adapter plate), spacer and rear snap ring behind bearing (this snap ring engages groove in shaft. These snap rings furnished in .003" steps as follows: No. 338472, 3, 4, 5 (Front Snap Ring—thinnest to thickest). No. 338458, 9, 338460, 1 (Rear Snap Ring—Thinnest to thickest).

Overdrive Unit Rear Bearing—Two types used. First type has compressible spacer sleeve on shaft between bearings with bearing pre-load controlled by universal joint flange nut on rear end of shaft. This type bearing assembly should be changed to second type (with bearing adjustment controlled by Belleville type spring washer between bearings) whenever overdrive unit disassembled or bearings removed, by installing Solid Spacer No. 341264, Belleville Spring Washer No. 341266. See Warner Overdrive (with Electrical Control) for complete disassembly directions and bearing adjustment.

CAUTION—On models with this first type bearing, universal joint flange nut must not be loosened which will disturb bearing adjustment. If bearings dismantled or adjustment lost by changing nut position, re-adjust bearings as directed in Warner Overdrive article. NOTE—On later cars with Belleville type washer between bearings, universal joint nut should be kept tight (nut does not control bearing adjustment). These cars may be identified by letter 'M' stamped on side of universal joint flange.

REO TRANSMISSION

Used On:

MODELS S, S2, S3, S4, S7 (1932-35)

NOTE:—Warner Transmissions used on other Reo models. See Warner Transmission articles for complete data.

Free-Wheel Unit—External type on rear of transmission case (1932), in transmission case (1933 on). See special free wheel data below.

TYPE:—Constant-mesh, synchro-mesh, helical gear (second and high), sliding spur gear (low and reverse). Clutch shaft and main drive gear mounted on ball bearing in front end of case. Mainshaft mounted on roller bearing (front), ball bearing (rear.) Rear bearing is carried in special bearing ring ahead of free wheel unit in case (two single row ball bearings used on drive shaft at rear of free wheel unit). Counter gear cluster mounted on bronze bushings on stationary shaft. Second and high gears engaged by sliding clutch sleeve (outer member of synchronizing unit) which engages clutch teeth on the main drive gear and second speed gear hubs.

Synchronizing Unit. Consists of synchronizing cones on gear hubs and drums at each end of sliding sleeve splined on mainshaft. This inner sleeve centered within clutch sleeve by spring loaded detent balls so that both sleeves move as a unit until synchronizing drums and cones engage. Outer clutch sleeve then slides further to engage gears.

SERVICING:—Disassembly. Remove shift lever, cover, shifter shaft and fork assemblies, taking care not to lose lock balls and springs and interlock balls at forward end of case. Remove brake band assembly and brake support on rear of case. Take off universal joint yoke nut, pull yoke. Take out countershaft and reverse idler shaft locking plate retaining screws and remove plate. Drive countershaft out toward rear allowing counter gear cluster to drop down and unmesh gears. Remove speedometer pinion, take out capscrews in rear bearing retainer, withdraw retainer, free wheel unit and drive shaft as an assembly (see free wheel data below). Withdraw free wheel clutch gear through rear of case. Take out lockscrew on left side of case which holds mainshaft rear bearing ring, withdraw ring and mainshaft assembly (including second speed gear and synchronizing unit) through rear of case. Remove bearing retainer on front end of case, withdraw clutch shaft main drive gear and bearing assembly. To remove reverse idler gears, drive shaft out toward rear.

Main Drive Gear & Bearing Assembly:—Main drive helical gear is separate part and keyed on shaft. May be pressed off shaft with bearing after bearing snap ring removed. When installing, see that straight side of gear is in or toward rear of car, that shielded side of bearing is toward gear, and that oil slinger is in place under snap ring. See that new leather oil seal installed in retainer and that retainer oil holes line up with holes in case.

Mainshaft Bearing Assembly:—Front bearing positioned by spacer between bearing and shoulder on shaft (see that this spacer in place when installing shaft). Rear bearing held on shaft by retainer ring which engages notches in splines. To remove bearing, bend down lip on washer which locks retainer, rotate retainer until prongs line up with splineways on shaft, withdraw retainer. Make certain that retainer ring engages splines and that washer lips are bent down to prevent retainer rotating when reinstalling. Bearing outer race is seated against shoulder in bearing ring and retained by snap ring at rear.

Synchronizing Unit:—Can be removed from shaft without disassembling. If unit is dismantled, mark inner and outer sleeves and reassemble in same position, use extreme care not to lose detent balls and springs which will fly out when outer clutch sleeve removed. Special assembling tool T529 will facilitate reassembly.

Second Speed Gear:—To remove second speed gear, depress plunger under front thrust washer, rotate washer until prongs on inner edge line up with splineways on shaft, withdraw washer and gear, being careful not to lose locking plunger and spring. Rear thrust washer is pinned to shaft to prevent rotation. When installing front thrust washer, see that prongs engage notches in splines and that locking plunger engages washer to prevent rotation.

Counter Gear Assembly:—See that steel spacer installed on rear end of gear cluster with pin engaging hole in gears. Bronze thrust washers should be installed with lip engaging notch in case at each end.

REO FREE WHEEL UNIT

TYPE:—Cam and roller type. Cam is splined on rear end of mainshaft. Rollers assembled between cam and outer sleeve or case which is integral with stub drive shaft. Free wheel is locked out by sliding clutch gear splined on mainshaft in front of unit which engages clutch teeth on the inner rim of the free wheel sleeve.

SERVICING:—Entire unit is matched in assembly and no parts are available. Should be replaced as a unit after removal from rear bearing retainer (bearings can be serviced independently).

Removal:—To dismantle assembly for bearing replacement, press shaft out of housing toward front open end. Take out bearing snap rings and remove bearings. Speedometer drive gear can then be lifted out.

WILLYS TRANSMISSION

Used On:

MODEL 77 (1933-34-35-36)

NOTE:—Clutch bell housing integral with transmission case and must be removed as a unit.

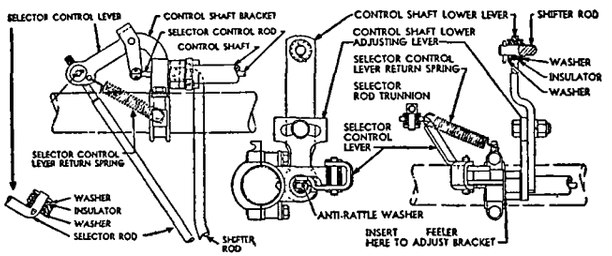
Willys later Models. 1937 and later Willys models equipped with Warner Transmissions. See Warner Transmission articles for complete data.

TYPE:—Sliding spur gear type (all speeds). Mainshaft mounted on bushing in main drive gear with thrust balls in bearing recess ahead of shaft (1933-35), thrust washer on shaft between shaft shoulder and main drive gear (1936). Taper roller bearing used on main drive gear at forward end of transmission and on rear end of mainshaft (entire assembly adjusted by shims under rear bearing retainer). Counter gear cluster mounted on bushings on stationary countershaft. Gears engaged by shifting sliding gears on mainshaft (clutch teeth for direct drive cut inside second speed gear).

SERVICING:—Disassembly. Remove shift lever and cover assembly, shifter shafts and forks, lock balls and springs. Take off universal joint flange nut and flange, remove speedometer gear assembly, take off rear bearing retainer (speedometer drive gear housing) and gear, being careful not to lose shims under retainer. Pull mainshaft out toward rear, disengaging low and second speed sliding gears and removing these gears through top of case. Remove bearing retainer on front of case (within bell housing), pull out main drive gear and bearing assembly toward front, being careful not to lose loose thrust balls in mainshaft bearing hole (1933-35 models only). Drive out countershaft and lift counter gear cluster out.

Bearing Adjustment:—When installing mainshaft, see that thrust balls (1933-35), washer (1936) in place at forward end of mainshaft, tighten front bearing retainer screws securely, install shims between rear bearing retainer and case as required so that mainshaft endplay is .004-.006" (1933-35), .006-.008" (1936).

BUICK TYPE



Std. Equipment On:
MODELS 40-40, 50, 60, 70, 80, 90 (1940)

TYPE:—Remote control type with steering column mounted gearshift lever. Design changed from that used on 1939 car models as follows:

Gearshift Lever—Lever pivoted in bracket on outer control shaft with inner end engaging socket assembly on upper end of selector control rod (within control shaft) so that rod is pressed down when lever raised to Low-Reverse position. Direction Signal now located in separate housing on upper end of steering column.

Control Shaft Adjustment—Adjustment provided so that gearshift lever position may be varied to suit operator and consists of double lever arrangement at lower end of control shaft on steering column (lower lever fixed on shaft, upper lever to which shift rod attached is clamped to lower lever by clamp bolt and can be changed to new position after clamp bolt loosened).

Selector Rod & Lever Assembly—Selector control rod in control shaft on steering column now linked to new type selector shaft and lever assembly in transmission by selector rod (no cable used). Adjustment consists of socket assembly threaded on upper end of selector control rod.

ADJUSTMENT:—Place gearshift lever in neutral position. Adjust lever position so that it does not contact edge of hole in housing nut in Second-High position by removing selector control lever (to which lower end of selector control rod attached) from steering column bracket and selector control rod, turning rod in or clockwise until it bottoms in control lever socket (on upper end of rod), and then backing rod out exactly 2 complete turns. Move outer selector lever on transmission case to extreme rear or Second-High position (this is small forward lever on vertical shaft). Adjust trunnion on forward end of control rod so that clearance between shift lever and edge of hole in housing nut is approximately 1/16" with rod and trunnion connected. Loosen two screws in bracket at lower end of control shaft, place .020" feeler between insulating washer and control shaft nut (directly above bracket), hold control shaft assembly in uppermost poistion, tap bracket up until feeler gauge is just gripped between washer and nut, tighten bracket screws securely.

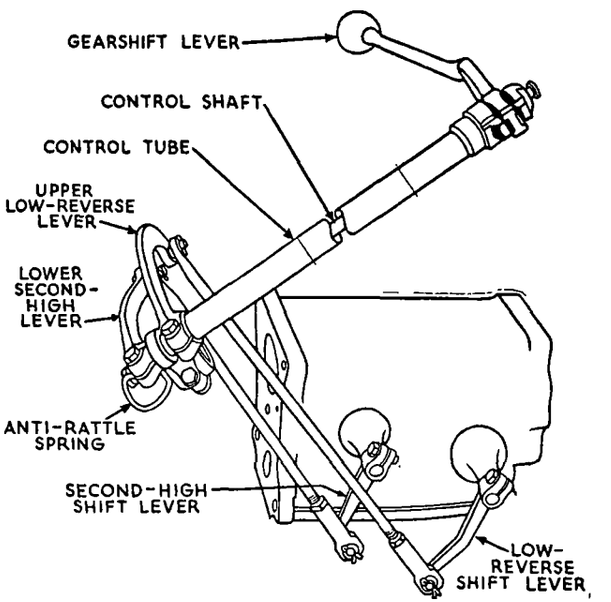
Gearshift Lever Position—To locate shift lever for convenience of operator, loosen clamp bolt on control shaft levers (at lower end of shaft), move shift lever and control shaft assembly forward or backward to suit operator, then tighten clamp bolt. CAUTION—This adjustment is limited and shift lever must not be moved so far in either direction that it interferes with steering column jacket when gears are engaged. Check lever for full travel after making this adjustment.

SERVICING:—**Steering Column Unit**—Control shaft upper bearing is located in Direction Signal switch housing on steering gear and spring washer, insulating washer, and bearing must be assembled in correct order if dismantled. Lower bearing bracket is clamped on steering column by two bolts and bracket has locating tongue which must enter slot in column jacket (slotted hole in jacket permits bracket to be moved up or down for adjustment as directed above). When installing assembly, make certain that control shaft does not bind in rubber grommet which seals hole in dash.

Gearshift Lever—Lever bearing is spherical type installed on ball on lever and clamped in lever bracket by housing nut. To renew bearing, remove gearshift lever knob (screwed on end of lever), unscrew housing nut, slip nut and bearing off end of lever. Install bearing with smaller radius toward column bracket and lubricate all movable parts of lever and socket assembly with Lubriplate. Make certain that small anti-rattle spring installed in inner end of control lever and that spring and upper seat are in place in socket above lever end.

Idler Lever (Series 50, 70 Only)—These models have idler lever on flywheel housing which must be lubricated at regular chassis lubrication periods or more often if shifting is difficult.

Transmission Case Shifter Mechanism—Selector shaft and shifter shaft mechanism (for gear engagement) similar to type used on 1939 cars. Cross-shift selector lever and shaft (vertical shaft and small forward lever on transmission case) are new type. See separate Transmission article for disassembly and servicing directions. CAUTION—Selector shaft must be removed through right side of transmission case and installed on left side to avoid damage to oil seal. Cross-shift lever must be removed from vertical shaft before selector shaft driven out (to permit cross-shift lever to disengage from shaft).



CADILLAC-LA SALLE TYPE

Std. Equipment On:
CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)
CADILLAC V16, SERIES 40-90 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)

TYPE:—Same design as used on 1939 Cadillac and La Salle models except that hairpin type anti-rattle spring installed on lower end of control shaft on steering column (this spring not used on Cadillac 75 and 90 models).

ADJUSTMENT:—Place gearshift lever in neutral position on Second-High side (normal position). Disconnect Low-Reverse rod at rear lever on transmission case, place lever in neutral (can be checked by feel of detent balls engaging notch in lever shaft sector), adjust rod length by loosening locknut and turning rod end until gearshift lever can be lifted freely into Low-Reverse position with rod connected and without disturbing position of transmission case shift lever. NOTE—Second-High rod (connected to forward lever on transmission case) should not require adjustment. If setting has been lost, adjust this rod by placing gearshift lever in neutral, disconnect rod, place transmission case lever in neutral, then adjust rod length so that it can be connected without disturbing position of either lever. Low-Reverse rod must then be adjusted (as directed above) to insure smooth cross-over of shift lever from Second-High to Low-Reverse position at neutral.

Shifter Levers—To adjust lever positions on control tube and shaft, disconnect rods on levers, remove anti-rattle spring (not used on 75 & 90), install special tool No. J-1204 on lower end of Second-High control shaft, tighten thumbscrew on tool slightly. Loosen clampscrew on Second-High lever (lower lever), tighten thumbscrew on tool until 2 lbs. force required to move this lever back and forth (measure with spring scale attached to outer end of lever), tighten clampscrew and remove tool. NOTE—Low-Reverse (upper) lever does not require adjustment.

SERVICING:—**Disassembly**—Remove horn button or horn ring and steering wheel, remove anti-rattle spring (at lower end of control shaft). Loosen clampscrew and remove Second-High (lower) lever, loosen clampscrew on Low-Reverse (upper) lever, remove cross-over spring at upper end of control shaft. Loosen clampscrew holding upper shifter housing on steering column, lift upper housing and shifter control assembly up and off steering column. Remove pin and collar on lower end of Second-High (inner) shaft, pull this shaft out of Low-Reverse tube at upper end. Remove gearshift lever and pull Low-Reverse tube out of housing.

Reassembly—Install Low-Reverse tube in housing with lug pointing away from center, hold shift lever in position and install Second-High shaft. Place two spring washers on lower end of shaft with concave sides up and install shaft collar and pin. Push housing and shaft assembly down in place next to steering column, slip Low-Reverse lever on tube before entering assembly in lower bracket. Install two spring washers with concave side up on lower end of Second-High shaft, install lever on shaft,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Position housing so that shift lever does not strike at any point and tighten housing clampscrew. Install steering wheel. Adjust levers and control rods as directed above. NOTE—If new Second-High shaft being installed, see directions below for positioning collar on lower end of shaft (shaft must be drilled for pin).

Lower Bracket Mounting—If lower bracket removed, make certain that clamping bolt washer on bracket engages slot in steering column. This is important to position bracket properly.

Shifter Shaft & Tube Replacement:—Adjustment between Low-Reverse (outer) tube and Second-High (inner) shaft maintained by collar on lower end of shaft. Shaft must be drilled for correct location of collar locking pin if either tube or shaft replaced. To locate collar pin hole in shaft, assemble control on bench without the two anti-rattle spring washers located between the collar and tube (upper washers). Pull shaft through tube until all clearance taken up between upper ends, place .036" feeler thickness between collar and lower end of tube, drill and ream for locking pin without disturbing position of collar (use #32 drill and ⅛" or .1245-.1255" reamer). Then assemble control as directed above making certain that spring washers properly installed.

TROUBLE SHOOTING:—Hard Shifting—Check rod and lever adjustments (above). Check clutch for incorrect pedal adjustment, dragging or spinning clutch. Check transmission for improper or low lubricant, damaged gears, worn synchronizer drums or broken detent springs.

Slipping out of Gear—Check adjustment, see that shift lever has full travel and that rod lengths correct. Check rubber connections at ends of connecting rods. Check for loose rear engine support.

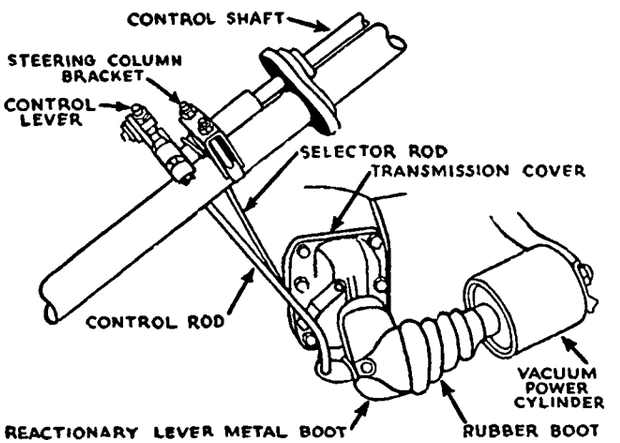
CHEVROLET 1940 TYPE

Std. Equipment On:

MODELS KA, KB, KH PASS. CARS & SEDAN DELIVERY (1940)

Transmission Control design changed from type used in 1939 as described below.

SPECIAL SERVICE NOTES:—Gearshift Lever Flutter—If a 'flutter' is noticed at idle speed or in operation (may cause jumping out of High Gear at high speed), install special Vacuum Power Cylinder Valve Friction Spring, No. 3655072, as follows: Slip forward end of rubber boot off rear end of metal boot over reactionary levers, take out two bolts fastening halves of metal boot together and remove top half. Remove piston rod yoke clevis pin and disconnect piston rod yoke and valve link from reactionary levers. Pull out vacuum cylinder valve rod, snap friction spring in place on rod about midway between valve and valve rod guide with spring 'prongs' pointing out toward clevis pin yoke, reassemble rods and boot.



TYPE:—Design changed from 1939 type as follows: **Gearshift Lever (Steering Column Unit)**—One shaft only is used (in tubular housing on steering column) and operates both selector (cross-shift) rod and gear engagement (vacuum cylinder) rod. Gearshift lever is new type and lifts up on control shaft when lever lifted into Low-Reverse position.

Vacuum Cylinder & Linkage—Reactionary lever assembly now riveted together and covered by metal boot. Mounting changed to provide for new type side-mounted transmission shift mechanism. Vacuum cylinder operates in same manner as 1939 type. **Transmission Case Shifter Mechanism**—New type shifter mechanism mounted in side cover on transmission case. See Chevrolet Transmission article for shifter servicing data.

ADJUSTMENT:—If operation unsatisfactory or if shift mechanism dismantled for servicing, adjust as follows:

Steering Column Control Assembly—See Servicing data below for dimensions to which parts should be set up when assembled.

Selector Rod—Loosen check nut on selector rod adjustment (at lower end of steering column), pull selector rod forward as far as possible, adjust swivel on rod by screwing it up or down on rod so that distance between lower side of steering wheel and

top of gearshift lever is 1 27/32" with selector rod connected to selector control lever. Install washer and cotter pin on swivel pivot and lock adjustment by tightening selector rod check nut.

Control Rod (Gear Engagement Rod)—Set gearshift lever in horizontal position, loosen checknut on control rod. Push control rod to rear until all clearance has been taken up and note location of swivel with reference to shift control lever, then pull rod forward until all clearance has been taken up and again note swivel location. Neutral valve position is midway these two positions. Hold control rod in this neutral position, adjust swivel position on control rod (screw swivel up or down on rod) until swivel pivot just enters hole in shift control lever. Install flat washer and cotter pin on swivel pivot, lock adjustment by tightening control rod check nut.

SERVICING STEERING COLUMN UNIT:—Gearshift Lever Removal—Lever can be removed without disturbing steering column assembly by shifting into Reverse, depressing pivot pins 3/32" and then lifting up and out on lever. To remove anti-rattle spring and pivot pin spring, compress legs of pivot pin spring and lift up. When reassembling gearshift lever, coat control shaft ball with graphite grease, install anti-rattle spring in control shaft ball and over neck of control shaft, thread pivot pins on ends of spring and in holes in gearshift lever swivel, thread gearshift lever over this assembly, compress pivot pins and press down on top of lever until pivot pins snap into place.

Disassembly—Disconnect gear engagement control rod and selector rod at lower end of steering column by taking out cotter pins and removing flat washers. Remove clamp bolt on shift lever at lower end of control shaft, remove lever and spring. Remove horn button and steering wheel nut, pull steering wheel (use knockout to protect threads on shaft). Remove instrument panel steering column jacket clamp. Take out two screws in upper support on steering column jacket, pull control shaft and upper support up and out of lower support. If gearshift lever to be removed, see preceding paragraph for directions.

Lower Support Bushing Servicing—If bushing worn, press old bushing out, press new bushing in until distance from face of support to lower end of bushing is 19/64".

Reassembly—Screw gearshift lever swivel into upper support until shoulder on swivel extends approximately ⅛" above support. Install control shaft by threading it through upper support and swivel. Install gearshift lever (see above). Install lower support on steering column jacket and see that key engages slot, tighten clamp bolts just snug (excessive tightening will collapse jacket). Screw upper support up or down on swivel until clearance between lower edge of gearshift lever and top of support is 3/32-⅛". Thread toeboard grommet over control shaft, install control shaft through lower support and attach upper support to steering column by installing two screws. Install spring and lever on lower end of control shaft making certain that end of selector operating lever is engaged in slot on control shaft lever. Adjust control rod and selector rod (see Adjustment section above). Check distance from upper face of control shaft lever to lower face of lower support bracket. If distance not ¾", adjust by loosening lower support clamp bolts and moving support up or down on column jacket. CAUTION—Do not tighten support clamp bolts excessively which will collapse steering column jacket.

SERVICING TRANSMISSION LEVER LINKAGE:—Note—Reactionary lever assembly is of riveted construction and cannot be disassembled (service as an assembly).

Disassembly—Disconnect shift control rod from reactionary lever assembly, remove vacuum hose from vacuum inlet stack and slip forward end of rubber boot off rear end of metal boot. Remove two screws holding metal boot halves together, lift off outer half of boot. Take out piston rod yoke clevis pin, push cylinder rod into cylinder to disconnect it from reactionary lever, then re-install clevis pin to prevent valve adjustment being disturbed. Loosen operating lever clamp bolt, pull reactionary lever assembly off operating lever shaft, remove second half of metal boot.

Servicing—Clean reactionary lever assembly with clean gasoline, examine rubber seal at front of metal boot and replace if damaged.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Reassembly—Coat reactionary levers lightly with graphite grease, place inner half of metal boot on operating lever shaft, thread rubber seal over idler lever, install reactionary lever assembly on operating lever shaft to point just beyond chamfered end of shaft and tighten clamp bolt. Pull piston rod forward and connect yoke and valve link to reactionary levers, install piston rod valve clevis pin. Assemble outer half of metal boot and install the two retaining screws. Slip end of rubber boot over rear end of metal boot, install vacuum hose and shift control rod.

SERVICING VACUUM CYLINDER:—Removal—Disconnect vacuum and air hose, remove outer half of metal boot and disconnect piston rod and valve links from reactionary levers (see Servicing Transmission Lever Linkage above for directions). Take off cotter pin and nut on cylinder mounting stud, remove vacuum cylinder.

Installation—Install rubber cushion and steel retainer on mounting stud, insert stud through hole in bracket and install rubber cushion, flat washer, and nut on stud in that order, tighten stud just sufficiently to allow cotterpin to be installed (mounting must be flexible). Connect piston rod yoke and valve link to reactionary levers, install vacuum and air hoses.

Vacuum Cylinder Lubrication:—Must be removed from car as directed above (cannot be lubricated on car as in 1939). Stand cylinder on mounting end, pull valve link forward to open valve, pour ½ oz. shock absorber insulating fluid into cylinder through vacuum inlet stack. Push valve rod into cylinder as far as possible, pour additional ½ oz. of fluid into vacuum inlet stack. Allow time for fluid to flow into cylinder, then work piston rod in and out several times and turn rod at same time to spread fluid over cylinder walls and piston leather.

NOTE—Cylinder can be washed out by following directions given above using 2 ozs. of fluid and draining fluid by inverting cylinder and moving valve rod until fluid flows out. Repeat until fluid drained from cylinder is clean (cylinder need not be lubricated after this process completed).

Vacuum Cylinder Valve Adjustment:—If vacuum valve adjustment disturbed by dismantling or servicing operations, adjust as follows: Disconnect piston rod and valve link from reactionary levers (see Servicing Transmission Lever Linkage above for directions). Install special adjusting bushing J1452-5 within valve link and re-install clevis pin. Run engine to provide vacuum source. Move valve link out or away from cylinder until all clearance between link and adjusting bushing is toward front of car, piston rod should move out of cylinder slowly in this position. Then move link in toward cylinder until all clearance between link and adjusting bushing toward rear of car, piston rod should move into cylinder in this position. If piston rod moves out but does not move in, valve link should be screwed out on valve rod. If piston rod moves in but does not move out, valve link should be screwed in on valve rod. To adjust, remove clevis pin and change valve link position ½ turn at a time until correct operation is secured.

Air Cleaner Servicing:—At 10000 mile intervals, remove cleaner, wash in gasoline, and dip in engine oil before re-installing.

CHRYSLER-DE SOTO-DODGE TYPE

Std. Equipment On:

CHRYSLER, MODEL C25 ROYAL & WINDSOR ('40)
CHRYSLER, C26 TRAVELER, SARATOGA, NEW YORKER (1940)
CHRYSLER, MODEL C26 CROWN IMPERIAL ('40)
DE SOTO, MODEL S7 CUSTOM & DELUXE (1940)
DODGE LUXURY LINER, D14 DELUXE, D17 CUSTOM (1940)

These Transmission Controls same as type used on corresponding 1939 cars except as noted below.

TYPE:—Same design as used on 1939 cars except as follows:

Steering Column Unit—Same as for 1939 except for construction details. Steering column upper and lower halves formed with integral flanges and bolted together with spacer between flanges to form slot for gearshift tube lever. Cross-shift selector cable is connected to lever pivoted on bracket bolted to lower steering column flange so that this lever contacts lower face of gearshift tube lever (no cable plunger used).

Transmission Case Shifter Mechanism—New design built in side cover on transmission case. Gear engagement finger or lever is mounted on vertical shaft which is connected to steering column gearshift tube lever by control rod. This gear engagement lever is normally in lower position on shaft (held down by spring on shaft above lever) in engagement with Second-High shifter shaft, and is lifted so as to engage the Low-Reverse shifter shaft by the lever on the horizontal cross-shift shaft to which the cross-shift selector cable is attached. Entire shifter mechanism is assembled in side cover and may be removed for servicing by taking out cover attaching screws. For servicing directions, see Chrysler Transmission article.

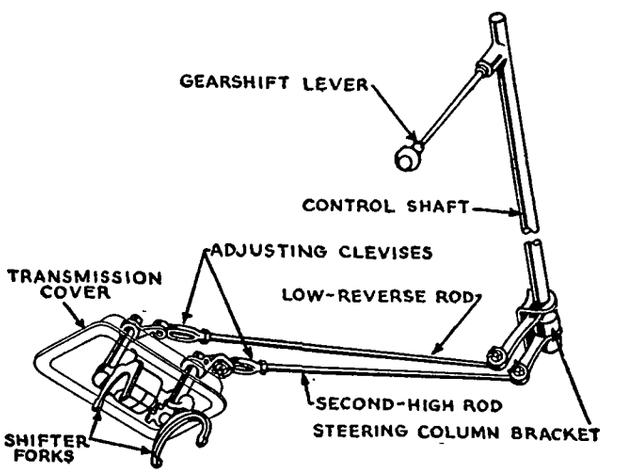
ADJUSTMENT:—Control Rod (Gear Engagement)—Disconnect control rod from lever at lower end of steering column control tube. See that transmission gears and shift lever on transmission case in neutral (can be determined by feel of detent balls engaging neutral notches in shifter shafts). Place gearshift lever approximately 10° above horizontal and hold in this position. Adjust control rod length so that it slips freely over pin on control tube lever, tighten locknut, replace cotter pin, flat washer and rubber grommet.

Selector Cable (Cross-shift)—Place gearshift lever in neutral position, see that transmission gears in neutral. Loosen locknut on selector cable at transmission selector lever (rear lever on transmission case side cover), tighten acorn nut on cable until all play removed from cable, then back off ½ turn for clearance, tighten locknut.

SERVICING:—Note—Steering gear assembly must be removed from car to permit gearshift control to be dismantled.

Disassembly—With steering gear out of car and steering wheel removed, remove steering wheel upper column bushing (use Puller C-580), remove nut on upper end of gearshift tube (special wrench C-595). Take out bolts in flanges and separate upper and lower steering gear jacket halves. Remove upper column jacket from steering gear shaft and remove control tube through lower end of jacket. Gearshift lever assembly may then be removed through slot in side of upper column jacket.

Assembly—Assemble by reversing disassembly directions given above. Do not lubricate bushings (3 used) in upper column jacket and use special drift, Tool C-581, to install upper bushing in upper end of housing. Adjust control rod and selector cable as directed above when control installed on car.



Transmission Case Shift Mechanism—See Chrysler Transmission article for servicing instructions.

FORD, LINCOLN-ZEPHYR, MERCURY TYPE

Used On:

FORD, '60' 022A, '85' 01A PASS. CARS (1940)
LINCOLN-ZEPHYR, MODEL 06H (1940)
MERCURY, MODEL 09A (1940)

TYPE:—Remote control type with steering column mounted gearshift lever. Used in connection with transmission having new type shifter mechanism on transmission case side cover which consists of separate Low-Reverse (rear) shift lever and Second-High (front) lever. Steering column unit consists of a control tube with a clutch pin at the lower end which normally engages the lower (second-high) lever on the steering column. When the gear shift lever is raised to engage Low or Reverse, the control tube is lifted up so that the clutch pin engages the upper (Low-Reverse) lever. These levers are connected to shift levers on transmission case by control rods with adjusting clevis at transmission case end.

ADJUSTMENT:—Adjustment should be checked whenever steering column position is changed or when linkage disconnected. Before making adjustments, make certain that both shift levers on transmission case are in neutral with detent balls engaging neutral notch in shifter shaft sectors (can be determined by feel with control rods disconnected). Disconnect Low-Reverse control rod at rear lever on transmission case, loosen locknut and adjust clevis on end of rod so that gearshift lever moves up and down freely (cross-shift at neutral) with control rod connected. Second-High control rod will not ordinarily require adjustment. Make certain that gearshift lever has full travel in both directions so that gears are fully engaged (detent balls should engage end notches in shifter shaft sectors with gears engaged).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SERVICING:—Steering Column Unit—Steering column unit is mounted on steering column by retainer clamped in bracket bolted on column and can be dismantled after bracket has been loosened and retainer setscrew removed. Gearshift lever is pivoted on pin in control tube elbow and inner end engages fulcrum pin within upper end of control tube. If assembly dismantled, make certain that spring installed at lower end of fulcrum pin and that bushing and boot installed on upper end of fulcrum pin when it is reassembled. Sleeve type insulator should be installed on end of gearshift lever before lever is installed.

Transmission Case Shifter Mechanism—See Transmission article for servicing data.

GRAHAM TYPE

Used On:

MODELS 107, 108, 109 (1940)

This control same design as used on 1939 cars.

ADJUSTMENT:—Same as for 1939 models. *See 'Graham Type' Transmission Control article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.*

HUDSON HANDY-SHIFT

Used On:

SIX, MODELS 40, 41, 43, 48 (1940)
EIGHT, MODELS 44, 45, 47 (1940)

This control same design as used on 1939 cars.

ADJUSTMENT & SERVICING:—Same as for 1939 models. *See 'Hudson Handy-shift' Transmission Control article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.*

HUPMOBILE TYPE

Used On:

HUPMOBILE SKYLARK, MODEL R (1940)

This Control same design as used on 1939 cars.

ADJUSTMENT:—Same as for 1939 models. *See 'Hupmobile Type' Transmission Control article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.*

NASH TYPE

Std. Equipment On:

NASH, SIX MODEL 4020, EIGHT MODEL 4080 (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)

TYPE:—Remote control type with steering column mounted gearshift lever. Design not similar to type used on 1939 car models. Shifter lever on lower end of gearshift rod has two cone-shaped prongs which engage rubber grommets in shift levers mounted on threaded bracket on steering column, these levers being connected through rods and idler levers to shift levers on transmission case. Shifter lever is normally engaged with lower (Second-High) shift lever and is lifted up so as to disengage this lever and engage upper (Low-Reverse) shift lever when gearshift lever is moved up toward steering wheel in neutral.

ADJUSTMENT:—If overshift stops out of adjustment (caused by removal or dismantling of transmission etc.), adjust these stops as directed below first, then adjust connecting rods as follows: Install aligning pin, Tool J-1390, through holes in both shift levers and notch in mounting bracket between levers (pin will hold levers in neutral position while adjustment being made). Loosen setscrews and locknuts in connecting rod trunnions at outer end of each shift lever on transmission case cover, adjust each rod by carefully placing shift lever in neutral position (determine by feel of detent plungers engaging notch in shifter fork sector), tighten trunnion setscrew and locknut without disturbing lever position, remove aligning pin.

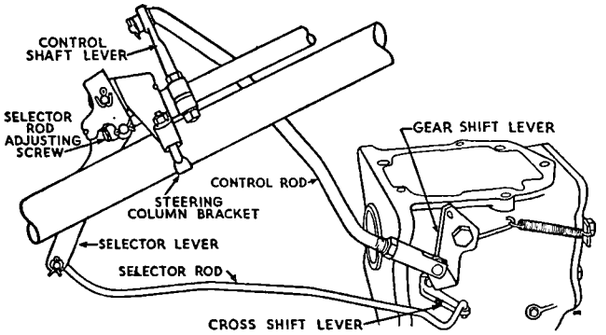
Overshift Stop Adjustment:—To adjust stops, loosen shift lever trunnion stopscrews so that levers can be moved freely. Move Second-High lever (front lever) to rear to engage Second Gear. Loosen locknut and back off second gear stopscrew (front screw on right hand side of case), make certain that detent plunger engaged in second gear notch in shifter fork sector (determine by feel), tighten stopscrew until very slight overshift or additional travel of lever toward rear is possible, then tighten locknut. Move Low-Reverse lever (rear lever) toward front to engage Low Gear, adjust stopscrew (rear screw on right hand side of case) in same manner as for second gear (above) to permit slight overshift of lever toward front. Then move Low-Reverse lever to rear to engage Reverse Gear, adjust reverse overshift stop (angle stop mounted on left rear transmission case cover screw) for minimum clearance with detent plunger engaged in reverse fork sector notch (stop must be parallel to lever and cover screw securely tightened). Then adjust connecting rods as directed above. NOTE—High Gear overshift stop is located within transmission case and cover must be removed to adjust this stop.

SERVICING:—Gearshift Lever—Lever pivoted on threaded bushing with fixed pivot and adjustable pivot screw. Threaded bushing turns in upper jacket tube bracket and must be installed with one full thread exposed above bracket to insure full travel and maximum bearing area of bushing threads in bracket. Lever must be securely fastened to threaded bushing by tightening adjustable screw and locked with capnut.

Shift Lever Assembly (Steering Column Unit)—Shift levers at lower end of control rod on steering column are mounted on threaded bearing tube which is mounted in lower support bracket and positioned by retaining screw and locknut in bracket. This threaded bearing tube also supports lower end of control rod and guides selector pin which allows cross-shift (up and down motion to engage one or the other shift lever) to be made only at neutral. If this assembly dismantled, screw shift levers on each end of bearing tube (one lever above bracket, other lever below bracket) with aligning pin bosses in until distance between inner faces of levers (not rubber grommets) is 1⅜". Install aligning pin through holes in both levers and notch in mounting bracket, adjust pronged shifter lever (keyed and clamped on control rod) up or down until prongs enter rubber grommets on levers and fully disengage from one lever when engaged in opposite lever, then tighten bearing tube retaining screw and locknut on side of lower support bracket. Screw on lower end of shift rod retains selector pin and limits up and down travel of control rod. This screw also retains rubber boot which seals lower end of bearing tube.

Idler Lever and Shaft—Idler levers are mounted on vertical shaft which is pivoted on crankcase flange at lower end and supported by tie rod extending to bracket on steering column at upper end. Adjust bracket on steering column so that shaft is vertical with engine idle. This mounting provides for engine movement due to torque reaction and noise is prevented by tension spring at lower end of shaft.

OLDSMOBILE HANDI-SHIFT



Std. Equipment On:

SIX, '60' SERIES F-40, '70' SERIES G-40 (1940)
EIGHT, '90' SERIES L-90 CUST. 8 CRUISER (1940)

TYPE:—Remote control type with steering column mounted gearshift lever. Design changed from that used on 1939 car models as follows:

Gearshift Lever—Lever now pivoted on plain pin in control shaft bracket. Pin is retained by retainer ring and entire shift lever pivot assembly is enclosed by rubber boot.

Selector Rod & Lever Assembly—Selector control rod in control shaft on steering column now connected to new type selector lever and shaft assembly in transmission by connecting rod (no cable used). Adjustment provided on lower end of selector control rod at connection to lever.

ADJUSTMENT:—Selector Rod (Cross-shift)—See that shift lever and transmission gears in neutral, check vertical distance from top of gearshift lever to lower face of steering wheel rim. This distance should be 2 11/16—2 13/16". To adjust, remove cotter pin and take out lock pin in lever which engages adjusting screw on lower end of selector rod, turn adjusting screw up to reduce lever-to-wheel distance, down to increase this distance. Install lock pin from engine side making certain that it passes through waved spring washer on inside of lever, install cotter pin.

Control Rod (Gear Engagement)—With transmission gears in neutral, gearshift lever should be approximately 1½" above horizontal position. To adjust, disconnect shift rod at lever on transmission case (upper gear engagement lever), see that this lever in neutral position (can be determined by feel of detent balls engaging notches in shifter shafts). Install special aligning gauge J-1445 over lower end of control shaft and steering column so that notch in gauge engages control shaft lever (gauge will hold gearshift lever and shaft assembly in correct neutral position which is 1½" above horizontal).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Loosen locknut and turn adjusting clevis on transmission end of shift rod until clevis pin can just be inserted without disturbing position of transmission shift lever. Tighten locknut and connect rod, remove gauge. NOTE—This adjustment should be made each time shift rod is disconnected at either end. Improper adjustment may cause interference with brake pedal.

SERVICING:—Gearshift Lever—To remove lever, slide rubber cover toward outer edge to expose retainer ring, remove retainer ring, take out shift lever pivot pin, remove lever being careful not to lose shims and washers between lever and bracket. When reinstalling lever, make certain that anti-rattle spring in place of inner end of lever and that spring washer installed on pin on one side of lever and install shims (as required) on opposite side of lever so that lever operates freely without excessive sideplay or rattles.

Transmission Case Shifter Mechanism—Selector shaft and shifter shafts (for gear engagement) similar to type used on 1939 cars. Cross-shift selector lever and shaft (vertical shaft and small forward lever on transmission case) are new type. See Transmission article for dismantling and servicing directions. CAUTION—Selector shaft must be removed through right side of case and installed on left side to avoid damage to oil seal. Lower lever must be removed from vertical cross-shift shaft before selector shaft is driven out (to permit upper lever on shaft to disengage from selector shaft).

PACKARD TYPE

Std. Equipment On:
'110' SIX 1800, '120' EIGHT 1801,1A (1940)
'160' SUPER EIGHT MODELS 1803, 4, 5 (1940)
'180' CUSTOM SUPER EIGHT 1806, 7, 8 (1940)

This Transmission Control same as type used on corresponding 1939 car models except for construction details.

SPECIAL SERVICE CAUTION:—Always insert 3/16" lock pin aligning gauge through holes in both levers at lower end of control tube on steering column when working on engine in proximity to control rods and levers to prevent accidental gear engagement which would prevent operation of gearshift lever until gears and rods had been reset in neutral.

TYPE:—Remote control type with steering column mounted gearshift lever. Same design as used on 1939 Packard models.

ADJUSTMENT:—See that gearshift lever in neutral, install 3/16" rod through alignment holes in both levers at lower end of control tube on steering column and leave this pin in place while adjustments being made. Disconnect control rods at bellcranks, place both shifter levers on transmission case in neutral position (this can be determined by feel of detent balls engaging neutral notch on each shifter lever shaft sector within transmission). Adjust each control rod at bellcrank (loosen locknuts and turn adjusting sleeve on upper rod, adjusting clevis and locknut also provided at bellcrank end of lower rod) so that lengths are correct and rods can be connected without disturbing position of shift levers, connect rods and remove pin from alignment hole in levers.

SERVICING:—***See Packard Handi-shift article in Mechanical Equipment Section of manual (or 1939 Supplement) for data.***

PLYMOUTH TYPE

Std. Equipment On:
ROADKING MODEL P9, DELUXE MODEL P10 ('40)

This Control not similar to type used on 1939 cars.

TYPE:—Remote control type with steering column mounted gearshift lever. Design not same as type used in 1939 and consists of new steering column unit and new transmission unit as follows:

Steering Column Unit—Gearshift lever mounted on pivot stud screwed in upper support bracket on steering column and pinned to external control shaft mounted in brackets on steering column (not within column jacket as in 1939). Control shaft has cable connection (for cross-shift) and lever assembly (for gear engagement) mounted on lower end and is normally held in the upper (Second-High) position by return spring on lower end. When gearshift lever lifted up for Low-Reverse engagement, control shaft is forced down and actuates cross-shift cable which is connected to rear lever on transmission case. Control shaft lever assembly consists of a lower adjusting lever and upper idler lever to which connnecting rod is attached. Levers are clamped together by clampscrew and may be adjusted after clampscrew has been loosened.

Transmission Case Shifter Mechanism—Same design as on other Chrysler models.

ADJUSTMENT:—Control Rod (Gear Engagement)—Loosen lock bolt clamping levers together at lower end of control shaft on steering column, see that shift lever on transmission case side cover is in neutral position (can be determined by feel of detent balls engaging notches in shifter shafts). Place gearshift lever approximately 10° above horizontal and hold in this position while tightening lever clamp bolt.

Selector Cable (Cross-Shift)—Place gearshift lever in neutral position, see that transmission gears are in neutral. Loosen locknut on selector cable at transmission selector lever (rear lever on transmission case side cover), tighten acorn nut on cable until all play removed from cable, back nut off ½ turn for clearance, tighten locknut.

SERVICING:—Disassembly of Steering Column Unit—Remove horn button, horn wire, and steering wheel. Disconnect rod on lever at lower end of control shaft, disconnect selector cable and remove levers and spring from shaft. Remove attaching screws in upper support bracket on steering column—CAUTION—screws have nuts on inner end which must be held while screws taken out and then removed to prevent them dropping down in steering gear jacket which would necessitate steering gear removal from car to recover these nuts. Pull control shaft and gearshift lever assembly up and remove from car. To disassemble gearshift lever, press in on bearing pins on both sides of lever (pins assembled with spring between them), withdraw pivot stud. Drive out clevis pin and remove gearshift lever from control shaft.

Assembly—Reassemble by reversing dissembly directions given above. Make certain that spring and ball assembled in pivot stud and that flat anti-rattle installed on upper end of control shaft in gearshift lever. Adjust control rod and selector cable as directed above after control installed on car.

PONTIAC SAFETY-SHIFT

Std. Equipment On:
SPECIAL SIX 40-25, DELUXE SIX 40-26 (1940)
DELUXE EIGHT 40-28, TORPEDO EIGHT 40-29 (1940)

TYPE—Remote control type with steering column mounted gearshift lever. Design changed from that used on 1939 Pontiac cars as follows:

Selector Rod & Lever Assembly—Control shaft on steering column has special collar which engages new selector control lever assembly, this lever being connected to new type selector shaft and lever assembly in transmission by selector rod (no cable used). Adjustment provided at steering column lever assembly (double levers clamped together by bolt, outer idler lever can be shifted after bolt has been loosened).

ADJUSTMENT:—Gearshift Lever Clearance—Clearance between upper edge of control shaft upper support and shoulder on upper control shaft bearing which is screwed in the bracket must be ⅛" minimum, 5/32" maximum, to avoid interference when engaging gears. If clearance incorrect, adjust by removing gearshift lever (see Servicing data below), screw bearing in or out of support bracket.

Selector Rod (Cross-shift)—With gearshift lever in neutral on Second-High side (normal position), distance from lower edge of steering wheel rim to upper edge of gearshift lever should be 2⅞" (plus or minus ⅛"). To adjust, loosen clamp bolt holding selector control lever and selector control idler lever together (these are levers pivoted on lower suport bracket on steering column), see that selector rod and levers are in Second-High position (rod moved to rear as far as possible), place gearshift lever in correct position and tighten lever clamp bolt.

Control Rod (Gear Engagement)—With gearshift lever in neutral, lever should be approximately horizontal but can be varied approximately 1½" to suit individual operators. To adjust, loosen clamp bolt holding control shaft lever and control shaft idler lever together (these are levers mounted on lower end of control shaft on steering column), see that control rod and transmission case shifter lever are in neutral, move gearshift lever to desired position and tighten lever clamp bolt. Check to make certain that gearshift lever has full travel required for gear engagement without interference after making this adjustment.

SERVICING:—Disassembly—Remove front compartment floor mat, center floor panel, and steering wheel (use puller J-452). Remove gearshift lever using tool J-1044 to remove shift lever pins and springs and use extreme care not to lose shims and spring washer on pivot pin. Remove left hood side panel, disconnect return spring hooked to clip on lower end of control shaft, remove selector control lever pivot pin. Take out screw in lower end of control shaft, remove selector lever collar, control shaft lever and idler lever assembly from shaft. Remove screws in upper support bracket at upper end of control shaft (use Philips #2 screwdriver). Pull upper support and control shaft assembly up parallel to steering column and lift out being careful not to lose anti-rattle spring and spring cup (in upper support), flat anti-rattle spring (in lower suport).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Reassembly—Reassemble by reversing disassembly directions given above. Make certain that anti-rattle spring installed in lower support bracket and upper support bracket (spring and cup must be installed in upper bracket before bracket mounted on steering column). Lubricate all moving parts (including anti-rattle springs) with Lubriplate before assembling. Use caster oil in insulators at rod connections in levers (oil or grease will cause insulators to swell and bind on rods).

Gearshift Lever Assembly—One anti-rattle spring washer must always be used on gearshift lever pivot pin and shims should be installed as required to take up excessive clearance so that lever operates freely without excessive play or rattles.

Transmission Case Shifter Mechanism—Selector shaft and shifter shafts (for gear engagement) similar to type used on 1939 cars. Cross-shift selector lever and shaft (vertical shaft and small forward lever on transmission case) are new type. See separate Transmission article for dismantling and servicing instructions. CAUTION—Selector shaft must be removed through right side of case and installed on left side to avoid damage to oil seal. Lower lever must be removed from vertical cross-shift shaft before the selector shaft is driven out (to permit upper lever on shaft to disengage from selector shaft).

TROUBLE SHOOTING:—Bind in Shifter Rods—Most noticeable when shifting out of low gear. Caused by control rod binding in lever at lower end of control shaft on steering column. To check, disconnect rod at control shaft lever and note position of rod end as transmission gears are shifted out of low gear by hand. Bend rod so that end will drop into hole in lever without binding.

STUDEBAKER TYPE

Std. Equipment On:

CHAMPION, MODEL 2G (1940)

COMMANDER, MODEL 10A (1940)

PRESIDENT, MODEL 6C (1940)

This Transmission Control same as type used on 1939 Champion Model (not similar to type used on 1939 Commander and President).

SPECIAL SERVICE TOOL NOTE:—New Gauge No. J-1308-A required for use in adjusting transmission shift rods on 1940 cars. Old Gauge J-1308 (used for 1939 Champion cars) can be worked over for 1940 cars by reducing over-all width across prongs from .750" to .672" by grinding equal amount (.039") off outer face of each prong and maintaining 1/16" chamfer at 45° on end of prong. With this change, gauge can be used both for 1939 Champion and all 1940 cars.

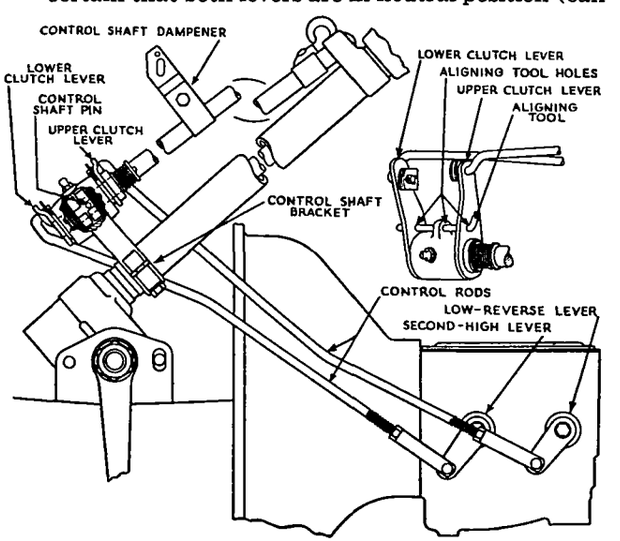
TYPE:—Remote control type with steering column mounted gearshift lever. Same design as used on 1939 Champion except that cross-over travel of control shaft and lug (up-and-down movement) has been reduced to 5/8". This requires new gauge for rod adjustment (see note above).

ADJUSTMENT:—Pry out inspection plug in engine side of control housing cover on steering column at lower end of control shaft, insert forked end of adjusting gauge J-1308-A (see service tool note above) in hole and press up on control shaft until gauge prongs enter above and below the selector lever on the control shaft which hold control levers and shaft assembly in neutral position while adjustments are being made. Disconnect both connecting rods at shift levers on side of transmission case, place each lever in neutral position (can be determined by feel of detent balls engaging neutral notch in shift lever shaft sectors). Loosen locknut and adjust clevis on transmission end of each rod so that clevis pins can be inserted without disturbing lever positions, tighten locknuts and connect rods. Remove gauge and replace inspection hole cover.

SERVICING:—If control mechanism removed from steering column, coat upper bracket pin threads and shift lever ball with Lubriplate, turn pin into upper bracket so that end of thread on pin is flush with lower face of bracket. Make certain that key on lower control housing mounting bracket engages notch in steering column. Adjust rods as directed above when control re-installed on car.

WILLYS TYPE

Used On:



MODEL 440 DELUXE PASS. CARS (1940)—STD.

MODEL 440 OTHER CARS (1940)—OPTIONAL.

IMPORTANT NOTE ON FIRST CARS:—On first cars, if shift does not operate smoothly and positively, check adjustments and refer to Trouble Shooting data (below) for recommended corrections.

TYPE:—Remote control type with gear shift lever on control shaft under steering wheel. Shaft has dog clutch at lower end (pin in shaft engages slots in levers) by which it is engaged with upper lever (connected to rear lever on transmission case) for Low-Reverse, or lower lever (connected to front lever on transmission case) for Second-High engagement. Control rods connecting steering column levers and transmission case levers have adjusting clevises at transmission case end.

ADJUSTMENT:—Disconnect both control rods at transmission case levers by removing clevis pins, make certain that both levers are in neutral position (can

be determined by feel of detents engaging notches in shifter lever shaft sectors). Place steering column shift lever in neutral position, install aligning tool (short piece of 1/4" drill rod) through hole in each lever and hole in boss on steering column clutch housing (at lower end of control shaft) to hold levers in neutral position while adjustment being made. Loosen locknut and adjust clevis at transmission end of each control rod until clevis pin can just be inserted without disturbing position of transmission case lever. Tighten locknut and install clevis pin. Remove aligning tool. Check operation. If shaft pin strikes edges of slots in lever clutches, disconnect low-and-reverse control rod at transmission lever (rear lever) and lengthen or shorten rod slightly so that shaft pin engages both clutch slots smoothly.

SERVICING:—Removal & Installation—To remove assembly from steering column, remove steering wheel, remove floor boards, disconnect control shaft dampener at cowl. Assembly can then be removed by taking out gearshift lever and freeing housing assembly clamp bracket at lower end of steering column. When re-installing, note following points:

Clutch Clearance—Clearance between faces of shift clutches must be .015-.031" (1/64" to 1/32"). Can be checked by removing lubrication fitting on clutch housing and inserting narrow feeler gauge through this hole. If clearance not correct or if clutch assembly has been dismantled, check clutch pin clearance in slots (must not exceed .009"—replace Clutch Lever and Housing Assembly #116221 if clearance excessive) and set up levers as follows: Screw upper clutch lever in housing as far as possible, then back lever out one full turn until alignment holes line up. Then screw lower clutch lever into housing until clutch face contacts upper clutch lever face, then back off lever exactly 1/4 turn which will give correct clearance of .015-.031" between clutch faces. If alignment holes do not line up in this position, remove lower clutch lever and grind off clutch face squarely not more than .015". It is very important that lower clutch lever be backed off exactly 1/4 turn from position where it contacts upper clutch lever and that alignment holes line up in this position. If correct clearance between clutch faces cannot be secured by this method, or if control shaft clutch pin has more than .009" clearance in clutch slots, replace entire Clutch Lever and Housing Assembly #116221.

Control Shaft Bracket Position—When installing steering column assembly, see that steering gear outer casing or jacket is positioned so that gear shift control shaft clutch pin bottoms in upper clutch slot when gear shift lever and shaft is in the uppermost position (Low-Reverse). If jacket and brackets installed too far down on steering gear shaft, gear shift control shaft will bottom in upper bracket and prevent clutch pin fully disengaging from lower (Second-High) clutch slots.

Gearshift Lever Clearance—Lever sideplay at fulcrum pin must not exceed .005" (excessive play will cause rattles). To reduce sideplay, add thin washer (.005-.010") under head of fulcrum pin or grind down shoulder on pin so that it will squeeze stamping closer to lever when installed. Also see that anti-rattle trigger spring on gearshift lever has suffcient tension on lever to dampen rattles.

Control Shaft Dampener—When installing dampener, see that it is positioned on cowl so that ten-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

sion applied to shaft and that dampener cross bolt spacer short enough so that slight drag results on shaft when cross bolt is tightened.

TROUBLE SHOOTING:—Shift not smooth and positive—Adjust control rod lengths (see Adjustment above).

Shift sticks or does not disengage—Check adjustment. If adjustment does not correct trouble, check Clutch Clearance (Servicing—above) and adjust clearance or replace Clutch Lever and Housing Assembly.

Gearshift Rattles—Check Gearshift Lever Clearance and Control Shaft Dampener position (Servicing—above). NOTE—If gearshift lever breaks at the weld (first cars only) and lever can not be welded, install new Control Shaft Assembly #638022.

GRAHAM SENIOR, MODELS 107, 108 (1940)

NOTE:—Steering Column Gearshifts—Standard or optional equipment on all models except Bantam, Crosley, and Willys Speedway & Commercial models. See separate 'Transmission Control' articles for servicing and adjustment data on each car model.

Overdrive—Transmissions with Overdrive optional on all Graham and Studebaker models. See following article for data on Transmissions with Overdrive.

TYPE:—Same design as used on corresponding 1939 models except for Gearshift mechanism and Synchronizer design on some models as follows:

Synchronizer Assemblies:—Type used on each car as follows (no Synchronizer on Crosley—see description of Transmission below).

Double Blocker—Double Spring Type (Studebaker T86C, Studebaker & Willys T84F)—Synchronizer Rings are free in ends of inner clutch sleeve and are actuated by three shifting plates or struts which fit in slots in the inner clutch sleeve and engage notches in the synchronizer rings. Struts are centered in outer clutch sleeve by two wire springs (within struts on either side of inner clutch web) and move with the outer clutch sleeve to engage the synchronizer rings with the cones on the gear hub. Teeth on the outer rim of the synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes the clutch teeth on the inner rim of the clutch sleeve to slide past the synchronizer teeth and engage the clutch teeth on the gear hub. Inner clutch sleeve is stationary on shaft and does not move (retained with second speed gear by single snap ring at forward end of sleeve).

Wire Bound Strut Type Blocking Synchronizer (Graham)—Similar to double blocker type (above) except that struts are centered by single locking wire or ring in outer clutch sleeve which engages notches in center of each strut.

Poppet Ball Type (Bantam, Willys T84F)—Inner and outer clutch sleeves centered by spring-loaded poppet balls. Synchronizer rings are fixed in ends of inner clutch sleeve (inner clutch moves with outer sleeve to engage rings, second speed gear mounted separately and retained by thrust washer and locking plunger at forward end of gear).

Gearshift Mechanism (Studebaker T86C, Studebaker and Willys T84F):—Consists of two shifter shafts and lever assemblies mounted in side of transmission case, each lever operating entirely independently (rear lever for Low & Reverse, forward lever for Second & High) with forks on inner ends of shafts engaging the sliding gear (Low-Reverse) or synchronizer clutch sleeve (Second-High). Interlock and detent plungers are mounted in boss in case between shafts and engage notched sectors on each shifter shaft. NOTE—On T86C, separate detent plungers are located in holes in ends of case and are accessible after plugs which close these holes are taken out.

Graham Models—Shift lever (for gear engagement) and selector lever (cross-shift) are mounted in side cover on transmission case with conventional shifter plates or rails within the case. Cross-shift lever actuates a small lock lever which holds one or the other of the rails stationary while the other rail moves to engage the gears. Detent and interlock plungers are located between the shifter rails.

Bantam, Crosley, Willys T84D Models—These models have conventional gearshift lever mounted on top cover of transmission case.

Crosley Transmission:—This transmission is a conventional sliding spur gear type. Forward gear on mainshaft is moved backward to engage Second, forward to engage High (clutch teeth on inner rim of gear engage clutch teeth on main drive gear). Rear gear on mainshaft engages low and reverse in same manner.

SERVICING:—Serviced in same manner as previous types except for new Gearshift mechanism and Synchronizers. ***See Warner Transmission and Warner Horizontal Transmission articles in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note the following changes:***

Disassembly:—Mark both synchronizer rings as well as inner and outer clutch sleeves of synchronizer before removal to insure reassembly in same positions. On T86C and T84F with gearshift levers in side of case, drive out shift lever shaft lockpins (in hole in lever boss on case) and pull levers out as far as possible before removing mainshaft and gears (do not do this unless transmission is being dismantled—detent balls and plungers must be reset when levers reassembled). On all models except T86C, mainshaft rear bearing is seated directly in case and synchronizer and gears must be removed through top of case (see Synchronizer and Second Speed Gear data below).

Crosley Note—On this model, no rear bearing retainer is used and bearing is held in case by lock ring on each side of bearing outer race. To remove mainshaft and bearing, remove speedometer gear snap ring, speedometer gear and key, rear bearing snap rings, rear bearing and oil retainer washer, then pull mainshaft out through rear of case.

Synchronizer Assembly (Double Blocker—Double Spring Type):—Install struts with open face toward inner clutch sleeve and hooked end of each spring wire engaged in the same strut (free end of spring will be between this strut and next strut in clockwise direction). See Second Speed Gear Assembly for installation instructions.

Wire Bound Strut Type—Install struts in inner sleeve and install lock wire so that it engages notches in struts with open end of wire midway between two struts (synchronizer will not operate if wire installed with open end at strut so that strut free to move endwise). When installing inner sleeve and strut assembly in outer sleeve, narrow strips of .003" feeler stock can be installed directly over each strut to prevent wire disengaging from strut slot when it is contracted to enter outer sleeve. CAUTION—Make certain that open end of wire is engaged between two clutch teeth in outer sleeve and remove feeler strips before assembling synchronizer on mainshaft. See Second Speed Gear Assembly below for installation instructions.

Poppet Ball Type—Synchronizer is free on shaft and can be removed as an assembly. If outer clutch sleeve removed use extreme care not to lose poppet balls and springs (will fly out when sleeve removed).

Second Speed Gear Assembly (With Double Blocker—Double Spring & Wire Bound Strut Type Synchronizers):—Gear and inner sleeve or hub of synchronizer are mounted on mainshaft as an assembly and retained by a snap ring at the forward end of the synchronizer. To disassemble, remove snap ring, withdraw synchronizer assembly and gear. When reassembling make certain that second speed gear has .003-.012" endplay with synchronizer hub pressed forward against the snap ring. On T86C, clearance between face of synchronizer ring and second speed gear must be .047" min., .055" max. On T84F, clearance between end of outer clutch sleeve and second speed gear should be .035" max. when shifted into second gear. On all models, synchronizer ring should turn freely after assembly (gears not engaged).

Gearshift (T84F, T86C):—Shifter shafts can be withdrawn through case after nut on outer end of lever has been removed and lever taken off. When reassembling shafts, see that interlock and detent plungers and springs are properly installed and engage notches in sectors on shifter shafts, install oil seal in recess in case at outer end of shafts. Coat shaft lock pins with Permatex or shellac, drive pins in so that they are ⅛-3/16" past flush.

WARNER MODELS WITH OVERDRIVE

Model AS9-T88 (Horizontal)
GRAHAM SENIOR, MODELS 107, 108 (1940)

Model AS6-T86F
STUDEBAKER CHAMPION, MODEL 2G (1940)

Model AS2-T86C
STUDEBAKER COMMANDER, MODEL 10C (1940)
STUDEBAKER PRESIDENT, MODEL 6C (1940)

TRANSMISSION CONTROL NOTE:—These models have 'kick-down' type electrical control. See Warner Overdrive Control article (following) for complete adjustment data and specifications for Solenoid, Relay, and Throttle Switch adjustment.
Steering Column Gearshift—See separate Transmission Control articles for adjustment directions on gearshift on each car model.

TYPE:—Same design as used on corresponding 1939 car models except as follows:
Synchronizer Unit (Studebaker Models)—New type Double Blocker—Double Spring Type (same as for standard transmissions without overdrive as used on these models). See preceding article for description of this synchronizer.
Gearshift Mechanism (T86C)—Same design as used on 1939-40 Champion and other Studebaker transmissions without overdrive. See preceding article for description.

SERVICING:—Same as for 1939 types except for new Synchronizer and Gearshift Mechanism (Studebaker models only) for which servicing articles are given in preceding article. *See 'Warner Transmission (With Electrical Control Overdrive)' article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.*

OVERDRIVE UNIT:—See Warner Overdrive (following) for complete adjustment and servicing directions.
Cut-in Speed—With standard setting, cut-in speed should be 32-36 M.P.H. (Studebaker Champion), 28-32 M.P.H. (Studebaker Comm. & Pres.).
CAUTION—Both adjusting screws must be adjusted exactly alike.
Clutch Core Assembly Endplay—Should be .005-.010".

WARNER OVERDRIVE

Type R7B
CHRYSLER, MODELS C25, C26, C27 (1940)
DE SOTO, MODEL S7 (1940)

Type R7

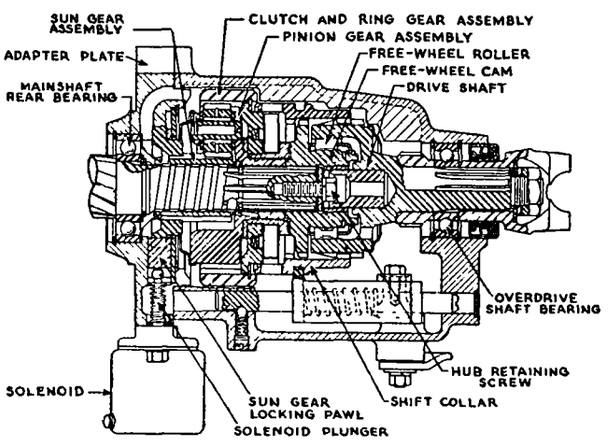
Model AS13-R6
HUDSON 6 & 8, ALL MODELS (1940)

Model AS12-R6
NASH, 4020 SIX, 4080 EIGHT (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)

Type R7
STUDEBAKER COMMANDER, MODEL 10A (1940)
STUDEBAKER PRESIDENT, MODEL 6C (1940)

Type R7A
STUDEBAKER CHAMPION, MODEL 2G (1940)



NOTE:—These Overdrive units are used in conjunction with Warner Transmissions (Graham, Studebaker) or with Transmissions built by the car manufacturer (Chrysler, De Soto, Hudson, Nash). See separate articles for Transmission servicing data.

Packard Models—Overdrive on these models is of different design (Type R9 & R9A). See separate article (following) for data on this type.

TYPE:—Same design as used on 1939 car models with sun gear normally locked in position by solenoid controlled pawl and overdrive engagement controlled by clutch pawls. When accelerator pedal depressed fully to operate 'kick-down' feature, solenoid is energized and withdraws pawl from sun gear, allowing gear to rotate freely, resulting in a direct drive from the engine to the rear wheels.

SERVICING:—Chrysler Note—Adapter plate and overdrive case are held together by three special screws inserted in holes in front face of adapter plate. Overdrive assembly must be removed from the transmission as a unit with the adapter plate and mainshaft assembly. Special tool C-577 must then be used to take out screws in adapter plate before overdrive can be disassembled.

Disassembly:—See Chrysler note above. On all models, remove speedometer drive pinion assembly, take off retaining screw and washer on rear end of driveshaft, use puller to remove universal joint companion flange (J-820 Hudson, SE-601 Nash). Remove screws and nuts holding overdrive case and adapter to transmission (on Hudson, if transmission not being disassembled, take out 2 screws holding overdrive case on adapter only, leave adapter bolted

to transmission case). Press forward on rear end of driveshaft and pull overdrive case off to rear using extreme care not to allow adapter to separate from transmission case (if transmission not being disassembled). Clutch collar will remain in overdrive case but overdrive assembly will not be disturbed otherwise (if driveshaft removed as a unit with case, overdrive will separate at free-wheel cam and free-wheel rollers will fall out). Remove clutch collar from case (if necessary, remove control fork guide rail to free the collar). Remove rear main bearing from case by taking out snap ring in front of bearing and tapping bearing out through front of case. If oil seal being replaced, remove bearing rear snap ring from case, tap oil seal out through rear of case. Lift speedometer drive gear off end of driveshaft, pull driveshaft off toward rear, using a rubber band to retain free-wheel rollers or catching rollers as they drop out. Remove capscrew, washer, and bushing on end of mainshaft, withdraw free-wheel cam, then remove clutch pawl and pinion assembly from shaft (do not pull ring gear off pinions unless these parts being dismantled, pinions are split type and must be properly wound up when meshed with ring gear). Take out mounting screws and remove kick-down solenoid, solenoid plunger assembly, and spring. Remove pinion cage stop ring from shaft directly behind sun gear. Take out sun gear retaining snap ring in adapter plate, remove mounting plate, withdraw sun gear and hub assembly, lift out sun gear pawl.

Sun Gear & Hub Assembly:—To dismantle assembly, take out snap ring in hub at forward end of gear, withdraw gear from hub. Check balk ring friction on sun gear hub. Pull required to turn balk ring in clockwise direction on hub should be 8-10 lbs. (if friction less than this amount, balk ring will not block pawl out for 'kick-down' direct drive). When reassembling sun gear and hub,see that oil slots in gear and hub are lined up.
Sun Gear Pawl & Balk Ring Clearance—Clearance between end of pawl and face of lug on balk ring should be .015" with balk ring rotated to block out pawl. If solenoid assembled, clearance can be checked by energizing solenoid so that pawl is withdrawn. Adjust by adding or removing solenoid gaskets.

Pinion Cage Assembly:—To remove pinion assembly, pull pinions out of ring gear. Assembly cannot be dismantled (oil slinger which is spun on pinion cage retains pinion shaft pins). When remeshing split type pinions in ring gear, wind up narrow half of each split pinion 1½ teeth so that marked teeth on wide and narrow halves of pinion are together, mesh ring gear with pinions held in this position.

Ring Gear & Clutch Pawl Assembly:—Take out snap ring in inner rim of ring gear, clutch pawl and core assembly from ring gear. Clutch pawl adjusting screws, washers, and springs can be removed but no further disassembly is possible (clutch core must be concentric with gear teeth and cannot be reamed sufficiently accurately in the field, parts are not furnished separately). CAUTION—If adjusting screws removed, count number of notches or 'clicks' as each screw is turned out so that screws can be replaced in exactly same position. These screws control cut-in speed (see adjustment directions below). On Hudson, turn each screw in so that head is exactly 1/16" below top edge of counterbore.
Clutch Pawl & Pinion Cage Thrust Washer—Bronze thrust washer between clutch pawl hub and pinion cage should be installed with projection on washer engaging notch on hub (washer can be retained with cup grease while assembling parts). Clutch core assembly endplay should be .005-.010" with all parts installed on mainshaft and retaining screw tight.

Overdrive Solenoid & Plunger Assembly:—See following article on Warner Overdrive Control for complete solenoid data.

Reassembly:—Use new snap rings if old rings distorted or damaged by removal, reverse disassembly directions given above and note following points: Make certain that snap ring installed on main shaft in back of sun gear assembly (this snap ring controls pinion cage endplay), see that split type pinions are correctly wound up when meshed with ring gear, pack free-wheel rollers with cup grease or use rubber band to retain rollers, start drive shaft over free-wheel rollers and cam (turn rollers and cage counter-clockwise so that rollers on low points of cam), remove rubber band and push drive shaft forward into place. See that rear bearing and oil seal properly installed in overdrive case (on Hudson,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

oil seal must protrude 7/32" beyond rear face of case), and that snap rings in place on both sides of bearing, install shift collar in case and see that it engages shift fork in case, then install case and collar on shaft assembly, guiding reverse lock-out plunger through hole in adapter plate and shift collar so that it engages teeth on free-wheel cam and clutch pawl assembly. Adjust overdrive control when transmission re-installed on car.

ADJUSTMENT:—Cut-in Speed. Should not require adjustment but can be adjusted in same manner as on previous models by removing plug on top of overdrive case, turning shaft until hole in clutch shell and adjusting screw in clutch pawl assembly (two screws—adjust in succession) line up with hole in case, and turning adjusting screw in to increase cut-in speed, out to decrease cut-in speed. Make certain that screws not turned so far as to cause interference. With standard setting, cut-in speed should be as follows:

Car Model	Cut-in Speed
Chrysler, De Soto	25 M.P.H.
Hudson	30-35 M.P.H.
Nash	33 M.P.H.
Studebaker Champion	32-36 M.P.H.
Studebaker Comm. & Pres.	28-32 M.P.H.

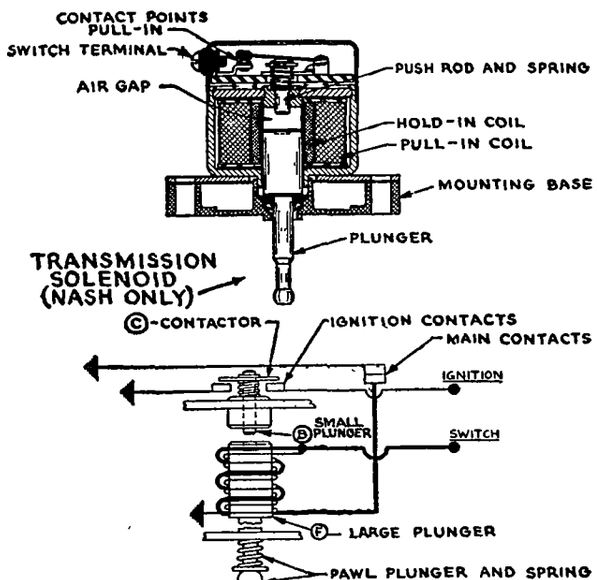
CAUTION—Both adjusting screws must be adjusted exactly alike. One screw marked by single slot, opposite screw marked by double slot for identification. Use care not to adjust same screw twice.

Overdrive Lock-out Control Adjustment:—To adjust lock-out control button cable, loosen clampscrew on lever on overdrive case, move control button on dash to fully 'in' position, then pull button out ⅛", make certain that overdrive case lever moved to rear as far as possible, tighten control wire clampscrew and locknut.

Reverse Lock-out Plunger (Nash Models)—Reverse lock-out pin is actuated by lever mounted on adjustable stud in rear end of transmission case. To check adjustment, place transmission gears in reverse, see that overdrive is locked out, check clearance between lock-out lever and roller on end of shift fork plate. Clearance must not exceed .005". Adjust by screwing lever mounting stud in or out of transmission case.

WARNER 1940 ELECTRICAL 'KICK-DOWN' OVERDRIVE CONTROL

Std. or Optl. Equipment On:



CHRYSLER, MODELS C25, C26, C27 (1940)
DE SOTO, MODEL S7 (1940)
GRAHAM, MODELS 107, 108 (1940)
HUDSON 6 & 8, ALL MODELS (1940)
NASH, SIX 4020, EIGHT 4080 (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)
STUDEBAKER CHAMPION 2G, COMMANDER 10A (1940)
STUDEBAKER PRESIDENT 6C (1940)

NOTE:—This electrical 'kick-down' control is used to control the kick-down or return to direct drive on cars using Warner Overdrives. See preceding article for Overdrive servicing data.

Packard Models—Overdrive control on Packard models is of different design. See separate article (following Warner Packard Type Overdrive article) for adjustment directions on Packard models.

DESCRIPTION & OPERATION:—Same as for 1939 car models with 'kick-down' feature except as follows:

Nash Models—Transmission solenoid used on this model does not have ignition contacts or provision for cutting out ignition in order to allow solenoid to disengage sun gear pawl. Ignition control is effected by a second relay unit in the Transmission Relay case. On all cars with overdrive, the customary ignition feed wire (from ammeter to ignition switch) is omitted, and the switch feed is taken through the transmission relay Series Relay contacts. The high initial current draw of the transmission solenoid (when accelerator pedal depressed to close throttle switch contact which causes closing of transmission relay Shunt Relay contacts and allows current to flow through both transmission solenoid windings) causes the Series Relay contacts to open and opens the ignition circuit so that the

TRANSMISSION SOLENOID (ALL OTHERS)

ignition is cut out. As soon as the transmission solenoid withdraws the sun gear pawl, the bottoming of the solenoid plunger opens the solenoid contacts so that current flow through the pull-in coil is interrupted. The remaining current flow through the solenoid hold-in coil (approx. 1 ampere) is not sufficient to hold the Shunt Relay contacts open, the contacts close and ignition is restored. As soon as accelerator pedal is released (opening throttle switch contacts), transmission relay Shunt Relay contacts open and current flow through solenoid hold-in coil is interrupted. The solenoid plunger spring then causes the pawl to re-engage in the sun gear plate slot.

Other Models—Operate in same manner as in 1939 (small plunger in transmission solenoid closes ignition contacts and shorts out ignition, large plunger then withdraws pawl and opens ignition contacts so that ignition is restored).

CAR WIRING CIRCUITS:—See wiring diagram on car model 'T&E' page for complete transmission control wiring diagrams.

ADJUSTMENT:—Check and adjust throttle switch linkage on each car model as directed below whenever linkage is disconnected or disturbed by carburetor adjustment, removal of units, etc.

Chrysler, De Soto Models—Gap between switch plunger contact screw and plunger should be 3/32" with throttle valve wide open. To adjust, remove air cleaner (to observe throttle valve), open throttle until throttle valve is just wide open, loosen locknut and turn contact screw until gap is 3/32", tighten locknut.

Graham Models—Adjust position of operating block (on connecting rod linkage ballcrank and throttle valve lever) so that throttle switch plunger is depressed not more than 1/32" with throttle in wide open position. See that linkage over-travel is sufficient to close switch contacts before accelerator pedal bottoms on toeboard.

Hudson Models—Contact disc on accelerator connecting rod should just contact throttle switch plunger with throttle valve wide open. To adjust, remove air cleaner (to observe throttle valve), open throttle until valve is just wide open, loosen adjusting nuts above and below contact disc on rod, move contact disc up or down until it contacts switch plunger, tighten mounting nuts.

Nash Models—Throttle switch is mounted on dash and is cable operated. To adjust, loosen locknut and adjust switch position on mounting bracket so that contacts close when throttle is wide open and spring on carburetor throttle shaft pulley just begins to compress. Check accelerator pedal over-travel and adjust stopscrew on floor board so that pedal has sufficient travel beyond wide open throttle position to operate switch.

Studebaker Models—Depress accelerator pedal until throttle valve is just wide open and throttle lever contacts wide-open throttle stop. Hold linkage in this position, loosen locknut on switch mounting stud, turn switch in or out of mounting bracket until small shoe on idler lever (Champion, Commander), end of accelerator rod (President) just contacts switch plunger, tighten locknut.

SERVICING OVERDRIVE SOLENOID:—Removal—To remove solenoid (for transmission and overdrive removal or for servicing), take out two capscrews in mounting flange, withdraw solenoid case without disturbing base plate and plunger assembly.

CAUTION—Do not lose gaskets under solenoid assembly. These gaskets control pawl mesh and must be replaced when solenoid installed.

Servicing—No servicing required other than to keep contacts clean and parallel so as to make good electrical contact. To remove cover for contact inspection, disconnect wires, take out flat headed screw, pull cover off base. See that lower face of contact disc on plunger 'B' and contact plates (which short out ignition) are clean and smooth. Resurface main contacts (which control 'starting coil' circuit with a file, if necessary, to secure smooth parallel contact surfaces. Check contact gaps and solenoid performance (see specifications below).

FUSES:—Fuses located on Solenoid Relay to protect solenoid circuits. If solenoid does not withdraw sun gear pawl for any reason, fuse will blow so that ignition is restored and car can be driven normally except that kick-down feature will not operate.

CAUTION—Do not use fuse of any other capacity than that shown in table below (no fuse used on Graham and Nash models).

Car Model	Fuse Capacity
Chrysler, De Soto	20 ampere
Hudson	20 ampere
Studebaker	14 ampere

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Hudson Note—On first cars, fuse located in holder in relay case. After car No. 48622, fuse mounted in clip on bottom of relay.

SPECIFICATIONS:—Control System units for each car model are of various makes as follows:

Car Model	Solenoid Relay	Solenoid
Chrysler, De Soto	A-L. HR-4201	A-L. SSB-4001
Graham	R-B-M No. 4740	D-R. 1569
Hudson	A-L. HR-4201	D-R. 1569
Nash	D-R. 1116798	D-R. 1118004
Studebaker	A-L. HR-4201S	D-R. 1118001

AUTO-LITE SOLENOIDS

Small Plunger 'B'—Should close with 2.5 volts min., 4 volts max. (6 volt units), 5 volts min., 8 volts max. (12 volt units) with large plunger 'F' 3/8" from bottom.

Large Plunger 'F'—Should exert pull of 21 lbs. min. (70° F.), 15 lbs. min. (210° F.) when 3/8" from bottomed position.

Contact Gap (main contacts)—.047" plus or minus .015" with large plunger 'F' bottomed in coil.

Current Draw (At 70° F.)—'Both coils' figure is for both Holding and Starting coils together (main contacts closed). 'Holding Coil' figure is for Holding coil only (main contacts open—plunger bottomed in coil).

Six Volt Units

	Min.	Amperes	Max.	Volts
Both Coils	29.0		31.0	3
Holding Coil	1.2		1.3	6

Twelve Volt Units

Both Coils	14		15	6
Holding Coil	.55		.65	12

AUTO-LITE RELAYS

Contact Gap—.026". **Air Gap**—.012-.017" (closed).

Closing Voltage—2.5-3.5 volts (6 volt units), 5.0-7.0 volts (12 volt units).

Current Draw—Measure between 'TH.SW' and 'IGN. SW.' terminals. Current should be 1.07-1.15 amperes at 6.0 volts (6 volt units—winding resistance 5.2-5.6 ohms), .89-.93 amperes at 12.0 volts (12 volt units—winding resistance 12.9-13.5 ohms).

R-B-M RELAYS

Contacts Close—3.5-4.5 volts.

Current Draw—Approximately 3/4 ampere.

DELCO-REMY SOLENOIDS

Nos. 1569 & 1118001 (6 Volt), 1573 (12 Volt)

Small Plunger 'B'—Should close at 5.0 volts (6 volt units), 6-10 volts (12 volt units) with 3/8" gap of large plunger.

Large Plunger 'F'—Should close against 16 lbs. pull with 3/8" plunger air gap at 6.3 volts max. (6 volt units), 12.6 volts max. (12 volt units) with both coils operating.

Contact Gap (Main Contacts)—.020-.060" with large plunger 'F' bottomed in coil.

Contact Spring Tension—10-13 ounces.

Current Darw—'Both Coils' figure is for both coils together (main contacts closed), 'Holding Coil' figure is for holding coil only (main contacts open and plunger bottomed in coil).

Six Volt Units

	Amperes	Volts
Both Coils	28-34	6.0
Holding Coil	.9-1.1	6.0

Twelve Volt Units

Both Coils	24.5-27.5	12.0
Holding Coil	.6-.72	12.0

Model No. 1118004 (Nash)

NOTE—This solenoid does not have small plunger and ignition contacts. Both windings are connected to the single solenoid terminal (starting coil circuit is opened by the opening of the main contacts as the plunger bottoms in the coil, holding coil only then holds plunger in coil).

Solenoid Plunger—Should close against 16 lbs. pull with 3/8" plunger air gap at 6.3 volts maximum.

Current Draw—28-34 amperes at 6.0 volts (Both coils—main contacts closed), .9-1.1 amperes at 6.0 volts (Holding coil only—main contacts open).

DELCO-REMY RELAYS

Model No. 1116798 (Nash)

NOTE—This unit consists of two separate relays which operate as follows: **Series Relay**—Winding connected in series with shunt relay contacts. All current for solenoid goes through this winding. When armature attracted to core, contacts open and break ignition circuit (all ignition current goes through this series relay contacts). Current draw of solenoid holding coil is not sufficient to hold armature down and closing of contacts restores ignition as soon as transmission solenoid operates (which cuts out solenoid starting coil and causes solenoid current to drop from approximately 30 amperes to 1 ampere—see solenoid specifications above). **Shunt Relay**—Winding is connected in throttle switch circuit and contacts control current flow to transmission solenoid (closing of contacts when armature attracted to core completes solenoid circuit, contacts remain closed until throttle switch contacts are opened).

Series Relay Specifications.

Contacts Open (Armature attracted to core)—13.0-16.0 amperes.

Contacts Close (Armature Released)—6.0 amperes min.

Contact Gap—.030".

Shunt Relay Specifications.

Contacts Close (Armature attracted to core)—3.0-4.0 volts.

Contact Gap—.025".

Air Gap—.012" (with contacts closed).

WARNER (PACKARD TYPE) OVERDRIVE

Model AS1-R9

PACKARD '110' SIX, MODEL 1800 (1940)

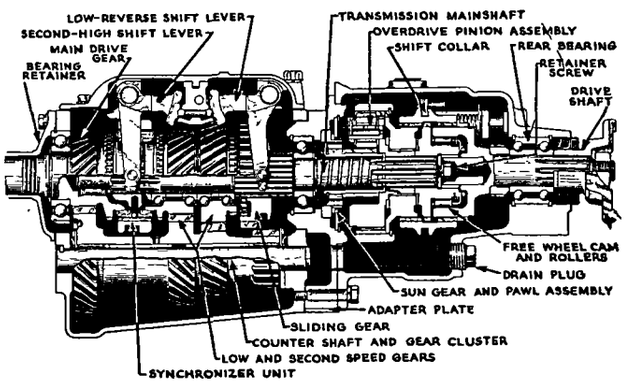
PACKARD '120' EIGHT, MODELS 1801, 1A (1940)

Model AS1-R9A

PACKARD '160' SUPER 8, 1803,3A,4,5 (1940

PACKARD '180' CUST. SUPER 8, 1806,7,8 (1940)

NOTE:—This Overdrive unit used in conjunction with Packard Transmission. See Packard Transmission article for transmission servicing data.



TYPE:—New design simplified unit without centrifugal clutch pawls. Ring gear mounting plate is linked directly to final drive shaft by shift collar (shift collar also engages free-wheel cam when overdrive locked out) so that engine drives rear wheels through overdrive pinion gears (when overdrive operative) or through free-wheel mechanism (for direct drive below overdrive cut-in speed and also for the 'kick-down' direct drive—drive is exactly the same in both instances).

OPERATION:—Overdrive cut-in and cut-out is controlled electrically by a solenoid which operates in exactly opposite manner from the kick-down solenoids used on 1939 Packard and other car models (solenoid plunger pushes pawl in to engage sun gear for overdrive, pulls pawl out to disengage sun gear for both direct drive below cut-in speed and for kick-down direct drive). Pawl is pushed in electrically and is pulled out by a spring within the solenoid case. *See Transmission Control article (following) for solenoid description and servicing data.*

SERVICING:—Except for omission of entire centrifugal clutch pawl assembly, and sun gear pawl guide plates, these Overdrives serviced in same manner as other Warner models. *See preceding Warner Overdrive service article for complete instructions and note following additional data:*

Driveshaft Rear Bearing (in overdrive case)—Bearing is new type double-row ball bearing which is pre-loaded in assembly so that no pre-load adjustment or special installation directions required. Bearing is retained in overdrive case by snap ring at each end of bearing outer race.

Lock-out Control Adjustment—Control knob should clear stop 1/8" with knob pushed all the way in. To adjust, loosen cable clamp on overdrive control lever, adjust cable so that lever is in full rear position.

Sun Gear Pawl Interlock Plunger—An interlock plunger installed in hole in overdrive case engages notch in side of sun gear pawl when the control button is operated to lock-out the overdrive. Plunger prevents pawl engaging sun gear. Clearance between end of interlock plunger and side of pawl should be .010" in overdrive position (pawl engaged in sun gear mounting plate slot).

Governor Switch—Switch is mounted on rear end of overdrive case and is driven by the speedometer drive gear. Remove governor switch assembly before dismantling overdrive.

ADJUSTMENT:—Cut-in speed is controlled by Governor Switch and is not adjustable except by changing governor switch springs. See Warner Overdrive Control article (following) for governor switch spring data.

WARNER (PACKARD TYPE) OVERDRIVE CONTROL

Optl. Equipment On:

PACKARD 6 & 8, ALL MODELS (1940)

DESCRIPTION:—New design, all electrical control with 'kick-down' direct drive feature. New type Transmission Solenoid is 'push type' and pushes pawl in to engage sun gear mounting plate slot (to hold sun gear stationary for overdrive) when sole-

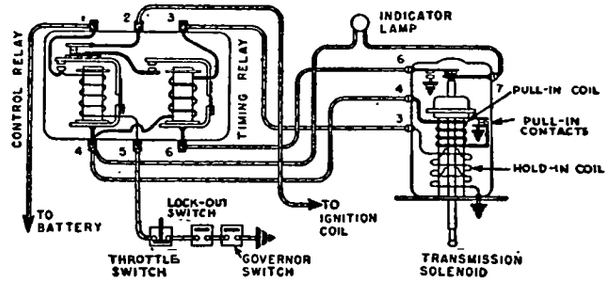
CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

noid is energized. Spring in solenoid case pulls pawl out to disengage sun gear (for direct drive) when solenoid circuit is broken. Both solenoid windings (Pull-in Coil and Hold-in Coil) are energized to engage pawl for overdrive, Hold-in coil only is energized during entire period in which car is in overdrive. Solenoid is controlled by a Lock-out Switch (operated in conjunction with the lock-out control knob on the instrument panel), Governor Switch, Throttle kick-down Switch, and two unit relay (Control Relay and Timing Relay) as follows:

Lock-out Switch—Connected in series with kick-down switch and governor switch. Contacts are closed with control knob pushed in (for overdrive) and are opened when control knob pulled out (to lock-out overdrive).

Governor Switch—Centrifugal type switch mounted on rear of overdrive case and driven by speedometer drive gear. Acts as the main switch to engage overdrive (switch contacts close at cut-in speed of 22 M.P.H. and remain closed until speed drops below 17 M.P.H.). Governor switch is not adjustable and cut-in speed can be changed only by installing special switch springs (see Adjustment data below).



Throttle Kick-down Switch—Switch contacts are normally closed (throttle wide open or less) and are opened when the accelerator pedal is fully depressed to operate the kick-down for direct drive.

Control & Timing Relay—Consists of two units, a double contact (upper and lower contacts) Control Relay which controls the transmission solenoid circuit, and a single contact Timing Relay which controls the ignition 'cut-out' which permits the sun gear pawl to be withdrawn from the sun gear for return to direct drive (kick-down direct drive, or direct drive below cut-in speed).

OPERATION:—Overdrive Engagement—Throttle switch and lock-out switch contacts are normally closed (control knob pushed in). At cut-in speed of 22 M.P.H., governor switch contacts close which completes circuit for Control Relay winding. Control relay upper contacts open and lower contacts close which completes circuit for both pull-in and hold-in coils in transmission solenoid. This causes the solenoid plunger to bottom in the coil, compressing the pawl spring, and causing the pawl to be pushed into engagement with the sun gear mounting plate slot so that the overdrive is operative (spring engages pawl as soon as accelerator pedal released momentarily, indicator light on dash which is controlled by solenoid upper contacts will light to indicate that overdrive should be engaged, light goes out as soon as overdrive is engaged). The bottoming of the solenoid plunger in the coil opens the pull-in coil contacts in the solenoid (lower contacts) and cuts this pull-in coil out of action. The hold-in coil remains energized during the entire time the overdrive is engaged and holds the solenoid plunger bottomed in the coil.

Overdrive Disengagement—When the overdrive engages, the timing relay contacts close (this relay winding is connected in series with the solenoid hold-in coil) and the solenoid upper contacts also close, but the ignition is not cut out because the control relay upper contacts have already opened (all three sets of contacts are connected in series in the ignition cut-out or ground circuit). When the throttle switch contacts are open (when accelerator pedal depressed fully for kick-down direct drive) or governor switch contacts open (for return to direct drive at speeds below 17 M.P.H.), the control relay upper contacts close first and, since the other two sets of contacts are also closed, the ignition is shorted or cut out momentarily to allow the solenoid spring to disengage the pawl from the sun gear for direct drive. The timing relay winding circuit is opened by the opening of the control relay contacts (which occurs before the control relay upper contacts close) but the 'time delay' feature of this timing relay causes a very short interval to elapse before the timing relay contacts open. As soon as these contacts open, or when the solenoid upper contacts open (which occurs as soon as the spring pulls the pawl out of engagement), the ignition ground circuit is broken and ignition is restored (both sets of contacts protect the ignition circuit when the overdrive is not operating).

ADJUSTMENT:—Throttle Switch—Should be adjusted whenever carburetor linkage adjusted or disconnected. To check setting, remove air cleaner (to observe throttle valve), open throttle until valve is just wide open. If tappet screw on accelerator link lever does not contact throttle switch plunger at this point, adjust by loosening locknut and turning screw in or out of lever.

Governor Switch—Governor switch is not adjustable and no attempt should be made to change cut-in speed by stretching spring or shimming cover. Governors with three different springs are available for special cut-in speeds as follows:

Part No.	Cut-in Speed
355075	22 M.P.H.
347478	26 M.P.H.
354943	33 M.P.H.

FUSE:—A 30 ampere fuse is located in a fuse container in the line between the starting switch and the Solenoid Relay '1' terminal. Do not use fuse of any other capacity at this point.

SERVICING:—Overdrive Relay—This relay consists of two units which should be checked and adjusted differently as follows:

Control Relay

Air Gap—.012" (lower contacts closed), .032" (lower contacts open). Check first with armature held down so lower contacts closed, adjust by loosening two screws on hinge bracket on back of relay and raising or lowering armature, see that gap uniform across whole surface of core. Then check air gap with armature released (upper contacts closed), adjust by bending upper contact support—do not loosen hinge bracket screws.

Contact Gap—.022" (top contacts) with lower contacts held closed. Should be correct if air gaps correct (above) and contact spring not bent.

Closing Voltage—3.4-4.0 (6 volt units), 6.8-8.0 volts (12 volt units). CAUTION—This voltage will attract armature and close **lower** contacts (upper contacts open as lower contacts close). To check closing, connect battery and variable rheostat to relay terminals #1 and 5, increase voltage and note when contacts close. To adjust, bend spring hanger at upper and lower end of spiral armature spring.

Timing Relay

Air Gap—.031" with contacts open. Adjust by bending upper armature stop—**do not disturb armature hinge bracket mounting screws.**

Contact Gap—.022". Adjust by bending lower contact support.

Closing Voltage—.6-1.1 volt (6 volt units), 1.2-2.2 volts (12 volt units). To check closing, connect battery and variable rheostat to terminals #3 and 4, increase voltage and note when contacts close. Closing voltage should not exceed above figures.

'Time Delay' Action—.1-.2 seconds (between instant current flow through winding is stopped and opening of contacts). To check timing action on car, operate engine at medium speed, close **control relay** lower contacts by hand (timing relay contacts will close), release control relay contacts and note interval before timing relay contacts open (lag should be noticeable). Adjust by bending spring hangers on upper and lower end of spiral armature spring (increase spring tension to shorten time interval).

Transmission Solenoid:—Solenoid cover can be removed, for inspection and servicing, by taking off two nuts on studs on cover. CAUTION—Pawl rod must not be forced into solenoid with cover removed—this will damage contact plate flat springs. Test solenoid as follows:

Solenoid Operation Test—Plunger actuating voltage should be 4.9 volts (6 volt units), 6.8 volts (12 volt units) max. at room temperature. To check performance, block pawl rod so that it cannot move out of solenoid when plunger is actuated, remove solenoid cover, connect voltmeter, battery, and variable rheostat between terminals #3 and 4 (connect these terminals together) and ground on solenoid case. Increase voltage and note voltage reading at point where plunger is actuated.

Pull-in Coil Contact Gap—With solenoid bottomed in coil, pull-in coil contact gap should be .018-.040". Remove solenoid cover to check these contacts. See Pawl Rod Adjustment below.

Solenoid Current Draw—To check current connect battery and ammeter between #4 terminal and ground on solenoid case (Pull-in Coil), or #3 terminal and case (Hold-in Coil). This check must be made at specified voltage. 'Both Coil' figure below is for both Pull-in and Hold-in Coil together, 'Hold-in Coil' figure is for Hold-in coil only.

6 Volt Units

Both Coils.....31.0-36.0 amperes at 6.0 volts.
Hold-in Coil.....1.4-1.6 amperes at 6.0 volts.

12 Volt Units

Both Coils.....14.0-16.0 amperes at 12.0 volts.
Hold-in Coil.....1.0-1.2 amperes at 12.0 volts.

Pawl Rod Adjustment—With pawl rod assembly removed from solenoid, check length from lower face of adjusting nut on upper end of pawl rod to lower edge of plunger. This distance should be 2.022-2.037". To adjust, press down on locking spring below adjusting nut so that prong on spring clears notch in nut, turn nut on plunger. CAUTION—Use care not to distort locking spring and see that prong on spring engages notch in nut after adjustment completed.

BUICK 60, 70, 80, 90 TYPE

Used On:

BUICK, SERIES 60, 70, 80, 90 (1940)

These Transmissions same design as used on corresponding 1939 models except as noted.

TYPE:—Design has been changed from 1939 type as follows:

Shifter Mechanism—New cross-shift mechanism used consisting of vertical shaft in side of transmission case with lever on upper end engaging selector shaft so that movement of the selector lever on the transmission case (small forward lever) shifts the selector shaft sidewise in the transmission to engage the Low-Reverse or Second-High shifter rail.

Synchronizer Cones & Gears—Synchronizing cones have 7° angle and are marked 'S' for use with second speed gear. Service gears are marked '7' and must be used with these cones (do not confuse these gears with types used on previous models).

Countershaft & Reverse Idler Shaft Retainers—Shafts now retained by special grooved lockpin which is driven into hole in case so as to enter hole in shaft. Pin must be driven through into shaft before shafts can be removed and new pin must be used when shafts re-installed.

SERVICING:—Same as for previous models with exception of new disassembly directions (required because of new shifter mechanism), new Shifter Mechanism, and new Countershaft and Reverse Idler Shaft retainers. ***See 'Buick Transmission 60, 80, 90 Type' article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following new instructions:***

Transmission Disassembly:—Remove cover, drive countershaft locking pin in until it is completely within shaft, use service tool J-1001 (dummy shaft) to drive countershaft out through rear of case leaving tool in countergear cluster until it is replaced in case (tool will retain bearing rollers and spacer). Take out mounting screws and remove universal joint ball and cover, remove speedometer drive pinion, take out screw in end of shaft and pull universal joint yoke, then take out mounting screws and remove rear bearing retainer. Loosen lockscrews in both shifting forks, move synchronizer drum assembly to high gear position. Move entire mainshaft assembly back until forward end clears pilot bearing in drive gear, lift shaft up and to left until fork clears collar on synchronizer, move fork to rear in case. Move shaft to right to clear Low-Reverse shifter fork, move fork forward. Remove synchronizer assembly from shaft. Take out second speed gear snap ring, slide second speed gear forward on shaft, take out low speed gear stop ring. Support gears by hand and withdraw mainshaft and bearing through rear of case. Lift out second speed and low speed gears. Remove main drive gear snap ring (on front of case), tap gear through into case and remove through top. Lift out countergear cluster being careful not to lose steel and bronze thrust washers. To remove reverse idler, drive lockpin into shaft, drive shaft out.

Shifter Mechanism:—Before removing selector shaft, remove lever on cross-shift (vertical) shaft to permit lever on upper end of this shaft to disengage from selector shaft as shaft is driven out. Remove lever on left end of selector shaft, take out locking screws in each selector cam, drive shaft out through right side of case (shaft will dislodge sealing plug in hole). This is important to avoid damage to oil seal on lever end of shaft. Inner selector shaft and lever can then be lifted out of case. When replacing this lever, make certain that spring washer, plain washer, and seal are assembled on shaft within case. When installing selector shaft, insert shaft through left side of case and close shaft hole on right side of case with sealing compound. See Transmission Control article for adjustments when replacing transmission on car.

Countershaft & Reverse Idler Retainers:—With countershaft and reverse idler shaft out of engine, remove locking pins from shaft and discard these pins (pins must not be re-used). After shafts reinstalled in transmission case, line up holes in case and shaft, install a new locking pin and drive pin in 5/8-3/4" past flush with outer surface of case.

BUICK-OLDSMOBILE-PONTIAC TYPES

Used On:

BUICK, SERIES 40-40, 50 (1940)

OLDSMOBILE 6 & 8, ALL MODELS (1940)

PONTIAC 6 & 8, ALL MODELS (1940)

These transmissions same design as used on corresponding 1939 car models except as noted below.

OLDSMOBILE NOTE:—This synchro-mesh transmission is standard equipment on all 1940 models. New type Hydra-matic Transmission (with Fluid Coupling) is optional equipment on these models. See separate article on Oldsmobile Hydra-matic Transmission for data on this type.

SPECIAL SERVICE NOTES:—Easier Shifting on 1939 Pontiac—To make shifting into Second Gear easier on 1939 cars, new type 1940 shifter shaft can be installed on these cars (new shaft has tapered section between center and end detent poppet ball grooves in shaft). To make this change, dismantle transmission and install new No. 1312495 Second-and-High Shifter Shaft and new No. 1314658 shaft Poppet Ball Spring.

Gearshift Lever stiffness complaints—To correct complaints of stiffness in lever and difficulty in moving lever toward wheel (for cross-shift), dismantle transmission and remove vertical selector lever shaft, clean shaft and hole in transmission case thoroughly and lubricate shaft and hole in case with Lubriplate when shaft re-installed (see Servicing directions below for dismantling instructions).

TYPE:—Same design as used on 1939 car models except for following changes:

Shifter Mechanism—New cross-shift mechanism consisting of a vertical shaft on side of transmission case with inner lever at upper end engaging selector shaft so that movement of selector lever on transmission case (small forward lever) shifts the selector shaft sideways in the transmission to engage the Low-Reverse or Second-High shifter rail.

Countershaft Bearings—Countergear cluster now mounted on roller bearings (loose rollers) at either end with spacer on shaft between bearings. Special service tool (dummy shaft) must be used when removing countershaft to retain bearing rollers.

Countershaft Retainer (Oldsmobile only)—Consists of a grooved lockpin (similar to reverse idler shaft pin used on other models) driven in through hole in case and shaft. Pin must be driven through into shaft before shaft can be removed and new pin must be used when shaft re-installed. NOTE—On Buick & Pontiac, shafts are retained by locking ball fitted into groove in shaft and case at rear end.

Synchronizer Cones & Gears (Buick only)—Synchronizing cones have 8° angle and must be used with new gears marked '8' (do not confuse these gears with gears used on previous models). Bronze cones must always be used with Second Speed Gear.

SERVICING:—Same as for previous models with exception of new disassembling directions (required because of new shifter mechanism). ***See 'Buick-Olds-Pontiac Type' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following new instructions:***

Transmission Disassembly:—Remove cover, remove speedometer driven gear assembly. Disconnect spring on shifter lever on left side of case. Take out rear bearing retainer screws, set transmission in high gear position (to prevent sliding sleeve and low speed gear from dropping down into case), withdraw bearing retainer, second speed gear, and mainshaft assembly through rear of case. Remove setscrews from shifter forks and selector shaft cams (use tool KMO-244), take out retainer screw and remove lever from left end of selector shaft, remove lever from lower end of vertical shaft (necessary to permit inner lever on upper end of shaft to disengage from selector shaft), drive selector shaft out through right side of case (this is important to prevent damage to oil seal on lever end of shaft), remove selector cams from case. Remove shifter rails through front end of case (Oldsmobile—welch plug in case at front end of Second-High rail must be removed also), rear of case (Pontiac), being careful not to lose detent balls and springs which are located under rails on all models. Lift out shifter forks, sliding sleeve and low speed gear. On Oldsmobile only, drive countershaft locking pin in so that it is completely within shaft. On all models, use special tool (arbor or dummy shaft) J-1334 (Buick), J-1449 (Oldsmobile & Pontiac) to drive countershaft out through rear of case, leaving tool within counter gear cluster to retain bearing rollers until shaft is replaced. Remove snap ring on main drive gear bearing (on front of case), tap main drive gear and bearing through into case and lift out. Lift countergear cluster out being careful not to lose thrust washers on either end of cluster or bearing rollers. To remove reverse idler, remove setscrew (Oldsmobile), drive locking pin through into shaft (Buick, Pontiac), then drive shaft out.

Synchronizing Unit:—No detent springs used. Synchronizer drums are retained on gears by snap rings and may be removed after snap rings are released.

Buick Note—Make certain that drum used on second speed gear is Bronze (aluminum drums used on some models for high gear).

Mainshaft & Bearing Assembly:—Second speed gear retained on shaft by snap ring at forward end and can be removed after snap ring has been taken off (use tool J-1130). To remove bearing retainer, take out bearing snap ring, tap end of shaft on wooden block. Then remove snap ring on shaft at rear of bearing, press speedometer gear, spacer and bearing off shaft (on Buick, speedometer gear is mounted on universal joint yoke which is held on end of shaft by retainer screw and washer). When installing bearing, see that shielded side is forward (toward second speed gear). Bearing should be .0007" tight to .0002" loose on shaft and .0011" tight to .0005" loose in bearing retainer.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Mainshaft Rear Bushing (Oldsmobile G-40, L-40 only)—New type steel-backed bronze bushing used in transmission extension housing to support mainshaft. Bushing can be replaced after oil seal removed from end of housing by using tool J-1450 to remove old bushing and install new bushing. New bushings must be reamed after installation to provide .0025-.004" clearance on shaft (reamer is part of J-1450 tool set). NOTE—This new type bushing may be used for replacement on 1939 cars.

IMPORTANT INSTALLATION NOTE (OLDSMOBILE)—When transmission installed on Models G-40 & L-40, fill transmission rear bearing housing asembly with ½ pint of transmission lubricant after transmission has been installed in car and propeller shaft installed.

Rear Oil Seal (Oldsmobile)—New oil seal must be installed in rear end of rear bearing retainer whenever oil seal removed. Soak new oil seals in engine oil for 5 minutes, install seal with felt to rear using tool J-1050. NOTE—New type oil seal has shoulder which locates it in housing. This seal can be used for replacement on 1939 cars.

Rear Oil Seal (Pontiac)—Old oil seals can be removed by prying with a screwdriver. Use tool J-1323 to install new oil seals (seal has extension rim which will be damaged if tool not used).

Main Drive Gear & Bearing:—Bearing can be removed from shaft after lock ring has been removed by tapping end of shaft on wooden block. When installing bearing, see that shielded side is toward gear. Bearing should be .0003" tight to .0007" loose on shaft and .0002" tight to .001" loose in case.

Pilot Bearing (Oldsmobile Models)—Pilot bearing in flywheel consists of special Durex bushing installed with flat end in toward oil-soaked felt pad (in recess in back of bushing) and retained by sheet metal retainer pressed in outer end of bearing recess. To install new bushing, soak felt in SAE #30 engine oil, install felt, drive bushing in with J-1329 tool, install retainer using J-1329-2 adapter and J-1329 tool.

Second Speed Gear:—Clearance on shaft should be .001-.0026" (Buick), .0005-.0027" (Pontiac). Endplay should be .000-.010". When installing gear, make certain that thrust washer installed in front of gear, use special thimble J-1267 (Oldsmobile) to start snap ring on end of shaft.

Shifter Mechanism:—Selector shaft must be removed when transmission is disassembled (see Disassembly directions above). To remove shaft, use KMO-244 tool to remove shifter cam setscrews, remove lever on left end of shaft by taking out retainer screw, remove lever on lower end of cross-shift shaft (necessary to allow inner selector lever on upper end of shaft to disengage from selector shaft). Drive selector shaft out through right side of case (this is important to avoid damage to oil seal on lever end of shaft). With selector shaft out, inner selector lever and shaft can be lifted out. See that this shaft and hole in case are clean, lubricate with Lubriplate when shaft replaced being certain that spring washer, plain washer and oil seal installed on upper end of shaft within case. Install selector shaft through left side of case and use sealing compound to close hole on right side (this hole originally closed by plug which will be driven out when shaft removed. CAUTION—When installing lever on selector shaft, hold shaft with wrench to avoid damaging selector cams and make certain that lockwasher installed on lever retainer screw. This lockwasher is very important to prevent lever loosening in service.

CADILLAC-LA SALLE TYPE

Used On:

CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)
CADILLAC V16, SERIES 40-90 (1940)
LA SALLE V8, SERIES 40-50, 52 (1940)

These Transmissions same design as used on 1939 cars.

SERVICING:—Disassembly—Remove speedometer driven gear adapter housing and gear. Take out retaining screw and remove universal joint flange on rear end of shaft, remove extension housing capscrews and pull extension housing off shaft. Remove transmission bottom cover, drive countershaft out through rear end of case, remove countergear cluster, thrust washers, and bearing rollers. Take out lockscrews in front end of case, pry main drive gear and bearing out of case toward front, remove synchronizer assembly from front end of mainshaft. Use Tool J-1007 to remove lock ring in front of second speed gear, tap mainshaft and bearings out through rear of case (second speed and low speed gears will slide off shaft and should be removed from case). Tap reverse idler shaft out through rear of case and remove reverse idler gear and thrust bearing. Loosen clamp bolts and remove levers on shifter shafts, remove shifter lever shafts through inside of case being careful not to lose interlock spring, balls, and tube.

Reassembly:—When reassembling transmission, note the following points:

Shifter Shafts & Levers—Install Second-High lever first, see that shaft in neutral position and shoe in place on inner end of shaft. Install interlock assembly, compress interlock spring and install Low-Reverse shifter shaft, see that shaft in neutral position (interlock ball engaging center notch in shaft sector) and that shoe in place on inner end of shaft. Install new cork seals on outer ends of shafts (use tool J-1169) and install levers.

Reverse Idler Gear—Start shaft in through rear of case, install rear steel backed-babbitt thrust washer on shaft with clip in washer fitting into slot in case, install new cork seal on outer end of shaft. Install gear on shaft, use pilot tool J-1010 to hold front thrust washer in position while shaft is tapped into place, see that locking screw hole in shaft and case line up (shaft locked by long cover screw which must be installed in this hole). Idler gear bushing clearance on shaft is .002-.0035" (new), .005" (worn limit). Gear endplay should be .006-.018".

Mainshaft Assembly—When installing mainshaft, hold low speed and second speed gears in position and engaging shift lever shoes, insert shaft through gears. Use tool J-1007 to install new second speed gear lock ring, tool J-1170 to install mainshaft front roller bearings in main drive gear (bearing rollers held in place by lock ring). Low speed gear backlash on mainshaft splines should be .004-.007" (new), .010" (worn limit). Synchronizer hub backlash on mainshaft splines should be .0005-.001" (new), .003" (worn limit).

Countershaft Assembly—Start countershaft through rear end of case, install needle bearings and retaining washers in countergear cluster with tool J-1184, place bronze thrust washers in position on each end of gear cluster and steel thrust washer on rear end, tap countershaft into place in gear cluster with new cork seal on end of shaft, see that locking hole in shaft and case line up (shaft locked by long cover screw which must be installed in this hole).

Extension Housing and Oil Seal—Rear bearing (in extension housing) should be tapped into place after housing installed on transmission and tool J-1354 should be used to install oil seal in rear end of extension.

CHEVROLET THREE-SPEED TYPE

Used On:

SPECIAL DELUXE KA, MASTER DELUXE KH ('40)
MASTER '85', MODEL KB (1940)
MODELS KC, KD, KE TRUCKS (1940)

These Transmissions same design as used on 1939 Cars and Trucks except as noted below.

NOTE:—Passenger Car Models—These models have new type Shifter Mechanism mounted in side cover on transmission case (no top cover used). All service replacement gears are Carburized type (same as used in Truck transmissions).

Truck Models—Same design as 1939 with conventional shift lever mounted on top cover. All gears are Carburized type (carburized gears furnished for passenger car transmission service also).

Transmission Extension (all models)—All transmissions have extension on rear end so 4 speed transmission can be installed without difficulty on truck models. NOTE—When installing 4 speed transmission on Half Ton (KC), new brake master cylinder must be installed. Special speedometer gear adapter and new speedometer gears must be installed on all models.

Vacuum Power Gearshift (Passenger Cars)—See separate Chevrolet Transmission Control article for complete adjustment, disassembly, and servicing directions.

SPECIAL SERVICE NOTES:—New Bearing Retainer (1938-39-40 Models)—A special malleable iron Clutch Gear Bearing Retainer (Front Bearing Retainer) #604227 is available and can be installed on 1938-39 Passenger cars and 1938-39-40 Trucks (½, ¾, ¾ Ton Special) with three speed transmission for severe service. This retainer will prevent lubricant loss due to cracked bearing retainers.

SERVICING:—Disassembly and servicing operations same as for previous models except for Shifter Mechanism on Passenger cars (below). ***See 'Chevrolet Three Speed Type' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note new Passenger Car Shifter Mechanism servicing data as follows:***

Shifter Mechanism (Passenger Cars):—Consists of two shifter forks on 'I' beam type guide bar bolted on inner face of transmission side cover. Forks are operated by toggle lever in cover and one fork is locked by cross-shift lever while the other fork is being moved to engage gears (cross-shift lever has short arc between slots in gears).

Disassembly—With cover off transmission case, remove two bolts holding guide bar and shifter fork assembly on cover, remove assembly, lift shifter yoke lever, anti-rattle spring, and operating shaft

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

out. Slide shifter forks off guide bar being careful not to lose shift lock balls and spring (in hole in guide bar under forks). Wash all parts in gasoline.

Reassembly—Install long shifter fork on guide bar with fork end toward nearest mounting screw hole, line up lock ball recess in fork with hole in guide bar, install one lock ball and spring in hole, start opposite shifter fork on guide bar, assemble other lock ball on spring, use flat tool to compress spring and slide fork into position over lock ball. Check operating shaft cork seal and retainer, replace if worn. Install operating shaft in cover, assemble anti-rattle spring and shifter yoke lever on bell crank end of operating lever, move selector (cross-shift) bell crank over center of shifter yoke lever. Press on outer end of operating shaft so that shifter yoke lever held firmly against selector lever bell crank, make certain that both shifter forks in neutral position on guide bar, then assemble guide bar and shifter fork assembly on cover with low-reverse shifter fork toward bottom (narrow side) of cover. Make certain that selector lever bell crank engages slots in shifter forks and that pins in forks engage slots in end of shifter yoke lever. Bolt guide bar to cover. CAUTION—Low-reverse sliding gear and clutch sleeve must be in neutral position when shifter mechanism installed on transmission case. See Chevrolet Vacuum Power Transmission Control article for adjustment of gearshift levers when transmission installed on car.

CHEVROLET FOUR-SPEED TRUCK TYPE

Std. Equipment On:

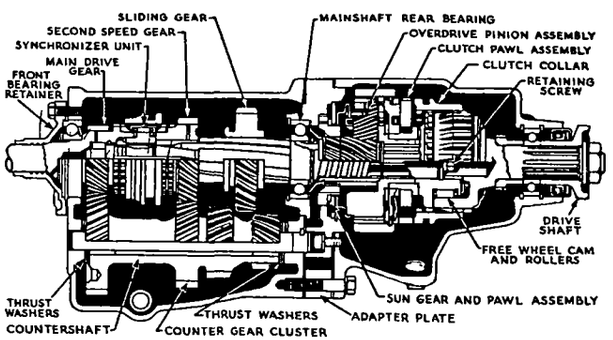
1½ TON TRUCK WA, WB, SCHOOL BUS WC (1940)
CAB-OVER-ENGINE TRUCK WD, WE, WF (1940)

Optional On:

½ TON KC, ¾ TON KD, ¾ TON SPEC. KE (1940)
This Transmission same design as used on 1939 Trucks.

SERVICING:—All service operations same as for previous models. *See 'Chevrolet Four Speed Truck Type' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions.*

CHRYSLER-DE SOTO-DODGE-PLYMOUTH



Used On:

CHRYSLER, MODEL C25 ROYAL & WINDSOR ('40)
CHRYSLER, C26 TRAVELER, SARATOGA, NEW YORKER (1940)
CHRYSLER, C27 CROWN IMPERIAL (1940)
DE SOTO, S7 CUSTOM & DELUXE (1940)
DODGE, D14 DELUXE, D17 SPECIAL (1940)
PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)

OVERDRIVE TRANSMISSION NOTE:—Warner Model R7B Overdrive unit electrical 'kick-down' control is mounted on rear end of Chrysler Transmission (in place of extension housing) as Optional equipment on Chrysler C25, C26 to De Soto S7; Standard equipment on Chrysler Model C27. *See separate articles on Warner Overdrive Control for complete servicing and adjustment directions.*

TYPE:—New design, own make, constant-mesh, synchro-mesh, all helical gear type (sliding gear for low-reverse). Main drive gear and clutch shaft mounted on ball bearing in front of case (retained by retainer bolted on case). Mainshaft mounted on roller bearings (in drive gear pilot hole) at front end, ball bearing in rear of case and additional ball bearing at rear end of transmission case extension. Second speed gear retained on shaft with inner sleeve of synchronizer assembly by snap ring on shaft in front of synchronizer unit. Counter gear cluster mounted on roller bearings on stationary shaft (spacer on shaft between bearings) with thrust washer and plate on each end of cluster. Reverse idler gear mounted on roller bearings with thrust washer at each end of gear.

Synchronizing Unit—Double-blocker, double-spring type. Synchronizer rings are free in ends of inner clutch sleeve and are actuated by three shifting plates or struts fitted in slots in inner clutch sleeve which engage notches in synchronizer rings. Struts are centered in outer clutch sleeve by two wire springs (within struts on either side of inner clutch sleeve web) and move with the outer clutch sleeve to engage the synchronizer rings with the

cones on the gear hub. Teeth on the outer rim of the synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes the clutch teeth on the inner rim of the clutch sleeve to slide past the synchronizer ring teeth and engage the clutch teeth on the gear hub. Inner clutch sleeve is stationary on shaft and does not move during synchronization and gear engagement.

SERVICING:—Overdrive Removal Note—Overdrive unit can be removed as an assembly if care is taken to see that adapter plate does not separate from overdrive case as the assembly is withdrawn from the transmission case (see disassembly directions following). If adapter is allowed to separate from overdrive case, overdrive must be disassembled and free-wheel rollers re-installed.

Disassembly:—Remove speedometer drive pinion, remove nut and washers on rear end of driveshaft, pull universal joint yoke flange and brake drum assembly. Take out two plugs on transmission side cover, remove detent balls and springs, remove cover and gear selector assembly. Unscrew shifter fork guide rail and remove guide rail through front end of case. See that gears in neutral, take out lock-screws holding shifter forks on shift rails, remove welch plug in lower shifter rail hole on front of case (collapse plug by striking in center with punch), remove shifter rails through front of case, remove plug on top of transmission case and take out interlock plunger (in hole between shift rails). On transmissions without Overdrive, take out capscrews holding extension housing on transmission case, remove extension and mainshaft assembly through rear of case using care that synchronizer assembly does not slide off shaft. On cars with Overdrive, take out capscrews holding overdrive case and adapter on transmission case, remove overdrive, adapter, and mainshaft assembly through rear of case using extreme care that overdrive does not separate from adapter plate and that synchronizer assembly does not slide off shaft. Use special arbor C-578 and soft hammer to drive countershaft out toward rear of case (remove locking key from shaft as soon as it is exposed at rear of case), allowing counter gear cluster to drop down in case. Take out mounting screws and remove main drive gear bearing retainer from front end of case, pull main drive gear and bearing assembly out toward front. Lift counter gear cluster, thrust washers, and bearing rollers out of case. To remove reverse idler, drive shaft out toward rear (remove locking key from shaft when exposed at rear of case), lift out idler gear, thrust washers, and bearing rollers. See Warner Overdrive article for Overdrive disassembly directions.

Mainshaft & Bearing Assembly:—To remove mainshaft from extension housing, take out snap ring at forward end of synchronizer unit, remove synchronizer assembly, second speed gear, and low speed gear from shaft. Remove snap ring in housing in front of bearing outer race, withdraw shaft from housing, then remove bearing, spacer, and speedometer drive gear from housing. Remove oil seal and bearing from rear end of housing (bearing is press fit in housing and is positioned by spacer on shaft—no snap rings used). When reassembling mainshaft, use new snap rings. If oil seal being replaced, soak leather in thin oil for 30 minutes and work leather with smooth bar. Seal must protrude 7/32" from end of case (use C-579 drift to install seal). If driven in too far, seal and bearing will be damaged.

Synchronizer Assembly:—Install struts or shifting plates in slots in inner clutch sleeve with open face of strut in, assemble outer clutch sleeve and synchronizer springs making certain that hooked ends of both springs engage same strut, install synchronizer rings with notches engaging ends of struts. Synchronizer assembly is retained on shaft with second speed gear by single snap ring (see Second Speed Gear below).

Second Speed Gear:—Gear endplay on shaft should be .003" min., .008" max. To install gear, place gear on shaft, install synchronizer assembly, install snap ring in groove in shaft in front of synchronizer.

CAUTION—All snap rings should be tight fit in grooves (furnished in various thicknesses).

Main Drive Gear & Bearing:—Bearing retained on shaft by snap ring and can be removed after snap ring taken out and thrust washer removed. Use snap ring when re-installing bearing. Mainshaft pilot bearing rollers are retained in drive gear recess by snap ring. Use cup grease to hold rollers in position until mainshaft is installed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Counter Gear Cluster:—When replacing this assembly, use arbor C-578 to position bearing rollers and pack rollers with cup grease to hold rollers in place. Install steel washer next to gear cluster at each end and bronze thrust washer between steel washer and case. Endplay should be .002" min., .008" max. Adjust by selecting washers of correct thickness (furnished in three thicknesses—'A' thinnest, 'B', 'C' thickest). Make certain that locking key is in place in slot in rear end of countershaft when shaft installed in case.

Reverse Idler Gear:—Use C-464 arbor to retain bearing rollers when idler gear being installed. See that thrust washer installed at each end of gear and that locking key is in place in rear end of shaft.

Gearshift Mechanism:—To assemble gearshift mechanism, hold shifter forks in position and insert guide rail through front end of case. Install lower shift rail, insert interlock plunger down through hole in top of case so that plunger engages groove in shift rail, then install upper shift rail (see Note below). Lock shifter forks to rails by installing lockscrews and locknuts, make certain that locking washers are crimped in place. Install welch plug in forward end of lower shift rail. CAUTION—This hole is below lubricant level and plug must be installed tightly to prevent lubricant loss. Install two C-590 cover locating pilots in cover screw holes on case, install cover and gear selector assembly, making certain that selector lever enters shifter fork slots. Install two cover capscrews, remove pilots, install remaining cover screws. Install detent balls and springs, tighten retaining plugs. *See Chrysler Transmission Control article for adjustment directions when transmission replaced on car.*

FORD, LINCOLN-ZEPHYR, MERCURY TYPE

Used On:

FORD '60' PASS. CAR, MODEL 022A (1940)
FORD '85' PASS. CAR, MODEL 01A (1940)
FORD COMM'L., MODELS 022C, 01C, 09C (1940)
FORD TRUCK, ¾ & 1 TON MODELS (1940)
LINCOLN-ZEPHYR, MODEL 06H (1940)
MERCURY, MODEL 09A (1940)

NOTE:—Four speed transmission is standard on other truck models and optional on these ¾ and 1 Ton models. See Ford Four Speed Transmission article (following) for data on this type.

TYPE:—Same design as used on corresponding 1939 car models except for new Gearshift mechanism (Passenger Cars only) and new Synchronizer unit as follows:

Gearshift Mechanism (Passenger Cars)—Consists of two independent shifting levers and shafts mounted on transmission case side cover (rear lever is Low-Reverse, forward lever Second-High). Fork on inner end of lever shaft engages gears directly and no shifter rails are used. Detent balls and interlock mechanism consist of a spring, plunger, and two balls assembled in a tube in a boss within the transmission case so that the balls engage notches in sectors on each of the shifter shafts. The entire gearshift mechanism can be removed as a unit with the side cover by disengaging the forks from the gears. CAUTION—When reassembling cover, make certain that rear fork engages low speed gear, forward fork engages outer sleeve of synchronizer unit.

Synchronizer Unit—Ball & Strut, double blocker type. On this type unit, synchronizer rings are loose in ends of inner clutch sleeve and are actuated by struts assembled in the rings. Struts are centered in clutch sleeve assembly by conventional poppet balls and springs so that struts move with the outer clutch sleeve (inner sleeve is stationary) during the initial movement to engage the synchronizer rings with the cones on the gear hubs. Teeth on outer rim of synchronizer rings block or prevent gear engagement until synchronization completed when final movement of outer clutch sleeve causes the clutch teeth on the inner rim of the sleeve to slide past the synchronizer ring teeth and engage the clutch teeth on the gear hubs. NOTE—Inner clutch sleeve is retained on mainshaft with second speed gear by single snap ring in front of clutch sleeve. This inner sleeve does not move during synchronization or gear engagement.

SERVICING:—Same as for previous models except for Synchronizer data and Passenger Car Gearshift mechanism as given below. *See 'Ford, Lincoln-Zephyr, Mercury (Own Make)' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following changes:*

Synchronizer Assembly:—To remove synchronizer unit and second speed gear from mainshaft, take out retaining snap ring in groove in shaft in front of synchronizer inner clutch sleeve, slide synchronizer assembly off shaft, remove hub spacer and second speed gear.

Synchronizer Unit—Inner and outer clutch sleeves marked by etched line to insure reassembly in same position. If unit being dismantled, use extreme care not to lose poppet balls and springs (3 each) which will spring out when outer sleeve removed. When reassembling unit, place struts in slots in inner sleeve, install springs and balls in holes in struts and sleeve, install outer sleeve (lining up marks on inner and outer sleeves), see that synchronizer ring notches engage ends of struts. Backlash between inner and outer clutch sleeves should be .000-.001". Synchronizer unit is mounted on shaft by same snap ring used to retain second speed gear.
NOTE—This type synchronizer can be distinguished from wire-bound blocking type synchronizer used on previous models by absence of shoulder on second speed end of outer clutch sleeve.

Second Speed Gear—Gear bushing not furnished separately. When installing gear on shaft, select hub spacer of correct thickness so that gear endplay (with synchronizer in place and snap ring installed) is .004-.008". This hub spacer furnished in three thicknesses—.0655-.0665" (81A-7069-A) .0705-.0715" (81A-7069-B), .0630" (81A-7069-C).

Gearshift Assembly:—To dismantle gearshift assembly, remove lockrings on shifter shaft ends of forks, remove forks from shifter shafts. Drive out locking pins in levers at outer ends of shifter shafts, withdraw shafts from inside of cover using extreme care not to lose detent balls, spring, and plunger. Reassemble shifter mechanism in same manner. See that oil seal in recess in cover at outer end of each shifter shaft is in good condition. See Ford & Lincoln-Zephyr Transmission Control article for adjustment directions when transmission installed on car.

FORD FOUR-SPEED TRUCK TYPE

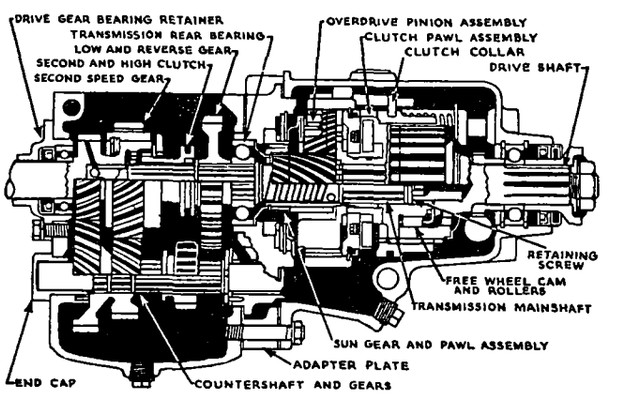
Used On:

ALL TRUCK MODELS EXCEPT ¾ & 1 TON (1940)
OPTIONAL ON ¾ & 1 TON MODELS (1940)

This Transmission same design as used on previous Truck models except as noted below.

1940 CHANGES:—Rear end of transmission has been changed slightly for new type Hotchkiss drive and shaft mounted hand brake (brake drum mounted on front universal joint companion flange, brake band mounting brackets and linkage mounted on transmission case). Except for these changes, transmission is same design as used on previous models.

SERVICING:—Same as for previous models. *See 'Ford Four Speed Truck Type' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete servicing instructions.*



HUDSON TYPE

Used On:

HUDSON 6 & 8, ALL MODELS (1940)

This Transmission same design as used on 1939 Hudson models except as noted below.

OVERDRIVE TRANSMISSION NOTE:—Warner Overdrive, Model AS13-R6, with electrical 'kick-down' control is optional on all models (mounted on rear of transmission case). *See separate articles on Warner Overdrive and Warner Overdrive Control for complete servicing and adjustment directions.*

TYPE:—Design changed from that used in 1939 as follows:

Standard Transmission—New type low and reverse gears used (gears have thicker case hardening and longer life). Air vent now located on transmission case cover (vent is larger and has loose fitting cap). Gear ratios have been changed and Model 40 ratios are different than those on other models.

Overdrive Transmission—For overdrive, regular transmission is modified as follows: New retainer used on mainshaft low-and-reverse gear consisting of conical shaped pressed steel cap fitted over lock ring and pressed into place in groove in gear. New countershaft rear bearing cap, reverse gear cap, main shaft shift sleeve, and low-reverse shift rail used. Transmission case is heavier and oil tube is assembled in rear wall of case to convey oil to mainshaft bearing.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SERVICING:—Except for new specifications and service tools, these transmissions serviced in same manner as previous models. *See 'Hudson & Terraplane Type' Transmission article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions and note following changes:*

Mainshaft Removal & Installation:—Use adapter J-778 with puller J-352 when removing mainshaft from transmission case. When shaft installed, tighten speedometer housing (rear bearing retainer) mounting screws, then install shims (as required) under main drive gear bearing retainer so that mainshaft endplay is .008-.012" measured with a dial indicator. Make certain that oil seals installed with lip on leather pointing in (toward rear on front seal, forward on rear seal).

Main Drive Gear & Second Speed Gear Assembly:—Lock ring tool remover for use in removing lock ring when disassembling second speed gear is No. J-448-1. Second speed gear endplay should be .003-.011". Second speed gear front thrust washer is now steel-backed, copper-lead faced type.

Counter Gear Removal & Assembly:—A retaining lock ring is used at front and rear of the countershaft second speed gear. Front lock ring must be removed (after gears separated with J-786 drift) before this gear can be driven forward on shaft. When installing counter gear assembly, place steel spacer on rear end of countershaft, bronze thrust washer on face of rear bushing cap (spacer and thrust washer positioned by lockring in groove in shaft in front of assembly). Countershaft endplay should be .005-.009".

Gearshift Mechanism:—See separate article on Hudson Handy Shift for adjustment directions when transmission installed on car.

LINCOLN V12 TYPE

Used On:

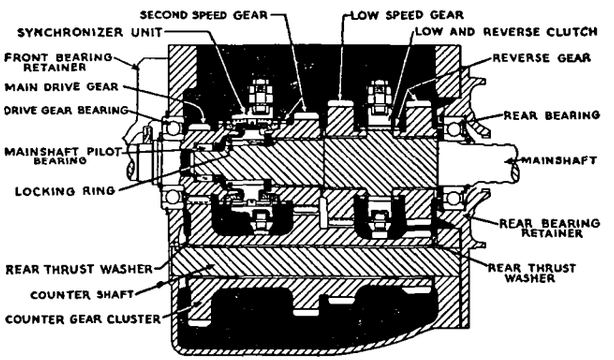
LINCOLN, V12 MODELS (1940)

This Transmission same design as used on previous Lincoln cars.

SERVICING:—Same as for previous models. *See 'Lincoln Transmission' article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions.*

NASH, NASH-LAFAYETTE TYPE

Used On:



NASH, 4020 SIX, 4080 EIGHT (1940)
NASH-LAFAYETTE, MODEL 4010 (1940)
This Transmission same design as used on 1939 car models.

OVERDRIVE TRANSMISSION NOTE:—Cruising gear or Overdrive Warner Model AS12-R6, with electrical 'kick-down' control is optional equipment on all models. *See separate articles on Warner Overdrive and Warner Overdrive Control for complete servicing and adjustment directions.*

SERVICING:—Except for new Shifter Fork adjustment, Main Shaft endplay adjustment, Second Speed Gear retainer washer and plunger, Countershaft removal instructions as given below; all service operations same as for previous models. *See 'Nash (Own Make)' Transmission article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data and note following changes:*

Countershaft Removal:—To remove countershaft (this must be done before mainshaft can be withdrawn from transmission case), remove plug on lower rear face of overdrive case, insert special SE-568 countershaft pilot and washer retainer tool through this hole and hole in front end of case, drive countershaft out through front end of transmission case allowing tool to remain within counter gear cluster until it is removed from case. When installing countershaft, insert countershaft through front end of case and push tool out toward rear.

Shifter Fork Adjustment:—When installing shift mechanism mounting plate assembly, adjust shift forks before tightening shift fork nuts as follows: Use SE-612 gear spacing gauge placing narrow section of handle between low speed gear and clutch sleeve. Make certain that shifter shaft in neutral position, tighten rear shift fork nut, bend up lock plate on nut. Use two SE-612 gauges placing large end of one gauge between main drive gear and high speed synchronizer ring, second gauge between second speed gear and second speed synchronizer ring. See that shifter shaft in neutral position, tighten front shift fork nut, bend up lock plate on nut. Adjust overshift stops (see Nash Transmission Control article) before replacing transmission case cover.

Mainshaft Endplay Adjustment:—When installing rear bearing retainer, install SE-612 gauge between rear face of main drive gear and high speed synchronizer ring, install correct shim thickness between transmission case and rear bearing retainer so that, when mounting screws tightened, gauge clearance will be from .0 to .016" (if gauge tight, add additional shim). CAUTION—Rear bearing retainer must be tight when this check made.

Second Speed Gear & Synchronizer Retainer:—Second speed gear and synchronizer unit inner sleeve are retained by washer which is locked by spring-loaded plunger installed in hole in shaft. To dismantle assembly, depress plunger so that washer is freed, turn washer so that prongs line up with splines in shaft, withdraw washer, synchronizer assembly, second speed gear bronze thrust washer, spacer, second speed gear, low speed gear bronze thrust washer, and low speed gear. Use care not to lose plunger and spring in the shaft hole. Reassemble these parts in same order.

Gearshift Mechanism:—See Nash Transmission Control article for overshift stop adjustment and adjustment of gearshift mechanism when transmission re-installed on car.

OLDSMOBILE HYDRA-MATIC TYPE

Optional On:

SIX, '60' F-40, '70' G-40 (1940)
EIGHT, '90' MODEL L-40 (1940)

FLUID COUPLING NOTE:—See article on Oldsmobile Fluid Drive for description of Fluid Coupling used with this transmission. Service data for Fluid Coupling is given below.

DESCRIPTION:—The Hydra-matic Drive consists of a Fluid Coupling (replacing clutch used with conventional transmission) combined with a self-shifting transmission which differs from the type used on previous Oldsmobile models as follows:

Fluid Coupling:—Unlike other designs in that driver or impeller (rear set of vanes) is not driven directly by the engine crankshaft. The engine drives the flywheel housing (fluid coupling case bolted on flywheel) and the front planetary unit ring gear. The drive is then taken through the planetary gear set and back to the fluid coupling through a tubular shaft, through the fluid coupling, and back to the transmission through the inner intermediate or transmission mainshaft. Fluid coupling is kept filled with oil from transmission case by forward oil pump and does not require attention.

Planetary Units & Servos:—Design changed and new type Servos used to actuate units as follows:

Front Planetary Unit—Planetary unit is similar to design used on previous self-shifting transmission with actuating brake band and hydraulically operated clutch. Front Servo unit (which controls front planetary unit brake band) is new design in which brake band is applied by hydraulic pressure and is released by spring pressure. Servo unit is combined with front oil pump which is built in servo housing and has the oil pressure regulator assembly mounted on the housing also. This front servo is not adjusted in same manner as on previous models (see Adjustment instructions below).

Rear Planetary Unit—This unit is new design and consists of a single planetary gear set. It is controlled by the Rear Servo unit which is similar to previous type except that band is applied by both spring and hydraulic pressure. The usual hydraulically operated disc clutch is used (all clutches have six pistons instead of three as used on former type). Rear Servo is adjusted in same manner as former type (see Adjustment instructions below).

Reverse Planetary Unit—This unit is entirely new and replaces the "Headset' or mechanically engaged reverse gear used on former models. It consists of an additional planetary gear unit in the transmission case in back of the Rear Planetary Unit. This unit does not have the customary brake band and servo unit and is actuated by a toothed pawl in the right side of the transmission case which engages teeth on the rim of the reverse gear planetary ring gear so as to hold the ring gear stationary when the lever on the steering wheel is placed in the 'Reverse' position.

Oil Pumps & Control Valve:—Entirely new design and consist of two separate pumps as follows:

Front Oil Pump:—This pump is built-in front servo housing and is driven by a gear on the front planetary ring gear (drive gear) sleeve. It operates whenever engine is operating and supplies oil for transmission lubrication and for the Fluid Coupling. It also supplies oil for transmission operation (servo and clutch actuation) when car is first started up, this latter function being taken over by rear oil pump as soon as car speed reaches 20 MPH.

CONTINUED ON NEXT PAGE

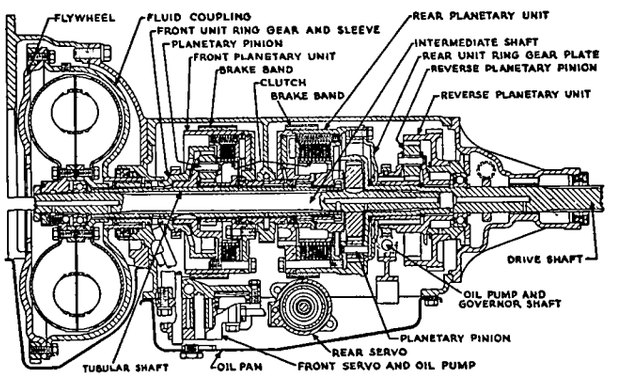
CONTINUED FROM PRECEDING PAGE

Rear Oil Pump:—Mounted as an assembly with the Control Governor and is driven by a gear on the transmission driven shaft (in front of reverse planetary unit). At car speeds above 20 M.P.H this pump develops sufficient pressure to operate planetary gear servos and clutches. At all speeds above this point, front pump provides oil only for transmission lubrication and to keep fluid coupling case filled (fluid coupling has return pipe and control valve through which excess oil is returned to transmission case so as to provide oil circulation for temperature control).

Pressure Regulator Valve—Mounted on front servo housing. Controls oil pressure and delivery from front and rear oil pump as detailed above. See 'Checking Oil Pressure' below for oil pressure checking and servicing data.

Main Oil Control Unit—Mounted on right hand side of transmission case under side cover plate. See Servicing data below for removal and installation

Control Lever on Steering Wheel:—New design lever with four positions—High—Low—Neutral—Reverse. This lever is linked to relay lever and manual shift lever on transmission case by a control rod but does not engage gears as in former designs (no Headset used). Lever case is illuminated by small #51 bulb (see Servicing data below for bulb replacement) and detents are used to locate lever in each position. See Adjustment Section below for Manual Control Lever Linkage adjustments.



Carburetor Throttle Linkage:—Controls speed at which actual gearshifts occur and must be adjusted exactly as detailed below (see Adjustment Section).

OPERATION:—Fluid coupling provides slip at idling speed so that car does not move. When control lever on steering wheel is placed in 'High' or 'Low' position and engine is accelerated, car moves forward and shifts occur automatically as speed increases (in 'low' position, car shifts only from low to second; in 'high' position, car shifts from first to second to third to fourth or direct drive as the speed is increased), the fluid drive transmitting the engine torque with practically no slippage at speeds above idling speed. The speed at which shifts occur is controlled by the Governor with an overriding control by the accelerator linkage by which shifts are delayed or retarded with a wide open throttle so as to provide improved acceleration and power when this is desired. In normal operation the 'Low' range is not used and the lever is moved directly to 'High' position when the car is started up. In this position no further attention is required and car shifts through to direct drive at the proper speed. To reverse the car, the lever is placed in the 'Reverse' position which engages the reverse pawl so that the reverse planetary gear set ring gear is held stationary. Operation of the transmission in each gear ratio is as follows:

First or Low Gear—Brake band of front planetary gear unit is applied by hydraulic pressure and brake band of rear planetary unit is applied by spring and hydraulic pressure. Both planetary unit clutches are released (no oil pressure) and engine drives through both planetary units in tandem providing maximum gear reduction (reverse planetary unit ring gear is released and this unit does not operate).

Second Gear—Front planetary unit brake band is released by hydraulic pressure and clutch is engaged by hydraulic pressure so that this unit is locked and rotates as an assembly. Engine then drives through rear planetary gear unit only.

Third Gear—Engine drives through front planetary gear unit in same manner as for low gear (brake band applied and clutch released) and then drives both the ring gear (directly) and the sun gear (through the fluid coupling) of the rear planetary unit (brake band is released by hydraulic pressure but clutch is also engaged which is unlike low gear operation) so that a gear reduction less than either low or second gear is obtained through the rear planetary unit pinion plate and drive shaft.

Fourth Gear or Direct Drive—Both planetary gear units are locked out (brake bands released, clutches engaged) so that the engine drives straight through the transmission for direct drive to the rear wheels.

Reverse Gear—In reverse gear, the reverse gear planetary ring gear is locked (by reverse pawl engaging teeth on ring gear rim). The engine drives through the front planetary unit in the same manner as for low and then drives both the pinion plate and ring gear of the rear planetary unit (rear unit brake band released by hydraulic pressure). The rear unit ring gear drives the sun gear of the reverse planetary unit and the drive is taken through the reverse unit pinion plate to the transmission drive shaft (shaft is also driven directly by pinion plate of rear planetary unit so that final torque is combination of these two drives).

LUBRICATION:—**Capacity**—10 quarts. Use only special lubricant furnished by manufacturer and specified for use in the Hydra-matic Transmission.

CAUTION—Do not use any other type oil.

Filler Plug & Gauge—To check oil level, remove sheet metal cover under right front corner of floor mat. Check only after engine has been run, allow car to stand for a minute before noting oil level reading on level stick in filler hole in top of case. Keep oil up to 'F' mark on level stick (oil can be added through this filler hole).

Oil Pan & Screen—See Servicing directions below for oil pan removal. Clean oil screen when pan removed. CAUTION—When installing pan, make certain that copper washers used on 3 screws on left hand side and 2 screws at rear of case.

CHECKING OIL PRESSURE:—If transmission operation not satisfactory check to make certain that oil pressure sufficient for correct operation as follows:

To Check Oil Pressure—Use special service fixture J-1467 and a reliable 100 lb. oil pressure gauge. Remove plug in front of transmission side cover plate, remove plug from governor sleeve by threading standard ¼" capscrew into plug and removing plug through side cover plate hole. Assemble J-1467 fixture in place in side cover plate and governor housing using extreme care not to cause any bind in governor assembly. Assemble pressure gauge to fixture plug so that gauge can be read while car being operated. Operate car on road until transmission fluid is hot, see that control lever in high range, allow car speed to drop to 20 MPH and note gauge reading. Oil pressure must not be less than 78 lbs. at 20 MPH.

Low Oil Pressure Correction—If pressure less than 78 lbs., check for excessive oil leakage in transmission or oil regulator valve assembly, see that oil regulator valve body is tight, check for sticking regulator valve or weak valve spring (substitute new spring and recheck pressure). Inspect for leak in main control valve body or at delivery tube connections between main control valve body and governor sleeve.

ADJUSTMENT:—**Linkage**—Should be checked and adjusted, if necessary, whenever it has been disconnected or disturbed by removal of other units, carburetor adjustment, etc. Adjust as follows:

Carburetor Throttle Linkage—This linkage determines speed at which shifts occur and should be adjusted carefully. First adjust carburetor for correct idle speed and fast idle throttle opening (see Oldsmobile 'T&E' page and Carter WA-1 and WDO carburetor articles in 'C' Section for directions). Then disconnect carburetor throttle rod at carburetor, bell crank to throttle cross-shaft rod at bell crank, cross-shaft to transmission rod at transmission case lever. Install special Oldsmobile setting gauge J-1486 on bell crank, adjust trunnion on throttle rod at throttle lever so that, when rod connected and carburetor throttle valve held closed in slow idle position, rod contacts both legs of gauge. Tighten trunnion locknut, connect rod, remove gauge. Install special setting gauge J-1470 between lever on right end of cross-shaft and toeboard to establish correct clearance (CAUTION—Clearance should be 9/16"—6 cyl. cars, ⅜"—8 cyl. cars, make certain that correct end of gauge marked '6' or '8' used on each model). Press back on cross-shaft lever to make certain that gauge is against toeboard, hold carburetor throttle lever closed in slow idle position, adjust trunnion on bell-crank end of cross-shaft rod so that it enters bell-crank freely, tighten locknut, connect rod, remove gauge. Check cross-shaft stopscrew by rotating throttle cracker lever on left end of cross-shaft to limit of cross-shaft travel with carburetor throttle valve wide open, adjust stopscrew to just contact stop on cross-shaft bracket. Tighten locknut and release cross-shaft. Make certain that carburetor throttle closed in slow idle position, press back on throttle lever on side of transmission case so lever against stop, loosen locknut and adjust clevis on end of cross-shaft to transmission lever rod so that rod can be connected without disturbing position of cross-shaft or transmission lever, tighten locknut and connect rod. Check entire throttle linkage for free operation.

Manual Control Lever Linkage:—Disconnect front control rod at intermediate lever on flywheel housing, rear control rod at relay lever on side of transmission case. Set control lever on steering wheel in 'R' (Reverse) position, make certain that detent ball engages notch. Rotate intermediate lever until hole in lever lines up with hole in bracket, install special gauge J-1469 through both holes to hold lever in this position. Move manual shift lever on side of transmission case to extreme rear position (check by rotating propeller shaft by hand until

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

reverse pawl is felt to engage and lever is against stop). Adjust clevis on end of rear control rod until rod can be connected without disturbing position of relay lever, tighten locknut and connect rod (make certain anti-rattle washer in place). Remove setting gauge from intermediate lever, hold manual shift lever against reverse stop (press backward on rear rod), adjust clevis on end of forward control rod until rod can just be connected without disturbing levers, tighten locknut, connect rod (make certain anti-rattle washer in place). Check to see entire control mechanism operates freely.

Servo Bands:—Oil must be drained and transmission oil pan removed for servo band adjustments. Front and rear servo bands are adjusted differently and each band must be adjusted exactly as directed below. NOTE—No band used on reverse planetary unit (pawl used which engages teeth on ring gear rim) and no adjustment required for this unit.

Front Servo Band—Remove oil pan, install special tool J-1459 over capscrew on lower side of unit to hold screw while adjustment being made. Loosen locknut, use socket wrench to tighten adjusting screw to point where drum cannot be moved in either direction, mark screw to indicate this position, back adjusting screw off exactly 8 full turns, tighten locknut taking care that adjusting screw does not turn.

CAUTION—Adjusting screw must not be backed off more or less than 8 turns, and tool J-1459 **must** be used when adjusting.

Rear Servo Band—Remove oil pan, install adjusting gauge J-1460 on bottom of servo unit. Loosen adjusting screw locknut, turn adjusting screw in until end of servo plunger is flush with outer edge of gauge (plus or minus 1/32"). Hold adjusting screw and tighten locknut.

SERVICING (ON THE CAR):—Units listed below can be serviced without removing transmission from the car. When removing and installing these units, follow instructions carefully.

Servo Units and Front Oil Pump—Drain oil and remove oil pan. Remove main oil line being certain to hold coupling in valve body while this end of line loosened to avoid damage to front connection. Remove oil pressure regulator valve and body. Remove two oil delivery pipes from front cover. Loosen rear servo adjusting screw only. Take out 4 servo to transmission case mounting screws, lift out front and rear servos and front oil pump as a unit. Adjust servos when re-installed.

Main Oil Control Valve and Body Assembly—Remove side cover on transmission case. Loosen four attaching bolts mounting oil control unit on side of case (CAUTION—withdraw bolts only far enough to free unit from case, leave bolts in holes in body to prevent body separating when removed). Slide control unit toward front of transmission to disengage oil pipes from governor unit, lift unit off using extreme care to prevent body separating. Install in same manner, tighten all screws evenly to avoid distorting case.

Rear Oil Pump and Governor Assembly—Remove main oil control unit (above). Take out attaching bolts and remove reverse linkage and pawl assembly from side of transmission case. Take out mounting bolts and remove oil pump and governor assembly through bottom of case (turn round governor weight toward front of transmission for clearance while unit being withdrawn). Install in same manner.

Transmission Case Side Cover—When installing cover see that cork gasket in place over shaft and that copper washer used on 7 lower mounting screws, install manual shift outer lever and adjust linkage as directed above.

Oil Pan—When installing oil pan, make certain that oil screen is in place, use copper washers on 3 screws on left side and 2 screws at rear of case.

Steering Column Control Lever Lamp—Lamp bulb in control lever housing is accessible for replacement by taking out 2 screws holding housing to bracket and sliding housing around so that lamp is exposed. To remove lamp, take out screw in lamp socket.

SERVICING:—Front Servo—To disassemble after removal from transmission, remove oil suction line, take out pump cover attaching bolts, remove pump cover. Remove servo pistons, springs and oil pump gear from housing. When assembling, install servo piston and sleeve in housing, slip retracting spring over piston shaft. Install oil pump idler gear. Install accumulator piston, booster spring, booster spring retainer in servo unit cover, install cover assembly in servo housing, tighten cover bolts. Install suction line making certain that gasket is in good condition. When installing servo in transmission case, see that plunger enters anchor on brake band. Adjust servo after installation.

Rear Servo—To disassemble after removal from transmission, place servo in arbor press and hold squarely in steady position on baseplate so that tension removed from spring retainer. Remove retainer screws, release pressure slowly and guide accumulator body out of servo, remove all parts. When assembling, install booster piston, booster spring, large initial spring, accumulator and piston body in servo body, centering small ring on booster spring so that it enters accumulator body freely. Hold accumulator in place on servo, install inner and outer servo springs and spring retainer. Compress assembly in arbor press and tighten spring retainer screws. Adjust servo after installation in transmission.

Fluid Coupling—To remove fluid coupling members with transmission off car, place manual shift lever in reverse position, loosen mainshaft locknut washer. Use tool KMO.334 to remove locknut retaining driven member (runner) on front end of mainshaft, slide driven member off. Remove drive member (driver) by gripping vanes with pliers at 2 diametrically opposite points and pulling forward while tapping on end of mainshaft with bronze hammer (CAUTION—do not attempt to remove drive member by pushing or pulling on flywheel cover—this will damage oil seal rings).

PACKARD TYPE

Used On:

SIX '110', MODEL 1800 (1940)
EIGHT '120', MODELS 1801, 1A (1940)
SUPER 8 '160', MODELS 1803, 3A, 4, 5 (1940)
CUST. SUPER 8 '180', MODELS 1806, 7, 8 (1940)

This Transmission same design as used on corresponding 1939 models except for new Overdrive Unit.

OVERDRIVE TRANSMISSION NOTE:—New Econodrive or Overdrive, Warner Model AS1-R9A, is optional on all models. This Overdrive unit is entirely new design with electrical control (with lock-out button in 'Overdrive' position, overdrive cut-in is controlled by governor switch and occurs automatically, overdrive may be cut out at any speed by operating the accelerator pedal control). ***See Warner (Packard Type) Overdrive article for complete servicing and adjustment directions.***

SERVICING:—Overdrive Transmission Note—Transmissions with overdrive can be disassembled without disturbing overdrive unit as follows: Remove overdrive drain plug (on lower rear end of case), transmission cover and shifter mechanism, main drive gear bearing retainer (on front of transmission case). Insert special ST-5043 roller bearing assembly bar through overdrive drain plug hole and hole in front end of case, drive countershaft out through front end of transmission case leaving the assembly bar in the counter gear cluster to retain the bearings until the gear cluster is removed. Take out two short capscrews holding adapter plate to transmission case (do not disturb screws bolting overdrive case to adapter). Remove main drive gear and bearing through front of case, slide synchronizer assembly off front end of mainshaft. Withdraw overdrive unit, adapter plate, and mainshaft assembly from rear end of transmission case as a unit. CAUTION—Do not permit adapter plate to separate from overdrive case which will require complete disassembly of overdrive.

Transmission Disassembly (Without Overdrive):—Remove transmission case cover and shifter mechanism, take off nut on rear end of shaft, pull universal joint flange, take out screws and remove rear bearing cap, remove countershaft lock plate, remove main drive gear bearing retainer on front of case. Use ST-5043 roller bearing assembly bar as a drift and drive countershaft out through front of case (leave bar in counter gear cluster to retain bearing rollers). Remove main drive gear and bearing through front of case. Move mainshaft and gear assembly to rear until rear bearing clears case, tap bearing off shaft, then remove mainshaft assembly through top of case. Lift out counter gear cluster, thrust washers, and bearing rollers. To remove reverse idler gear, drive shaft out toward rear.

Synchronizer Unit:—Conventional poppet ball and spring type. Unit can be dismantled by sliding outer clutch sleeve off inner sleeve using extreme care not to lose poppet balls and springs which will fly out (mark inner and outer sleeves and replace in same position). Use band type ring compressor or ST-5014 clamp to re-install balls and springs.

Synchronizer Travel Adjustment—Check clearance between lug on second-high shifter fork and stop on cover with shift lever in High Gear position. Clearance should be .005" min., .010" max. Adjust by bending lug. CAUTION—If clearance greater than .010", outer clutch sleeve may move too far forward which will allow synchronizer balls and springs to fly out. If this occurs, cover must be removed and synchronizer reassembled.

Mainshaft, Low & Second Speed Gear Assembly:—Both low and second speed gears are furnished as an assembly with the mainshaft and should not be removed. These gears are constant-mesh type and are mounted on double row ball bearings on shaft.

Shifter Mechanism:—Entire shifter mechanism mounted in transmission case cover and not disturbed by cover removal. When re-installing cover, make certain that shifter forks are in neutral position and that they engage sliding gear (rear fork), synchronizer clutch sleeve (forward fork).

DETROIT 200, 400, 500, 4100, 4200, 4400 SERIES

SERIES 4400 (ROLLER BEARING TYPE)

Chrysler Imperial, Models C19 ('38), C23 ('39)
*—Used on rear shaft only, Spicer on front shaft.

NOTE:—Series 200, 400, 500. Plain bushing (not roller Bearing). Service data below applies to these models with exception of data on roller bearings.

Series 4100, 4200, 4400. Roller bearing type. These series same except for size and serviced in same manner.

DESCRIPTION:—Ball and Trunnion type with Roller Bearings. Consists of a body or housing bolted to companion flange which has two parallel ball slides machined on its inner surface. Ball head on shaft has cross pin with ball at each end which engages ball slide in housing. Ball mounted on loose rollers on pin which are retained by centering button at outer end of pin. Ball head centered by spring retained by cover (spring seat and grease retainer) clipped to housing flange. Leather boot on opposite end of housing is clamped to housing and shaft to retain grease.

DISCONNECTING UNIVERSAL:—Take out bolts which mount housing to companion flange. Do not disturb cover clipped to housing flange (cover has notation 'Do not remove cover') unless joint is to be disassembled.

SERVICING:—Disassembly—Bend back three lugs only on one side of grease cover, slide cover off sideways, push housing back on shaft, remove centering buttons and balls (CAUTION—do not lose roller bearings out of balls). Wash all parts and inspect for wear. If balls or rollers show wear, replace with complete ball and roller assembly. Check housing, raceways for ball impressions which result in backlash, replace housing if unduly worn. Press out pin in ballhead only if pin or housing is to be replaced.

Assembling—First slip housing over ballhead, press pin in place **being sure that equal amount of pin extends through each side of ballhead**—this is important. Place 1/16" washers over ends of pins, install ball and roller assemblies, finally install centering buttons with 1/64" spring washers next to pin ends. Pull housing forward to hold parts in place. Apply 1½ ozs. of fibre grease across face of balls. Install conical spring, being certain that small end of spring rests over pilot on end of ballhead, new gasket, and grease cover, bend down lugs on grease cover. When connecting universal joint, use new lockwashers and tighten nuts holding housing on companion flange securely, this is important.

NOTE—Grease capacity is 1¼ ozs. (4100, 4200), 1½ ozs. (4400).

UNIVERSAL JOINT BOOTS:—Original equipment boot is seamless type secured by a clamp on each end. To remove boot, remove clamps and cut off old boot (see Note). Install service boot which is hook-on type and can be installed without removing shaft from car, pressing metal hooks down tight to close longitudinal seam and twisting wires tight on each end.

IMPORTANT SERVICE NOTE—1937-38-39 cars are factory equipped with a boot having a leather cone extending into the housing. When removing outer cover, use care not to disturb this cone, leaving cone in place and installing new hook-on boot over it. If cone is destroyed, install special combination cone and outer boot which is available for service.

DETROIT 600, 700 SERIES

Used On:

Auburn Eight, 8-100, A (1932)—after Serial Number 5510
Auburn Eight, 8-101, A (1933)—Serial Numbers 2601-3200, 3801-5500

Pierce Arrow Eight, 836, Twelve 1236 (1933)
Studebaker 8, Pres. 82, Sp'way Pres. 92 (1933)

DESCRIPTION:—Roller bearing, split ring type. No cross used. Front yoke assembled with separate trunnion pin, rear yoke trunnion pins integral with slip yoke assembly. Bearings consist of loose rollers held in place in bearing cup by retainer (dust shield) and shoulder on yoke at open (inner) end. Bearing cups assembled over pins and retained by split ring clamped together with four bolts. Cork washer and dust cap assembled between bearing and shoulder on yoke to retain lubricant.

DISCONNECTING UNIVERSAL:—End yoke flange bolted to companion flange. Take out bolts in flange to free shaft and universals.

SERVICING:—Disassembly. Remove four ring bolts, pull ring halves apart to free bearing cups, lift bearing cups off with cork gasket and dust cap. Trunnion pin in front (slip) yoke may be pushed out if necessary.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn parts. Repack assembly with good grade lubricant.

Assembling—Reverse disassembling directions above. New cork gaskets must be used.

NOTE—When installing shaft see that arrows on shaft and universal yoke at splined joint are in alignment.

NOTE:—5200 Series joint used on these models. Roller bearing assembly retained by dovetail lock bar assembled on each yoke end. Serviced by driving out lock bars. Service data below applies to these models with exception of data on locking rings.

DESCRIPTION:—Roller bearing type. Universal has conventional cross with individual bearings on cross ends. Bearings consist of loose rollers held in place in bearing cup by retainer at open (inner) end. Bearing cups assembled directly in holes in ends of yokes and are retained by locking ring on inner face of yoke which engages recess in bearing cup. Cork washer and dustcap installed between bearing cup and shoulder on cross to retain lubricant.

DISCONNECTING UNIVERSAL:—End yoke flange is bolted to companion flange. Take out bolts in flange to free shaft and universals.

SERVICING:—Disassembly—Take out locking rings from opposite bearing cups. Tap on outer end of one bearing cup to start opposite cup out, withdraw bearing cup, tap on end of cross to start opposite bearing cup. Remove dustcap and cork gasket.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts. Clean out lubricant holes in cross, repack entire assembly with correct type lubricant.

Assembling—Use new cork gasket. Reverse disassembling directions above.

NOTE—When installing shaft, see that arrows on shaft and universal yoke at splined joint are lined up.

Type 4C Used On:

Cadillac V-8, 355-D Series 10, 20 ('34), 30 ('34-35).
Cadillac V-12, 370-D Series 40 ('34-35).
Cadillac V-16, 452-D Series 60 ('34-35), 36-90 ('36), 37-90 ('37).

* —One 2C and one 3C joint used.
**—Steering column joint.

DESCRIPTION:—Roller bearing type. Universal has conventional cross with individual trunnion bearings on cross ends. Two types of trunnion bearings used: 1) Wing Type bolted to yokes or flanges by capscrew in each trunnion boss, 2) Round Type fitting directly in hole in yoke ends and retained by bushing plate clamped on bearing hole by capscrew. Trunnion bearings are cup-shaped and retain loose rollers which must be assembled before trunnion bearing installed on cross. Cork packing washers used between trunnion bearing and shoulder on cross to retain lubricant.

DISCONNECTING UNIVERSAL:—Turn down locks and take out two capscrews in opposite trunnion bearings on companion flange, wire trunnions together to prevent them coming off ends of cross (unless joint is to be disassembled), tap trunnions lightly with soft hammer to disengage drive lugs (lugs on trunnion bearing engage slot in flange and flange end is turned up to retain trunnions).

SERVICING:—Disassembly—Wing type trunnion bearings may be pulled directly off universal joint cross after mounting capscrews have been removed (do not lose loose rollers in bearing). To remove Round type trunnion bearings, shaft must be removed to the bench. Clamp yoke or drive shaft tube (at weld) in vise, take out screws and remove bearing end plates (both sides). Use flat end drift slightly smaller in diameter than bearing, drive on outer end of one bearing, driving bearing in until shoulder on cross strikes inside of yoke lug. This will start opposite bearing out. Grip this bearing in vise (use brass or copper jaws) work shaft back and forth until bearing comes out. Drive other bearing out in same manner (using drift against end of cross).

Servicing—Wash all parts in gasoline. Clean out lubricant passage in cross. Replace worn parts (examine cross journal, trunnion bearing and rollers for wear), repack all space with semi-fluid chassis lubricant or SAE. #160 oil.

Assembling—Use new cork seal or packing washers. Reverse disassembling directions above. When installing Round type bearings, tap bearings in place or if arbor press used, see that pressure is not great enough to sprink yoke ends. On Wing type bearings, use new lock plate and see that ears on lock plate turned up against capscrews after screws are securely tightened.

NOTE—When installing drive shaft, see that arrows on shaft and universal joint yoke at sliding joint line up.

MECHANICS

Used On:

Auburn 12, 12-160, 161, 165 ('32-33-34)
Hupmobile Six, Model 216 (1932)
Packard Eight, Model 901, 2 (1932)
Packard Super Eight, Model 903, 4 (1932)
Packard Twelve, Model 905, 6 (1932)
Studebaker Six, Model 56 (1933)
Studebaker Eight, Commander 73 (1933)
Stutz, SV-16, DV-32 (1932-34)

DESCRIPTION:—Oil lubricated type. No cross used. Consists of two yokes with trunnion bearings installed over yoke ends. Two threaded studs, (formed on opposite sides of bearings) fitted in holes in either housing to which nuts attached clamping housing halves together. Yoke ends bear directly on inner surface of housing. Oil tight seal obtained by ground edges on housing halves and cork washers assembled under trunnion bearings at inner end of yoke pins.

DISCONNECTING UNIVERSAL:—Take out bolts connecting yoke flange to companion flange to free shaft and universals.

SERVICING:—Disassembly—Remove two oil plugs from slip yoke half of housing, drain oil. Bend back lock plates, remove eight nuts holding housing together, tap on studs to separate halves. With halves pulled away from yokes, remove trunnion bearing, spring washer, brass ferrule and cork washer from each yoke pin.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts.

Assembling—Assemble halves separately. Use new cork washers and brass ferrules. Oil yoke pins, assemble cork washer, brass ferrule (with flange toward trunnion), spring washer and trunnion bearing to each yoke pin, with lock plate under nut, bolt to housing. Shellac ground edges of housing, clamp housing together with four remaining nuts, bend lock plates up against nuts. Lubricate as directed below.

Oiling—Oil plugs located on slip yoke half of housing. Turn joint to place plugs one above the other. Remove upper vent plug, remove lower plug and insert Oil Gun. Using heavy oil (not grease) fill joint until oil escapes from top hole. Replace top plug, turn joint one half revolution, withdraw oil gun and replace plug. Splined yoke with plug should be lubricated with grease. Lubricate joint every six months for normal service.

*—Used on front propeller shaft, Detroit ball-and-trunnion type used on rear shaft.

DESCRIPTION:—Needle bearing type. Universal has conventional cross or spider with individual bearings on cross ends. Bearings consist of loose needle rollers held in place in bearing cup by retainer and assembled with cork gasket and dustcap between bearing cup and shoulder on cross to retain lubricant. Bearing cups fit directly in holes in yoke ends and are retained by locking ring in yoke at outer end or by bearing cap held in place on yoke end over bearing cup by two capscrews. On some models, bearing cups are bolted directly to trunnions on companion flange by 'U' bolt passing completely through flange with nuts on opposite side.

DISCONNECTING UNIVERSAL:—Take out bolts in companion flange or remove nuts on U bolts mounting bearing cups on flange and remove U bolts. When disconnecting this type see that bearing cups do not fall off universal cross.

SERVICING:—Disassembly—Remove locking rings or take out capscrews and remove bearing cups. Tap or press on outer end of one bearing cup until cup on opposite side has been forced out of yoke end. Turn universal joint over and press first bearing cup out (applying pressure on exposed end of universal cross). Bearing cups are light press fit in yoke lugs.

Servicing—Wash all parts in gasoline. Clean out lubricant holes in cross. Examine all parts for wear. Use new cork gasket when reassembling joint.

Assembly—Place cross in yoke, install needle rollers in bearing cups, assemble retainer, new cork gasket, and dustcap, pack bearing cup and lubricant passage in cross with SAE. #160 oil, insert bearing cup in yoke end on cross. Use special clamp to press bearing cups in and compress sufficiently so that locking rings can be installed. See that locking rings are firmly seated in recess in yoke. On types using bearing caps, use new lock plate under screw heads, turn up lock tang against capscrew after screws have been securely tightened. On U bolt types, see that lockwashers installed under nuts.

NOTE—When installing drive shaft, see that arrows on shaft and universal joint yoke at sliding splined joint are lined up.

SPICER G AND IG TYPES

Used On:

Chrysler Imperial, Model CH (1932)
Chrysler Cust. Imp., Models CL ('32), CL* ('33)
Dodge Six, Model DL (1932)
Dodge Eight, Models DK (1932), DO (1933)
Graham Eight, Model 57 (1932)
Hudson Super Six (1933)
Hudson Greater Eight (1932-33)
Oldsmobile Six, F-32 ('32), F-33 ('33)
Oldsmobile Eight, L-32 ('32), L-33 ('33)
Pierce Arrow Eight, Model 54 (1932)
Pierce Arrow 12, 51, 52, 53, 54 ('32), 1242, 47 ('33)
Studebaker Six, Model 56, 1932)
Studebaker President, Model 82 (1933)
Studebaker Speedway President, 91 ('32), 92 ('33)
Terraplane Six, Models K ('32), KU ('33)

DESCRIPTION:—Plain bushing type. Universal consists of journal fitted with bushings on journal ends carried by flange yoke and sleeve (splined) yoke. Two piece casing covers entire unit. Inner casing bolted to flange yoke, outer casing held on sleeve yoke by spring. Oil seal formed under inner casing by baffle cup (retained on yoke by spring) bearing against underside of casing. Cork seal on outer casing edge excludes dirt and moisture. Joint lubricated through plug on sleeve yoke and should be filled with good grade of grease.

DISCONNECTING UNIVERSAL: — Take out bolts mounting flange yoke to companion flange. Do not allow shaft to swing from one joint or edge of outer casing will be damaged causing cork seal to wear rapidly.

SERVICING:—Disassembly—Unscrew dust cap on end of sleeve yoke. Remove steel washer, felt washer, snap ring and casing spring, outer and inner casing (do not dent or distort). Baffle cap, spring and retainer can then be removed. Remove bushing lock rings, drive out bushings with flat nose punch, removing bushings on flange yoke first. Journal will be free to slip out.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts.

Assembling—Install journal on sleeve yoke with journal turned so that shoulders do not extend beyond yoke. Reverse disassembling directions above. Test each set of bushings after installing by moving journal. Journal must move freely. Baffle cup and spring must be free fit on yoke. Do not paint curved portion of inner casing immediately ahead of cork seal or paint ridge will cause seal to wear rapidly. After assembling fill with grease.

NOTE—When replacing joints on shaft, grease filler plug on front and rear must be in alignment.

BUICK (OWN MAKE) FIRST TYPE

Used On:

Buick Models 50, 60, 90 (1932-35)
Buick Model 80 (1932-33)

NOTE:—These models have Torque Tube drive and have a single universal within a two-piece ball housing at the rear of the transmission. Universal can be exposed by taking out ball housing flange bolts and sliding ball back on shaft. Leather boot cover used on some models.

DESCRIPTION:—Plain bushing, split ring type. No cross used. Hardened bushings installed on yoke ends and held in place by snap rings engaging recess in bushing and ring. Yokes clamped together by two-piece ring bolted with four bolts.

DISCONNECTING UNIVERSALS:—See Disconnecting Universals in following article.

SERVICING:—Disassembly. Remove four bolts from ring and separate halves. Bushings (with snap rings) can then be removed from yoke ends. Use soft nosed punch when removing bushings.

Specifications. Clearance between yokes and pins should be .0025-.0045". Backlash or clearance of driveshaft splines in splineways in universal rear yoke should be .002-.006" (32-50, 60), .001-.006" (32-80, 90), .001-.004" (all others).

Assembly. Tap bushings in place with soft nosed hammer. Assemble snap rings in grooves on bushings and bolt rings together making sure that snap rings engage grooves in clamp ring halves.

UNIVERSAL BALL HOUSING:—See Universal Ball Housing in following article for complete data.

BUICK—CADILLAC—LA SALLE (OWN MAKES)

Used On:

BUICK MODELS

Series 40 (1934-35)—SEE NOTE
Series 40 (1936-37-38)
Series 60,80,90 (1938), 80,90 (1939)

CADILLAC MODELS

V-8, Models 355-B (1932), 355-C (1933)
V-12, Models 370-B (1932), 370-C (1933)
V-16, Models 452-B (1932), 452-C (1933)

LA SALLE MODELS

V-8, Models 345-B (1932), 345-C (1933)

NOTE:—These models have Torque Tube drive and have a single universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out ball housing flange bolts and sliding ball housing back on shaft.

Buick 40 (1934-35). These models have dowel lock pins retaining bushings in yokes. Dowel pins should be driven out to free bushings. All other service data below applies.

Buick 1938-39 Models. Universals have new type lubricating feed consisting of slot in bearing retainer below transmission rear main bearing (40), shelf in transmission case which collects lubricant and feeds to universal through drilled hole in bearing retainer (60, 80, 90) with larger drain holes to allow surplus lubricant to drain back to transmission case and oil groove and return hole in rear yoke bushing (this bushing installed in rear end of ball housing). This new type ball and bushing assembly may be installed on previous car models. Ball is marked 'TOP' to insure correct installation.

Buick 40, 60 (1939). These models equipped with Mechanics Model 2C needle bearing type universal. See Mechanics Universal article for data.

DESCRIPTION:—Universal has conventional cross or spider. Special hardened bearing bushings are installed individually in ends of yokes on the cross journals. Bushings are retained in yokes by locking rings (yokes are open end type and locking rings are inserted in ends to engage bushing and yoke).

DISCONNECTING UNIVERSALS:—Rear yoke is integral with stub (splined) shaft and front yoke is bolted directly on rear end of transmission main shaft (speedometer drive gear is cut on yoke shoulder and speedometer drive must be disassembled before yoke is removed). Rear axle should be removed by taking out bolts in torque tube flange at rear end of ball housing and pulling shaft out of stub shaft. If universal is to be removed, special wrench can be inserted through opening in splined shaft and mounting screw removed from front yoke, or universal can be dismounted.

SERVICING:—Disassembly—Remove locking ring from each yoke bushing. Drive out bushings with flat nosed punch inserted from opposite side of yoke being careful to keep bushing lined up with cross journal so that bearing surface will not be marred.

Buick Specifications. Clearance between cross journals and bushings should be .002-.005" (40), .0025-.004" (60, 80, 90). Bushing clearance in yoke should be .004-.006". Backlash or clearance of drive shaft splines in splineways in universal rear yoke should be .001-.004" (40), .0015-.004" (60, 80, 90).

Assembly—Tap bushings in place with soft nosed hammer, being careful to keep bushings lined up so that bearing surface on cross journals is not marred. Install locking rings.

UNIVERSAL BALL HOUSING:—Cork oil seal used at rear end of outer retainer. Inner and outer retainers and universal ball are plated. To correct oil leaks past oil seal, disconnect rear axle, remove cork oil seal, adjust ball housing by removing shims from between inner and outer retainer until joint can be moved by hand at outer end (if bar must be used, housing is too tight), re-install cork seal.

NOTE—Oil seal (at rear end of outer universal ball retainer) used on 1937-38 models consists of a Duprene rubber bonded cork oil seal and Belleville type spring washer.

CHEVROLET—PONTIAC (OWN MAKE)

CHEVROLET MODELS

Master Models CA ('33), DA ('34), EA, ED ('35), FA, FD ('36), GB ('37), HB ('38), JB ('39)

PONTIAC MODELS

Six, Models 701-A, B ('35), 36-26A, B ('36)
Eight, 601('33), 603('34), 605('35), 36-28 ('36)

NOTE:—These models have Torque Tube Drive with a single Universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out ball housing flange bolts and sliding ball housing back on shaft.

Chevrolet (Standard Models.) These models have riveted type joint (serviced as an assembly).

Chevrolet ¾, 1, 1½ Ton Trucks. These trucks have additional universal mounted at intermediate bearing on frame. Both universals are 'cross' type with hardened steel bushings retained in yoke ends by locking rings (similar to design used on Buick models). See Buick Universal Joint article for service data on these types.

DESCRIPTION:—No cross used. Bearing journals formed directly on ends of yokes. Bearing bushings are installed individually on yoke journals and clamped in two-piece circular ring. Universal is 'split' by taking out bolts which clamp these rings together. Rear yoke is integral with stub (splined) shaft and front yoke is bolted directly on end of transmission main shaft. Speedometer drive gear is mounted on universal front yoke and speedometer drive should be disassembled before universal removed to avoid damage to gears.

REMOVAL:—Rear axle ordinarily removed by pulling torque tube and drive shaft out of splined joint at rear of universal. If universal is to be removed, special wrench can be inserted through hole in rear yoke and mounting screw removed from front yoke.

SERVICING:—No special disassembly directions required. Bearing bushings can be lifted off after bolts have been taken out of circular retainer ring. When installing bushings see that beveled side is installed toward inside of yoke. After universal joint installed on car and ball housing in place, fill ball with transmission lubricant through pipe plug on top of universal ball retainer (1933-36), through battery ground strap hole at rear of transmission case (1937-39). Front universal oiled from transmission case when car is in operation. On truck models, pressure lubricant fitting located on rear universal ball and on side of front propeller shaft housing. These fittings lubricate rear universal and front propeller shaft bushing and must be given attention at 1000 mile intervals.

SPICER (FORD) TYPE

Used On:

Ford V8, All '60' & '85' Models (1932-39)
Ford Truck, All Models (1932-39)
Lincoln-Zephyr, H('36), HB('37), 86H('38), 96H('39)
Lincoln, V12 Models (1932-39)
Mercury, Model 99-A (1939)

NOTE:—These models have Torque Tube Drive with a single universal within a ball housing at the rear of the transmission case. Ball housing flange mounting screws must be taken out and axle assembly pulled back to expose universal.

Ford Truck Models (1932-39). These models have additional universal mounted at intermediate bearing on frame cross-member. Both universals are needle bearing type (see Needle Bearing Service Note below).

NOTE—Rear yoke of front universal integral with a companion flange which is bolted to flange on splined sleeve which engages front propeller shaft. After cover screws are taken out and cover pushed back on shaft, screws can be taken out of companion flange and splined sleeve pushed back on shaft (against spring tension) to disconnect front driveshaft. This will allow transmission to be removed without disturbing intermediate universal joint or rear propeller shaft.

Lincoln-Zephyr (1938-39). Universal joint is needle bearing type. See Needle Bearing Service Note below.

DESCRIPTION:—Universal has conventional cross or spider. Special bearing bushings are installed individually in ends of yokes on cross journals. Bushings are retained in yokes by locking rings (yokes are open end type and locking rings are inserted in yoke ends to engage recess in bushing and yoke).

Needle Bearing Types. These types have loose needle bearings assembled in retainer cup or bushing which is retained in yoke end by locking ring in same manner as bushing on hardened-bushing types. Serviced in same manner except that loose needle bearings will fall out of retainer cup when removed and care must be taken not to lose them.

REMOVAL:—Rear axle ordinarily removed by pulling drive shaft out of splined joint at rear of universal after ball housing flange bolts have been taken out (rear universal yoke integral with stub splined shaft, front yoke bolted directly on end of transmission main shaft). Universal can be disassembled or removed by taking out mounting bolt in front yoke (accesible through hole in cross).

SERVICING:—Disassembly—Remove locking ring from each yoke bushing. Drive out bushings with flat nosed punch inserted from opposite side of yoke being careful to keep bushing lined up with cross journal so that bearing surface will not be marred.

NOTE—On needle bearing types take care not to loose needle bearings which will fall out of bearing retainers or bushing when removed from cross journal. Pack needle bearings with grease before installing.

Assembly—Tap bushings in place with soft nosed hammer being careful to keep bushings lined up with cross journal to avoid marring cross journals. Line up locking ring groove in yoke and bushing, install locking rings. If universal front yoke has been removed, see that transmission rear bearing is against shoulder on shaft and that yoke shoulder is against bearing. Tighten mounting screw securely and see that washer under screw head is seated in counterbore in yoke. When correctly assembled, transmission main shaft should have no endplay.

NOTE—Universal is not oiled from transmission case and should be lubricated with special universal lubricant after assembly completed.

THOMPSON TYPE

Used On:

Studebaker Dictator, Models 5A, 6A (1937).

Studebaker Six, Commander, State Commander, Models 7A, 8A (1938)

DESCRIPTION:—Rubber bushed type. Assembly consists of four rubber spools compressed within a steel cage which is riveted together. Steel bushings inset in the rubber spools serve as guides for yoke bolts. Shaft yoke and end yoke are bolted rigidly to these steel trunnions or spool bushings by bolts which pass entirely through assembly (head on universal cage side, nut on yoke side). No splined or slip joint used and shaft tube welded directly to yokes at both ends.

DISCONNECTING UNIVERSALS:—Remove nuts on bolts in end yokes (if universals to be removed with shaft), or on shaft yokes (to remove shaft only), push bolts out. Do not attempt to remove steel bushings.

SERVICING:—Universal joint cannot be disassembled and no service work is required.

INSTALLING DRIVE SHAFT:—One leg of shaft yoke at each end of drive shaft marked by punch marks (single mark at front end, double mark at rear end). Shoulder of one steel bushing in front and rear universals similarly marked. When installing shaft see that these punch marks are lined up. See that lockwashers are installed under bolt nuts and tighten bolts securely.

DETROIT 4100, 4200 SERIES

SERIES 4100

Bantam Super Four, Model 65 (1940)
Willys, 440 Spd'way, Del., Pick-Up (1940)
Willys, Model 440P Panel Delivery (1940)

SERIES 4200

①DeSoto, S7 Some Cars (1940) Except 7 Pass.
Dodge, Model D14, D17 (1940) Except 7 Pass.
Graham, Model 108, Schgr. 107 (1940)
Plymouth, Model P9, P10 (1940) Except 7 Pass.

①—Detroit Series 7200 used on some Coupes & 5 Pass. Sedans and all 7 Passenger Sedans. See Detroit 7200 Series article following.

DESCRIPTION:—Ball and Trunnion type with Roller Bearings. Consists of a body or housing bolted to companion flange which has two parallel ball slides machined on its inner surface. Ball head on shaft has cross pin with ball at each end which engages ball slide in housing. Ball mounted on loose rollers on pin which are retained by centering button at outer end of pin. Ball head centered by spring retained by cover (spring seat and grease retainer) clipped to housing flange. Leather boot on opposite end of housing is clamped to housing and shaft to retain grease.

DISCONNECTING UNIVERSAL:—Take out bolts which mount housing to companion flange. Do not disturb cover clipped to housing flange (cover has notation 'Do not remove cover') unless joint is to be disassembled.

SERVICING:—**Disassembly**—Bend back three lugs only on one side of grease cover, slide cover off sideways, push housing back on shaft, remove centering buttons and balls (CAUTION—do not lose roller bearings out of balls). Wash all parts and inspect for wear. If balls or rollers show wear, replace with complete ball and roller assembly. Check housing, raceways for ball impressions which result in backlash, replace housing if unduly worn. Press out pin in ballhead only if pin or housing is to be replaced.

Assembling—First slip housing over ballhead, press pin in place **being sure that equal amount of pin extends through each side of ballhead**—this is important. Place 1/16" washers over ends of pins, install ball and roller assemblies, finally install centering buttons with 1/64" spring washers next to pin ends. Pull housing forward to hold parts in place. Apply 1¼ ozs. of fibre grease across face of balls. Install conical spring, being certain that small end of spring rests over pilot on end of ballhead, new gasket, and grease cover, bend down lugs on grease cover. When connecting universal joint, use new lockwashers and tighten nuts holding housing on companion flange securely, this is important.

UNIVERSAL JOINT BOOTS:—Original equipment boot is seamless type secured by a clamp on each end. To remove boot, remove clamps and cut off old boot (see Note). Install service boot which is hook-on type and can be installed without removing shaft from car, pressing metal hooks down tight to close longitudinal seam and twisting wires tight on each end.

IMPORTANT SERVICE NOTE—All 1940 cars are factory equipped with a boot having a leather cone extending into the housing. When removing outer cover, use care not to disturb this cone, leaving cone in place and installing new hook-on boot over it. If cone is destroyed, install special combination cone and outer boot which is available for service.

DETROIT 7200, 7300 SERIES

SERIES 7200

Chrysler Six, Model C25 (1940)

SERIES 7300

Chrysler Eight, Models C26, C27 (1940)

①—Detroit Series 4200 used on some Coupe and 5 Passenger Sedans. See preceding article.

DESCRIPTION:—Roller bearing type. Universal has conventional cross with individual bearings on cross ends. Bearings consist of loose rollers held in place in bearing cups (propeller shaft yoke ends) and bearing blocks (companion flange ends) by retainer at open (inner) end. Bearing cups assembled directly in holes in ends of propeller shaft yoke and are retained by locking ring on inner face of yoke which engages recess in bearing cup. 2 bearing blocks (one for each end) attached to companion flange by screws and are retained by tie spring clipped to bearing block retainer assembled in groove at open (inner) end of each bearing block (spring prevents bearing blocks dropping off cross when attaching screws removed). Dust seal and seal retainer assembled between bearing cups (and blocks) and shoulder on cross to retain lubricant.

DISCONNECTING UNIVERSAL:—Bearing blocks attached to companion flange by screws. Take out screws and lockwashers in blocks to free shaft.

SERVICING:—**Disassembly**—Remove tie spring holding bearing blocks on cross. Remove bearing blocks, dust seals and retainers. Take out locking rings from bearing cups in yoke. Tap on outer end of one bearing cup to start opposite cup out, withdraw bearing cup, tap on end of cross to start opposite bearing cup. Remove dust seals and retainers.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts. Clean out lubricant holes in cross, repack entire assembly with correct type lubricant.

Assembling—Use new dust seals. Reverse disassembling directions above.

NOTE—When installing shaft, see that arrows on shaft and universal yoke at splined joint line up.

MECHANICS 1½C, 2C, 3C TYPES

TYPE 1½C—SEE NOTE

Cadillac V8, Model 40-75 (1940)
Cadillac V16, Model 40-90 (1940)

Oldsmobile Eight, '90' Model L-40 (1940)
Packard '110' 6, 1800 (1940)—Without Overdrive
Pontiac Six, Models 40-25, 40-26 (1940)
Pontiac Eight, Models 40-28, 40-29 (1940)

TYPE 3C

Cadillac V8, 40-60S, 62, 72, 75 (1940)
Cadillac V16, Model 40-90 (1940)
LaSalle V8, Models 40-50, 52 (1940)
Nash Ambassador Eight, Model 4080 (1940)
Packard '110' 6, 1800 (1940)—With Overdrive
Packard '120' 8, 1801, 1A (1940)
Packard '160' 1803,3A,4,5; '180' 1806,7,8 (1940)

NOTE:—This universal joint used on steering column.

DESCRIPTION:—Roller bearing type. Universal has conventional cross with individual trunnion bearings on cross ends. Two types of trunnion bearings used: 1) Wing Type bolted to yokes or flanges by capscrew in each trunnion boss, 2) Round Type fitting directly in hole in yoke ends and retained by bushing plate clamped on bearing hole by capscrew. Trunnion bearings are cup-shaped and retain loose rollers which must be assembled before trunnion bearing installed on cross. Cork packing washers used between trunnion bearing and shoulder on cross to retain lubricant.

Slip Joint—Oldsmobile & Pontiac—Solid propeller shaft used. Slip joint formed by splines on front universal slip yoke mating with splines on transmission mainshaft (yoke not bolted on shaft).

DISCONNECTING UNIVERSAL:—Turn down locks and take out two capscrews in opposite trunnion bearings on companion flange, wire trunnions together to prevent them coming off ends of cross (unless joint is to be disassembled), tap trunnions lightly with soft hammer to disengage drive lugs (lugs on trunnion bearing engage slot in flange and flange end is turned up to retain trunnions).

SERVICING:—Disassembly—Wing type trunnion bearings may be pulled directly off universal joint cross after mounting capscrews have been removed (do not lose loose rollers in bearing). To remove Round type trunnion bearings, shaft must be removed to the bench. Clamp yoke or drive shaft tube (at weld) in vise, take out screws and remove bearing end plates (both sides). Use flat end drift slightly smaller in diameter than bearing, drive on outer end of one bearing, driving bearing in until shoulder on cross strikes inside of yoke lug. This will start opposite bearing out. Grip this bearing in vise (use brass or copper jaws) work shaft back and forth until bearing comes out. Drive other bearing out in same manner (using drift against end of cross).

Servicing—Wash all parts in gasoline. Clean out lubricant passage in cross. Replace worn parts (examine cross journal, trunnion bearing and rollers for wear), repack all space with semi-fluid chassis lubricant or SAE. #160 oil.

Assembling—Use new cork seal or packing washers. Reverse disassembling directions above. When installing Round type bearings, tap bearings in place or if arbor press used, see that pressure is not great enough to spring yoke ends. On Wing type bearings, use new lock plate and see that ears on lock plate turned up against capscrews after screws are securely tightened.

NOTE—When installing drive shaft, see that arrows on shaft and universal joint yoke at sliding joint (on all except Oldsmobile and Pontiac) line up.

SPICER (FORD) TYPE

Used On:

Ford V8 All Passenger Cars & Comm'l (1940)
Lincoln V12 Model (1940)
Lincoln-Zephyr Model 06H (1940)
Mercury Model 09A (1940)

NOTE:—Torque tube drive used with a single universal in a ball housing at rear of transmission. Housing flange mounting screws must be taken out and axle assembly pulled back to expose universal.

Ford Trucks—Hotchkiss drive used. See Spicer Needle Bearing Type universal joints for data.

Lincoln-Zephyr—Universal is needle bearing type.

DESCRIPTION:—Conventional cross used with individual bearings on cross ends. Bushings used on Ford and Mercury, loose needle bearings assembled in retainer cap on Lincoln-Zephyr. Bushings and caps

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

retained in yokes by lock rings (yokes are open end type with lock rings inserted in yoke ends to engage recess in bushing or cap and yoke).

REMOVAL:—Rear axle ordinarily removed by pulling drive shaft out of splined joint at rear of universal after ball housing flange bolts removed (front yoke bolted on end of transmission mainshaft). Universal can be removed by using special wrench through opening in splined shaft and taking bolt out of front yoke.

SERVICING:—**Disassembly.** Remove lock ring from each yoke. Drive bushings or caps out with punch (do not lose needle bearings when caps removed).

Assembling—Reverse disassembly directions above (line up lock ring groove in bushing or cap and yoke, install ring). Pack needle bearings with grease before installing. When installing front yoke, see that rear bearing against shoulder on shaft and yoke shoulder against bearing. Tighten mounting screw (see that washer under screw head seated in counterbore in yoke). Fill joint with universal lubricant.

SPICER NEEDLE BEARING TYPE

Used On:

Chevrolet, Cab-over-Engine Truck WD (1940)
Chevrolet, School Bus WC (1940)—See Note
Ford, All Truck Models (1940)
Graham, Hollywood Supercharger 109 (1940)
Hudson Six, Models 40P, 40T, 41, 43, 48 (1940)
Hudson Eight, Models 44, 45, 47 (1940)
Hupmobile Skylark, Model R (1940)
Studebaker Champion, Model 2G (1940)
Studebaker Commander, Model 10A (1940)
Studebaker President, Model 6C (1940)

NOTE:—Used on front propeller shaft, Chevrolet (Own Make) on rear shaft. See Chevrolet (Own Make) Universal Joint article following for data on rear universal.

Ford Trucks—Additional universal mounted at intermediate bearing on frame.

DESCRIPTION:—Needle bearing type. Universal has conventional cross or spider with individual bearings on cross ends. Bearings consist of loose needle rollers held in place in bearing cup by retainer and assembled with cork gasket and dustcap between bearing cup and shoulder on cross to retain lubricant. Bearing cups fit directly in holes in yoke ends and are retained by locking ring in yoke at outer end or by bearing cap held in place on yoke end over bearing cup by two capscrews. On some models, bearing cups are bolted directly to trunnions on companion flange by 'U' bolt passing completely through flange with nuts on opposite side.

Slip Joint—Studebaker Champion (Std. Trans.)—Solid propeller shaft used. Front yoke of front universal splined on transmission main shaft (not bolted).

DISCONNECTING UNIVERSAL:—Take out bolts in companion flange or remove nuts on U bolts mounting bearing cups on flange and remove U bolts. When disconnecting this type see that bearing cups do not fall off universal cross.

SERVICING:—**Disassembly**—Remove locking rings or take out capscrews and remove bearing cups. Tap or press on outer end of one bearing cup until cup on opposite side has been forced out of yoke end. Turn universal joint over and press first bearing cup out (applying pressure on exposed end of universal cross). Bearing cups are light press fit in yoke lugs.

Servicing—Wash all parts in gasoline. Clean out lubricant holes in cross. Examine all parts for wear.

Assembly—Place cross in yoke, install needle rollers in bearing cups, assemble retainer, new cork gasket, and dustcap, pack bearing cup and lubricant passage in cross with SAE. #160 oil, insert bearing cup in yoke end on cross. Use special clamp to press bearing cups in and compress sufficiently so that locking rings can be installed. See that locking rings are firmly seated in recess in yoke. On types using bearing caps, use new lock plate under screw heads, turn up lock tang against capscrew after screws have been securely tightened. On U bolt types, see that lockwashers installed under nuts.

NOTE—When installing drive shaft, see that arrows on shaft and universal joint yoke at sliding splined joint are lined up.

BUICK TYPE

Used On:

Series 40,50,60,70,80,90 (1940)

NOTE:—These models have Torque Tube drive and have a single universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out ball housing flange bolts and sliding ball housing back on shaft.

DESCRIPTION:—Universal has conventional cross or spider. Special hardened bearing bushings are installed individually in ends of yokes on the cross journals. Bushings retained in yokes by dowel pins.

Lubrication—These universals have a new type lubricating feed consisting of drilled hole in top of rear bearing retainer (40, 50), by a groove in top of Low-Reverse shift rail through drilled hole in retainer (60, 70, 80, 90) with large drain holes to allow surplus lubricant to drain back to transmission case. On Series 60, 70, oil seal assembled to rear of yoke bushing (installed in rear end of ball housing). On Series 80, 90, this yoke bushing grooved allowing oil to pass through to lubricate steady rest bearing and oil seal installed to rear of this bearing. Ball is marked 'TOP' to insure correct installation.

DISCONNECTING UNIVERSALS:—Rear yoke is integral with stub (splined) shaft and front yoke is bolted directly on rear end of transmission main shaft (speedometer drive gear is cut on yoke shoulder and speedometer drive must be disassembled before yoke is removed). Rear axle should be removed by taking out bolts in torque tube flange at rear end of ball housing and pulling shaft out of stub shaft. If universal is to be removed, special wrench can be inserted through opening in splined shaft and mounting screw removed from front yoke, or universal can be dismounted.

SERVICING:—**Disassembly**—Remove dowel pins from each yoke bushing. Drive out bushings with flat nosed punch inserted from opposite side of yoke

Buick Specifications—Clearance between cross journals and bushings should be .002-.004". Bushing clearance in yoke should be .004"-.006". Backlash or clearance of driveshaft splines in splineways in universal rear yoke should be .0005-.0045".

Assembly—Tap bushings in place with soft nosed hammer, being careful to keep bushings lined up so that bearing surface on cross journals is not marred. Install dowel pins.

UNIVERSAL BALL HOUSING:—Cork oil seal used at rear end of outer retainer. Inner and outer retainers and universal ball are plated. To correct oil leaks past oil seal, disconnect rear axle, remove cork oil seal, adjust ball housing by removing shims from between inner and outer retainer until joint can be moved by hand at outer end (if bar must be used, housing is too tight), re-install cork seal.

NOTE—Cupped spring washer assembled between outer retainer and cork seal.

CHEVROLET TYPES

Used On:

Passenger Cars KA, KB, KH & Comm'l (1940)
½ & ¾ Ton Trucks KC, KD, KE (1940)
1½ Ton Truck WA, WB, School Bus WC (1940)
Cab-over-Engine Truck WE, WF (1940)

NOTE:—These models have Torque Tube Drive with a single Universal within a ball housing at the rear of the transmission. Universal can be exposed by taking out 4 retaining collar capscrews and sliding ball housing back on shaft.

¾, ¾ Special, 1½ Ton Trucks—These trucks have additional universal mounted at intermediate frame cross-member. Both universals are cross type. Front universal has hardened steel bushings retained in yoke ends by locking rings. Rear universal is a needle bearing type.

Cab-over-Engine Truck WD (107⅝" W.B.)—Hotchkiss drive used on this model with Spicer Needle Bearing Type universals front and rear. See Spicer Needle Bearing Type article for data.

School Bus WC—Same as 1½ Ton Truck (above) except that Spicer Needle Bearing Type universal used at front. See Spicer Needle Bearing Type article for data.

DESCRIPTION:—Roller bearing type (Pass. Cars, Trucks—rear), hardened steel bushing type (Truck—front). Universals have conventional cross with individual bearings on cross ends.

Hardened Steel Bushing Type—Bushings are installed individually in ends of yokes on cross and are retained in yokes by locking rings (yokes are open end type and rings are inserted in yoke ends to engage recess in bushing and yoke).

Needle Bearing Types—Two types of trunnion bearings used: 1) Wing type bolted to each yoke by two capscrews in each trunnion (used on front yoke of passenger cars only), 2) Round type fitted directly in yoke ends and retained by locking ring at inner end.

SERVICING:—**Disassembly (Passenger Cars)**—Remove 4 capscrews from universal joint ball collar, slide ball and collar back on shaft housing. Take out 4 capscrews in trunnion bearings on front yoke, remove trunnons (use care not to lose rollers—19 rollers used in each trunnion). Slide rear yoke off shaft and remove lock rings from bearings. Take off bearing caps by placing yoke in vise and driving down on center of cross with punch until cross seats on yoke, raise cross, insert 15/16" flat washer over bearing and continue to tap on cross until cap removed (do not lose rollers).

Trucks—Same as for passenger cars (above) except that hardened steel bushings in front universal must be driven out after locking rings removed. Rear universal trunnion bearings are roller type and retained by lock rings which are removed in same manner as for rear yoke on passenger cars.

Servicing—Thoroughly clean all parts. Examine for wear and replace all worn or damaged parts.

Assembling—Reverse disassembling directions above. When installing needle bearing caps, Round type should be pressed on yoke just far enough to install snap ring, Wing type caps should be fitted to openings in front yoke. Universals and front propeller shaft (trucks) should be filled with transmission lubricant. NOTE—Pack needle bearings with grease before installing.

BUICK TYPE

Used On:

BUICK, MODELS 50, 60, 90 (1932-35)
BUICK, MODEL 80 (1932-33)

TYPE:—Adjustable packing type. Packing installed under packing nut within forward end of pump housing. Shaft mounted on two bronze bushings.

SERVICING:—Lubrication. Pressure gun fitted provided on top of pump housing between bushings. Use G2½ graphite grease only.

Packing Renewal. Back off adjusting nut and install split type packing rings. Make certain that joints in rings are 120-180° apart to prevent leakage.

OVERHAUL:—Disassembly. Take out screws and remove cover plate on rear of pump body. Remove drive coupling on forward end of shaft, withdraw impeller and shaft assembly through rear end of pump housing (impeller pinned on shaft). Press out old bushings.

Clearances. Shaft clearance in bushings should be .0015-.0035". Impeller end play should be .006-.013".

BUICK & LA SALLE TYPE

Used On:

BUICK, MODEL 40 (1934-35-36)
BUICK, MODELS 60, 80, 90 (1936)
LA SALLE, 350 ('34), 35-50 ('35), 36-50 ('36)

NOTE:—LaSalle pump same design as Buick models with ball bearing (350) bushing (35,36-50) at forward end of shaft. Serviced in same manner except that on Model 350 split locking ring (behind front ball bearing) must be removed before shaft can be withdrawn. To remove locking ring, move shaft back ¼" to free ring from retaining collar.

TYPE:—Adjustable packing type. Shaft mounted on two oil-retaining bushings (40), bronze bushing at rear and sealed ball bearing at front end (60, 80, 90). Packing installed under adjusting nut in front of rear bushing within fan pulley.

SERVICING:—Packing Adjustment. New split type packing rings can be installed without dismantling pump. Make certain that joints in adjacent packing rings are placed 120-180° apart to prevent leaks.

Lubrication. On Model 40, oiler provided for each bearing. Lubricate with engine oil at 1000 mile intervals. On Models 60, 80, 90 use special G2½ water pump lubricant in rear bearing oiler. Front ball bearing is packed with lubricant and requires no attention.

OVERHAUL:—Disassembly. Take out four capscrews in fan pulley hub, remove fan and pulley. Remove rear cover on water pump housing. Impeller and pulley hub can then be removed from shaft. On Models 60, 80, 90, front ball bearing is retained in housing by snap ring at forward end. Rear bushing on this type pump is staked to prevent bushing rotating in service.

Clearances (Buick). Shaft clearance in bushings should be .0015-.0035"(40 '34-35), .0025-.004"(40 '36), .0015-.003"(60,80,90). Impeller endplay should be .006-.015" (40 '34-35), .004-.006" (40 '36), .004-.012" (60,80,90).

Clearances (LaSalle). Shaft clearance in new bushings should be .001-.0025" (rear bushing '34), .0015-.0032" (rear bushing '35-36), .0005-.0022" (front bushing '35-36). Worn limit .005" (all bushings). Impeller clearance in pump housing should be .055-.070" (new), .080" (worn limit).

BUICK 1937-38 TYPE

Used On:

40, 60, 80, 90 (1937); 80, 90 (1938)
40 (1938) BEFORE ENGINE NO. 43535259
60 (1938) BEFORE ENGINE NO. 63524449

NOTE:—Pump used on Model 40 not interchangeable with type used on Models 60, 80, 90. Packing assembly bushings and shaft are interchangeable.

Replacement Pumps. See following article for Packless type ball-bearing pump which can be used as replacement unit on these cars.

TYPE:—Self-adjusting type (no adjustment required in service). Packing is installed on shaft between bushings with spring at forward end of assembly. Bushings are special oil-retaining type and are lubricated from oil reservoir in pump body. NOTE—Pump reservoir should be filled with No. 10-W engine oil at 1000 mile intervals. Heavier oil will not feed through bushings.

OVERHAUL:—Disassembly. Remove fan blade and pulley assembly, pull hub (using puller J-679A) and remove any burrs on shaft, remove rear cover plate, withdraw impeller and shaft at rear of housing.

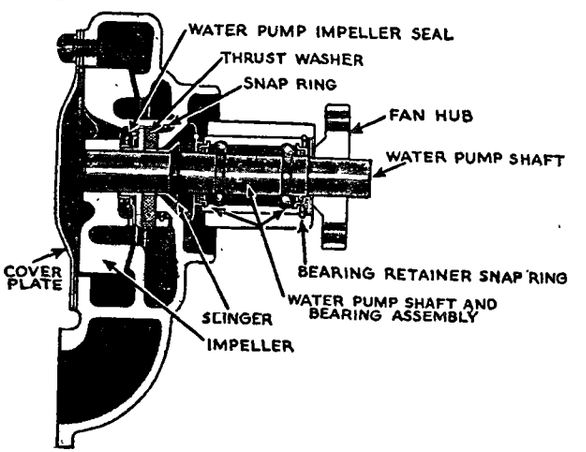
Bushing & Packing Assembly—Bushings must be removed in order to renew packing assembly. Use puller J-999 and pull rear bushing (leave front bushing in to pilot new rear bushing), remove packing assembly. Install new rear bushing (use tool J-684). Pull front bushing (use tool J-999) install packing assembly before installing new bushing. Lubricate all parts of packing assembly with chassis lubricant, then install in following order: two chevron packing rings with convex side toward rear bushing (insert one at a time, edgewise until past openings in body, then turn up into place), duprene rubber spacer, two additional chevron packing rings with convex side toward front, steel spring seat, packing spring, then install new front bushing (tool J-684) so that end is flush with front edge of pump body. NOTE—New bushings and packing assembly should be installed whenever either bushing is removed.

Assembly—Enter impeller and shaft assembly through rear bushing until hub end is flush with spring seat (shaft through packing but with packing spring still exposed), fill packing spring chamber with chassis lubricant, push pump shaft through into place. Press pump shaft hub on shaft leaving .004-.006" clearance between hub and pump body for end play. Use new gasket and install rear cover plate.

BUICK 1939 TYPE

Used On:

38-40 (1938) AFTER ENG. NO. 43535259
38-60 (1938) AFTER ENG. NO. 63524449
39-40, 39-60, 39-80, 39-90 (1939)



NOTE:—Replacement Pumps. This type pump furnished for replacement of other types used on earlier car models as follows (see Service directions below for installation instructions):

Model	Group No.	Part No.
40 (1934-Early 1938)	1.069	1307778
60 (1936-Early 1938)	1.069	1307779
80, 90 (1936-38)	1.069	1307779

Service Parts. Furnished in package assemblies only as follows: Package #1 Group #1.003—Impeller & Seal assembly, ball bearing and shaft assembly, and fan hub (and fan pilot ring for earlier models); Package #2 Group #1.073—Pump body, gasket, cover plate and attaching screws.

TYPE:—Ball-bearing, packless type. Seal consists of spring-loaded rubber seal and carbon block assembled in impeller hub and retained by snap ring. Bearing consists of a double row ball bearing permanently assembled on shaft (shaft serves as inner race and cannot be removed), factory lubricated and sealed (requires no attention in service). Bearing and shaft assembly retained in pump body by snap ring at forward end of bearing hub.

OVERHAUL:—Disassembly. Remove fan and fan pulley, use special puller to remove fan hub, take out rear cover screws and remove cover, remove bearing snap ring at forward end of pump body. Support pump in arbor press, press shaft out of impeller, lift impeller out, press shaft and bearing assembly out of pump body toward front.

Seal Assembly. Manufacturer recommends that seal not be disassembled (seal and impeller serviced as assembly). Carbon disc is ground convex on one surface and must be assembled with this face toward pump body.

Assembly. See that face of pump which contacts carbon seal is smooth (replace pump body if rough or burred). Use arbor press to install bearing and shaft assembly supporting pump body on press and applying pressure to bearing outer race only (do not press on shaft or bearing seal), install bearing snap ring. Press fan hub on shaft (support impeller end of shaft allowing pump to float on shaft so that bearings will not be damaged) until shaft projects beyond front face of hub exactly ⅜" (40), 3/16" (60, 80, 90). Apply small amount of cup grease to impeller end of shaft, face of pump body and face of carbon disc, press impeller on shaft so that it is flush with end of shaft (support shaft at fan hub end allowing pump to float on shaft while installing impeller).

Replacement Pump Installation Directions. Fan pilot ring must be pressed on shaft in front of fan hub to pilot fan when pump installed on 1936 and earlier models (see NOTE above). To install pilot ring, remove rear cover plate on pump, support impeller end of shaft in arbor press, press pilot ring on until it just contacts fan hub (do not disturb fan hub position). Fan hub has double set of fan mounting bolt holes to fit all fans. NOTE—Discard this pilot ring (furnished in all pump packages) when installing pump on 1937-38 models.

CADILLAC & LA SALLE TYPE

Used On:
CADILLAC V8, ALL MODELS (1932-35)
LA SALLE V8, ALL MODELS (1932-33)

TYPE:—Adjustable packing type. Packing located under adjusting nut within pump body mounting flange at rear end of pump. Shaft mounted on two bronze bushings (front bushing mounted in pocket in pump cover).

SERVICING:—Lubrication. One grease cup provided. Fill with water pump grease and turn down at 1000 mile intervals.

Packing Adjustment. Special fabric type packing used. To adjust, pull up on adjusting nut locking pin to free adjusting nut, tighten nut as much as possible, then back nut off and turn up again until it just contacts packing.

OVERHAUL:—Disassembly. Remove nuts on front cover bolts, lift off pump front cover. Withdraw impeller and shaft assembly (impeller pinned on shaft). Press out old bushings (front bushing is cupped type and must be pulled).

Assembly. Reverse disassembly directions. See that thrust washer installed between impeller and shoulder on front bushing in pump cover.

Clearances. Shaft clearance in bushings should be .001-.003" (new), .005" (worn limit). Clearance between impeller and pump housing .055-.070" (new), .080" (worn limit).

CADILLAC & LA SALLE 1937-39 TYPE

Used On:
CADILLAC V8, ALL SERIES (1936-37-38-39)
LA SALLE V8, SERIES 50 (1937-38-39)

TYPE:—Self-adjusting type (no packing adjustment required in service). Packing rings installed at each end of rear bushing with packing spring located between bushing and front packing ring. Shaft mounted on bushing at rear and sealed type ball bearing at front end.

Lubrication. Grease fitting provided for rear bushing and packing assembly. Should be filled with water pump grease (G-13) every 1000 miles (front bearing requires no attention).

OVERHAUL:—Disassembly. Remove nut and lockwasher on front of pump pulley, remove pulley and woodruff key in shaft. Remove bearing snap ring in front end of housing, push impeller to rear to expose split washer in back of front bearing, remove washer. Remove snap ring at forward end of rear bushing assembly, withdraw impeller and shaft through rear end of housing. Remove rear bushing assembly toward front noting location of spring, spring seats, bushing and packing rings to insure correct reassembly. If necessary, press front bearing out of housing toward front, press bushing out of bearing.

Bushing & Packing Assembly. To assemble packings on shaft, install special pilot, No. J-831, on end of shaft, insert shaft in pump housing, wind washer groove on shaft with string to avoid damage to packing rings. Coat packing rings with water pump grease, install packing, spring, and bushing parts in same order as removed from pump (make certain that bushing installed with grooved side toward rear packing rings).

Pump Assembly. Reverse disassembly directions given above. Make certain that split washer and snap rings correctly installed and that fan pulley key is in place in shaft before tightening pulley nut.

CADILLAC V12, V16 TYPE

Used On:
CADILLAC V-12, ALL MODELS (1934-35-36-37)
CADILLAC V-16, ALL MODELS (1934-35-36-37)

TYPE:—Self-adjusting type (no packing adjustment required). Packing is installed on shaft at outer ends of bushings with loading spring in housing between bushings. Shaft mounted on two floating bushings in housing with thrust button at impeller end (in rear face of pump body). Shaft bushings are oilite type and should be lubricated with water pump grease (G13) through pressure fitting on top of pump body.

OVERHAUL:—Disassembly. Remove nuts on front cover bolts, withdraw front cover and impeller assembly from pump body. Withdraw impeller from cover toward rear. Take out snap ring at forward end of shaft hub, remove packing rings, bushings and spring at forward end. Note order so that pump can be reassembled in same manner.

Packing & Bushing Assembly. Use special pilot J-831 installed on end of shaft and wind string on recess near end of shaft before installing packing rings to avoid damage to rings. Coat chevron packings with water pump grease, install rear packings with convex side forward, then insert rear bushing with grooved side toward packings, install spring, front bushing with convex side out, front packings with convex side out, snap ring.

Assembly. Reverse disassembly directions given above. Shaft clearance in bushings should be .001-.003" (front—new), .001-.0025" (rear—new), .005" (worn limit). Endplay should be .0065-.025" (new), .050" (worn limit).

CADILLAC V16 1938-39 TYPE

Used On:
CADILLAC V16, SERIES 90 (1938-39)

NOTE:—Two pumps used, one pump mounted at forward end of each cylinder bank. Both pumps driven in tandem with fan and generator by dual belts. Both pumps are same design and serviced in same manner.

Fan Hub Assembly Balance. Fan hub is balanced and should be marked when disassembled so that all parts will be replaced in same position (first cars). On later cars, 1/16" hole drilled through all parts and holes should be lined up when assembled.

TYPE:—Packless type with spring-loaded rubber and carbon disc seal assembled in housing in front of impeller. Shaft mounted on two sealed ball bearings in housing. Bearings require no attention in service and should not be disassembled (replace shaft and bearings as a unit).

OVERHAUL:—Disassembly. Take out four pulley capscrews and remove pulleys. Support pulley drive flange in arbor press, press impeller shaft out of flange. Remove bearing lock ring in front end of pump housing, support front end of housing in arbor press, press pump shaft out of impeller, remove shaft and bearing assembly from housing. Remove lock ring at rear end of housing, withdraw carbon seal, rubber seal, spring and spring retainers noting location so that these parts can be replaced in same position.

Seal Assembly. Coat contact surfaces of rubber seal and carbon ring with water pump grease, install front spring retainer (concave side out), spring, rear spring retainer (with shoulder in toward spring), rubber seal, and carbon seal in pump housing, install locking ring.

Pump Assembly. Reverse disassembly directions given above. When pressing impeller on shaft, see that clearance between front face of impeller and pump housing is .015" minimum, .025" maximum.

NOTE—If new pump, or rebuilt pump with new seal, leaks slightly, this may be caused by carbon seal not seating properly on face of impeller and should correct itself after short period of operation.

CHEVROLET TYPE

Used On:
CHEVROLET, ALL MODELS (1933-36)

TYPE:—Adjustable packing type. Packing consists of two pre-formed spiral-wound metallic rings assembled with a spacer between them (lubricant is fed into this space). Shaft mounted on two bushings in pump body.

SERVICING:—Packing Adjustment & Renewal. When limit of packing adjusting nut is reached, back off nut, install special split packing rings without removing old packing. When pump again requires packing, remove spacer and add packing at rear end also.

Lubrication. Fill grease cup above rear bushing with #2½ water pump grease and turn down at 1000 mile intervals. Use engine oil only in front bushing oiler.

OVERHAUL:—Disassembly. Remove fan, use special puller to remove fan pulley. Withdraw impeller and shaft assembly through rear end of pump. Use special pilot driver to press out old bushings in pump body.

Assembly. Use special pilot to press new bushings in pump body. Make certain that thrust washer is installed between impeller and pump body. See that spacer installed between the two packing sections and fill spacer recess with water pump grease.

Engine Block Baffle (1933-35 Models). Special sheet metal baffle plate installed in block behind pump impeller. If baffle removed, use special driver to install (baffle must be 1" from front face of cylinder block). This baffle not used on 1936 models.

CHEVROLET 1937-38 TYPE

Used On:
ALL MODELS (1937), FIRST CARS (1938)

NOTE:—1937 Pumps changed in production as follows:

Engine Nos. 1 to 38076. Original pumps did not have oil hole in lower part of oil reservoir in center of bore between bushings. Replace all pumps without this hole with later type.

Engine Nos. 38076 to 427405. Felt wick installed in hole in lower part of oil reservoir in center of bore between bushings. Only felt wick must be used for replacement (see Overhaul data below).

Engine Nos. 427405 Up. Copper graphite wick with spring (no spring used with felt wick) used instead of felt wick. Use only same type wick for replacement.

1938 Later Cars—Equipped with ball-bearing packless type pump. See following article for data.

TYPE:—Self-adjusting type (no packing adjustment required in service). Chevron type packing rings installed on shaft at inner end of each bushing with spring between packing ring assemblies. Bushings

CHEVROLET 1937-38 TYPE CONT.

are porous bronze type and lubricated from oil reservoir which surrounds pump body. Packing rings lubricated by oil metered by bronze oil wick in body which extends down into oil reservoir.

Lubrication. Reservoir should be kept filled with SAE. No. 20 or 20-W oil (water pumps not in service should be kept filled to prevent bushings drying out, and new bushings must be soaked in oil before being installed).

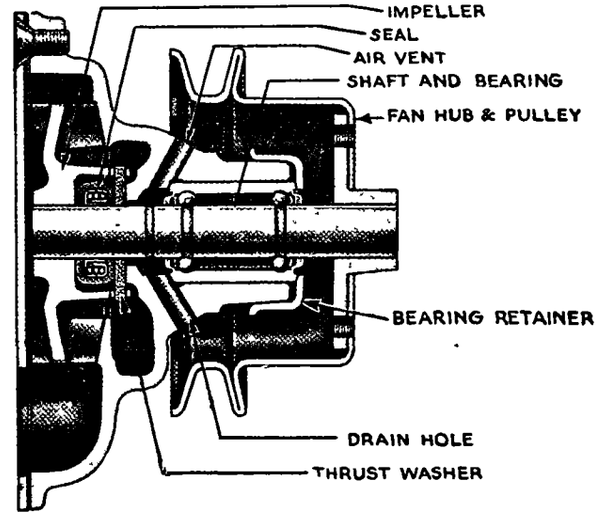
OVERHAUL:—Note. Manufacturer recommends that pump not be dismantled for servicing unless special pump packing tools (bushing and packing drivers and installing sleeve, and oil reservoir replacer) used. New 1938 tools can be used on previous pump model but 1937 tools cannot be used on 1938 water pumps.

Disassembly. Remove two flat headed screws on rear cover plate, remove plate and gasket. Place pump assembly in arbor press and press rotor shaft out of fan and pulley assembly, remove rotor and shaft through rear of pump body. Screw threaded bushing puller into inner (rear) bushing, press bushing out of housing. Remove front bushing in same manner. Remove packing rings, spring seats, and spring. To remove oil reservoir, clamp pump housing in vise (use copper jaws), drive reservoir off body using chisel with flat face. Do not disturb bronze oil wick.

Oil Wick Installation. Oil wick type may be checked by removing oil reservoir cover (see above). Use only same type wick for replacement (felt or copper-graphite—replace pumps without this wick, see note above). Install felt wick by pushing it through hole and flaring end over in bushing bore in housing. Install copper graphite wick by pressing it into hole within 1/16" of inner surface of bushing bore (use this type only in pumps with wick spring).

Bushing & Packing Assembly. Soak new bushings in light engine oil before installing. Use special bushing driver and press front bushing into pump body. Insert packing installing sleeve in rear bushing bore, install two packing rings (dip rings in 20 oil), with grooved side toward front bushing, use packing driver to press packing rings firmly against front bushing, withdraw sleeve, install spring seat (with open 'V' toward packing), spring, second spring seat (with open 'V' toward rear). Use packing sleeve and driver, install 4 ('37), 3 ('38) packing rings (dip in oil, groove side toward rear). Use bushing driver and install new rear bushing (driver pilots in front bushing) in arbor press so that rear end of bushing is flush with end of housing.

Pump Assembly. Use special driver to install oil reservoir on housing (press on in arbor press). Install new thrust washer on shaft, fill space in housing between packing rings with No. 20 oil, insert impeller and shaft, press pulley and fan assembly on shaft so that clearance or endplay is .003-.005". Install rear cover plate using new gasket and staking screws with center punch to prevent loosening.



CHEVROLET 1939 TYPE

Used On:

CHEVROLET, ALL MODELS (1938-39)

NOTE:—This pump used on late 1938 cars. Interchangeable on all 1939 car and truck models provided only that special fan for each model is installed.

TYPE:—Ball bearing, packless type. Seal consists of a spring-loaded rubber seal and thrust washer assembled in impeller hub (spring and spring cups are integral part of rubber seal). Bearing consists of a double row ball bearing permanently assembled on shaft (shaft serves as inner race and cannot be moved) factory lubricated and sealed so that no lubrication required in service. Bearing and shaft assembly is retained in housing by a metal cap which is a press fit on the forward end of the housing. Pulley and impeller are press fit on shaft.

OVERHAUL:—Pump serviced only as a unit by the factory with no exchange.

Disassembly—Take out screws and remove rear cover plate. Use puller to remove fan pulley from shaft, remove bearing retainer cap. Support pump housing in arbor press, press bearing and shaft assembly out of impeller and housing toward forward end, lift off impeller and remove thrust washer and rubber seal from impeller recess. Do not attempt to remove bearing from shaft.

Seal Assembly—Install rubber seal in impeller hub (spring is integral part of seal), place thrust washer on seal with lugs on washer engaging slots in impeller so that washer bears against ground face of pump housing when impeller installed.

Assembly—Assemble pump in reverse order from disassembly. When installing pump on engine, make certain that correct fan installed for each model.

CHRYSLER TYPE

Used On:

CHRYSLER SIX, ALL MODELS (1934 to 1939)
CHRYSLER IMPERIAL, ALL MODELS (1934-37)
CHRYSLER CUST. IMP., ALL MODELS (1934-37)
DE SOTO, SE ('34), SF,SG ('35), S1 ('36), S3 ('37), S5 ('38), S6 ('39)
DODGE, ALL MODELS (1934 to 1939)
PLYMOUTH, ALL MODELS (1934 to 1939)

TYPE:—Packless type. Shaft mounted on two bushings in front of impeller. Lubricated by single lubricant fitting on upper side of housing. Seal consists of spring-loaded rubber seal and washer assembly within impeller hub on shaft.

OVERHAUL:—Disassembly. Drive out fan pulley hub pin, pull hub (use puller C-412), remove capscrews on rear cover plate and remove cover, pull impeller and shaft assembly out of pump. Drive out pin holding impeller on shaft, remove impeller and dismantle seal assembly. To remove bushings, drive front bushing pin into shaft hole to free bushing in housing, use puller C-373 and pull both bushings and thrust washer out at forward end.

Servicing—If new bushings installed, use special tool C-373 (same puller used when removing bushings) to press bushings in place. See that thrust washer installed between bushings with slotted side to rear. Bushings must be line-burnished after installation with tool C-384 (tool also refaces housing). Install locking pin in hole in housing and make certain that pin engages hole in front bushing to prevent bushing turning in service.

Assembly—With impeller assembled on shaft, install seal in following order: thrust spring (small end in), seal retainer (cupped end out), seal, seal retainer washer (glazed surface in toward seal), compress assembly and install lock ring in impeller hub. Install assembly in water pump housing making certain that thrust washer is aligned so that shaft fits properly. Press fan pulley hub on shaft so that clearance for end play between hub and front bushing is .005" (before '39), .003" ('39). Install fan hub (see Note below) and peen retaining pin flush after installing, use new gaskets between pump housing and cover and also between pump and engine block.

Seal Assembly—Lubricate seal with light engine oil and use special tool C-528 to install seal ring on shaft.

Fan Hub Installation—New fan hub must always be used when pump overhauled (old hub will not have satisfactory tight fit on shaft after having been removed. Mark location of old fan hub pin hole on end of shaft before installing new hub, drill new pin hole **at right angles** to old hole through both hub and shaft, install new pin (pin should not project from hub at either end).

Pump Housing Cover—When installing cover plate on back of pump housing, use plain washer (not lockwasher) on screw which projects through housing into water passage.

CHRYSLER BALL-BEARING TYPE

Used On:
CHRYSLER IMPERIAL, C19 ('38), C23 ('39)
CHRYSLER CUST. IMP., C20 ('38), C24 ('39)

TYPE:—Packless type with special factory-lubricated and sealed ball-bearing shaft. Seal assembly is similar to type used on other Chrysler models.
1939 Seal Assembly—Consists of a 'U' section rubber seal (with spring and spring cups located within the seal) used with the regular seal retainer washer.
OVERHAUL:—Disassembly—Use special puller C-498 to pull impeller off shaft. Take out locking ring in slot in pump housing bearing hub, withdraw shaft and bearing assembly at front end of pump housing. To disassemble seal, remove locking ring within impeller hub, withdraw seal retainer washer and seal. To remove fan hub from shaft, drive out pin, use puller C-412 and pull hub off shaft. NOTE—Do not attempt to remove bearing from shaft (bearing and seals serviced as assembly with shaft).
Servicing—If seal retainer washer face on pump body nicked or scratched, reface housing using special tool C-551 (impeller must be removed but shaft must be installed in housing to pilot refacing tool).
Seal Assembly (1938)—See preceding article on Chrysler Water Pump for complete data.
Seal Assembly (1939)—Seal is unit assembly (spring and spring cups located within rubber seal) and cannot be dismantled.
Reassembly—Install seal in impeller hub, install seal retainer washer (glazed side in toward seal) and locking ring. Install shaft and bearing assembly in pump housing, press impeller on shaft, install locking ring in pump housing slot (ring must engage at center of bearing). See Chrysler Water Pump (above) for fan hub installation data.

DE SOTO BALL BEARING TYPE

Used On:
DE SOTO, AIRFLOW MODEL S2 (1936)

TYPE:—Packless type. Shaft mounted on two ball bearings in pump housing in front of impeller. Seal assembly similar to type used on other Chrysler and De Soto models (see preceding article).
OVERHAUL:—Disassembly. Remove fan, drive out pulley hub pin, pull hub off shaft, withdraw impeller and shaft assembly through rear end of housing. To remove bearings, take out locking ring in forward end of housing in front of bearing outer race, withdraw front bearing, spacer and rear bearing.
Assembly. Install impeller and shaft (with seal assembly) in housing, install rear ball bearing on shaft and in housing so that it seats against shoulder in housing. Slide bearing spacer in place on shaft, install front bearing so that it contacts spacer, install locking ring. Install pulley and hub, pressing hub on shaft until it contacts front bearing inner race. Drill hub and shaft for locking pin, install pin and peen ends over before installing fan.

FORD TYPE

Used On:
FORD, ALL MODELS (1933-36)

TYPE:—Packless type. No packing or other type of seal used. Shaft mounted on single bronze bushing in pump housing and retained by retaining nut within fan pulley at forward end of pump housing (this nut is not a packing nut). Bushing is porous type and extends through oil reservoir in center of pump body from which oil feeds through bushing to shaft. Shaft drives impeller through tongue-and-slot coupling, impeller is free and is retained in position in housing by coil spring (first type) flat spring (later type) and thrust button which engage rear face of impeller.
Special Truck Type. Same design as above except that shorter bushing used and roller bearing mounted on forward end of shaft. Serviced in same manner as passenger car type.
SERVICING:—Lubrication. Keep oil reservoir in pump housing filled with engine oil (oil will not seep through bushing unless reservoir full). On truck type, pressure gun fitting provided for forward roller bearing.
OVERHAUL:—Disassembly. Disengage pump spring in impeller end of housing, withdraw spring and impeller. Unscrew retainer nut on forward end of housing (within fan pulley), withdraw shaft from housing. Press out old bushing.
Assembly. Reverse disassembly directions above. New bushing should be pressed in place in pump housing. See that retainer nut securely tightened.

FORD '85', LINCOLN ZEPHYR, MERCURY TYPE

Nos. 78-8501 (R.H.), 78-8502 (L.H.)
FORD V8 '85', PASS. CAR & COMM'L. ('37-39)
MERCURY V8, MODEL 99A (1939)
Nos. 79-8501 (R.H.), 79-8502 (L.H.)
FORD V8 '85' & '95' TRUCKS ('36-37-38-39)
Nos. H-8501-B (R.H.), H-8502-B (L.H.)
LINCOLN-ZEPHYR, H (1936), HB (1937)
Nos. 86H-8501-A (R.H.), 86H-8502-A (L.H.)
LINCOLN-ZEPHYR, MODEL 86H (1938)
Nos. 86H-8501-B (R.H.), 86H-8502-B (L.H.)
LINCOLN-ZEPHYR, 86H (1938), 96H (1939)

NOTE:—These pumps are similar except that '78' types (passenger car models) have porous bronze bushings and are lubricated with oil, '79' types have ball bearings packed with grease. Lincoln Zephyr (86H type) has porous bronze bushing at rear with oiler for lubrication, ball bearing at forward end packed with grease. All models serviced in similar manner except for removal of shaft and bearing assemblies (see directions for each model below).

TYPE:—Packless type with special seal assembled in recess in impeller hub (Ford), special packing cage at impeller end of shaft (Lincoln Zephyr). Bronze bushing is porous and lubricated by oil from engine oiling system (Ford), through oiler on top of pump body (Lincoln Zephyr). Ball bearings are packed with grease at assembly and require no further attention.
OVERHAUL:—Disassembly (Ford). Place pump in arbor press, press impeller and shaft assembly out of pulley (see note below for '79' types), lift off pulley and front thrust washer, remove impeller and shaft through rear of housing. Press old bushing out of housing. To dismantle seal, remove snap ring within impeller hub at forward end, remove seal parts (note order and assemble in same positions).
NOTE FOR '79' PUMPS. Shaft and bearing assembly must be pressed out of housing toward forward end (bearing seats against shoulder in housing at rear). Do not dismantle this assembly (replace as a unit).
Disassembly (Lincoln Zephyr). Remove drive pulley pin, press pulley off shaft, remove front ball bearing lock ring (in outer end of pump housing hub), remove impeller shaft pin, press shaft and bearing assembly out of pump toward front.
Seal Assembly. When installing seals, install parts in following order: Spring (large end in toward impeller), Spring Guide (tangs out), Seal Clamp Ring, Seal (with projecting face in, and lugs engaging slots in impeller hub), Thrust Washer (engage lugs in impeller hub slots), Snap Ring.
Pump Assembly. Use special tool V-247 (Ford), Z-191 (Lincoln Zephyr) to reface front and rear thrust surfaces of pump housing (necessary to prevent excessive thrust washer wear). Use special reamer Z-193 to ream bushing on Lincoln Zephyr pumps. To assemble pumps, reverse disassembly directions above. On Lincoln Zephyr, make certain that felt packing, retainer, and locking ring in place behind front ball bearing, and that front spacer and locking ring installed to retain bearing. Fill oil reservoir in pump housing with engine oil.

FORD '60' TYPE

No. 52-8501-B (R.H. & L.H.)
FORD V8 '60', FIRST CARS ONLY (1937)
No. 52-8501-C—See Note
FORD V8 '60', ALL MODELS (1937-38-39)

FORD '60' NOTE:—This pump differs from 52-8501B type (used on first '60' Engines) in that pump body is not conical (inner gasket seats against shoulder on body) and no separate retaining nut is used (outer gasket seats against pump body flange). Except for these points, all '60' pumps are serviced in same manner.

TYPE:—Packless type. Pump is special design with conical body which fits into recess in engine front cover (mounting bracket and gear cover) and is retained by large nut directly behind pulley. Pump interchangeable for right and left hand mounting. Impeller is driven by shaft through tongue-and-slot coupling and is retained by spring running through shaft to retainer button under rubber cap on forward end. Shaft mounted on bushing (rear), and ball bearing (front) which is part of shaft assembly (bearing is single row ball type with shaft serving as inner race). Pump lubricated by engine oiling system through oil lead at center of body (body sealed by gasket at each side of oil channel).
OVERHAUL:—Special service tool set recommended for pump servicing (includes spring tools to remove impeller without damaging spring and drivers to install shaft and bearing assembly).
Disassembly. Remove rubber cap on forward end of pulley, use tool S-221 to pull retainer button out slightly so that wedge S-222 can be inserted between spring coils to hold spring (do not pull spring out further than necessary to avoid stretching it), unhook retainer button, remove impeller and spring at rear end. Mount pump in S-225 holder in arbor press, press pulley off shaft, remove locking ring at forward end of body, press shaft and bearing out. Press out old bushing, ream new bushing after it is pressed in place.
Assembly—Reverse disassembly directions. When installing shaft and bearing assembly, use S-226 and S-226-B drivers as a combination to prevent damage to ball bearing. Assemble spring to impeller and use S-223 tool to pull spring through shaft so that retainer button can be assembled. Use new gaskets on body when installing pump (these gaskets seal oil channel). Tighten large retainer nut securely.

GRAHAM TYPE

Used On:

GRAHAM CAVALIER, MODELS 90, 90A (1936)
GRAHAM SUPERCHARGER, MODEL 110 (1936)

TYPE:—Packless type with spring-loaded carbon disc type seal assembled in recess in impeller hub at rear end of pump. Shaft mounted on two ball bearings assembled on shaft (spacer between bearings, assembly retained by bearing nut at rear end).

SERVICING:—Lubrication. Pressure fitting provided on top of housing. Use light chassis lubricant only (do not use water pump grease).

OVERHAUL:—Disassembly. Take out capscrews on shaft flange, remove fan and fan pulley, take out 'U' shaped snap ring at forward end of pump housing, press shaft forward out of impeller, remove shaft and bearing assembly through forward end of housing. To dismantle bearings, bend up locking washer ears, remove bearing nut on rear end of shaft, remove bearings and spacer from shaft.

Seal Assembly. Same as for other Graham models. See following article.

Assembly. Reverse disassembly directions. Make certain that locking washer ears are turned over on bearing nut before inserting shaft and bearing assembly in housing.

GRAHAM TYPE

Used On:

***GRAHAM CRUSADER, 80, 80A ('36), 85 ('37)**
GRAHAM CAVALIER, 95 (1937)
GRAHAM SUPERCHARGER, 116, 120 (1937)
GRAHAM, STD. & SPECIAL 96 (1938-39)
GRAHAM, SUPERCHARGER 97 (1938-39)

*1936 Models after Eng. No. 308875.

TYPE:—Packless type with spring-loaded rubber and carbon disc type seal assembled in recess in impeller hub at rear end of pump housing. Shaft mounted on double row ball bearing (special type assembled integrally on shaft with shaft serving as inner race, cannot be disassembled and should be replaced as a unit). Bearings are sealed type, packed with lubricant at factory and require no attention in service.

OVERHAUL:—Disassembly. Take out capscrews and remove rear cover plate, remove bearing locking wire from housing (end of locking wire visible in slot in housing hub at center of bearing assembly). Support pump housing in arbor press, press shaft out of impeller and shaft and bearing assembly out of housing toward front end.

Seal Assembly. Install seal in same order as when taken out (carbon disc next to housing, rubber seal with larger diameter against carbon disc, spring retainer with dished side toward rubber seal, spacer, and spring with large end toward rubber seal).

Pump Assembly. Reverse disassembly directions given above. Make certain that locking wire is installed to retain bearing and shaft assembly.

HUDSON & TERRAPLANE TYPE

Used On:

HUDSON, ALL MODELS (1936-37-39)
TERRAPLANE, ALL MODELS (1936-37-38)

REPLACEMENT PUMP NOTE:—Replacement pump for 1934-35 Hudson and Terraplane models is same design as following type and is serviced in same manner.

TYPE:—Packless type. Requires no adjustment in service. Seal consists of spring-loaded rubber seal and thrust washer assembled in impeller hub and retained by locking ring at forward end of hub. Shaft mounted on two bushings with lubricant reservoir in housing between bushings (single fitting on top of housing, should be filled with water pump grease). Pump assembly consists of two major parts, front housing or pump body with shaft and impeller assembly, rear impeller housing which is bolted to engine and forms pump chamber.

1939 Water Pump Seal—New cupped seal retainer is used at impeller end of rubber seal which retains rubber seal under compression so that tighter fit secured at shaft which prevents leaks at this point. Seal is installed in same manner as previous type.

1939 Later Cars—Beginning with car #40780, new impeller assembly used with new shaft seal compression spring washer (spring reversed so that small end against washer and large end against impeller). NOTE—This new Impeller Assembly No. 158937 may be installed on 1938 and early 1939 cars.

OVERHAUL:—Pump shaft is peened over at each end to retain impeller and fan hub. Manufacturer recommends use of special Tool Set J-788 consisting of special body to be bolted to pump in place of impeller housing, pullers and pushers (for bushing service), and cutter (to remove burr on shaft so that shaft can be pressed out).

Disassembly:—Remove fan and pulley, take out screws and remove impeller housing. Clamp pump upright in vise (grip fan hub in vise jaws), mount tool set body on pump, assemble cutter and thumbscrew and cut burr off shaft at impeller end (turn cutter with wrench while applying pressure with thumbscrew). Install driver and press shaft through impeller, remove shaft from forward end. Lift off impeller and baffle plate, pull old bushings (rear bushing toward rear, front bushing toward front). To dismantle seal, take out locking ring in impeller hub, lift out seal parts.

Bushing Installation—New bushings have inside diameter of .6205-.6206" which is reduced to .6185-.6190" when bushing pressed in place. Bushings cannot be reamed and special bushing pilot must be used to press bushings in (driving bushings with hammer cause bushings to collapse). Shaft clearance will be .0015-.0025" if bushings properly installed.

Assembly—Press new bushings into place. Assemble seal in following order: compression spring, seal retainer, seal, thrust washer, locking ring (see that it engages groove in impeller hub). Install shaft assembly, place baffle and new impeller assembly on shaft, peen impeller end of shaft (use ball peen hammer) until endplay as measured between pulley flange and front bushing face is .005-.009" (first type impeller), .010-.014" (with late 1939 type impeller). Assemble impeller housing on pump body, fill grease reservoir with aluminum soap base lubricant.

NOTE—Thrust face of rear bushing must be burnished smooth and flat to prevent thrust washer wear. Use burnishing tool J-733A-5 (spin burnishing tool with socket wrench with thumbscrew 'finger tight' to supply pressure, release pressure while turning tool—this is important). Bushing face must be highly polished and free from all burrs or scratches.

HUPMOBILE SIX TYPE

Used On:

HUPMOBILE SIX, 417-W, 421-J ('34), 517-W, 521-J, 518-D ('35), 618-G ('36), 822-E ('38), 922-E ('39)
HUPMOBILE SKYLARK, MODEL R (1939)

TYPE:—Adjustable packing type. Packing located under adjusting nut on pump housing (at rear of front bearing assembly) and consists of two packing sections separated by a drilled separator (separator lines up with grease channel and distributes grease to shaft). Shaft is mounted on ball bearing (front), bushing in housing (rear) and fan hub and impeller are pressed on shaft.

ADJUSTMENT:—Packing Adjustment. Turn down grease cup first, turn up packing nut until shaft is locked, then back nut off one-fourth turn, operate engine. This procedure should be repeated several times to secure good packing seat on pump shaft.

NOTE—When limit of packing adjustment nut travel is reached, nut can be backed off and special service split-packing installed without dismantling pump.

Lubrication. Fill rear bushing grease cup with water proof grease and turn down every 1000 miles. Plug in housing above front ball bearing should be removed and bearing lubricated at 20,000 miles intervals with high melting point ball bearing grease such as Keystone No. 44.

OVERHAUL:—Disassembly. Back off packing nut, remove snap ring in front of front ball bearing in forward end of pump housing. Support pump housing in arbor press, press shaft out of impeller, remove shaft and ball bearing at forward end of housing. Press old bushing out of pump housing. Remove all old pump packing and separator, clean grease out of separator groove and holes.

Assembly. Press new rear bushing into pump housing, coat new packing assemblies with heavy graphited oil before installing in housing. Front ball bearing should be packed with high melting point lubricant. Assemble by reversing disassembly directions above. Impeller and fan hub must be tight press fit on shaft and pressed on so that shaft is flush with end of hub. Install ball bearing with shielded side out toward fan and make certain that retaining snap ring is installed in front of bearing.

HUPMOBILE EIGHT TYPE

Used On:

HUPMOBILE EIGHT, 427-T('34), 527-T, 521-O('35), 621-N ('36), 825-H ('38), 925-H ('39)

TYPE:—Packless type with spring-loaded cork and bakelite seal assembled on shaft in recess in impeller. Impeller shaft mounted on two ball bearings in pump housing. Bearings are packed with grease at assembly and require attention at 40,000 mile intervals only or whenever pump disassembled.

OVERHAUL:—Disassembly. Take out screws and remove rear cover, remove nut and lockwasher on forward end of impeller shaft, remove fan and pulley hub, take out woodruff key. Remove impeller and

HUPMOBILE EIGHT CONT.

shaft assembly through rear end of housing. Take out capscrews in bearing retainer on front end of pump housing, remove retainer, bearings and bearing spacer. Disassemble seal in impeller recess on shaft (note order and replace in same position).

Seal Assembly. Thrust washer and springs are lead plated. To assemble seal, install spring with small end toward impeller, spring washer, cork seal, bakelite seal, and snap ring in impeller recess.

Pump Assembly. Install ball bearings with sealed side out, pack bearings and housing hub with Keystone #44 grease. Make certain that spacer is in place between bearings and that front bearing washer is in place in housing behind outer race.

LINCOLN V12 TYPE

Used On:

ALL V12 MODELS (1933 to 1939)

TYPE:—Adjustable packing type. Impeller is mounted on center of shaft with bronze-bushed bearing in cover plate at rear of pump. This bearing lubricated by lubricant connection in plug at rear end of shaft. Packing is installed under packing adjusting nut on forward end of pump housing behind generator (pump driven through flexible coupling by generator armature shaft).

SERVICING:—Packing Adjustment. Adjusted in usual manner by turning up packing adjusting nut.

Lubrication. Lubricate fitting on rear end of pump at 1000 mile intervals using gear lubricant.

OVERHAUL:—Disassembly. Press drive fitting off forward end of pump shaft, remove rear cover plate, withdraw impeller and shaft through rear of pump housing. Impeller is retained on shaft by pin in hub at forward end. Thrust washers on face of pump housing and cover plate are pinned in place.

Pump Assembly. Reverse disassembly directions as given above.

NASH TYPE

Used On:

NASH, ALL MODELS (1933 to 1939)
LAFAYETTE, ALL MODELS (1934-36)
NASH-LAFAYETTE, ALL MODELS (1937-38-39)

NOTE:—Pumps on all models are similar design but have slight differences in construction (cover plate at rear on some models, at front on shaft on others). All models serviced in same manner.

TYPE:—Adjustable packing type with 'floating impeller'. Pump is mounted on side of engine block and driven by flexible coupling from generator armature shaft. Packing adjusting nut provided on shaft on forward end of pump.

SERVICING:—Packing Adjustment. Adjusted in usual manner by turning up packing adjusting nut. Make adjustment with engine running and turn up nut only enough to stop leaks.

Lubrication. Pressure fittings on housing at rear of packing nut. Lubricate with water pump grease at 2000 mile intervals.

OVERHAUL:—To dismantle pump, take out screws and remove cover plate (at front or rear of pump housing), withdraw impeller and shaft. Assemble in same manner.

OLDSMOBILE & PONTIAC 1934-36 TYPE

Used On:

OLDSMOBILE SIX, F-34 ('34), F-35 ('35), F-36 ('36)
OLDSMOBILE EIGHT, L-35 ('35), L-36 ('36)
PONTIAC SIX, 701A,B ('35), 36-36A,B ('36)
PONTIAC SIX, 37-26CA ('37)—SEE NOTE
PONTIAC EIGHT, 601 ('34), 605 ('35), 36-28 ('36)
PONTIAC EIGHT, 37-28CA ('37)—SEE NOTE

NOTE:—Pontiac 1937 Models. This type pump used on first 1937 cars only. See following article for pump used on cars after Engine No. 6-262194 (Six), 8-95994 (Eight).

TYPE:—Adjustable packing type. Packing installed under adjusting nut at forward end of rear bushing (bushing threaded for nut). Shaft mounted on two bushings in housing (shoulder on rear bearing takes impeller thrust). Oilers provided for both bushings.

Pontiac 1937 Models. Special needle roller bearing used instead of bushing at forward end of pump (rollers retained by cage which serves as outer race, no inner race used). Pressure gun fitting provided to lubricate this bearing.

SERVICING:—Lubrication. Use engine oil only in oiler for each bushing (chassis lubricant in grease fitting for front bearing on 1937 Pontiac models).

Packing Replacement. Shaft must be removed from pump (see Disassembly directions below). Coat new packings and shaft with engine oil before replacing.

OVERHAUL:—Disassembly. Take out capscrews and remove fan (fan hub integral with shaft). Remove cover plate on rear face of pump housing, loosen packing nut. Support pump housing in arbor press, press shaft out of impeller, lift out impeller, remove shaft at forward end of housing. Press out old bearings (either bushing may be removed without disturbing opposite bushing). NOTE—On 1937 Pontiac, front needle bearing is retained by retainer installed in recess in housing at rear of bearing.

Servicing (Oldsmobile). If new bushings installed use tool J-613 and press rear bushing in first (tool will burnish bushing while pressing it into place). Screw packing nut in place on bushing to retain it and press tool out. Use same tool to install front bushing. Always oil burnishing portion of tool when installing bushings. Bushings should be burnished to inside diameter of .487-.488" and shaft clearance should be .0005-.002".

Servicing (Pontiac). Press new bushings in place and ream with special expansion reamer OR-108 (.483"). Shaft clearance should be .0005-.002".

Assembly. Coat both packing and shaft with engine oil, install packing and packing nut, insert shaft and press impeller on shaft until slightly more than flush with hub. Check endplay. Should be .008-.014".

OLDSMOBILE & PONTIAC 1937-39 TYPE

Used On:

OLDSMOBILE SIX, ALL MODELS (1937-38-39)
OLDSMOBILE EIGHT, ALL MODELS (1937-38-39)
PONTIAC SIX, 37-26CA ('37)—LATER CARS
PONTIAC SIX, ALL MODELS (1938-39)
PONTIAC EIGHT, 37-28CA ('37)—LATER CARS
PONTIAC EIGHT, ALL MODELS (1938-39)

NOTE:—These pumps are similar in design except for mounting of seal in pump housing. On Oldsmobile, seal assembly is held in pump housing by locking ring at rear end. On Pontiac, no locking ring is used and 'ears' on graphite washer engage slots in housing to prevent washer turning. NOTE—Washer used on 1937 type pump did not have these 'ears' and housing was not slotted.

TYPE—Packless type with special factory-lubricated and sealed ball bearing shaft. Requires no adjustment or lubrication in service. Bearing cannot be disassembled and must be replaced as unit with shaft (shaft serves as inner race). Seal consists of carbon graphite washer and spring loaded rubber sealing cup in recess in housing at impeller end

OVERHAUL:—Disassembly. Remove fan and pulley, and cover plate on rear of pump housing. Take out shaft retainer wire (bearing lock ring) in slot at top center of bearing hub on housing. Support front face of pump housing in arbor press, press shaft and bearing assembly out of impeller and housing toward front end. Remove seal assembly from housing (On Oldsmobile models, first take out locking ring in seal recess at rear of housing). If shaft and bearing assembly being replaced, press fan hub off old shaft and install on new shaft.

Servicing—If bearing retainer wire worn (indicating that bearing rotates and has excessive end thrust), or if impeller scrapes on housing due to excessive end thrust, pump assembly should be replaced. If bearing is rough or bearing seals loose in outer race so that they can be turned by hand, replace bearing and shaft assembly. Carbon washer, rubber seal, and spring are furnished as a package unit.

Assembly—Install seal assembly in pump housing in following order: inner spring cup (cupped side out), spring, outer spring cup (flange out toward seal), rubber seal (smaller diameter out, make certain that flared portion of inner spring cup enters rubber seal so that it is retained in housing when installed—see illustration), carbon washer (flat surface toward seal on Oldsmobile, polished surface toward impeller on Pontiac). Install locking ring on Oldsmobile models, see that ears on carbon washer engage slots in housing on Pontiac. Insert bearing and shaft assembly in from front, lining up retainer grooove with slot in housing (if bearing is press fit in housing, remove fan hub install bearing in arbor press applying pressure on outer race only, re-install fan hub applying pressure to impeller end of shaft and allowing housing to float on bearing so that no pressure exerted on bearing or races). Press impeller on shaft (support assembly on fan end of shaft) until clearance between rear face of impeller and face of cover plate flange on housing is 1/32" (Oldsmobile), 9/64" (Pontiac). Install shaft retainer wire through slot in housing, use new gasket and install rear cover

Installation (Oldsmobile only)—Use new rubber grommet between water pump and by-pass port in cylinder head to prevent leaks at this point when pump installed on engine. NOTE—This bypass not used on 1939 Six Cylinder Models F-39, G-39.

PACKARD 6 & 8 1935-37 TYPE

Used On:

PACKARD SIX, MODEL 115C (1937)
PACKARD 120, 120 ('35), 120B ('36), 120C ('37)

TYPE:—Adjustable packing type. Packing located under adjusting nut at forward end of rear bushing (bushing threaded for adjusting nut). Shaft mounted on two bushings inserted in pump housing. Oiler provided in housing for each bushing.

SERVICING:—Lubrication. Fill each oiler with SAE. #30 engine oil at 2000 mile intervals. Front oil reservoir has felt filler which retains oil.

Packing Renewal. Original packing is continuous ring type. When limit of adjustment reached, remove fan and pulley, backing off adjusting nut, remove old packing, install special split ring type service packing.

OVERHAUL:—Disassembly. Take out capscrews and remove fan and pulley, remove pump housing rear cover. Heat impeller in boiling water, press shaft out of impeller, remove shaft at forward end. Press out old bushings (rear bushings must be removed through rear opening, this bushing has shoulder which takes impeller thrust).

Assembly. Reverse disassembly directions. Heat impeller in boiling water before installing, press on shaft until clearance between front face of impeller and pump housing is .021-.029". Clearance between rear face of impeller hub and pump cover must be .005-.015". Use new gasket when installing cover plate.

PACKARD 6 & 8 1938 TYPE

Used On:

PACKARD SIX, SERIES 1600 (1938)
PACKARD EIGHT, SERIES 1601, 1602 (1938)

TYPE:—Packless type with special double-row ball bearing shaft. Requires no adjustment in service. Bearing and shaft must be replaced as an assembly (shaft serves as inner race and cannot be dismantled). Bearing oiled by wick in plug in lower side of pump housing (wick extends through outer race to contact shaft). Seal consists of spring loaded rubber seal and composition washer in recess in impeller hub (held by locking ring at forward end of hub).

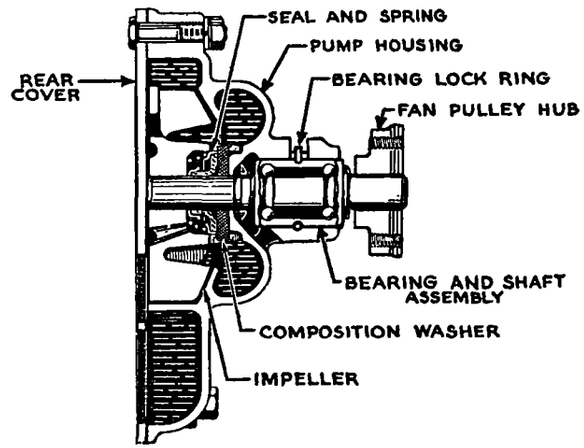
OVERHAUL:—Disassembly. Remove fan and pulley. Unscrew oil wick plug on underside of housing, remove cover plate on rear of pump housing. Support pump housing in arbor press, press shaft and bearing assembly out of impeller and housing. To dismantle seal assembly, take out locking ring in forward end of impeller hub, withdraw seal parts.

Servicing:—Bearing and shaft must be replaced as an assembly. When renewing seal, install spring with large end out, seal with flange out, composition washer with convex side out and install locking ring in hub groove.

Assembly:—Reverse disassembly directions above. Heat impeller in water just below boiling point before installing. Press impeller on shaft until clearance between edge of vanes and housing is .030-.050". Coat gaskets with Perfect Seal Grade A paste, make certain that gasket on oil wick plug is in good condition and tighten plug securely to prevent oil leaks (fill reservoir with SAE. No. 30 engine oil).

PACKARD 6 & 8 1939 TYPE

Used On:



SIX, MODEL 1700 (1939)
'120' EIGHT, MODELS 1701, 1A, 2 (1939)
SUPER EIGHT, MODELS 1703, 3A, 5 (1939)

TYPE:—Packless type with ball-bearing shaft similar to 1938 design except that oiler and oil wick not used and bearing permanently packed with lubricant during assembly (no lubrication required in service).

OVERHAUL:—Note—Rebuilt pumps available from factory on 'exchange' basis. To service pumps proceed as follows:

Disassembly—Remove fan and pulley, take out bearing locking ring in slot in bearing hub on housing. Support pump housing in arbor press, press impeller off shaft, remove shaft and bearing assembly through front of housing. To remove seal, take out locking ring in impeller hub, withdraw composition thrust washer, rubber seal, spring cup and spring. NOTE—Do not remove fan pulley hub or attempt to remove bearing from shaft. Shaft, bearing, and pulley hub serviced as an assembly.

Seal Assembly—When installing seal in impeller, make certain that small end of spring in toward impeller, coat inner surface of seal with glycerine and install with larger flanged face out toward composition washer, install composition thrust washer with smooth (convex) face out toward pump housing, install locking ring.

Assembly—Install shaft and bearing assembly in pump housing making certain that locking ring groove in bearing lines up with slot in pump housing. Coat impeller end of shaft with glycerine (to prevent damage to seal when impeller pressed on. Heat impeller in water just under boiling point for 1½ minutes, press impeller on shaft until clearance between impeller vanes and housing is .030-.050". Coat pump cover gaskets with Perfect Seal Grade A gasket paste when installing cover. Make certain that bearing locking ring installed in pump housing slot.

PACKARD SENIOR LINE TYPE

Used On:

PACKARD EIGHT, ALL MODELS (1932-36)
PACKARD SUPER 8, ALL MODELS (1932-38)
PACKARD TWELVE, ALL MODELS (1932-39)

NOTE:—These pumps are similar in design except for slight differences in bearing assembly. All other servicing instructions apply equally to both models.

TYPE:—Adjustable packing type. Packing located under adjusting nut on pump cover (at rear of bearing assembly). Shaft mounted on two ball bearings in recess in housing (space between bearings forms oil reservoir and is packed with oil-soaked felt). Fan hub is integral with pulley and is keyed on shaft and held by nut at forward end.
NOTE—On 1932-35 Eight and Super Eight models, bearings are not sealed and regular leather oil seal installed at each end of bearing bore in housing to retain oil.

ADJUSTMENT:—Original packing is continuous ring type. Split type packing rings furnished for service and can be installed without removing pump shaft (back off nut and install service packing ring when limit of adjusting nut travel is reached).

Lubrication—Both bearings lubricated by single oiler on top of bearing housing. Use SAE. No. 30 (summer), 20-W (winter) engine oil.

OVERHAUL:—Disassembly. Remove fan, take off pulley retaining nut at forward end of shaft, pull pulley, remove key from shaft. Shaft and impeller can then be withdrawn toward rear. Impeller mounted on shaft by pointed setscrew in hub which controls clearance between impeller vanes and housing.

Bearing Assembly (Super Eight)—Bearings positioned by snap ring in housing at inner end of each bearing outer race (front bearing retained by cover plate on forward end of housing). Shaft endplay adjusted by using gaskets as shims under this cover plate and should be .005-.010". Rear bearing inner race is seated against shoulder on shaft at rear end, spacer installed between bearings, and assembly is clamped together by pulley hub when nut at forward end of shaft is tightened. When installing bearings, soak felt packing in housing with SAE No. 50 engine oil and make certain that packing washer installed at each end with cupped side out toward bearing.

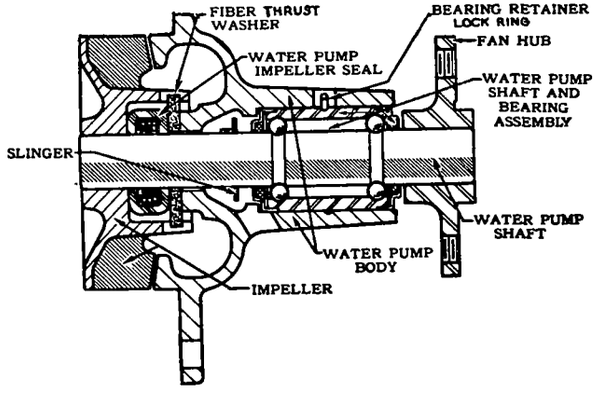
Bearing Assembly (Twelve)—Same as for Super Eight except that snap rings not used in housing and rear bearing outer race seated against shoulder in housing (both bearings must be removed at front).

Pump Assembly—Reverse disassembly directions. See that clearance between face of impeller blades and pump body is .010-.034" (Super Eight), .025-.042" (Twelve). This clearance controlled by impeller setscrew which engages hole in shaft.

STUDEBAKER CHAMPION TYPE

Used On:

STUDEBAKER, CHAMPION MODEL G (1939)



TYPE:—Packless type with spring-loaded rubber seal and fiber thrust washer assembled within recess in impeller. Shaft mounted on special sealed double row ball bearing which is an integral assembly with the shaft (bearing cannot be removed and assembly serviced as a unit). Pump requires no lubrication in service.

STUDEBAKER CHAMPION TYPE CONT.

OVERHAUL:—Disassembly—Remove bearing lock ring from slot in housing hub at center of bearing. Support housing in arbor press, press shaft and bearing assembly out of impeller and housing toward front end, lift off impeller and remove seal and thrust washer from impeller recess. Support fan hub in arbor press and press shaft out of hub. Do not attempt to remove bearing from shaft (serviced as a unit).

Seal Assembly—Spring and spring cups are located within rubber seal. Install rubber seal in impeller hub and place fiber thrust washer on rubber seal so that ears engage slots in impeller and washer contacts face of water pump housing when impeller installed.

Pump Assembly—Press fan hub on shaft so that front face is flush with end of shaft, install shaft and bearing assembly in pump housing so that groove in bearing lines up with locking ring notch in housing, install locking ring. Press impeller on shaft until clearance between edge of impeller vanes and face of housing is 1/32".

STUDEBAKER TYPE

Used On:

STUDEBAKER, ALL MODELS (1933-38)

STUDEBAKER COMM. 9A, PRES. 5C (1939)

TYPE:—Adjustable packing type. Packing located under adjusting nut at forward end of rear bushing. Shaft mounted on two bushings in pump housing (front bushing within fan pulley).

ADJUSTMENT:—Adjust packing by turning up adjusting nut (insert screwdriver between pulley and pump housing). Packing is grapho-metal ring type and requires more pressure than ordinary packing. To renew packing, thoroughly clean out old packing, install four new packing rings, one at a time, tightening adjusting nut down on each ring as it is installed. This special ring packing prevents shaft scoring (with more than ordinary adjusting nut pressure) and gives longer service.

Lubrication (Dictator 1934-35):—Special porous bronze bushings used (not drilled for lubrication). Use only SAE. #30 engine oil in oilers (one for each bushing).

Dictator 1936-37, All '38-39 Cars. Pressure gun fitting provided for front bushing (use chassis lubricant), grease cup for rear bushing (use Kasson or other water proof grease).

Commander, President 1934-37 Models. Grease cup provided at each bushing. Use Kasson or other water proof grease.

OVERHAUL:—Disassembly. Remove fan and pulley (on models where these are mounted directly on water pump shaft), take off rear cover plate on pump housing, remove nut on forward end of shaft (Dictator 1934), drive out pin on fan hub (Dictator 1935-37), press fan hub or coupling off shaft. Withdraw impeller and shaft through rear of pump housing (impeller pinned to shaft). Remove packing nut and packing, press rear bushing out to rear (see Note), front bushing out toward front end.

NOTE—On Commander & President 1933-37 models, rear bushing is inserted in blind hole in pump rear cover behind impeller.

Bushing Installation—Press new bushings in and check clearance on shaft. Should be .001-.003" (bushings need not be reamed if clearance is correct).

Assembly—Reverse disassembly directions. Make certain that thrust washer installed on shaft next to impeller before installing in pump housing. When pressing fan hub on shaft, see that clearance between hub and flange on forward bushing is .003-.005" for correct endplay. See Packing renewal instructions under Adjustment above.

Fan Hub Servicing—New fan hub should be installed whenever hub removed from water pump shaft. Hub must be tight fit on serrated end of shaft and will be loosened by removal so that tight fit cannot be secured if hub re-installed.

WILLYS TYPE

Used On:

WILLYS, ALL MODELS (1933 to 1939)

NOTE:—See Packing Installation in Servicing Section below for directions for installing new type packing on previous pump models.

TYPE:—Adjustable packing type. Packing consists of two opposed tapered packing rings assembled in recess in forward end of pump bushing and in adjusting nut. Shaft is mounted on ball bearing (front) and bronze bushing (rear). Impeller is pressed on shaft, Pulley and fan hub is keyed on shaft and retained by nut at forward end.

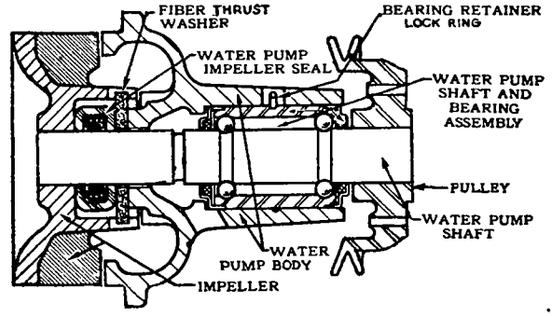
SERVICING:—Packing Adjustment—Adjusted in usual manner by turning up packing nut. Pumps can be packed in service by installing regular (#112367) packing between the two tapered packing halves.

Installing New Type Packing in Old Pumps:—The new style tapered packing rings (fitting in recess in forward end of bushing and in recess in packing nut) can be installed in previous type pumps by installing new Water Pump Shaft Bushing #636457 (which has recess in end for packing), Pump Packing Retainer #636459 (this is bushing to fit in packing nut and provide tapered recess for packing), Two Water Pump Packings #636458. See Overhaul data below for bushing installation.

Pump Lubrication:—Use Kasson waterproof grease in rear grease cup, engine oil in front bearing oiler. Make certain that grease reservoir around bushing is filled (requires one grease cup full of grease to fill channels when empty).

OVERHAUL:—Disassembly. Remove nut on forward end of shaft, pull fan pulley and hub, remove key in shaft. Front bearing retained in housing by end cap on pump body and positioned on shaft by spacer (front), retainer in notch on shaft (rear). Pump shaft rear bushing retained in housing by pin driven in through hole in bushing at bottom (drive pin out to free bushing). Impeller is press fit on shaft (furnished as an assembly).

Bushing Installation. Bushings furnished slightly undersize to insure good fit on worn shafts. Clearance between bushing and shaft should be .0025" minimum. Press bushing into place in pump body, drill dowel pin hole (at bottom), grease channel hole (through bushing at top), install dowel pin.



Pump Assembly. Make certain that oil seal at rear of front ball bearing is in good condition, install ball bearing with shielded side toward front. Clearance between impeller vanes and pump body should be .030" (.020" to .050") with pump assembled and fan pulley nut tight. When installing pump packings, see that wide edges are together (narrow edge of each ring in recess in bushing and packing nut).

WILLYS-OVERLAND TYPE

Used On:

WILLYS-OVERLAND, MODEL 39 (1939)

TYPE:—Packless type with special double row ball bearing shaft (shaft serves as inner race, bearing is sealed type and packed with lubricant at assembly). Shaft and bearing cannot be dismantled and serviced as an assembly. No lubrication required in service. Seal consists of spring-loaded rubber seal in recess in impeller hub and bakelite washer which bears against pump housing face.

OVERHAUL:—Disassembly—Use special W-116 puller and pull impeller off shaft, lift out bakelite seal washer. Remove bearing lock ring from slot in bearing hub on pump housing, support pump housing in arbor press, press shaft and bearing assembly out of pump housing toward forward end. To remove fan pulley from shaft, use any regular puller (special W-115 puller furnished for this purpose) to pull pulley off shaft. Do not attempt to remove bearing from shaft (shaft and bearing serviced as assembly).

Servicing—If rear face of pump housing (on which bakelite seal washer bears) is not smooth and flat, reface with special tool W-114.

Seal Assembly—Rubber seal is of 'U' section with spring in recess in seal. Install seal in recess in impeller hub, place bakelite thrust washer on seal, engaging ears on washer in slots in impeller hub.

Assembly—Reverse disassembly directions above. Make certain that bearing lock ring installed in slot in pump housing bearing hub so as to engage groove in bearing shell.

BUICK TYPE

Used On:

SERIES 40-40, 50, 60, 70, 80, 90 (1940)

This pump same design as used on 1939 Buick cars.

TYPE:—Ball-bearing, packless type. Bearing is sealed type (requires no lubrication in service).

OVERHAUL:—Same as for 1939 models. *See 'Buick Type' Water Pump article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete directions and note following specifications:*

Fan Hub Position (Endplay Adjustment)—Fan hub should be pressed on shaft until distance from face of hub to end of shaft (shaft projection) is exactly 3/8" (40, 50), 3/16" (60, 70, 80, 90). This dimension same as for 1939 models.

CADILLAC-LA SALLE TYPE

Used On:

CADILLAC V8, SERIES 40-60S, 62, 72, 75 (1940)

LA SALLE V8, SERIES 40-50, 52 (1940)

V-16 TYPE

CADILLAC V16, SERIES 40-90 (1940)

These pumps same design as used on 1938-39 cars.

LUBRICATION & OVERHAUL:—Same as for previous models (no lubrication required for V-16 type). *See 'Cadillac & La Salle Type' and 'Cadillac V16 Type' Water Pump articles in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions.*

CHEVROLET TYPE

Used On:

ALL PASSENGER CAR & TRUCK MODELS (1940)

These pumps same design as used on 1939 models.

NOTE:—Pump interchangeable on all Passenger Car and Truck models provided only that correct fan used for each model.

OVERHAUL:—All service operations same as for 1939 ball-bearing, packless type pump. *See 'Chevrolet Type' water pump article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete instructions.*

CHRYSLER TYPE

Used On:

CHRYSLER, MODEL C25 ROYAL & WINDSOR ('40)

DE SOTO, MODEL S7 CUSTOM & DELUXE (1940)

DODGE LUXURY LINER, MODELS D14, D17 (1940)

PLYMOUTH, P9 ROADKING, P10 DELUXE (1940)

These pumps same design as used on corresponding 1939 car models.

TYPE:—Packless type with seal assembly located within impeller hub. Shaft mounted on two bushings in pump housing lubricated from single grease reservoir.

SERVICING:—Lubrication—Single grease fitting provided on lower left side of pump body. Keep reservoir filled with water pump grease (lubricate at 2000 mile intervals).

OVERHAUL:—Disassembly—Drive out fan pulley hub pin, pull hub using C-412 puller (discard old hub, always use new hub whenever hub removed from shaft). Take out screws and remove rear pump cover, withdraw impeller and shaft from rear end of pump body. Take out locking ring within impeller hub, withdraw seal parts. Drive out impeller pin and remove impeller from shaft (if impeller or shaft being replaced singly). To remove pump shaft bushings, drive front bushing pin through into bushing, use puller C-373 to pull both bushings out through front end of pump body.

Seal Assembly—Install seal parts on shaft within impeller hub in following order: Thrust Spring (small end in toward impeller), Seal (use special tool C528 to install seal on shaft and make certain that metal spring cup in toward spring), Seal retainer thrust washer, and locking ring (ring must engage groove in impeller hub).

Pump Assembly—Use puller C-373 to install new bushings in pump body, make certain that thrust washer installed between bushings with large diameter hole toward rear of pump, install pin in hole in pump body and front bushing. Burnish bushings and reface pump housing with special tool C-384 (insert tool through rear end of pump, turn tool evenly in clockwise direction until cut has been taken on rear face of pump housing, withdraw tool while it is still being turned—this is important as tool will leave ridge on housing if turning stopped while tool is still in contact with pump housing face). Install impeller and shaft assembly in pump, mark location of old hub pin hole on front end of shaft. Press new fan hub on shaft (never use old hubs after they have once been removed from shaft) until clearance between front face of bushing and hub is .003", drill new hole through hub and shaft at right angles to old hole location, install new locking pin. Use new gaskets when installing pump cover and when installing pump on engine.

CHRYSLER BALL-BEARING TYPE

Used On:

MODEL C26 TRAVELER, SARATOGA, NEW YORKER (1940)

MODEL C27 CROWN IMPERIAL (1940)

These pumps same design as used on corresponding 1939 car models except for new Seal Assembly.

TYPE:—Pumps are same design as used on 1939 car models except for seal assembly which is same as used on other Chrysler models (see above). No lubrication or other service operations required.

OVERHAUL:—Disassembly—Use special puller C-498 to remove impeller from shaft (back cover normally left on engine when pump removed). Remove lock ring in impeller hub and withdraw seal parts. Drive out pin in fan pulley hub and remove hub with puller C-142 (discard both impeller and hub when removed from shaft, old parts cannot be re-installed). Remove bearing lock ring from groove in pump body hub, pull shaft and bearing assembly out of housing (do not attempt to remove bearing from shaft, no inner race used and these parts furnished as an assembly).

Seal Assembly—See directions above for other Chrysler models. Always use new impeller whenever impeller removed from shaft (old impeller will not fit tightly on shaft if re-installed).

Pump Assembly—Install shaft and bearing assembly in pump body (press on outer bearing race only) so that groove in bearing is in line with groove in body and install bearing locking ring. Use special tool C-551 to reface thrust washer bearing face on pump body piloting tool on pump shaft and using tapered face (85°) first to form 5° angle face, then use opposite end of tool (straight 90°) to form flat surface 1/32" wide (this tapered face causes thrust washer to wear in quickly and results in longer life). Press new impeller and seal assembly on shaft so that endplay is .0025-.0045" (measure between fan pulley hub and front face of pump body). If fan pulley hub has been removed, press new hub on shaft, drill hub and shaft and install locking pin.

FORD-MERCURY TYPE

FORD No. 52-8501C (RH & LH)

FORD '60', ALL MODELS (1940)

78-8501 (RH), 78-8502 (LH)

FORD '85', ALL MODELS (1940) SEE NOTE

MERCURY, MODEL 09A (1940)

79-8501 (RH), 79-8502 (LH)

FORD '95' TRUCK MODELS (1940)

These pumps same design as used on 1939 models.

FORD '85' TRUCK MODEL NOTE:—This 78-8501 & 2 type pump used on all truck models with '85' engine except Cab-over-Engine models. All Cab-over-Engine models equipped with 79-8501 & 2 pumps (same as used on '95' truck models).

OVERHAUL:—Same as for previous models. *See 'Ford 60 Type' and 'Ford 85 Type' Water Pump articles in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following change on Ford '60':*

Ford '60' Pump Housing—Conical pump body and separate retaining nut used on first '60' only. Later models have straight cylindrical body with gaskets seated against flanges on body. Except for this change, service directions same for all '60' pumps.

GRAHAM TYPE

Used On:

MODELS 107, 108, 109 (1940)

This pump same design as used on 1939 models.

OVERHAUL:—Same as for previous models. *See 'Graham Type' Water Pump article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data.*

HUDSON TYPE

Used On:

LATE 1939 CARS—SEE NOTE

SIX, 40T TRAVELER & 40P DELUXE (1940)

SUPER SIX, MODEL 41 (1940)

COUNTRY CLUB SIX, MODEL 43 (1940)

EIGHT 44, COUNTRY CLUB EIGHT 47 (1940)

These pumps same as types used on Late 1939 models (see Note for changes over early 1939 cars).

1939 PUMP CHANGES:—First Cars—Pump used on first cars similar to 1938 except for new cup shaped seal retainer (installed in same manner as 1938 type).

Later Cars (After Car No. 40780)—New Impeller Assembly used with new shaft seal compression spring washer. On this later type pump compression spring is reversed and installed with small diameter end against spring washer and large idameter end toward impeller.

IMPORTANT NOTE—This new Impeller Assembly, Part No. 158937 can be installed on 1938 and early 1939 water pumps. See installation directions below.

OVERHAUL:—Same as for previous models except as noted below. *See 'Hudson & Terraplane Type' Water Pump article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions and note the following changes:*

Seal Assembly—Seal has cup shaped retainer which should be placed next to compression spring washer. Compression spring should be installed in impeller with small diameter end toward washer and large diameter end toward impeller (all 1940 and Late 1939 pumps with new impeller assembly). NOTE—On early 1939 pumps, spring was installed in reverse position with small end toward impeller.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Whenever new impeller is installed in these early pumps, make certain that spring is correctly installed with large end toward impeller.

Pump Service Tools—Pump reconditioning tool set is J-733-S (1939 and 1940 Pumps).

Impeller Endplay—Endplay or clearance between fan pulley and face of front bushing should be .010-.014" (Late 1939 and all 1940 pumps with Impeller Assembly No. 158937) instead of .005-.009" (first 1939 pumps with old style impeller). Endplay is adjusted in same manner as on first pumps by peening end of shaft until endplay is correct.

Bushing Installation—Service bushings are furnished finished (cannot be reamed) and have an inside diameter of .6205-.6206" which is reduced to .6185-.6190" when bushings are pressed in place so that clearance on shaft is .0015-.0025".

CAUTION—Bushing pilot No. 7 (part of reconditioning tool set) must be used when pulling bushings into place. Bushings must not be driven in place (hammer blows will collapse bushings).

Burnishing Bushing—Rear bushing face must always be burnished with burnishing tool No. 8 (part of tool set) to provide highly polished surface for stainless steel thrust washer. When using burnishing tool, thumbscrew should be finger tight and must be released while tool is still being turned (if turning stopped with pressure on tool, crease will be formed on face of bushing).

LINCOLN-ZEPHYR TYPE

Used On:

LINCOLN ZEPHYR MODEL 06H (1940)

These pumps same as types used on previous Lincoln-Zephyr models except as noted below. Right and left hand pumps are not interchangeable.

IMPORTANT PUMP CHANGES:—Two different pumps used on 1940 cars as listed below. All 1940 pumps have new pump body for left hand pump only (Part No. 06H-8504) and some parts are not interchangeable between the different 1940 types.

Type 06H-8501-A (RH), 06H-8502-A (LH)—These pumps are same design as used on previous cars and parts are interchangeable except for new left hand pump body (06H-8504) and new impeller No. 06H-8512-A (used with 4 27/32" shaft H-8511-B).

Type 06H-8501-B (RH), 06H-8502-B (LH)—These pumps have new 5" shaft (06H-8511) and other new parts used with this shaft only as follows: Seal Cage No. 06H-8559 (4 prong type, old cage had 6 prongs), Thrust Washer Disc No. 06H-8557 (4 prong type, old disc had 6 prongs).

SERVICING:—Lubrication—Oiler provided for rear bushing. Lubricate with engine oil at 1000 mile intervals. Front ball bearing requires no attention.

OVERHAUL:—Disassembly—Drive out pin in pulley hub, remove pulley from shaft. Remove bearing lock ring from groove in forward end of pump body hub. Drive out pin in impeller hub, remove impeller and seal assembly from shaft. Press shaft and bearing assembly out of pump body toward front end. To dismantle shaft and bearing assembly, remove locking ring in groove in shaft directly behind bearing, take off bearing felt packing retainer and packing, press bearing off shaft.

Seal Assembly—Seal is assembled in cage which fits on shaft in front of impeller. To assemble seal, install parts in cage in following order: Packing Spring (large end seated in cage), Packing Retainer Washer or cup (cupped end out to receive packing), Seal Packing (fits in cupped end of retainer), Disc or thrust washer. NOTE—Ears on thrust washer disc engage slots in cage. Cage and disc with 6 prongs must be used with 4 27/32" shaft in "A" pumps, 4 pronged type with 5" shaft in "B" pumps

Pump Assembly—To install new bushing in pump body, press old bushing out, press new bushing in so that rear end is flush with thrust washer face in pump body, ream bushing with special reamer Z-193 and reface rear end of bushing and pump body with special tool Z-191. Install front felt retainer, felt packing, inner spacer, and lock ring on shaft behind front ball bearing, press shaft and bearing assembly in pump body, install outer spacer on shaft in front of bearing and lock ring in pump body groove. Install seal assembly and impeller on rear end of shaft, pin impeller to shaft.

NASH TYPE

Used On:

NASH-LAFAYETTE, MODEL 4010 (1940)
NASH SIX 4020, EIGHT 4080 (1940)

These pumps same design as used on corresponding 1938-39 car models.

SERVICING & OVERHAUL:—Same as for previous types. *See 'Nash Type' Water Pump article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete instructions.*

OLDSMOBILE TYPE

Used On:

SIX '60' MODEL F-40, '70' MODEL G-40 (1940)
EIGHT, SERIES 90, MODEL L-40 (1940)

These pumps same as 1938-39 types except as noted below (see Note for late 1939 changes).

1939 PUMP CHANGE NOTE:—Neoprene Seal, No. 503282, installed on rear of bearing to protect bearing from moisture on all late 1939 water pumps. This seal replaced by brass moisture slinger on '40 pumps.

1940 PUMP TYPES:—These pumps same as previous types except as follows:

Brass Moisture Slinger—Consists of small cup shaped brass slinger installed on shaft at rear of ball bearing. This slinger, No. 413778, serviced separately and new slinger should be installed whenever pump is serviced. See directions below.

Fan Pulley Hub—1940 type is 1/8" shorter than type used on 1939 pumps. 1939 type hub cannot be used on these 1940 pumps.

OVERHAUL:—Same as for previous types except as noted. *See 'Oldsmobile & Pontiac Type' Water Pump article in Mechanical Equipment Section of manual (or 1938 Supplement) for complete data and note following changes:*

Pump Shaft Moisture Slinger—To install slinger, start slinger on shaft with flared end toward bearing, stand shaft and bearing assembly in arbor press with slinger end up, use special tool J-1446 to press slinger down on shaft until slight drag is felt on .025" feeler placed between end of bearing and slinger. CAUTION—This .025" clearance between slinger and bearing is necessary to secure proper protection for bearing without slinger dragging on bearing which will cause noise.

Seal Assembly—Machined seat in pump housing must be smooth and clean to insure good seating of seal. Make certain that seat not scored, clean with thinner to remove all dirt and gum, wipe dry before installing seal. Soap solution may be used to wet housing to facilitate seal installation. See that seal does not hang up on sides of casting.

Pump Bypass in cylinder head—Used on eight cylinder L-40 model only. Install new neoprene grommet in bypass hole when installing pump.

PACKARD TYPE

Used On:

'110' SIX 1800, '120' EIGHT 1801,1A (1940)
'160' SUPER EIGHT, 1803, 4, 5 (1940)
'180' CUST. SUPER EIGHT, 1806,7,8 (1940)

These pumps same as types used on 1939 models.

OVERHAUL:—Same as for 1939 type except as noted below. *See 'Packard Six & Eight' Water Pump article in Mechanical Equipment Section of manual (or 1939 Supplement) for data and note following points:*

Seal Assembly—When installing composition thrust washer of seal assembly, make certain that smoothest face is out toward pump body. Machined face of pump body on which this washer rides must replace pump body or resurface face.

Impeller Endplay—Clearance between impeller be smooth and flat. If this surface scored or rough, vanes and pump body should be .012-.074".

PONTIAC TYPE

Used On:

SPECIAL 6 40-25, DELUXE 6 40-26 (1940)
DELUXE 8 40-28, TORPEDO 8 40-29 (1940)

These pumps same as 1938-39 types except as noted below (see Note for late 1939 changes).

1939 PUMP CHANGE NOTE:—Neoprene Shield No. 503282, installed on rear of bearing to protect bearing from moisture on all cars after Eng. No. 6-502121 (Six), 8-164131 (Eight). This seal furnished with pump parts packages for installation on pumps in service. See 1940 data below for installation directions.

1940 PUMP TYPES:—These pumps same as late 1939 types (with Neoprene shield) described above.

OVERHAUL:—Same as for previous types except as noted. *See 'Oldsmobile & Pontiac Type' Water Pump article in Mechanical Equipment Section of manual (or 1938 Supplement) for data and note following:*

Shaft Bearing Shield—Neoprene shield No. 503282 should be installed on shaft with larger diameter end against bearing and small diameter end toward seal assembly (this shield used on late 1939 and all 1940 water pumps). Outer rim of shield seats in bore in pump housing and prevents moisture collecting on bearing.

STUDEBAKER TYPE

Used On:

CHAMPION, MODEL 2G (1940)
COMMANDER, MODEL 10A (1940)
PRESIDENT, MODEL 6C (1940)

These pumps same types as used on 1939 cars.

OVERHAUL:—Same as for 1938-39 pump. *See 'Studebaker Champion' and 'Studebaker Type' Water Pump articles in 1939 or 1938 Supplement for complete data.*

WILLYS TYPE

Used On:

MODEL 440 (1940) PASS. CARS & COMM'L.

This pump same as used on 1939 Willys-Overland.

OVERHAUL:—Same as for 1939 Willys-Overland (not same as Willys 48). *See 'Willys-Overland Type' Water Pump article in Mechanical Equipment Section of manual (or 1939 Supplement) for complete data.*

NATIONAL SERVICE MANUAL

1941 SUPPLEMENTS

FIELD & PRODUCTION CHANGES
NEW TYPE UNITS—SPECIAL SERVICE NOTES

BUICK

1941 MODELS

Compound Carburetion—This two-carburetor system Optl. on Series 41-40, Std. on all other 1941 Buick models. Consists of two carburetors acting together at idle speed and for full power operation (front carburetor acts alone at intermediate speeds). Refer to 1941 Carburetor Index for 'Buick Compound Carburetion' article.

Tune Up on Compound Carburetion Cars—Requires special carburetor and linkage adjustment instructions. Refer to 1941 Carburetor Index for 'Buick Compound Carburetion' article for complete data.

Carter & Stromberg Carburetors—Both carburetors used on all models. Rear carburetor on Compound Carburetion Cars (with two carburetors) is special type without Accelerating Pump, Fast Idle, Choke Valve or Automatic Choke, or Power Jet (no metering rod on Carter types). Refer to 1941 Carburetor Index for Buick (Carter) and Buick (Stromberg) Carburetors.

Carburetor Production Changes—Carburetors on Compound Carburetion cars (both Carter & Stromberg) have been changed in production. For complete data on all type carburetors, and instructions on changes to be made on first cars for improved idling and hot starting performance, refer to 1941 Carburetor Index for 'Buick Compound Carburetion,' Buick (Carter) and Buick (Stromberg) Carburetors.

Compression Ratio Change—Compression ratio changed in production on all cars with Compound Carburetion and new type head gasket used on Single Carburetor cars for approximately same compression ratio. Compression ratio on first Compound Carburetion cars can be lowered to correct spark rap. Refer to 1941 Carburetor Index for 'Buick Compound Carburetion' article for instructions.

Spark Plug Production Change—10 MM. spark plugs used on first cars changed to new type in production and new 14 MM. spark plugs used on later cars. Refer to 1941 Buick 'T&E' page or to 1941 Carburetor Index for 'Buick Compound Carburetion' article for new type 10 MM. spark plugs which should be installed in place of original plugs. Refer to 1941 Mechanical (M) Index for Buick Special Shop Notes for directions on installing of new 14 MM. spark plugs on first cars.

Sealing of Manifolds—Intake manifold gasket type changed in production and manifolds on first cars should be sealed by installing new gaskets. Refer to 1941 Carburetor Index for 'Buick Compound Carburetion' article for instructions.

Ignition Timing Mark (Series 40,50)—Flywheel has special wide mark and one edge of mark should be used when timing engines with Single Carburetor, other edge of mark when timing engines with Compound Carburetion. Refer to Ignition Timing on 1941 Buick 'T&E' page for complete instructions.

New Fireball Turbulator Top Pistons—Used on all models. New type pistons with hollow head and solid skirt (horizontal slot only). Refer to 1941 Buick 'M' pages (Mechanical Section) for complete data.

New Generator Air Scoop (Compound Carburetion Cars)—Combination heat deflector and air scoop installed on commutator end of generators on Compound Carburetion cars. Generators interchangeable on all models if correct pulley installed. Refer to 1941 Buick 'T&E' page for complete data.

New Ball Bearing Worm-and-Nut Steering Gear (All Models)—Refer to 1941 Mechanical Equipment Index for Saginaw Ball Bearing Worm-and-nut type steering gear for complete data.

New Rear Axle Shaft Retainer Washer—New type self-locking horseshoe washer (with reduced throat) used on all 1941 models. Requires special tool for removal. Refer to 1941 Mechanical Equipment Index for Buick Rear Axle article.

Two Types of Starter Controls—Different type Vacuum Switch (on carburetor) for each carburetor make. Refer to 1941 Electrical Equipment Index for 'Carter Car Starter' (Carter Carburetor), 'Delco-Remy Vacuum Switch' (Stromberg Carburetor) for complete data.

1940 & PREVIOUS MODELS

Starter Commutator Burning on Early 1940 Cars—Refer to 1941 Electrical Equipment Index for 'Delco-Remy Starters: Burn Commutator Correction' for recommended correction.

Fast Idle Setting Change on 1940 Carter Carburetors—Fast Idle Setting on Model 474-S (Series 40,50) and 448-S (Series 60,70,80,90) should be .030". Change 1940 Buick 'T&E' page and Carter WDO Dual Carburetor article in 'C' section to indicate this new setting.

Throttle Stop Dog Adjustment on 1940 Carter Carburetor 474-S (Series 40,50)—Refer to 1941 Carburetor Index for Carter WDO Dual Carburetor article and note Throttle Stop Dog Adjustment given under '1940 Special Service Notes'. On late 1940 supplements (with Throttle Stop Dog Adjustment instructions in Carter WDO Dual Carburetor article), change Adjusting Gauge number to T109-121S.

1940 Carburetor Change to Decrease Accelerator Pedal Pressure—Refer to 1941 Carburetor Index for 'Buick (Stromberg) Carburetor' and note special 1940 Service Note for new loose lever spring installation.

CADILLAC

1941 MODELS

Carter & Stromberg Carburetors—Both makes used on all models. Refer to 1941 Cadillac 'T&E' page and to 1941 Carburetor Index for Carter WDO and Stromberg AAV-26 carburetor articles.

Hydra-matic Drive Transmission—Optional on all 1941 Cadillac models. This transmission is special design and has 'Fluid Coupling'. Refer to 1941 Mechanical Equipment Index for Cadillac Hydra-matic Drive Transmission article.

Special Tune up Instructions for Hydra-matic Drive Cars—Special carburetor idle speed setting required and Hydra-matic Drive linkage must be adjusted. Refer to 1941 Cadillac 'T&E', page for tune up data and to 1941 Mechanical Equipment Index for Cadillac Hydra-matic Transmission for linkage adjustment instructions.

Special Generator on Hydra-matic Drive Cars—Refer to 1941 Cadillac 'T&E' page for complete generator data.

New Piston and Piston Pin Fitting Directions—Refer to Mechanical (M) Index for 1941 Cadillac Special Shop Notes for complete instructions.

New Propeller Shaft Slip-joint—Slip-joint is now located in transmission case extension ahead of front universal joint (one piece shaft between front and rear universal joints).

CONTINUED ON NEXT PAGE

COPYRIGHT 1941, NATIONAL AUTOMOTIVE SERVICE

CONTINUED FROM PRECEDING PAGE

Replacement Clutch Caution—Service clutches furnished with locking pin blocking each release lever. Pins must be removed when clutches installed in car to prevent them dropping down in clutch housing which may cause damage.
Clutch Balancing—Clutches must be balanced when installed in car for smooth operation. Refer to 1941 Mechanical (M) Index for Cadillac Special Shop Notes.
Rear Axle Pinion Bearing Caution—Do not loosen rear universal joint companion flange nut (controls pinion bearing 'pre-load'.

1940 & PREVIOUS MODELS

Replacement Clutch Caution—See Caution note for '41 Models (above) for locking pin or block removal.
1939-40 Rear Axle Pinion Bearing Caution—Rear universal joint companion flange nut controls pinion bearing 'pre-load' which will be disturbed if nut is loosened.

CHEVROLET

1941 MODELS

New Heavy Duty Truck Engine—New 235 cubic inch Heavy Duty engine Optl. on all 1½ Ton and Cab over Engine Trucks. Refer to 1941 Chevrolet Truck 'M' page for all data.
New Valves & Guides—New type valves and valve guides used on 1941 engines—not interchangeable with previous types. Refer to 1941 Chevrolet 'M' pages for complete data.
New Ignition System & Reversing Switch—New reversing switch (on starter) used in conjunction with new type Distributor, Ignition Coil and new (greater capacity) Condenser. Refer to 1941 Chevrolet 'T&E' page for complete data on ignition units and Caution in regard to use of above units on previous car models.
Reversing Switch Adjustment—First type Reversing Switch must be kept in adjustment (car will not start if adjustment incorrect). New type switch used on later cars non-adjustable. Refer to 1941 Electrical Equipment Index for 'Chevrolet Reversing Switch'.
New 10 MM. Spark Plugs—New 10 mm. small spark plugs used on 1941 models must not be tightened excessively. Refer to 1941 Chevrolet 'T&E' page for spark plug data and tightening Caution.
New 1941 Carburetors—Carburetors on 1941 models have new type granodized pump arm shaft, new type pump check valves and other changes. Refer to 1941 Carburetor Index for Carter 'W1' Carburetor.
New Clutch Driven Member (Pass. Cars)—New type used on 1941 cars and must not be used on previous models (will not release properly). Refer to 1941 Mechanical Equipment Index for Chevrolet Clutch for complete data.
Passenger Car Rear Spring Shackle Change—Design changed in production (2 types used). Refer to 1941 Mechanical 'M' Index for Chevrolet Special Shop Notes.
Shock Absorber Valve Change (Pass. Cars)—Valves on front shock absorbers changed in production to eliminate noise. Refer to 1941 Mechanical Equipment Index for 'Delco Parallel Cylinder Shock Absorber' for complete data.
Shifter Mechanism Change (Pass. Cars)—Design of shifter mechanism in transmission case cover changed so that interlock lever and shaft can be replaced separately (clamped instead of being welded together). Refer to 1941 Mechanical Equipment Section for 'Chevrolet 3 Speed Transmission'
Transmission Gear Change on Trucks—On 1941 Four Speed Transmission, gear ratios changed in production so that two different ratios will be found in service. Refer to 1941 Mechanical Equipment Index for 'Chevrolet 4 Speed Transmission' for identification markings to insure correct type gears being installed.
Hotchkiss Drive on Trucks—All 1941 Trucks (except ½ Ton) have Hotchkiss Drive and new type Propeller Shaft. Refer to 1941 Chevrolet Truck 'M' page

1940 & PREVIOUS MODELS

Starter Commutator Burning on Early 1940 Cars—Refer to 1941 Electrical Equipment Index for 'Delco-Remy Starters: Burnt Commutator Correction' for recommended correction.
Shifter Mechanism Change (1940 Pass. Cars)—Late 1940 cars have same type clamped interlock lever and shaft on transmission case as used on 1941 cars. See 1941 Note above.
Transmission High Gear Disengagement Complaints (1940 Three Speed Transmission)—Refer to 1941 Mechanical Equipment Index for 'Chevrolet 3 Speed Transmission' for recommended procedure in correcting this complaint and also for new type replacement transmission counter-gears (roller bearing type with carburized gears) now furnished for 1940 cars.
Carburetor Improvement (1940 Models)—Refer to 1941 Carburetor Index for 'Carter W1 Carburetor' for directions on installation of 1941 Float Bowl Cover (with improved granodized pump arm shaft) on 1940 carburetors to correct pump arm and shaft wear.
Axle Production Change (1940 ½ & ¾ Ton Trucks)—Refer to 1941 Mechanical Equipment Index for 'Chevrolet Rear Axle' for new method of attaching brake drum to axle shaft on late 1940 trucks (same as 1941) and for recommended correction when lubricant pumped out of first type axle vent hole (vent also changed on late 1940 trucks).
1½ Ton Truck Pinion Bearing Caution—Front pinion bearing must be properly installed (incorrect installation will cause rapid wear and failure of gears). Refer to 1941 Mechanical Equipment Index for 'Chevrolet Full Floating Rear Axle' for data.
Steering Gear Noise or 'Squawk' on 1940 Trucks—To correct noise or 'squawks' in 1940 steering gears, proceed as follows: Check adjustment as directed below and see that the correct special steering gear lubricant is used. If this does not correct trouble and steering gear binds or squawks when wheel is turned with truck standing still, remove and discard regular pitman shaft spacer #263583 and install new Pitman Shaft Bushing #266300 in its place making certain that the open ends of the oil grooves in the bushing are in toward the worm and sector. This bushing increases bearing surface for sector shaft.
NOTE—When installing this bushing, replace the following parts also which may be worn: Washer #263307, Packing #262155 & Retainer #262156.
Engine Running Backward when turned off—Refer to 1939 Carburetor Index for 'Carter W1 Carburetor' for recommended correction.
Manifold Heat Control Valve Rattle Correction—Refer to 1940 Chevrolet 'T&E' page for directions on installation of special anti-rattle spring (under Manifold Heat Control). CAUTION—Thermostatic spring tension most not be increased to correct rattles.
Caster & Kingpin Inclination (1940 KA, KH)—On 1940 Chevrolet Page M-295, Caster specification listed as Kingpin Inclination (Front Suspension data). Correct this page to read as follows: Front Suspension (KA,KH):—Kingpin Inclination—4¾° plus or minus ½°. Caster—0° plus or minus ½°, adjustable.

CHRYSLER—DE SOTO—DODGE PLYMOUTH

1941 MODELS

New Vacamatic Transmissions (Chrysler)—Vacamatic Underdrive type on Chrysler 6, Vacamatic Overdrive type on Chrysler 8. These types different designs. Refer to 1941 Mechanical Equipment Index
New Simplimatic Transmission (DeSoto)—Simplimatic Underdrive type. Entirely new design with automatic shift and 'kick-down' feature. Refer to 1941 Mechanical Equipment Index for DeSoto Transmission data.
Fluid Drive—Optional on Dodge, Chrysler Six (with Vacamatic Underdrive Transmission) and DeSoto (with Simplimatic Underdrive Transmission) as well as Std. on all Chrysler Eights. Refer to 1941 Mechanical Equipment Index for 'Chrysler Fluid Drive'.
Power Shift—Optional on all Chrysler, DeSoto, Dodge, Plymouth models. Refer to 1941 Mechanical Equipment Index for 'Chrysler Power Shift Transmission Control'.
Carburetor Changes—Carburetors changed in production on Chrysler 6, DeSoto, and Dodge with Fluid Drive. Refer to 1941 Carburetor Index for Carter (B&B) Carburetors (Chrysler, DeSoto), Stromberg BXV-3 & BXVD-3 (Dodge) for all data on each type.
Slow-Closing Throttles—Used on all Chrysler, DeSoto, and Dodge models with Fluid Drive. Chrysler 6 and DeSoto type changed in production (two types used—second type not adjustable). Refer to 1941 Carburetion Equipment Index for 'Slow-closing Throttles' for complete adjustment directions.
Plymouth Valve Timing Change—Valve Timing changed after approximately first 20000 cars. Refer to Plymouth 'T&E' or 'M' pages for complete Valve Timing data and directions on checking valve timing on first and later cars.
Chrysler 6 Vacamatic & DeSoto Simplimatic Transmission correction to prevent Ignition cutting out—Refer to 1941 Mechanical Equipment Index for Chrysler and DeSoto Transmissions for directions on installation of Interrupter Switch Insulator to prevent water splashing up on switch from road.
New Electric Convertible Top Control—Refer to 1941 Mechanical Equipment Index for 'Electric Type Convertible Top Control' for complete data.
New Front Suspension (All Models)—Design changed and new tools required for adjustments on 1941 cars. Refer to 1941 Mechanical Equipment Index for 'Chrysler Independent Suspension' for data.

1940 & PREVIOUS MODELS

1940 Auto-Lite Regulator Changes—Settings and specifications for Auto-Lite 'VRP' Regulators changed in production. Refer to 1941 Electrical Equipment Index for 'Auto-Lite Regulators—VRP & VRR Types' and note changes and new specifications which should be used in adjusting these 1940 regulators.
Starter Changes (1940 Dodge & Plymouth)—New type MZ-4062-A starter used on later cars. Specifications for this model same as for first type MZ-4062. Make this notation on 1940 Dodge & Plymouth

CONTINUED ON NEXT PAGE

FIELD & PRODUCTION CHANGES, NEW TYPE UNITS, SPECIAL SERVICE NOTES

CROSLEY

1941 MODEL

New 1941 Specifications—Engine specifications changed from 1940. Refer to 1941 Crosley 'T&E' and 'M' pages for new Compression Ratio, New Ignition Timing, tappet clearance, crankcase capacity, and other specifications.

New Rear Engine Mounting—New rear engine mounting at transmission case (used with new type drive and universal joint). Refer to 1941 Crosley 'M' page and Crosley Special Shop Ntoes.

New Propeller Shaft & Torque Tube—New design with universal joint and adapter at transmission case. Refer to 1941 Crosley 'M' page and Crosley Special Shop Notes for complete data.

FORD—MERCURY

1941 MODELS

New 4 Cylinder Commercial & Truck Models—New 4 Cylinder Engine Optl. on Commercial and Light Truck (¾ & 1 Ton) models. Refer to Ford 'T&E' and Ford Truck 'M' pages for data on this new 4 Cylinder Engine.

New 3-unit Voltage & Current Regulator—New adjustable type Regulator with separate Voltage & Current regulator units used on all 1941 models. Refer to 1941 Electrical Equipment Index for 'Ford Regulator—3 Unit Type' for complete data.

Cylinder Sleeves & Special Piston Servicing Data—Dry type cylinder sleeves used on all models. Refer to Ford 'M' pages and to 1941 Ford Special Shop Notes for sleeve data and special piston servicing data when sleeves are used.

1940 & PREVIOUS MODELS

New 3-unit Voltage & Current Regulator—New type regulator (as used on 1941 models—see note above) used in production on late 1940 cars and for replacement on all 2-unit regulators used on previous models. Refer to 1941 Electrical Equipment Index for 'Ford Regulator—3 Unit Type' for complete data.

HUDSON

1941 MODELS

Camshaft & Valve Timing Change (Model 10)—Camshaft changed in production on small 6 cylinder engine (used on Model 10) and new camshaft with different Valve Timing used on later cars. Tappet clearance must be set at different figure on cars with this new camshaft. Refer to 1941 Hudson Six 'T&E' or 'M' page for complete data.

Lighting Fuse Change—On all 1941 Models, fuse changed from 20 ampere to 30 ampere in production and new 30 ampere type should be used for replacement. Refer to 1941 Hudson 'T&E' pages for data.

New Type Transmission—New type Synchro-mesh transmission Std. on all 1941 models. Refer to 1941 Mechanical Equipment Index for 'Hudson Transmission' for complete data.

New Type Electrical Control Overdrive—New type with complete electrical control (no centrifugal clutch pawls—not like 1940 type) and 'kick-down' feature Optl. on all 1941 models. Refer to 1941 Mechanical Equipment Index for 'Hudson Overdrive'.

New Vacumotive Clutch Control—This automatic clutch control Optl. on all 1941 models. Refer to 1941 Mechanical Equipment Index for 'Hudson Vacumotive Clutch Control' for complete data and adjustment directions.

Governor Switch Changes (Overdrive & Vacumotive Clutch Control)—Governor switches changed in production to correct complaints of incorrect operation. Refer to 1941 Mechanical Equipment Index for Hudson Overdrive and Hudson Vacumotive Clutch Control articles.

New Timing Gears (all 1941 models)—New type gears with different tooth angle used (can be installed on earlier cars only as sets). Refer to 1941 Hudson 'M' pages for complete data.

Carburetor Changes (Models 11, 12, 14, 15, 17)—Carburetors changed in production (dashpot or slow-closing throttle not used on later type, Choke setting of later type changed in production). Refer to 1941 Carburetor Index for 'Carter WDO Carburetor' for complete data.

1940 & PREVIOUS MODELS

Carburetor Change to correct Throttle Sticking (1940 Models 41, 43, 44, 45, 47)—Refer to 1941 Carburetor Index for 'Carter WDO Carburetor' and note recommended procedure under 1940 Special Service Notes.

Starter Change (1940 Six Model 40, 41, 43)—Model MZ-4079A used on late cars. All data for this model same as given on 1940 Hudson Six 'T&E' page for first MZ-4079 starter.

LINCOLN

1941 MODELS

New 3-unit Voltage & Current Regulator—New adjustable type Regulator with separate Voltage and Current Regulator units used on all 1941 models. Refer to 1941 Electrical Equipment Index for 'Ford Regulator—3 Unit Type' for complete data.

New Type Electrical Control Overdrive—New type with complete electrical control (no centrifugal clutch pawls) with 'kick-down' feature Optl.on all models. Refer to 1941 Mechanical Equipment Index

New Hydro-electric Window Regulators—Std. on new Custom model. Refer to 1941 Mechanical Equipment Index for 'Hydro-electric Window Regulators' for complete data.

New Direction Signal—New type built-in steering wheel with automatic turn-off for direction signal switch. Refer to 1941 Lincoln 'T&E' page for wiring diagram or to 1941 Electrical Equipment Index for 'Direction Signals'.

1940 & PREVIOUS MODELS

New 3-unit Voltage & Current Regulator—New type regulator (as used on 1941 models—see note above) used in production on late 1940 cars and for replacement of earlier 2-unit regulator on previous models. Refer to 1941 Electrical Equipment Index for 'Ford Regulator—3 Unit Type' for complete data.

NASH

1941 MODELS

New '600' Ambassador Model—This model entirely new design with such features as: New type Independent Front Suspension, Coil Spring Rear Suspension, Delco-Remy Electrical Equipment, Carter (BB) Carburetor, Torque Tube Drive. Refer to 1941 Nash 4140 'T&E' and 'M' pages for complete data on this model.

Twin-Ignition Six Distributor Rotation Change—Distributor rotation on 1941 model reversed from previous models. Refer to 1941 Nash Model 4160 'T&E' page for new distributor data and new spark plug wiring diagram.

Carburetor Changes—Automatic choke setting changed in production on Nash 4160 & 4180 models. Refer to 1941 Carburetor Index for 'Carter WA1' and 'Carter WDO' carburetors for complete data.

Tappet Clearance Adjustment Caution (Model 4160)—Oil lead to rocker arms must be cut off by removing plug while tappet clearance being adjusted and plug must be replaced before engine put into service. Refer to 1941 Nash 4160 'T&E' or 'M' pages and see special note under Tappet Clearance Adjustment for data.

Independent Suspension Changes (4160, 4180)—New design Upper Control Arm used with Direct Acting Shock Absorbers and new shim type Caster & Camber adjustment. Refer to 1941 Mechanical Equipment Index for 'Nash Independent Suspension' for data.

Independent Suspension (4140)—Entirely new design not similar to any other type (has sliding wheel spindle on kingpin column). Refer to 1941 Mechanical Equipment Index for 'Nash 4140 Independent Suspension'.

Torque Tube Trunnion Bracket Adjustment (4140)—Must be adjusted whenever driveshaft disconnected and propeller shaft center bearing must be oiled every 5000 miles (oiler concealed by screw). Refer to 1941 Mechanical Equipment Index for 'Nash Rear Axle' for data.

1940 & PREVIOUS MODELS

1940 Auto-Lite Regulator Changes—Settings and specifications for Auto-Lite 'VRP' regulators changed in production. Refer to 1941 Electrical Equipment Index for 'Auto-Lite Regulators—VRP & VRR Types' and note changes and new specifications which should be used in adjusting these 1940 type VRP regulators.

OLDSMOBILE

1941 MODELS

Special Equipment & Settings on Cars with Hydra-matic Drive—When Hydra-matic Drive used, Special Carburetors, Generators, Ignition Timing, and Carburetor Idle Speed setting are required. Refer to Oldsmobile 6 & 8 'T&E' pages for complete data.

Hydra-matic Drive Linkage Adjustment—Entire linkage must be adjusted whenever disturbed or disconnected. Refer to 1941 Mechanical Equipment Index for 'Oldsmobile Hydra-matic Drive Transmission' for directions.

Hydra-matic Drive Interlock—New starter pedal linkage which kicks Hydra-matic Drive into Neutral position when engine is started. Refer to 1941 Mechanical Equipment Index for 'Oldsmobile Hydra-matic Drive Transmission' for adjustment directions.

Camshaft Endthrust Change (All Models)—Method of taking endthrust on camshaft changed so that no spring-loaded thrust button required though provision made for this thrust button. Refer to 1941 Oldsmobile Special Shop Notes in 'M' Section for complete data.

Timing Chain Change (8 Cyl. Engine)—Timing chain changed to new narrower (11/16") type after first 10,000 cars. Refer to 1941 Oldsmobile 'M' page

1940 & PREVIOUS MODELS

Starter Commutator Burning on Early 1940 Cars—Refer to 1941 Electrical Equipment Index for 'Delco-Remy Starters: Burnt Commutator Correction' for recommended correction.

1940 Clutch Release Bearing Change & Lubrication Instructions—Refer to 1941 Oldsmobile Special Shop Notes in 'M' Section for new type release bearing (with lubrication fitting) used on later cars and

CONTINUED ON NEXT PAGE

FIELD & PRODUCTION CHANGES, NEW TYPE UNITS, SPECIAL SERVICE NOTES

CONTINUED FROM PRECEDING PAGE

which can be installed on early 1940 and 1939 cars to correct complaints of dry or noisy clutch release bearing.

1940 Brakes (8 Cylinder Model L-40)—Brake lining width should be 2". Make this change on 1940 Oldsmobile Eight, Page M-324.

PACKARD

1941 MODELS

Auto-Lite & Delco-Remy Electrical Equipment (Six Cyl. Model)—Both makes of electrical units used on this model. Refer to Packard Six 'T&E' page for complete data.

New Clipper Model—Entirely new model with such as New Type Independent Suspension (no Torque Arms), new Battery Mounting (in engine compartment), new Carter Carburetor with Carter Car Starter (vacuum switch for accelerator pedal starting), new Hood hinge and instrument panel lock (hood hinged on both sides). Refer to 1941 Packard Clipper 'T&E' and 'M' pages for complete data.

Timing Mark Change (Six, Eight, Clipper)—Timing marks now located on vibration dampener instead of flywheel. Refer to Packard 'T&E' pages for complete Ignition & Valve Timing instructions.

New Distributors & Vacuum Spark Control (Six & Eight)—New distributors with new vacuum control linkage (timing quadrant) used on 1941 models. Refer to 1941 Packard 'T&E' pages for specifications and Timing instructions.

New Carter Carburetors (Eight & Clipper)—Refer to 1941 Carburetor Index for 'Carter WDO Carburetor' for data on these new carburetors. Refer to 1941 Electrical Equipment Index for 'Carter Car Starter' for starting vacuum switch used on Clipper.

Carburetor Change (Super Eight)—Refer to 1941 Carburetor Index for 'Stromberg Model AAV-26 Carburetor' for recommended correction for off-idle leanness on this model.

Electromatic Clutch (All Models)—Optl. on all models. New type automatic clutch with electrical control. Refer to 1941 Mechanical Equipment Index for 'Packard Electromatic Clutch Control' for adjustment and servicing data.

Hydro-electric Window Regulators (Super Eight)—Refer to 1941 Mechanical Equipment Index for 'Hydro-electric Window Regulators' for complete data.

1940 & PREVIOUS MODELS

1940 Regulator Production Changes (All Models)—New type VRP-4201A-1 (Six & Eight), VRP-4202A-1 (Super Eight) Regulators used on late 1940 cars. Specifications changed on all Auto-Lite 'VRP' Regulators. Refer to 1941 Electrical Equipment Index for 'Auto-Lite Regulators VRP & VRR Types' for data on later regulators and new specifications on first type regulators to insure latest specifications being used when these regulators are serviced.

Distributor Change (1940 Six)—New type IGC-4503 distributor used on late 1940 cars. All specifications for this distributor same as earlier IGW-4143A distributor except as follows: Cam Angle—38° closed, 22° open; Condenser Capacity—.28-.32 mfd. Make these notations on 1940 Packard Six 'T&E' page.

Spark Plug Gaps (All 1940 Models)—Spark plug gaps should be .028" (.0255-.0305"). Make this notation on all 1940 Packard 'T&E' pages (data omitted on some pages).

PONTIAC

1941 MODELS

New Type Built-in Oil Cleaner—Used on all 1941 models. Refer to 1941 Pontiac Special Shop Notes in 'M' section for description and complete servicing directions.

Carburetor Float Level Change (Six)—Refer to 1941 Pontiac Six 'T&E' page or to 1941 Carburetor Index for 'Carter WA1' carburetor for new specifications.

Transmission Shifter Change (Streamliner & Custom Models)—New single shifter lever without idler lever (replacing front and rear rods) used on later cars and furnished for service on first cars. Refer to 1941 Mechanical Equipment Index for 'Pontiac Transmission Control' for directions on installing this new type linkage.

Hard Shifting Complaints (All Models)—Refer to 1941 Mechanical Equipment Index for 'Pontiac Transmission Control' for directions on alignment of shifter rods and idler lever bracket. See also shifter linkage change above.

Steering Gear Noise Correction (Models with Std. Steering Wheel)—Refer to 1941 Mechanical Equipment Index for 'Saginaw Worm-and-roller Steering Gear' for recommended correction to prevent noise being carried up steering column.

Sticking Throttle Correction (All Models)—Refer to 1941 Carburetor Index for 'Carter WA1' carburetor for accelerator pedal rod production change and directions for adding stop on first type rod to correct throttle sticking.

1940 & PREVIOUS MODELS

Starter Commutator Burning on Early 1940 Cars—Refer to 1941 Electrical Equipment Index for 'Delco-Remy Starter: Burnt Commutator Correction' for recommended correction.

Water Pump Impeller Clearance (1939-40 Models)—Clearance between impeller and back face of pump housing should be 3/64" (not 9/64"). Refer to 1941 Mechanical Equipment Index for 'Pontiac Water Pump' and make this correction on 1939 & 1940 Pontiac Water Pump articles in previous supplements.

Oil Cleaner Installation on Previous Models—New type built-in oil cleaner as used on 1941 models (see note above) can be installed on 1939-40 Six and 1940 Eights. Refer to 1941 Pontiac Special Shop Notes in 'M' Section for complete data.

Accelerator Pedal Sticking (1940 Models)—Refer to 1941 Pontiac Special Shop Notes in 'M' Section for recommended correction.

Clutch Pedal Rattles & Special Service Pilot Bushing—Refer to 1941 Pontiac Special Shop Notes in 'M' Section for recommended correction for pedal rattle on 1940 models and for special service pilot bushing installation on 1940 and previous models.

New Piston Pin Bushings for Service—Refer to 1941 Pontiac Special Shop Notes in 'M' Section for data on new corrosion-resisting aluminum-bronze piston pin bushings being furnished for service on 1940 and previous models (these bushings used on late 1940 and all 1941 cars).

Replacement Camshaft Sprocket (1937-39 Eight)—Spacer must be discarded when service sprocket installed on these models. Refer to 1941 Pontiac Special Shop Notes for data and Engine Nos. of cars to which this data applies.

STUDEBAKER

1941 MODELS

Carter & Stromberg Carburetors (Commander & President)—Both makes used on each model—Stromberg carburetors are new models. Refer to 1941 Carburetor Index for complete data on all types.

New Carburetor (Champion)—New Carter WA1 carburetor with Automatic Choke used on 1941 Champion model. Refer to 1941 Carburetor Index for Carter WA1 Carburetor data.

Carburetor Change (President)—Refer to 1941 Carburetor Index for 'Stromberg AAV-26 Carburetor' for recommended correction for complaints of off-idle leanness on this model.

Auto-Lite Electrical Equipment (President)—New Auto-Lite electrical units used on this model. Refer to 1941 Studebaker President 'T&E' page for complete data.

Clutch Replacement Caution (President)—Service clutches furnished with spacer at driving lugs which must be removed when clutch installed. Refer to 1941 Mechanical Equipment Index for 'Inland Clutch'.

1940 & PREVIOUS MODELS

Oil Leakage at Fan Drive Pulley (1939-40 Champion)—Refer to 1941 Studebaker Special Shop Notes in 'M' Section for recommended correction.

Clutch Sticking Correction (All 1939-40 Models)—Refer to 1941 Studebaker Special Shop Notes in 'M' Section for recommended lubrication procedure and installation of new type release shaft bushings on Champion.

Correction for Ignition missing or cutting out due to water splashing from road (1939-40 Models)—Refer to 1941 Studebaker Special Shop Notes in 'M' Section for Front Fender Apron correction (Comm. & President), Fender Baffle and Engine Pan installation (Champion).

Interlock Installation to correct shifting into two gears (1939-40 Champion)—Refer to 1941 Studebaker Special Shop Notes in 'M' Section for installation of new type Interlock on all 1939 and early 1940 cars.

1940 Auto-Lite Regulator Changes—Settings and specifications for Auto-Lite 'VRP' Regulators changed in production. Refer to 1941 Electrical Equipment Index for 'Auto-Lite Regulators—VRP & VRR Types' and note changes and new specifications which should be used in adjusting these 1940 type VRP regulators.

WILLYS

New Hypoid Rear Axle (Pass. Cars)—Refer to 1941 Mechanical Equipment Index for 'Willys Hypoid Rear Axle' for complete data.

New Overdrive Transmission—Std. or Optl. on Pass. Car Models. Has special 'kick-down' feature. Refer to 1941 Mechanical Equipment Index for Warner Overdrive article.

New Adjustable Shock Absorbers—Refer to 1941 Mechanical Equipment Index for Monroe Adjustable Direct Acting Shock Absorbers for data.

Starter Changes (All Models)—Starters changed in production and new type Bendix drive used on new models. Refer to 1941 Willys 'T&E' page for data on all starter models.

Commercial Models—These models have new Atwood Clutch, Hydraulic Brakes, and Carter Carburetor. Refer to 1941 Willys 'T&E' and 'M' pages for complete data.

BANTAM NOTE—All Bantam Model 65 (1941) Specifications and Service Data same as for 1940 model. Refer to 1940 Supplement for Bantam Model 65 (1940).

Cam Angles for Delco-Remy distributors are correct with breaker gap set midway between limits and breaker arm fibre bumper worn in (1000 miles).

Cam Angles for Auto-Lite distributors correct with gap specified by car manufacturer except in instances where special gap specified under 'Cam Angle.'

HOOD LOCK:—*See Buick Shop Notes in 'M' Section.*

SERIAL NUMBER:—First number (all Series) 1-3880108 (Flint), 2-3892008 (Calif.), 3-3897008 (Linden). On tag on right side of dash under engine hood.

ENGINE NUMBER:—First number (all Series) 4074859 with model prefix as follows: 4- (40), 5- (50), 6- (60), 7- (70), 9- (90). On right side of crankcase behind oil filter (40,50), above starter (60,70,90).

COMPRESSION:—Ratio—6.5-1 (First 40—Single Carb.), 6.4-1 (Later 40—Single Carb.), 7.0-1 (First 40,50,60, 70,90—Compd. Carb.), 6.7-1 (Later 40,50,60,70,90—Compd. Carb.). ***For Engine Nos. at which Ratio changed, and directions for lowering compression on first Compound Carburetion cars to correct complaints of spark rap, refer to 1941 Mechanical (M) Index for 1941 Buick Special Shop Notes.***

Pressure—142 lbs. (40—6.5-1 Hd.), 148 lbs. (40,50—7.0-1 Hd.), 151 lbs. (60,70,90—7.0-1 Hd.) at 1000 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—Delco-Remy Coil 1115024, 1115026 (with Radio). On engine side of dash. NOTE—Radio type has condenser mounted under coil end cover.

Ignition Current—2½ amperes idling, 4½ stopped.

Ignition Switch:—Delco-Remy No. 1116296 (40, 60, 90 LHD), 1116297 (40, 60, 90 RHD), 1116313 (50, 70 LHD), 1116314 (50, 70 RHD). Same design as 1940.

Ignition Lock—Briggs & Stratton No. 85370. Key Series—8000 to 9499. Groove—15.

Distributor Delco-Remy No. 1110801. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control.

Breaker Gap—.015". Limits .0125-.0175".

Cam Angle or Dwell—31° closed, 14° open.

Breaker Arm Spring Tension—19-23 ozs.

Rotation—Counter-clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Distributor Degrees	R.P.M.	Automatic Advance Degrees	Engine R.P.M.
Start	250	3.5	500
7	400	14	800
13	1500	26	3000

Vacuum Spark Control Model 681-H. On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above 18 MPH. except when engine accelerated or operated with wide open throttle when spark retarded by return spring. **Plunger Travel**—⅛" max.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
5-6°	10-12°	10-13"

Distributor Removal:—Mounted on right side of crankcase. To remove, disconnect vacuum line, take out 2 hold-down screws in advance arm, lift out.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARK PLUGS:—AC No. 106. 10 MM. (First Cars), No. 46 14 MM. (Later Cars). ***For Engines Nos. at which change made and directions on installing these new 14 MM. plugs on first cars, refer to 1941 Mechanical (M) Index for 1941 Buick Special Shop Notes.***

IMPORTANT SERVICE NOTE—No. 104 10 MM. plugs used on first cars. Should be changed to one of following types whenever found on cars in service: No. 104 with dash under 0, No. 106 with dash under 0, No. 106 without dash (all types satisfactory).

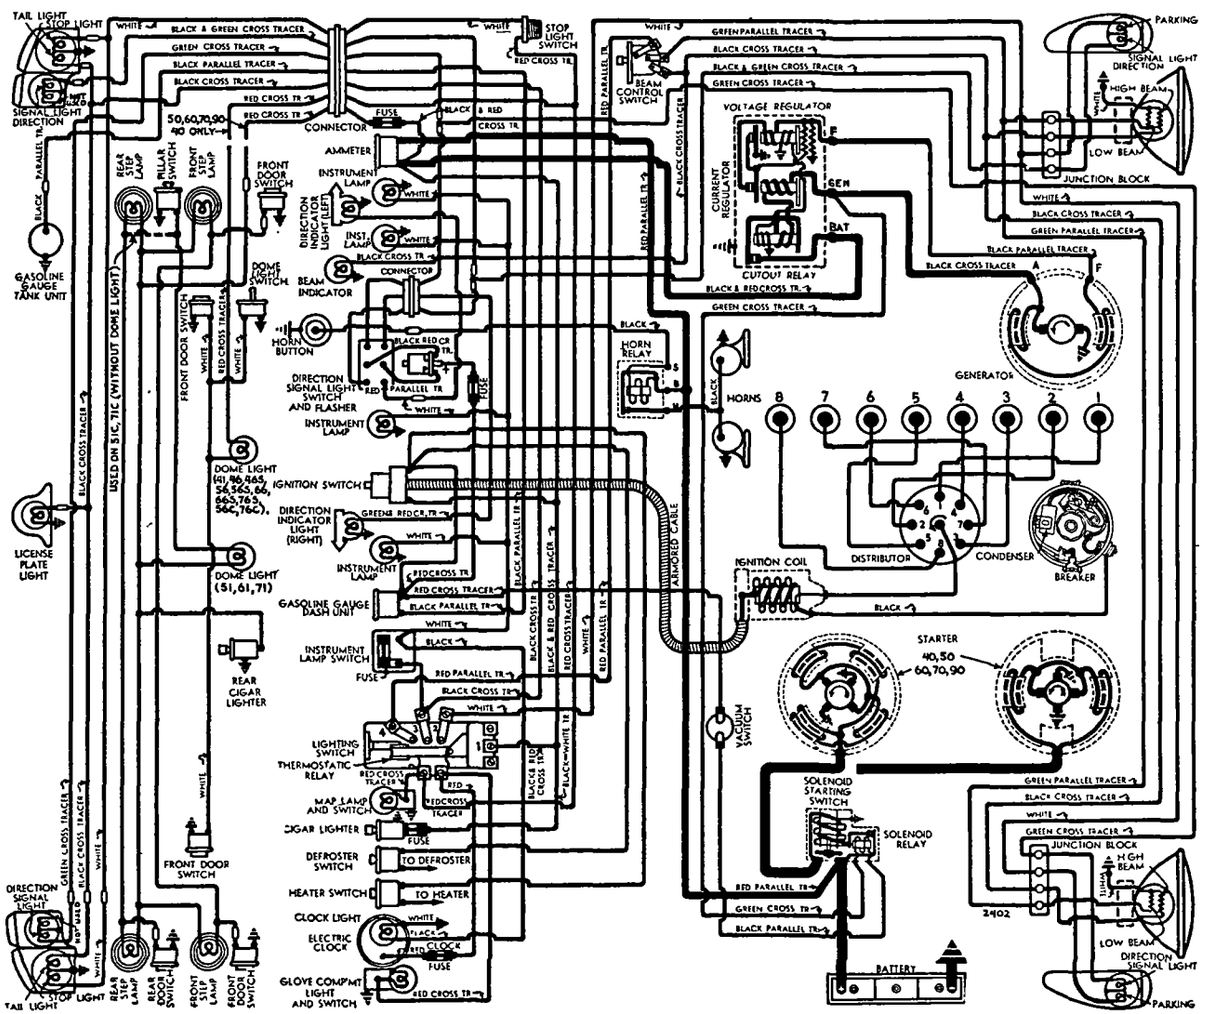
Spark Plug Gaps—.025". Limits .023-.028".

IGNITION TIMING:—Initial setting for fuel of 70 (40, 50), 76 (60, 70, 90) Octane Rating. See 'Final Ignition Setting' for fuel & operating condition correction.

	Flywheel Degrees	Piston Position
40 (1 Carburetor)	2° BTDC	.0015" BTDC.
40, 50 (2 Carb.)	4° BTDC	.0063" BTDC.
60, 70, 90 (2 Carb.)	6° BTDC	.0149" BTDC.

Timing Mark Note (40, 50)—Ignition mark is 2° serated section on flywheel. Use trailing edge of mark (4°) for 40 & 50 with Compound Carburetion or leading edge of mark (2°) for 40 with 1 Carb.

Timing (With Synchroscope)—Recommended method. Connect synchroscope to #1 spark plug, direct light on flywheel through inspection hole in right front face of housing. Idle engine at speed not greater than 350 RPM, loosen two distributor hold-down screws, rotate distributor until 'ADV' mark on flywheel (see 40, 50 note above), lines up with indicator. See Final Ignition Setting below.



Timing (Without Synchroscope)—With #1 piston on compression, turn engine over until 'ADV' mark on flywheel (see 40,50 note above) lines up with indicator. Adjust distributor as directed above.

Final Ignition Setting—Adjust for fuel used so slight 'ping' secured accelerating with wide open throttle between 10-20 MPH. To adjust, loosen distributor hold-down screws, rotate distributor in small steps counter-clockwise (if ping too severe), clockwise (if no ping). ***See Compression Ratio change (to eliminate spark rap) above.***

CARBURETION:—Carburetor (Series 40—Single Carburetor)—Carter Type WCD Model 487-S or Stromberg Model AAV-16 Code 7-37. 1" dual downdraft ***For special Tune Up & Idle Adjustment directions, refer to Carburetor Index for 'Buick Compound Carburetion'.***

Compound Carburetion (Series 40,40A,50,60,70,90):—Two Carter Type WCD, or Stromberg Model AAV-16 & AA-1, carburetors used together. 1" dual downdraft types. ***For Carburetor Production Changes, and Special Tune Up instructions required for Compound Carburetion, refer to 1941 Carburetor Index for 'Buick Compound Caburetion' and Buick (Carter) or Buick (Stromberg) Carburetor articles.***

IMPORTANT SERVICE NOTE—For instructions on Sealing of Manifolds (first cars), Compression Ratio and Spark Plug production changes, ***refer to 1941 Carburetor Index for 'Buick Compound Carburetion.'***

Accelerating Pump Setting (Front Carburetor only on Compound Carburetion Cars)—3 holes in throttle lever (Stromberg), 2 holes in pump arm (later type Carter Compd. Carb. only) for pump link connection. Adjust as follows (#1 & 3 only on Carter): #1 (Inner—Min.) Hot weather, high-test gasoline. #2 (Center—Med.) Std. normal all year setting. #3 (Outer—Max.) Cold weather, low-test gasoline.

Float Level (All Carburetors)—Adjust as follows:

Carter—9/64" for first type float (cross-rib reinforcement), 3/16" for second type float (11 vertical rib re-inforcement & all Later Compound Carburetor models. Measure from top seam of each float to bowl cover with valve seated. *Refer to Carter 'WCD' Carburetor article in Carburetor Section for Float Level Gauge & aligning data.*

Stromberg—Fuel level 19/32" below top edge of bowl with engine idling (5 lbs. pressure) or even with bottom of inspection hole on side of bowl).

Metering Jets & Rods—*See Carter & Stromberg Jet Tables in Carburetor Section.*

Fast Idle (Front Carburetor only on Compound Carburetion Cars):—Integral (built in carburetor). *For complete data, refer to 1941 Carb. Equip. Index.*

Setting (Carter)—Back off throttle stopscrew so throttle valves closed. With choke valve tightly closed, adjust fast idle screw for .012" (487-S, 509-S, 528-S), .015" (490-S, 533-S), throttle opening (turn screw in 2½ turns from point where it just contacts high step of fast idle cam).

Setting (Stromberg)—Close choke valve against #53 drill (.0595"), adjust by bending fast idle cam connector rod so that locking lever on throttle valve shaft just clears loose lever on fast idle cam stud as throttle is opened and closed.

Automatic Choke (Front Carburetor only on Compound Carburetion Cars):—Climatic Control (Carter), AAV-16 Type (Stromberg). Built-in type. *For complete data, refer to 1941 Carb. Equip. Index.*

Setting (Carter)—Centered (index mark on cover at reference mark on housing) for all models.

Setting (Stromberg)—1 Notch Lean (40—Single Carb.), 'V' mark on cover lined up with housing mark (All Cars with Compound Carburetion).

Air Cleaner:—AC No. 1542111 (40), 1529803 (50,60,70, 90). Heavy duty oil-bath type. NOTE—Screen at forward end of air intake tube should be cleaned by blowing out with air (disconnect air tube).

Fuel Pump:—AC Type AJ. Pump Exchange Part No. 529 (40,50), 530 (60,70,90). Fuel-&-vacuum type. *For complete data, refer to 1941 Carb. Equip. Index.*

Gasoline Gauge:—AC Electric. No. 1516304 (Dash Unit), 1516277 (Tank Unit exc. 90), 1516284 (90). *For complete data, refer to 1941 Carb. Equip. Index.*

MANIFOLD HEAT CONTROL:—Thermostatic coil type. **Setting**—Coil wind-up ¼ turn at 70°F. Adjust counterweight spring clip so edge of counterweight is approx. 7/16" (40 Single Carb.), ¾" (All Compd. Carb.) past vertical centerline of counterweight pivot with valve closed (pin must prevent valve striking body when closed or open).

VALVE TIMING:—To Check—With .015" tappet clearance #2 or #7 exhaust valve should be .145" (40,50), .155" (60,70,90) open with flywheel mark 'UDC/1&8' at indicator (inspection hole in right of housing).

Tappet Clearance:—.015" All valves—engine hot.

Valve Spring Pressure:—Total (inner & outer springs) 42-52 lbs. (closed), 112-124 lbs. (open).

LUBRICATION:—Crankcase Capacity 40,50 8 qts. (dry), 6 qts. (refill). **60,70,90** 10 qts. (dry), 8 qts. (refill).

Normal Oil Pressure—45 lbs. at 35 MPH.

COOLING:—Capacity—13 qts. (40,50), 16¾ qts. (60,70, 90). Allow 1¼ qts. extra for heater.

Pressure Valve—In filler cap. Opens at 7 lbs.

Thermostat—Harrison. In cylinder head outlet. Starts to open at 148-155°F. Fully open at 173°F.

BATTERY:—Delco Model 17E2 (Std.), 17K2 (RHD.Exp). 6 volt, 17 plate, 120 Ampere Hour (20 hr. rate).

Starting Capacity—140 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.5 minutes. Five second voltage—4.4 volts.

Grounded Terminal—Negative (—) to engine block.

Location—On right side under engine hood.

STARTER:—Delco-Remy 1107005 (40,50), 1107018 (40,50 RHD), 1107908 (60,70,90), 1107909 (60,70,90 RHD). **Armature**—1867897 (1107005), 820158 (1107908, 9), 810601 (1107018). **Brush Spring Tension**—24-28 ozs. **Drive**—Solenoid pinion shift & overrunning clutch. **Rotation**—Counter-clockwise at commutator end. **Cranking Engine**—(40,50) 135 RPM, 150 amperes, 4.5 volts (60,70,90) 115 RPM, 175 amperes, 5 volts.

Performance Data—1107005, 1107018

Torque	R.P.M	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Performance Data—1107908, 1107909

0 ft. lbs.	5500	5.0	65
16 "	Lock	3.0	600

Removal:—Flange mounted on right front face of flywheel housing. To remove, remove flange screws.

Starting Switch:—Solenoid Switch No. 1542 (1107005, 1107908), 1545 (1107018, 1107909) controlled by Vacuum Switch D-R No. 1990127 (Stromberg Carb.), Carter Car Starter No. 192-11U (Carter Carb.). *For complete data, refer to 1941 Elec. Equip. Index.*

GENERATOR:—Two brush (shunt) type. Interchangeable on all models with correct pulley.

NOTE—Air scoop and heat deflector installed on commutator end on cars with Compound Carburetion.

Car Model	Delco-Remy Model	Pulley Diameter	Groove Width
40, 50	1102679	3 13/32"	11/16"
60, 70, 90	1102668	3 17/32"	15/16"

Armature—No. 1877806 (all models).

Charging Rate Adjustment—None (controlled by regulator and dependent on battery condition).

Maximum Charging Rate—32-34 amperes, 8.0 volts, 2400 RPM, 26 MPH (exc. 90), 24 MPH (90). Actual charging rate controlled by voltage regulator.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1825

①—Not maximum output. See Current Regulator.

Brush Spring Tension—25 ounces each.

Field Current—1.67-1.82 amperes at 6.0 volts.

Rotation—Counter-clockwise at commutator end.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—½" deflection with light pressure midway between generator and pump pulleys.

REGULATOR:—Delco-Remy 1118201. Single Core Type. Vibrating Current & Voltage regulator on dash. *For complete data, refer to 1941 Elec. Equip. Index.*

CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.

Cuts Out—0-4.0 ampere discharge current.

Contact Gap—.020" (same for both sets).

Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Regulator over-compensated for temperature. Should be checked with cover in place and hot.

To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).

To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.

Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes hot (operating temp.).

To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulator 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F', current reading should agree with setting (above).

To Adjust—Same as for Voltage Regulator (above).

Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Guide 'Sealed Beam' type. *For complete data, refer to 1941 Elec. Equip. Index.*

Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).

Beam Indicator—In speedometer dial. Lighted when Upper Beams in use.

Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Delco-Remy No. 1995016.

Beam Selector—Delco Remy 1997008 or 1997009.

Directional Signal—Delco-Remy No. 1995503 (LHD-Brown), 1995504 (RHD-Brown), 1995507 (LHD-Grey), 1995508 (RHD-Grey).

Defroster, Heater, Dash Light—Delco-Remy 1997744.

Glove Comp't. Light & Switch—D-R. No. 1997747.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Park & Frt. Dir. Signal	21-3	1154
Rear Direction Signal	21-3	1154
Instr., Map, Clock, Glove Compt.	1.5	55
Beam & Dir. Sig. Indicators	1	51
Stop & Tail	21-3	1154
Rear License	3	63
Courtesy (step)	15	88
Dome	6	82

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. at 70°. Not adj.

FUSES:—Dome Light (50, 60, 70, 90). 30 ampere. In connector in lead on back of instrument panel.

Cigar Lighter—30 ampere. In back of lighter.

Direction Signal—14 ampere. In connector.

Instrument Lights—10 ampere. On switch.

Clock—2 ampere. In connector in clock lead.

Heater & Defroster—14 ampere. On switches.

HORNS:—Delco-Remy No. 1999519 (Low Note, right horn), 1999520 (High Note, left horn). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999519 (low note)	19-21 amperes	.045-.049"
1999520 (high note)	17-19 amperes	.035-.039"

Horn Relay:—Delco-Remy 1116775.

Contact Gap—.025". **Air Gap**—.015" (closed).

Contacts Close—2.75-4.0 volts.

HOOD LOCK:—Alligator type. Hood lock same as 1940. Push radiator ornament back freeing both manual and safety catches.

SERIAL & ENGINE NUMBER:—First No. (60S) 6,340,001, (61) 5,340,001, (62) 8,340,001, (63) 7,340,001, (67) 9,340,001, (75) 3,340,001. Stamped on left frame side member opposite steering gear and on left side of crankcase to rear of cylinder block.

COMPRESSION:—**Ratio**—7.25-1 Std. Ratio may be lowered by installing special shims between head and block.

Pressure—182 lbs. at 1000 RPM.

VACUUM READING:—20-21" steady idling at 7-8 MPH.

IGNITION:—**Delco-Remy Coil 1115128.** On dash.

Ignition Current—2.2 amperes idling, 4.4 stopped.

Ignition Switch:—Delco-Remy No. 1116298 (60S,61,63, 67), 1116299 (62, 75), 1116309 (RHD Cars). Connected to ignition coil by armored cable.

Ignition Lock—Briggs & Stratton No. 85373. Key Series—8000 to 9499. Groove—No. 15.

Distributor Delco-Remy 1110807. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual adjustment.

Breaker Gap—.0125-.0175".

Cam Angle or Dwell—31° closed, 14° open (.015" gap).

Breaker Arm Spring Tension—19-23 ounces.

Rotation—Clockwise viewed from above.

Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M
Start	500	1	1000
12	2000	24	4000

Vacuum Spark Control 1116030. On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above idling except when engine acelerated or operated with wide open throttle when spark retarded by return spring within unit. **Plunger Travel**—13/64" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5.5-7.5"
9°	18°	15-18"

Manual Adjustment—Permits 10° advance or retard from center position. See Ignition Timing (below).

Removal:—Distributor mounted between cylinder banks at rear of engine. To remove, disconnect vacuum line, take out two hold-down screws in advance arm, lift distributor out.

Installation Note—Turn crankshaft to firing position for #1 cylinder, mesh distributor driven gear with driving gear on camshaft so that slot in upper end of drive shaft coupling is offset toward left or rear of engine (narrow part of coupling to left or rear). CAUTION—See that oil pump driveshaft properly lined up (pump may be damaged by pushing shaft down if not aligned).

FIRING ORDER:—1-8-7-3-6-5-4-2 with cylinders numbered as shown on diagram.

SPARK PLUGS:—AC No. 104. 10 MM. Metric.

NOTE—Use special wrench J-1275 and tighten plugs just enough for good gasket seal (do not use torque wrench with these small plugs).

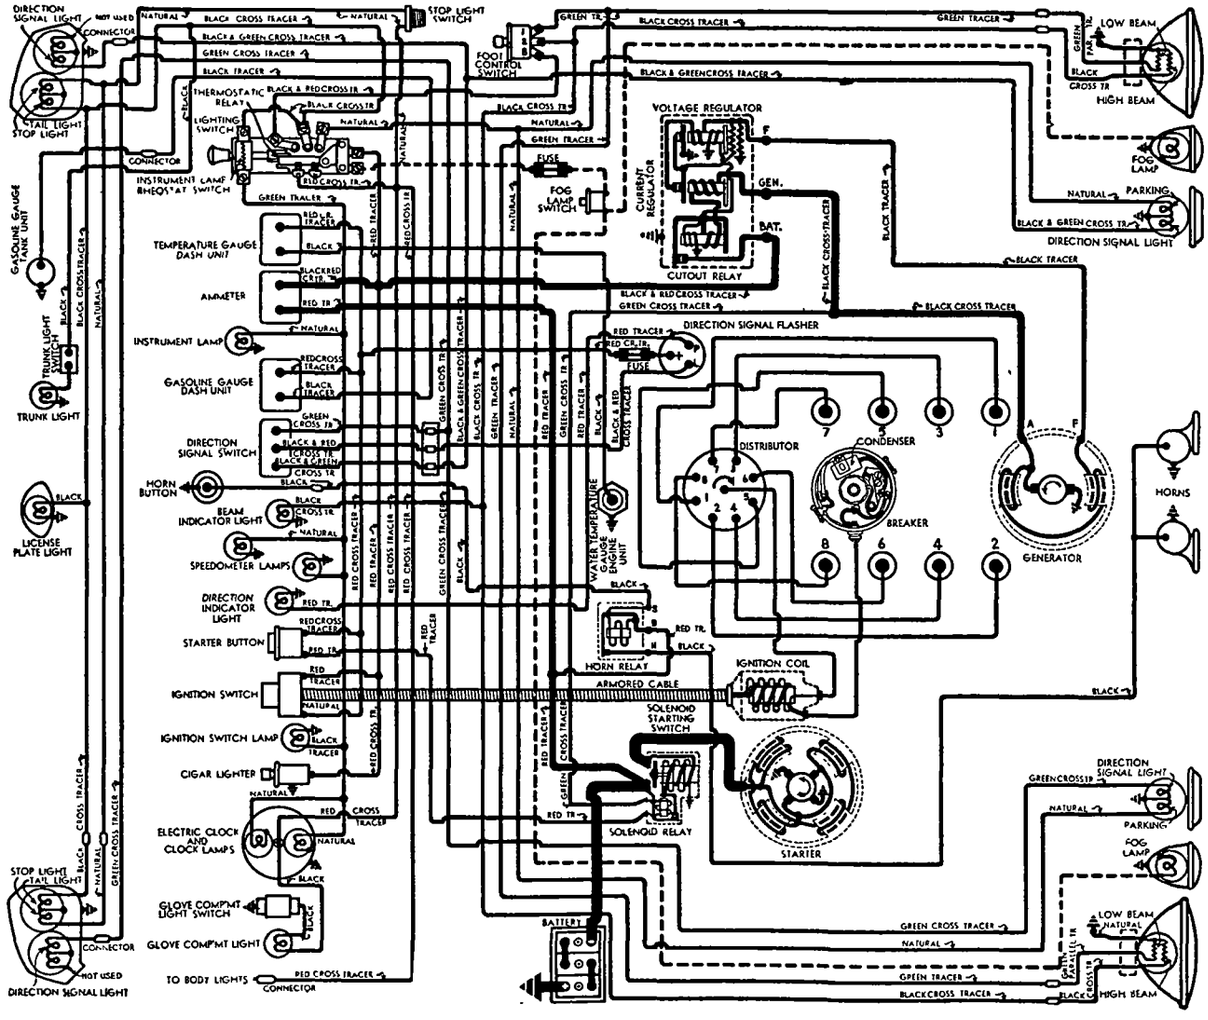
Spark Plug Gaps—.025-.030".

IGNITION TIMING:—Setting as given for Ethyl fuel. See Manual Adjustment (following) for correction for fuel of other Octane Rating.

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0114" BTDC.

Timing (With Synchroscope)—Recommended method. Disconnect vacuum line at distributor (to avoid damage to unit), clip synchroscope lead to #1 spark plug, idle engine and direct synchroscope light on timing disc behind crankshaft pulley at front of engine. Loosen advance arm clamp bolt, rotate distributor until 'IG/A' mark on timing disc (5° before top dead center mark 'C.1/6') lines up with pointer on chain case cover, tighten clamp bolt, reconnect vacuum line (hold connection with wrench while tightening), check setting for fuel used (see Manual Adjustment below).

Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston (front cylinder left bank) with 'IG/A' mark on timing disc behind crankshaft pulley in line with pointer on chain case cover and distributor rotor at #1 segment in distributor cap. Adjust distributor as directed above.



Manual Adjustment—Should be set for slight ping when accelerating engine with wide open throttle at speeds below 15 MPH. To adjust, loosen holddown screw in advance arm, rotate distributor clockwise (if ping too severe), counter-clockwise (if no ping noted) one graduation at a time. CAUTION—Check engine for faulty spark plugs, excessive carbon deposits, localized hot spots or lean carburetor setting before changing adjustment to correct pinging.

CARBURETION:—**Carburetor**—Stromberg Model AAV-26 or Carter WDO Model 506-S, 1¼" dual, downdraft type with Automatic Choke.

For complete data, refer to 1941 Carburetor Index.

Idle Adjustment (All Carburetors)—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for slow idle speed of 7-8 MPH. (Std.), exactly 375 Eng. RPM. (Hydra-matic Drive Cars). Adjust both idle screws (1 for each barrel) exactly alike so that engine idles smoothly (turn screws in for leaner mixture). Recheck idle speed. ***See Hydra-matic Drive article in Mechanical Equipment Section for linkage adjustments on cars with Hydra-matic Drive.***

Accelerating Pump Setting—On Stromberg carburetor, throttle lever has two holes for pump rod engagement. Connect rod as follows:
Inner Hole (short stroke)—Normal setting.
Outer Hole (long stroke)—for maximum discharge.
NOTE—Carter Carburetor not adjustable.

Float Level—Check each model as follows:
Carter—1/8" from top of float to machined surface (gasket seat) of bowl cover with needle valve seated (remove gasket and invert to check). Use Cadillac float level gauge J-818-5.
Stromberg—Fuel level 5/8" below top edge of bowl with engine idling (5 lbs. pressure) or even with bottom of inspection plug hole on side of bowl. Float level 1 13/32" from bottom of floats to gasket surface on bowl cover with valve seated (invert to check) or even with vertical guides of checking tool KMO-269-S-7 (Stromberg No. T-24971) with tool installed on gasket. Floats must be set alike.
Metering Jets & Rods—*See Carter & Stromberg Jet Tables in Carburetor Section for complete data.*

Fast Idle:—Integral (built-in each carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting (Carter)—With throttle stopscrew set for 7-8 MPH. hot or slow idle speed, close choke valve so that fast idle screw on high lobe of fast idle cam, adjust screw so that clearance between throttle stopscrew and stop on carburetor casting is .023"
Setting (Stromberg)—To check, hold throttle stopscrew against high lobe of fast idle cam, move choke valve toward closed position as far as possible, check remaining choke valve opening with #32 drill (.116"). To adjust, bend fast idle connector rod at point below choke valve for correct valve opening.

Automatic Choke:—Climatic Control (Carter), AAV-26 type (Stromberg). Built-in carburetor.
For complete data, refer to 1941 Carb. Equip. Index.
Setting (Carter)—Reference mark on thermostat cover centered on housing scale.
Setting (Stromberg)—'V' mark on thermostat cover in line with reference mark on housing.

Air Cleaner:—AC No. 1529928 (60S), 1529929 (62, 67, 75), 1529297 (61, 63). Heavy duty oil-bath type.

Fuel Pump:—AC Type. Pump exchange Part No. 521 (60S, 62, 67, 75), 522 (61, 63). Fuel-&-Vacuum
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—AC Electric. No. 1515368 (Dash Unit), 1516269 (Tank Unit except 75), 1516155 (75).
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check—Intake valve for #1 cylinder (front cylinder, left bank) opens with piston on top dead center and mark 'C.1/6' on timing disc behind crankshaft pulley in line with pointer on chain case cover.

Tappet Clearance:—None (Wilcox-Rich 'Zero-lash' hydraulic tappet take-up lifter used).
For complete data, refer to 1941 Mech. Equip. Index.

Valve Spring Pressure:—63½ lbs. at 1.926" (valve closed) 145 lbs. at 1.581" (valve open).

LUBRICATION:—Crankcase Capacity—7 qts.
Normal Oil Pressure—25 lbs. at 30 MPH.

COOLING SYSTEM:—Capacity—25 qts.
Pressure Valve—In filler cap.

Thermostat:—In radiator top tank (shutter control).
Setting—Std. type starts to open at 153-158°F, fully open at 175°F. High Reading Type (for use with heaters) starts to open at 168-173°F, fully open at 190°F. Stem travel (closed to open position) 9/16".
Shutter Adjustment & Thermostat Checking—*See Cadillac Shop Notes in 'M' Section for complete data.*

Temperature Gauge:—AC Electric. No. 1510773 (Dash Unit), No. 1510774 (Engine Unit).
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—Delco Model 17K3. 6 volt, 17 plate, 115 Ampere Hour Capacity (20 hour rate).
Starting Capacity—137 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.3 minutes. Five second voltage, 4.4 volts.
Grounded Terminal—Positive (+) to frame bracket.
Engine Ground—Strap connector from right front engine mounting bracket to frame bracket. On cars with Radio, additional ground strap connected from rear of right hand cylinder head to dash.
Location—On outside of right frame siderail at rear of engine comp't. Accessible with hood raised.
Dimensions—Length 10⅜". Width 7". Height 8 11/16".

Commercial Models—Delco 19-Q3. 6 volt, 19 plate, 125 Ampere Hour Capacity (20 hour rate).
Starting Capacity—145 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.0 minutes. Five second voltage 4.5 volts.
Dimensions & Grounded Terminal—Same as 17K3

STARTER:—Delco-Remy 1107923 (except 75 RHD), 1107925 (75 RHD). Armature No. 820158.
Drive—Overrunning clutch & solenoid pinion shift.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5500	5.0	65
16 "	Lock	3.0	600

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, take out flange mounting screws, pull starter forward and remove from below.

Starting Switch:—Delco-Remy Solenoid Switch No. 1542. Mounted on starter and controlled by Push-button Switch No. 1996009 on instrument panel.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—Delco-Remy 1102661 (Std.), 1102686 (Cars with Hydramatic Drive). Armature No. 1878211. Two brush (shunt) type with current & voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and max. output by Current Regulator.
Maximum Charging Rate—32 amperes, 8.0 volts, 2450 RPM. or 27 MPH. (60S, 61, 62, 63), 25 MPH. (67, 75, & 62, 75 Comml.). Current Regulator Setting (with load or discharged battery). Actual charging rate controlled by Voltage Regulator (dependent on battery).

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

①Not maximum output. See Current Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ozs. each.
Field Current—1.67-1.82 amperes at 6.0 volts.

Removal:—Generator flange mounted between cylinder banks at front of engine and belt driven in tandem with water pump (separate drive belt for fan). To remove, take out flange mounting bolts.

Belt Adjustment:—Loosen generator mounting bolts, raise generator (pivots on left bolt, right bolt hole slotted) until belt deflection is ¾-⅞" midway between generator and crankshaft pulleys.
Fan Belt—Adjust to same tension by raising fan

REGULATOR:—Delco-Remy 1118202. Single Core Type. Vibrating Current & Voltage Regulator on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay
Cuts In—6.2-6.7 volts hot, 800 generator RPM.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator
Setting—7.2-7.4 volts hot (operating temperature). Should be checked with cover in place and hot.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator
Setting—32-34 amperes hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT" terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Guide 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght).
Beam Indicator—In upper left face of speedometer dial. Lighted when Country (upper) beams in use.
Direction Signal—*Refer to 1941 Elec. Equip. Index.* Pilot light in upper right face of speedometer dial flashes when Direction Signal operating.

Switches
Lighting—Delco-Remy No. 1995015. Switch has instrument light rheostat on handle.
Beam Selector—Delco-Remy No. 1997002 (All LHD. cars), 1997009 (RHD. cars).
Direction Signal—Delco-Remy No. 1995505 (All LHD. cars), 1995506 (RHD. cars).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Park & Frt. Dir. Signal	21-3	1154
Rear Direction Signal	21-3	1154
Beam & Dir. Sig. Indicators	1	51
Instrument, Clock, Radio	1.5	55
Glove Comp't., Trunk	1.5	55
Ignition Lock	1	51
Stop & Tail	21-3	1154
Rear License Plate	3	63
Dome, Quarter	15	87

FUSES:—Direction Signal—9 ampere. In connector in feed wire on back of instrument panel near Flasher.

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. at 70°. Not adj.

HORNS:—Delco-Remy Model K-33-H. No. 1999537 (Low Note), 1999538 (High Note). Vibrator type, blended tone horns, operated by relay. NOTE—Horns mounted in front of radiator below filler plate.

Type	Current (at 6 volts)	Air Gap
1999537 (Low Note)	19-21 amperes	.045-.050"
1999538 (High Note)	18-20 amperes	.036-.040"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HEAVY DUTY TRUCK ENGINE:—Special 235.2 cu. in. (3 9/16" bore, 3 15/16" stroke) engine Optl. on 1½ Ton Truck. All service data same as std. engine except as noted.

FLEET (ECONOMY) MODEL:—Has special carburetor (492-S), and specifications as listed below.

HOOD LOCK:—Alligator type. Hood lock same as 1940. Pull out hood lock button on instrument panel, pull safety catch forward (under front end of hood).

SERIAL NUMBER:—First number 1001 (all models) with model prefix as follows: AG (Master Deluxe), AH (Special Deluxe), AK & AJ (½ Ton), AL & AN (¾ Ton), YR (1 & 1½ Ton), YU, YV, YW (1½ Ton Cab-over-Engine), YT (School Bus). On plate on right front floor (Pass. Cars), rear side of dash (C-O-E), right side of cowl under hood (Other Trucks).

ENGINE NUMBER:—Stamped on right side of crankcase to rear of distributor. First No. 1001 (each plant) with model prefix code letters as follows:

Model	Flint	Buffalo
AG, AH Pass. Cars & Sedan Del.	AA	AC
½ Ton	AD	AE
¾ & ¾ Ton Special	AAF	AAN
1½ Ton	AF	AN
1½ Ton (235 cu. in. Eng.)	AG	
1½ Ton C-O-E	AJ	
1½ Ton C-O-E (235 cu. in. Eng.)	AL	
Dubl Duti Panel	AM	

COMPRESSION:—**Ratio**—6.5-1 Std. 6.62-1 (Optl. 235.2 cu. in. Engine). **Pressure**—110 lbs. min. at cranking speed (all cylinders equal within 5-10 lbs).

VACUUM READING:—20-22" steady at idling speed.

IGNITION:—**Reversing Switch**—Delco-Remy No. 1997738 (1107033 Starter), D-R No. 1997752 (1107047 Starter). Mounted on starter (see diagram for connections). IMPORTANT SERVICE NOTE—See Reversing switch article for adjustment directions (car may not start if adjustment incorrect) and New Type Switch used on later cars.

For complete data, refer to 1941 Elec. Equip. Index.

Ignition Coil:—Delco-Remy No. 1115141. New type. On right side of engine near distributor.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Delco-Remy No. 1116304 (Pass. Cars), 1116315 (Can. Pass. Cars); 1116301, 1116302 (Comm'l. & Trucks); 1116291, 1116292 (Can. Comm'l & Trucks); 1116303 (Cab-over-Engine Trucks). Connected to ignition coil by armored cable.

Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.

Distributor Delco-Remy No. 1110090. Single breaker, 6 lobe cam, full automatic advance type with separate vacuum spark control and Octane Selector adjustment. NOTE—New type with insulated breaker plate and ground terminal for Reversing Switch

Breaker Gap—.018". Limits .015-.021".

Cam Angle or Dwell—38° closed, 22° open.

Breaker Arm Spring Tension—17-21 ozs.

Rotation—Clockwise viewed from above.

Condenser—Part No. 1882239. Capacity .28-.32 mfd. NOTE—Condenser must not be used with coil or distributor used on previous model (capacity too great).

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1	600
6.5	600	13	1200
10.0	1000	20	2000
19.75	1725	39.5	3450

Vacuum Spark Control No. 1116026. Mounted on Octane Selector and linked to advance arm. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring

Plunger Travel—11/64" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7" Min.
10°	20°	16-20"

Octane Selector—Adjustment on distributor provides 10° advance or retard from center '0' position. See Ignition Timing for adjustment instructions.

Removal:—Distributor mounted on right side of crankcase. To remove, loosen advance arm clamp bolt (does not disturb vacuum connections).

FIRING ORDER:—1-5-3-6-2-4. See diagram.

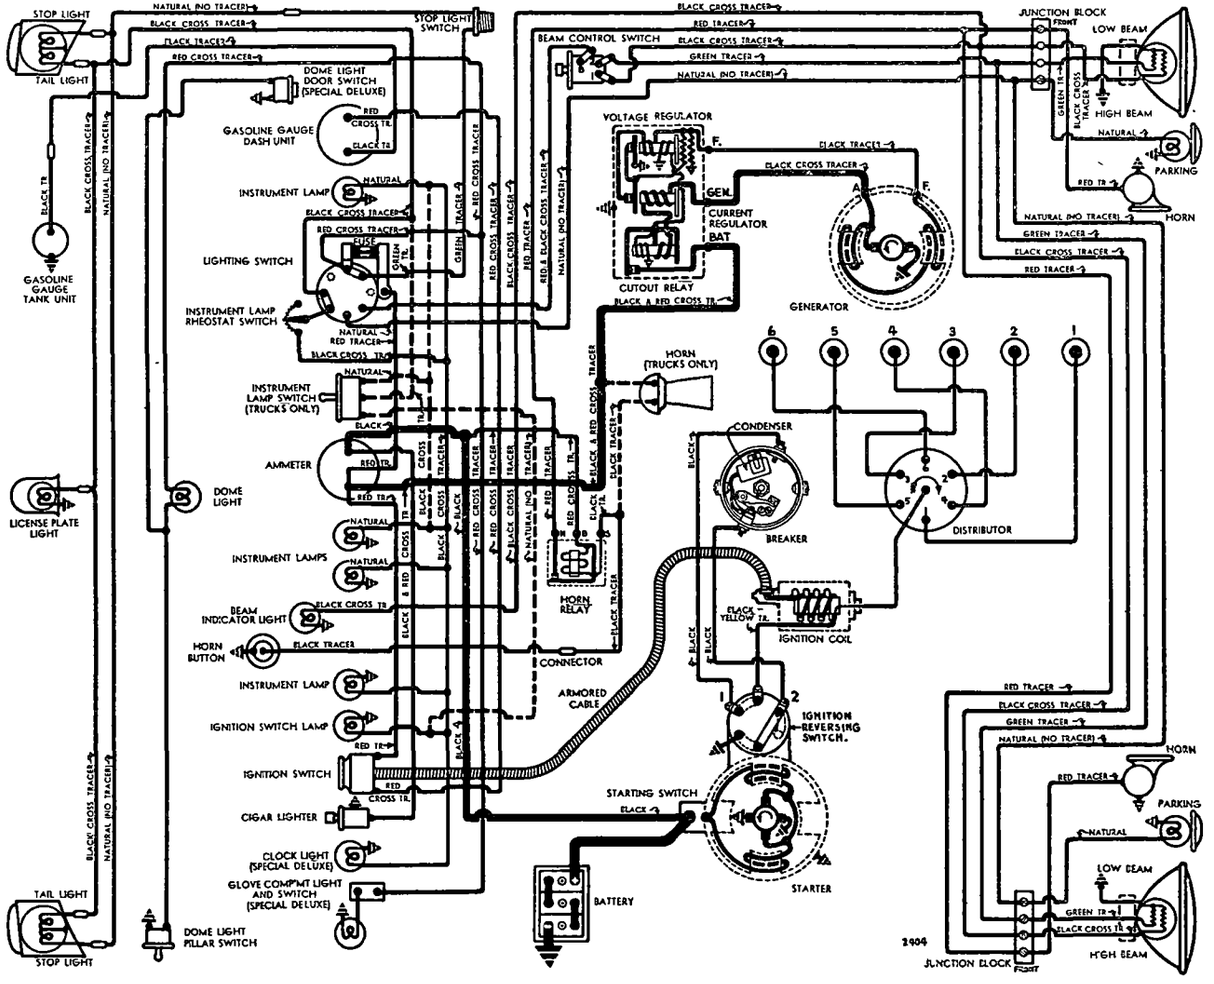
SPARK PLUGS:—AC No. 104. New 10 MM. Metric.

CAUTION—Do not tighten these small plugs excessively (15 ft. lbs. or finger tight plus ½-¾ turn).

Spark Plug Gaps—.040".

IGNITION TIMING:—See Octane Selector (below) for final setting dependent on fuel used.

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0091" BTDC



Timing (Neon Light)—Recommended method. Connect neon light to #1 spark plug, direct light on flywheel through inspection hole in right front face of housing. Set Octane Selector pointer at '0'. Idle engine, loosen advance arm clamp bolt, rotate distributor until ignition mark (steel ball insert in flywheel) lines up with pointer. Tighten clamp bolt and check Octane Selector setting.

Timing (Without Neon Light)—With #1 piston on compression, turn engine over until piston is 5° or .0091" before top dead center with ignition mark (steel ball insert in flywheel) at pointer in inspection hole in right front face of housing. Adjust distributor as directed above.

Octane Selector Setting—Set for slight ping when accelerating engine with wide open throttle. To adjust, loosen hold-down screw, move distributor and scale counter-clockwise to advance spark (if no ping), clockwise to retard spark (if too severe).

CAUTION—See that noise (like a ping) not caused by accelerator rod striking intake or exhaust manifold (at point where rod passes between manifolds).

CARBURETION:—**Carburetor**—Carter W-1 Model 483-S (Std.), 492-S (Econ. Engines). 1¼" downdraft type.

NOTE—483-S painted Black with Casting No. 421 on face of flange. 492-S Brown—Casting No. 432.

For complete data, refer to 1941 Carburetor Index.

Cab-over-Engine & Dubl Duti Panel—Carter BB, Model 489-S, 1¼" Updraft type.

For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and choke valve wide open, set throttle stopscrew so engine idles at 450-500 RPM. Adjust idle adjusting screw so that engine fires smoothly (turn screw in for leaner mixture). Final setting should be 1-2 turns (483-S, 492-S), ½-1½ turns (489-S) out from inner seated position. Recheck idle speed.

Accelerating Pump Setting (489-S)—Throttle lever has two holes for pump link connection as follows: Inner Hole (Short Stroke)—Summer temperatures. Outer Hole (Long Stroke)—Winter temperatures.

Float Level (483-S, 492-S)—½" from top of float at free end to gasket seat on cover with valve closed (remove gasket and invert to check).

Float Level (489-S)—Top of float 1/32-1/16" below top edge of bowl (gasket removed) with valve seated.

Metering Rods & Jets—***See Carter and Carter (B&B) Jet Tables in Carburetor Section for complete data.***

Throttle Cracker:—Opens throttle ⅓ for starting.

Adjustment—With carburetor correctly set for 450-500 RPM. idle speed, loosen locknut and adjust bolt so that clearance between head of bolt and lug on starter pedal cross-shaft is ⅛", tighten locknut.

Air Cleaner:—AC No. 1529667 (Pass. Cars). Oil-wetted type Std., heavy duty oil-bath type Optl.

Fuel Pump:—AC Type AF diaphragm type Std. Replacement exchange pump No. 429.

For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—AC Electric. No. 1516293 (Dash Unit), No. 1516280 (Tank Unit—Pass. Cars).

For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic type. Check when tuning engine. Spring should be wound up just enough to slip end over manifold pin (approx. ½ turn). CAUTION—Excessive tension may cause valve to stick, detonation, poor performance.

Anti-Rattle Spring Note—See 1940 Chevrolet T&E page for spring installation to correct rattles.

VALVE TIMING:—To Check—With tappet clearance of .006", #1 intake valve opens with piston 3° or .0032" before top dead center when point on flywheel approx. 1.158 teeth before 'U/C' mark lines up with indicator in right front face of housing.

Tappet Clearance:—.006-.008" Int., .013-.015" Exh. Hot (engine 'Normalized'). Use lower figure for ordinary service, higher figure for severe truck operation.

Fleet Economy Engines—.010" Int., .016" Exh. Hot.

All Trucks (Heavy Duty)—.010" Int., .020" Exh. Hot.

See Chevrolet Shop Notes in 'M' Section for Engine Normalizing instructions.

Valve Spring Pressure:—55 lbs. at 1 13/16" (valve closed), 128 lbs. at 1½" (valve open).

LUBRICATION:—Crankcase Capacity—5½ qts. (dry), 5 qts. (refill). **Normal Oil Pressure**—14 lbs. at 21 MPH. (Pass. Cars), 2000 RPM. (Trucks).

COOLING SYSTEM:—Capacity—14 qts. (except C-O-E), 16 qts. (with Optl. Engine), 16½ qts. (C-O-E Trucks).

Thermostat:—Harrison. In cylinder head outlet.

Setting—Begins to open at 142°F. (Std. type), 162° (All Econ. Engines & for permanent anti-freeze).

Temperature Gauge:—AC (not electric). No. 1511051.

BATTERY:—Delco Model 15X-3. 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.6 minutes. Five second voltage 4.2 volts.

Grounded Terminal—Negative (—) terminal.

Location—In engine compartment on right side (Pass. cars), under front floor on right side (Trucks).

Special Battery—Delco Model 19Q-3. 6 volt, 19 plate, 125 ampere hour capacity (20 hour rate).

Grounded Terminal & Location—Same as above.

STARTER:—Delco-Remy 1107033, 1107047 (all models), 1107038 (RHD Pass. Cars), Arm. No. 1867897 (1107033).

Drive—Overrunning clutch and manual pinion shift (1107033, 1107047), solenoid pinion shift (1107038).

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ozs. each.

Cranking Engine—65 RPM., 150 amperes, 5.5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Starter flange mounted on right front face of flywheel housing. To remove, disconnect starting pedal linkage and Reversing Switch wires. Take out flange mounting screws, remove starter & switch.

Starting Switch (1107033, 1107047):—Delco-Remy No. 820052. On starter. Operated by starting pedal.

(1107038)—Delco-Remy Solenoid Switch No. 1546. On starter. Operated through relay in switch case by pushbutton switch No. 1996010 on instrument panel.

For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—Delco-Remy 1102667 (Std.). Armature 1879002. Two brush type (Current&Voltage control).

Special Generators—For special service as follows: **1102677** (Door-to-door), **1106403** (City Police), **1105851** (State Police), **1106406** (Boston Police).

Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator. See Regulator data below.

Maximum Charging Rate (Std. Gen.)—38-40 amperes (cold), 7.3-7.7 volts, 2400 RPM., 25.5 MPH. (Pass. Cars). NOTE—Current Regulator limits maximum charging rate to 32-34 amperes. Actual charging rate controlled by Voltage Regulator.

Performance Date—Cold

	Amperes①	Volts	R.P.M.
1102667	30	8.0	1750
1102677	26	8.0	1450
1105851	40	8.0	1850
1106403, 6	35	8.0	1040

①—Not maximum output—See Current Regulator

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—25 ozs. each.

Field Current—1.67-1.82 amps. (1102667), 1.76-1.88 amps. (1102677), 1.82-1.94 amps. (1105851), 1.7-2.0 amps. (1106403, 1106406) at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Swing generator away from engine until belt side play at point midway between generator and fan pulleys is 1½" (light pressure).

REGULATOR:—Delco-Remy 1118201 (1102667 Gen.), 1118233 (1102677 Gen.), 1118237 (1105851 Gen.), 1118229 (1106403, 6 Gens. with Neg. Grd.), 1118232 (1106403 Gen. with Pos. Grd.). Single Core Type. Vibrating Current & Voltage Regulator on dash.

For complete data, refer to 1941 Elec. Equip. Index.

CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.

Cuts Out—0-4.0 ampere discharge current.

Contact Gap—.020" (same for both sets).

Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts (1118201), 7.0-7.2 volts (all others) at operating temperature (hot).

To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).

To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment section for other (2nd.) spring adjustment.

Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes (1118201), 34-36 (1118229, 1118232), 24-26 (1118233), 38-40 (1118237) at hot operating temperature.

To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).

To Adjust—Same as for Voltage Regulator (above).

Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Guide 'Sealed Beam' type.

For complete data, refer to 1941 Elec. Equip. Index.

Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).

Beam Indicator—Dot on upper edge of speedometer dial (above '50'). Lighted when upper beams in use.

Direction Signal—***Refer to 1941 Elec. Equip. Index.***

Switches

Lighting—Delco-Remy 1994022 (Pass. Cars), 1994015 (Comm'l. & Truck), 1997718 (State Police), 1995013 (Army). NOTE—1994022 switch (Pass. Cars) has instrument light rheostat in switch handle.

Beam Selector—Delco-Remy 1997003, 1997002 (Can.),

Instrument (Comml. & Truck)—Delco-Remy 1404.

Stop Light—Delco-Remy 1997725.

Glove Comp't. Light—Delco-Remy 1997742.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking (Without Dir. Sig.)	3	63
Parking & Direc. Signal	21-3	1154
Instrument, Spdmtr.	1½	55
Clock, Glove Compt.	1½	55
Ign. Lock, Beam Indicator	1	51
Tail & Stop (See Note)	21-3	1154
Rear License Plate	3	63
Dome	6	82

NOTE—Separate 3 cp., No. 63 bulbs on Pickup & Sedan Dlvry (Stop light 15 cp., No. 87 on Sedan Dlvry).

FUSES:—Lighting—30 ampere. On back of light switch.

Clock—2 ampere. On clock.

HORNS:—Pass. Cars—Delco-Remy No. 1999533 (Low Note—RH.), 1999534 (High Note—LH.). Vibrator type twin horns operated by relay.

Trucks—Delco-Remy 1999801. Vibrator type single horn.

	Current (at 6 volts)	Air Gap
1999801	7-9 amperes	.027-.033"
1999533 (low note)	19-21 amperes	.044-.049"
1999534 (high note)	18-20 amperes	.034-.039"

Horn Relay (Pass. Cars):—Delco-Remy No. 1116775.

Contact Gap—.025". **Air Gap**—.015" (closed).

Contacts Close—2.75-4.0 volts.

CHRYSLER 1941

SIX, ROYAL & WINDSOR MODEL C28
AUTO-LITE ELECTRICAL SYSTEM

HOOD LOCK:—*See Chrysler Shop Notes in 'M' Section.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—7,657,501 (Royal), 7,901,601 (Windsor), Canada—9,717,741 (Royal).

ENGINE NUMBER:—First number C28-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—**Ratio**—6.8-1 or 6.5-1 cast-iron heads, 7.2-1 aluminum Optl. (7.2-1 std. on 7 pass.).
Pressure—140-150 lbs. at 1000 RPM or 115-125 lbs. at 125 RPM. cranking speed (for 6.8-1 head).

VACUUM READING:—Steady 18-20" idling (below 1000').

IGNITION:—**Auto-Lite Coil No. IG-4669 (Std.), IG-4671 (With Vacamatic Trans.).** Service winding (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—2.25 amperes idling, 5 stopped.
Ignition Switch:—Mitchellock Model 30-R, No. 8794. NOTE—Switch has extra terminal for Transmission control (used with Vacamatic Transmission only).
Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80592. Key Series 1BP to 1000 BP. Groove 24.
Distributor Auto-Lite IGS-4113-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual adjustment.
Breaker Plate Identification—#7 stamped on plate
Breaker Gap—Set at .020".
Cam Angle or Dwell—38° closed, 22° open (distr. °).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-3927A. Capacity .25-.28 mfd.

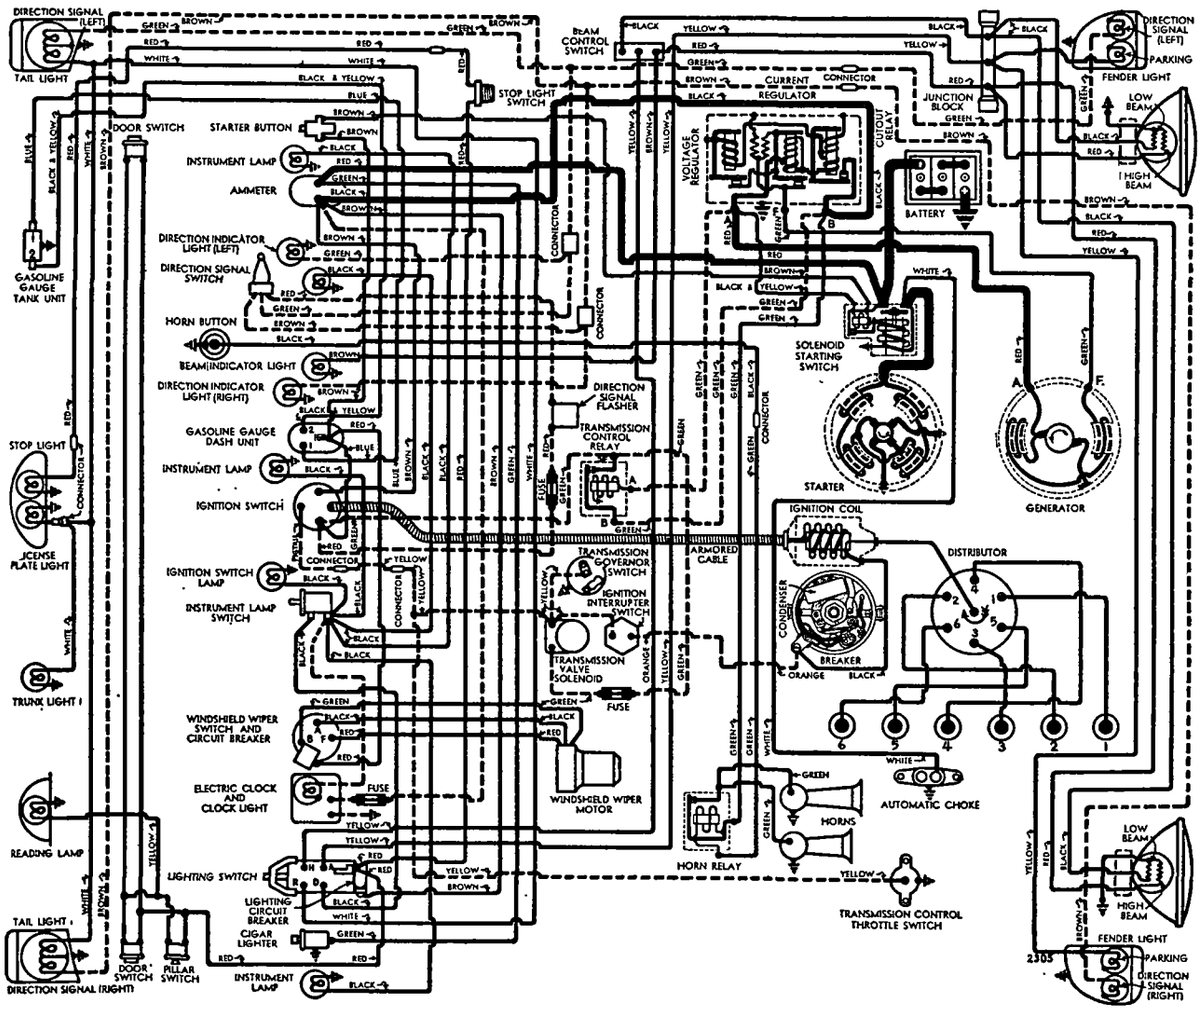
Distributor Automatic Advance		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance		
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position (at TDC) and rotor opposite #1 segment in cap.

FIRING ORDER:—1-5-3-6-2-4. See diagram.



SPARK PLUGS:—Auto-Lite A-7B (Cast iron head), AL-7A (Aluminum head). 14 MM Metric type.
NOTE—Spark plug tightening tension 26-32 ft. lbs.
Spark Plug Gaps—Set at .025".

IGNITION TIMING:—Initial setting (correct for fuel of approx. 70 octane rating at low altitudes for all heads) shown below. See Manual Adjustment (following).

Flywheel Degrees	Piston Position
All Engines ..... 0° at TDC	..... 0000" at TDC.

NOTE—Impulse neutralizer marked 'DC' at TDC point with 15 (1°) graduations on either side.
Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).
Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine and adjust distributor as directed above.
Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping noted), clockwise to retard spark (if ping too severe), tighten screw.

CARBURETION:—**Carburetor**—Carter (Ball & Ball) Models E6S2, E6S3, E6W1 (Std. Trans.), EA1 (Fluid Drive & Std. Trans.), E6T1, E6T2, E6U1, E6U2 (With Vacamatic Trans.). 1½" downdraft types.
For complete data, refer to 1941 Carburetor Index.
NOTE—EA1; E6T1, T2; E6U1, U2 models have dashpot (slow-closing throttle built in carburetor). Two type used (later type has solenoid control).
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for idle speed of 6 MPH min. (Std.), 450 RPM or 4 MPH max. (Cars with Vacamatic Transmission). Adjust idle adjusting screw for smooth idle (½-1½ turns open, turn screw in for leaner mixture). Recheck idle speed.
NOTE—If vacuum gauge used, adjust for highest obtainable vacuum (see Vacuum Gauge data above).
Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows:
Inner Hole (minimum stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal summer setting.
Outer Hole (max. stroke)—Winter temperatures.
Float Level—5/64" (all except EA1), 1/16" (EA1), from top of float (not seam) to top edge of bowl with valve seated. Check with tool C-449 (exc. EA1).
Metering Jet—*See Carter (B&B) Jet Table in Carburetor Section for complete data.*

NOTE—If lean metering jet (High Altitude calibration) used at lower altitudes for increased economy, speed and power are reduced (not recommended).

Slow-closing Throttle (EA1, E6T1, E6T2, E6U1, E6U2):
—*For complete data, refer to 1941 Carb. Equip. Index.*
Adjustment (First type only)—Turn adjusting screw above dashpot plunger in as far as possible, then back screw out 5 full turns for 7/32" stroke.

Fast Idle:—Built-in type. Not adjustable.

Automatic Choke:—Sisson Type AC-758B.
For complete data, refer to 1941 Carb. Equip. Index.

Air Cleaner:—AC #1529938 heavy duty oil-bath type.

Fuel Pump:—AC diaphragm type pump. Replacement Exchange Pump No. 505.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric. No. NG-9704D (dash unit), No. NG-9329T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve and shaft rotate freely. When installing coil, place inner end in slot in valve shaft, **wind free end up one turn only counter-clockwise** and hook end over stop.

VALVE TIMING:—**To Check**—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .063" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer. Reset tappet clearance at .008" hot.

Tappet Clearance:—.008" Intake, .010" Exh. (hot & idling). .002" add'l. exh. clearance desirable for sustained high speeds. NOTE—Self-locking tappet screws used. Remove right front wheel and lower wheel housing panel for access to valves.

Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed), 107-115 lbs. at 1⅜" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH & above.

COOLING SYSTEM:—**Capacity**—18 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9703.
For complete data, refer to 1941 Mech. Equip. Index.

VACAMATIC (UNDERDRIVE TYPE) TRANSMISSION CONTROL:—*For adjustments, refer to 1941 Mech. Equip. Index for 'Vacamatic Underdrive Transmission.'*

BATTERY:—**Willard Type WHT-2-17R.** 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—152 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.0 minutes. Five second voltage 4.4 volts.
Grounded Terminal—Positive (+) to engine.
Dimensions—Length 10¼". Width 7". Height 9⅜".
Location—Under hood in left fender shield.

STARTER:—**Auto-Lite MAX-4045, A. Arm. MAW-2030.**
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM, 175 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.	640
25.0 "	Lock	4.	880

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wires (tape battery lead), remove oil filter tubes, filter and 2 starter bolts.

Starting Switch:—A-L Solenoid Switch Type SS-4703.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—**Auto-Lite GDZ-4801A (Std.), GEB-4801A (City Police), GEG-4818A (City Police & Taxicab), GEG-4818B (State Police).** Two brush. With current and voltage regulation. Ventilated.
Armature Nos. GDZ-2006F (GDZ-4801A), GEB-2006F (GEB-4801A), GEG-2006F (GEG-4818B).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—As given in tables below reached at approx. 24 MPH (GDZ Gen.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

Cold Amperes	Volts	R.P.M.	Hot Amperes	Volts	R.P.M.

40①	8.0	1520	40	8.0	1680

①—Current regulator setting. See Regulator data.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ounces max. (GDZ Gen.), 64-68 ozs. (GEB & GEG Gen.) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amps. (GDZ Gen.), 4.0-4.5 amps. (GEB), 4.7-5.2 amps. (GEG) at 6.0 volts.

Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.

REGULATOR:—**Auto-Lite VRP-4001A (GDZ Gen.), VRP-4001B (GEB Gen.), VRP-4001F (GEG Gen.).**
Current-Voltage types. In case on dash.
NOTE—For negative battery ground, VRP-4005A (GDZ Gen.), VRP-4005B (GEB), VRP-4005E (GEG)
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts at approx. 1000 gen. RPM (VRP-4001A,5A), 600 RPM (1B,5B), 820 RPM (1F,5E).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A, 5A)—34-36 amperes (marked '35' on cover). **(VRP-4001B, 5B)** 31-33 (marked '32' on cover). **(VRP-4001F, 5E)** 39-41 (marked '40').
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
Adjustment, Contact Gap, Air Gap—Same as for Voltage Regulator (above).

LIGHTING:—**Headlamps**—Corcoran-Brown 'Sealed Beam' type. *For data refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Small red light on instrument panel near speedometer. Lighted with upper beams on.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Chrysler No. 934519.
Beam Selector—Chrysler No. 859974.
Instrument—Chrysler No. 853371.
Direction Signal—Chrysler No. 865763, 939577.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Dir. Sig. & Parking	21-3	1158
Instr., Glove Compt., Trunk	1½	55
Beam & Dir. Ind., Ign. Sw.	1	51
Rear Dir. Sig. & Tail	21-3	1158
Stop	21	1129
Rear License	3	63
Reading or Dome	15	87

LIGHTING CIRCUIT BREAKER:—Vibrating, thermostatic type. Mounted on lighting switch.

FUSES:—**Clock**—2 ampere. In connector behind clock.
Vacamatic Transmission Control—30 ampere. In wire fuse connector on left side of engine dash.
Direction Signal (late cars)—30 amp. Behind instr. panel in wire from ignition switch to flasher.

HORNS:—**Single**—Delco-Remy No. 1999911 (low note) 1999918 (High Note) or Auto-Lite HA-4001 Std.
Dual—Auto-Lite HO-5003 set operated by relay.
Current Draw—Approx. 7 amps. single, 35-40 dual.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER:—**Auto-Lite EWD-5001, 5003 (Conv. Coupe).** Electric type with circuit-breaker
For complete data, refer to 1941 Mech. Equip. Index.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

CONVERTIBLE TOP CONTROL:—Electric type.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—*See Chrysler Shop Notes in 'M' Section.*

SERIAL NUMBER:—On right front door hinge post. First Number 6,756,501 (Saratoga), 6,624,101 (New Yorker), 7,807,101 (Crown Imperial).

ENGINE NUMBER:—C30-1001 Up (C30), C-33-1001 (C33). On left side of block between #2 & 3 cylinders.

COMPRESSION:—**Ratio**—6.8-1. NOTE—Head material Cast Iron (Std. C30), Aluminum (Std. C33, Optl. C30). **Pressure**—150-160 lbs. at 1000 RPM or 120-130 lbs. at cranking speed of 125 RPM.

VACUUM READING:—Steady 18-20" idling (below 1000').

IGNITION:—**Auto-Lite Coil No. CE-4650.** Service winding (less switch & cable) CE-3224JS. On engine dash.

Ignition Current—2.25 amperes idling, 5 stopped.

Ignition Switch:—Mitchellock Model 24-R. No. 8052.

Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80592. Key Series 1BP to 1000BP. Groove #24.

Distributor Auto-Lite IGT-4103-1 (C30), IGT-4103A-1 (C33). Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual adjustment (at distributor).

Breaker Plate Identification—#8 (IGT-4103-1), #6 (IGT-4103A-1) stamped on plate.

Breaker Gap—Set at .018". Limits .016-.020".

Cam Angle—27° closed, 18° open (.017" gap).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Clockwise viewed from the top.

Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGT-4103-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	8"
4°	8°	11"
6°	12°	14"
8°	16°	17"

Vacuum Advance—IGT-4103A-1

Start	0°	5"
1°	2°	7"
3°	6°	11"
5°	10°	15"
6°	12°	17"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing

Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position and rotor opposite #1 segment in cap.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARK PLUGS:—Auto-Lite A-7B (Cast iron head), AL-7A (Aluminum head). 14 MM Metric type. NOTE—Spark plug tightening tension 26-32 lbs.

Spark Plug Gaps—Set at .025".

IGNITION TIMING:—Initial setting (correct for fuel of approx. 70 octane rating at low altitudes for all heads) shown below. See Manual Adjustment (following).

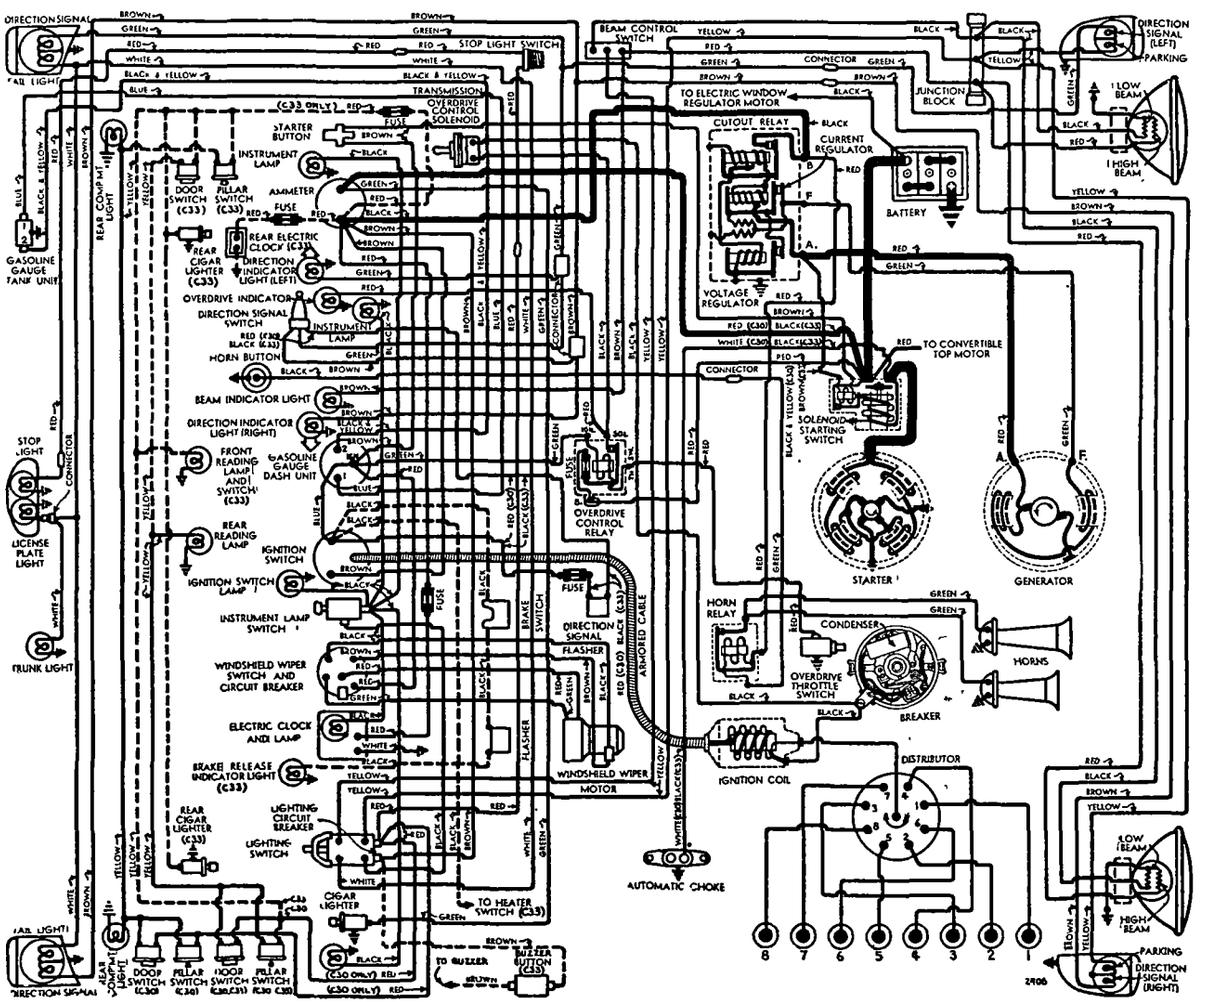
	Flywheel Degrees	Piston Position
6.8-1 cast-iron head	0° at TDC	.0000" TDC
6.8-1 aluminum hd	3° BTDC.	.0038" BTDC

NOTE—Impulse neutralizer marked at TDC with 15 (1°) graduations on either side.

Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #8 piston in firing position (see setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine and adjust distributor (as above)

Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping), clockwise to retard spark (if too severe).



CARBURETION:—**Carburetor**—Stromberg Model AAV-2, No. 380041 (Code No. 4-103), Chrysler No. 863619. 1¼" duplex downdraft with Sisson Automatic Choke. ***For complete data, refer to 1941 Carburetor Index.***

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for idle speed of 6 MPH. min. Adjust both idle screws (one for each barrel—adjust exactly alike) for smooth idle (turn screws in for leaner mixture). Recheck idle speed. NOTE—If vacuum gauge used, adjust for highest obtainable vacuum (see Vacuum Gauge data above).

Accelerating Pump Setting—Throttle lever has two holes for pump link engagement. Set as follows: Inner Hole (short stroke)—Extreme hot weather. Outer Hole (long stroke)—Winter temperatures.

Float Level—Fuel level 5/8" below top edge of bowl (even with bottom of sight hole on side of bowl) with engine idling (4 lbs. pressure).

Metering Jet—***See Stromberg Jet Table in Carburetor Section for complete jet data.***

Fast Idle:—Rotary cam, adjustable type.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust connector rod so choke valve ⅛" open with fast idle screw against first step on cam.
Automatic Choke:—Sisson Type AC-600.
For complete data, refer to 1941 Carb. Equip. Index.
Throttle Guard (Cars with Fluid Drive):—Vacuum operated throttle kicker prevents engine stalling.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—.010" clearance between cross-shaft lever adjusting screw and throttle control plunger with engine idling at correct hot or slow idling speed.
Air Cleaner:—AC #1529941 heavy duty oil-bath type
Fuel Pump:—AC diaphragm type. Replacement Exchange Part No. 514.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—Auto-Lite electric. No. NG-9704D (dash unit), No. NG-9330T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.
MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve and shaft rotate freely. When installing coil, place inner end in slot in valve shaft, **wind free end up one turn only counter-clockwise**
VALVE TIMING:—**To Check**—With .011" (cold) tappet clearance #8 intake valve should open with #8 piston 6° or .0170" BTDC with 8th graduation before DC mark on impulse neutralizer aligned with pointer on chain cover. Reset tappet clearance at .008" hot.
Tappet Clearance:—.008" Intake, .010" Exh. (hot and idling). .002" add'tl. exh. clearance desirable for sustained high speeds. NOTE—Self-locking tappet screws used. Remove right front wheel and lower wheel housing panel for access to valves.
Valve Spring Pressure:—52-58 lbs. at 2 1/32" (valve closed), 129-137 lbs. at 1 21/32" (valve open).
LUBRICATION:—**Crankcase Capacity**—6 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH & above.
COOLING SYSTEM:—**Capacity**—24 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162° F. Fully open 183°.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. Auto-Lite Part No. H-9703.
For complete data, refer to 1941 Mech. Equip. Index.
VACAMATIC (OVERDRIVE TYPE) TRANSMISSION CONTROL:—Standard C33, Optl. Equipment C30.
For complete data, refer to 1941 Mech. Equip. Index.
BATTERY:—**Willard Type WHT-2-19R.** 6 volt, 19 plate, 135 Ampere Hour capacity (20 hour rate).
Starting Capacity—171 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.8 minutes. Five second voltage 4.5 volts.
Grounded Terminal—Positive (+) to engine.
Dimensions—Length 10 5/16". Width 7". Height 9⅜".
Location—Under hood in left fender shield.
STARTER:—**Auto-Lite MAX-4045, A. Arm. MAW-2030.**
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM, 175 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
0.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.	640
25.0 "	Lock	4.	880

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wires (tape battery lead), remove oil filter tubes, filter and 2 starter bolts.
Starting Switch:—A-L Solenoid Switch Type SS-4703.
For complete data, refer to 1941 Elec. Equip. Index.
GENERATOR:—**Auto-Lite GDZ-4801A (C30 Std.), GEG-4818C (C30,C33 Std.), GEG-4818A (C30 City Police), GEG-4818B (C30 State Police), GEB-4801A (C30, C33 Police).** Two brush. With current & voltage regulation. Ventilated.
Armature Nos.—GDZ-2006F (GDZ-4801A), GEB-2006F (GEB-4801A), GEG-2006F (GEG-4818B&C).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—35 amperes (C30 GDZ Gen.), 8.0 volts, 2200 Gen. RPM or approx. 24 MPH, 40 amperes (C33 GEG Gen.), 8.0 volts, 1700 Gen. RPM or approx. 18 MPH and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GEB-4801A, GEG-4818A,B
See Chrysler Model C28 page (preceding) for data.

Performance Data—GDZ-4801A

Cold			Hot

40①	8.0	1520	40	8.0	1680

①—Current regulator setting. See Regulator data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ounces max. (GDZ Gen.), 64-68 ozs. (GEB & GEG Gen.) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amps. (GDZ Gen.), 4.0-4.5 amps. (GEB), 4.7-5.2 amps. (GEG) at 6.0 volts.
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.
REGULATOR:—**Auto-Lite VRP-4001A (GDZ Gen.), VRP-4001B (GEB Gen.), VRP-4001F (GEG Gen.). Current-Voltage types.** In case on dash.
NOTE—For negative battery ground, VRP-4005A (GDZ Gen.), VRP-4005B (GEB), VRP-4005E (GEG)
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts at approx. 1000 gen. RPM (VRP-4001A,5A), 600 RPM (1B,5B), 820 RPM (1F,5E).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A, 5A)—34-36 amperes (marked '35' on cover). **(VRP-4001B, 5B)** 31-33 (marked '32' on cover). **(VRP-4001F, 5E)** 39-41 (marked '40').
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.
LIGHTING:—**Headlamps**—Corcoran-Brown 'Sealed Beam' type. *For data refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Small red light on instrument panel near speedometer. Lighted with upper beams on.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Chrysler No. 934519.
Beam Selector—Chrysler No. 859974.
Instrument—Chrysler No. 853371.
Direction Signal—Chrysler No. 865763, 939577.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam

Rear Dir. Sig. & Tail	21-3	1158
Stop	21	1129
Rear License	3	63
Reading or Dome	15	87
Corner (C33)	6	81

LIGHTING CIRCUIT BREAKER:—Vibrating, thermostatic type. Mounted on lighting switch.
FUSES:—**Clock**—2 ampere. In connector behind clock.
Rear Clock (C33)—2 amp. Adjacent to ammeter.
Body Wiring (C33)—30 amp. Adjacent to ammeter.
Vacamatic Transmission Control—20 ampere. On relay case on left side of engine dash.
HORNS:—**Auto-Lite HC-5105 Horn Set.** Electric vibrator, air tone dual horns operated by relay.
Current Draw—Approx. 35-40 amperes.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).
WINDSHIELD WIPER:—**Auto-Lite EWD-5001, 5003 (Conv. Coupe).** Electric type with Circuit Breaker.
For complete data, refer to 1941 Mech. Equip. Index.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.
CONVERTIBLE TOP CONTROL:—Electric type.
For complete data, refer to 1941 Mech. Equip. Index.
WINDOW REGULATORS (C33):—Hydro-electric type.
For complete data, refer to 1941 Mech. Equip. Index.

ENGINE NOTE:—Engine is two cylinder, horizontally opposed type with connecting rods on individual crankpins so that both pistons move in and out together. Cylinders fire alternately at 360° intervals (one complete revolution between firing points).

SERIAL NUMBER:—First number 390-30000. Stamped on front face of cowl below battery shelf (in engine compartment).

ENGINE NUMBER:—First number C-21000. Stamped on top center of engine block at rear of carburetor.

COMPRESSION:—**Ratio**—5.6-1 Std. No Optional ratios. **Pressure**—80 lbs. at cranking speed.

VACUUM READING:—No means of connecting gauge.

IGNITION:—**Coil Model IG-4065.** Mounted on battery shelf between battery and gasoline tank. Service Coil IG-4070.

Ignition Current—2 amperes idling, 5 stopped.

Ignition Switch:—Douglas No. 2980.

Distributor Model IGW-4142-A. Single breaker, two lobe cam, full automatic advance type.

Breaker Gap—.020".

Rotation—Clockwise viewed from the top.

Cam Angle or Dwell—46° closed, 134° open.

Breaker Arm Spring Tension—17-20 ozs.

Condenser—No. IGB-1025. Capacity .20-.25 mfds.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	300	0	600
3	480	6	960
6	650	12	1300
10	1475	20	2950
14	2300	28	2600

Removal:—Distributor mounted on top of engine on left side. To remove, take out hold-down screw in advance arm, lift distributor out.

FIRING ORDER:—1-2. Cylinders fire alternately at intervals of 360° (one complete revolution of the crankshaft).

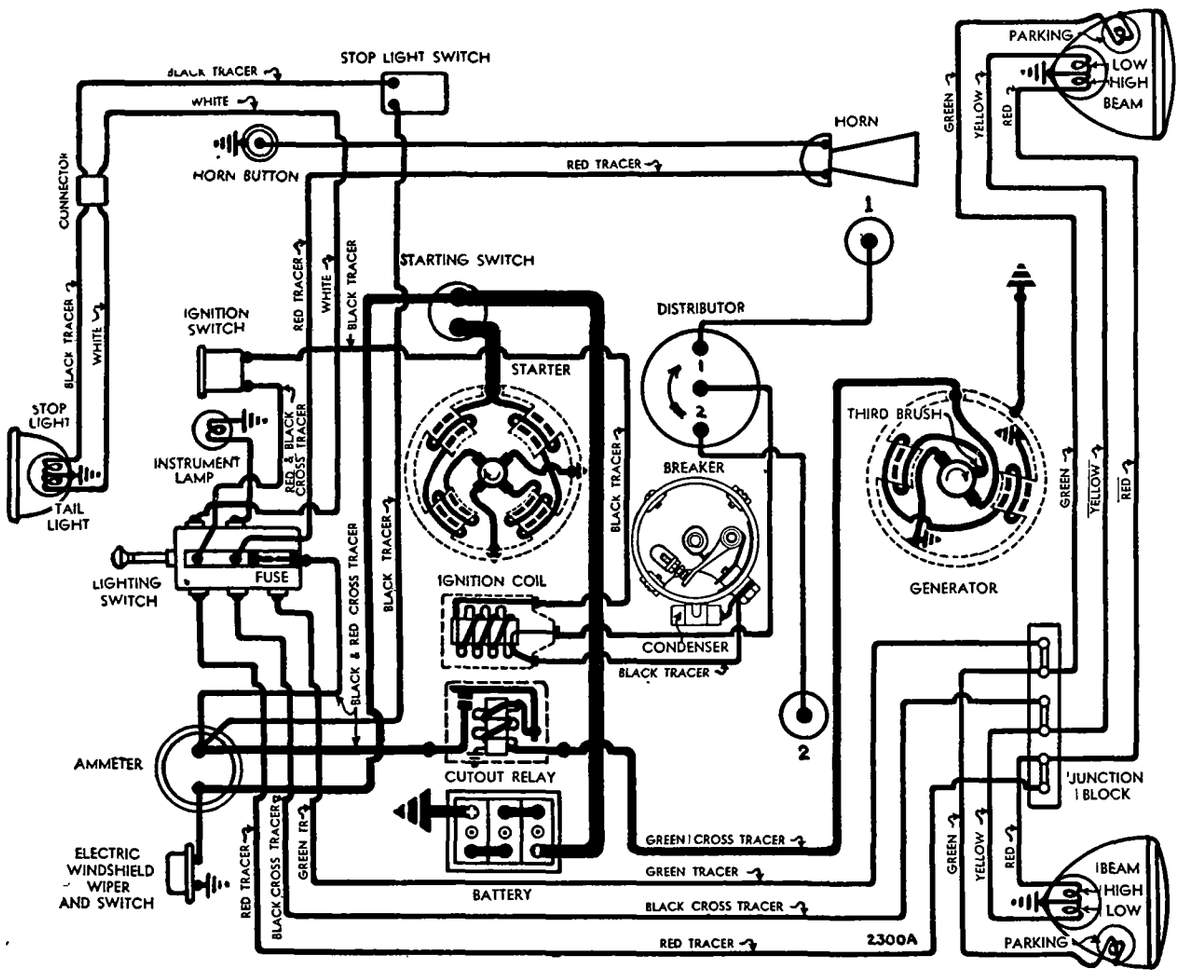
SPARK PLUGS:—Auto-Lite A-5. 14 MM. Metric.

Spark Plug Gaps—.025".

IGNITION TIMING:—Standard setting below correct for fuel of 76 Octane Rating. See Final Adjustment (following) for correction dependent on fuel used.

To Set Timing—Turn engine over until piston reaches firing position when half-round notch in rim of flywheel is ½-⅝" ahead of small rib on top center of crankcase. Loosen advance arm clamp screw, rotate distributor until contacts just begin to open, tighten clamp screw. See that distributor cap terminal which is in line with rotor is connected to spark plug in cylinder entering power stroke (flywheel mark will be at indicator at firing point for each cylinder on alternate revolutions of the crankshaft).

Final Adjustment—If Ethyl fuel, or fuel of better than 76 Octane Rating used, loosen advance arm clampscrew and rotate distributor so as to advance timing until slight 'ping' secured when engine pulling under load.



CARBURETION:—**Carburetor**—Tillotson Model DY-1A. 1", plain tube, single barrel downdraft type with low and high speed adjustments.

For complete data, refer to Carburetor Index.

ADJUSTMENT NOTE—If carburetor out of adjustment so that engine can not be warmed up, make preliminary adjustment as given below, then run engine until warm before making adjustments.

Preliminary Adjustment—Turn main (high speed) adjusting screw in or clockwise lightly until it is seated, then back adjusting screw out exactly two full turns. Turn idle (low speed) adjusting screw in or clockwise lightly until seated, then back adjusting screw out exactly one full turn. Start engine and run until thoroughly warm, then adjust as follows:

High Speed (Main) Adjustment—Open throttle so that engine runs at speed of 30-35 M.P.H. Turn main adjusting screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then turn adjusting screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting is approximately 1½-1¾ turns of the screw from the inner seated position.

Low Speed (Idle) Adjustment—Close throttle, set throttle lever stopscrew so that engine idles faster than normal. Turn idle adjusting screw in or clockwise slowly until engine begins to miss, then turn screw out until engine fires smoothly. Open throttle momentarily to clear manifold, recheck idle adjustment. Correct setting is approximately ¾-1¼ turns of the screw from the inner seated position. Adjust throttle lever stopscrew for high gear idling speed of 7 M.P.H.

Air Cleaner:—Oil-wetted type.

Fuel Pump:—AC Type R. No. GP-10208. Diaphragm type. Driven from front end of camshaft.
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—No adjustment.

VALVE TIMING:—**To Check Timing**—Intake valve should open when point on flywheel 5.5 teeth before TDC mark (half-round notch in flywheel rim) lines up with small rib cast on top center of crankcase. Exhaust closing point is 5.5 teeth past TDC mark.

Tappet Clearance:—.006-.0065" Intake, .008-.0085" Exhaust (Cold). No adjustment.

Valve Spring Pressure:—20 lbs. at 1½" (closed), 41 lbs. at 1 15/64" (open). Free length 1 27/32".

LUBRICATION:—**Crankcase Capacity**—3 quarts.
Normal Oil Pressure—30-45 lbs. (warm oil).

COOLING SYSTEM:—Air-cooled by suction fan built in flywheel. Fan capacity 700 cu. ft. per minute at 3600 R.P.M.

BATTERY:—**Auto-Lite Model AB-13.** 6 volt, 13 plate, 80 ampere hour capacity (20 hour rate).
Starting Capacity—96 amperes for 20 minutes.
Zero Capacity—300 amperes for 2.0 minutes.
Grounded Terminal—Positive (+) terminal grounded to right hand side of cowl. **Engine Ground**—Strap between engine and frame cross-member at front engine mounting on right hand side.
Location—On shelf on front of cowl in engine compartment on right hand side.
Dimensions—Length 9". Width 7". Height 8⅝".

STARTER:—**Model MZ-4077. Armature No. MZ-2085.**
Drive—Compression Type Bendix No. RCBX11-10.
Rotation—Clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.80 "	Lock	3.0	420
11.80 "	Lock	4.0	560

Removal:—Starter cradle mounted on top of flywheel housing. To remove, take out starting motor top plate (in driver's compartment), disconnect cable, take out two bolts in starter clamp band, lift starter out.

Starting Switch:—Model SW-4001. Manual type mounted on toeboard.

GENERATOR:—**Model GBM-4619-5. Armature GBM-2066.** Third brush control type. No ventilation.
Charging Rate Adjustment—Remove commutator cover band, shift third brush by hand clockwise to increase, or counter-clockwise to decrease, charging rate. Brush held in position by friction.
Maximum Charging Rate—12 amperes, 8.0 volts.

Performance Data

Cold			Hot		
Amperes	Volts.	R.P.M'	Amperes	Volts	R.P.M.
0	6.4	850	0	6.4	900
2	6.6	960	2	6.65	1040
4	6.75	1030	4	6.9	1180
6	7.05	1160	6	7.2	1330
8	7.25	1265	8	7.4	1500
10	7.45	1380	10	7.7	1720
12	7.7	1510	12	7.9	2080
14	7.9	1740	12.45	8.0	2400
15	8.0	2300			

Rotation—Clockwise at commutator end.
Brush Spring Tension—50-60 ozs.
Field Current—3.8-4.2 amperes at 6.0 volts.
Motoring Current—5.3-5.9 amperes at 6.0 volts.

Removal:—Generator flange mounted on timing gear cover and driven directly from front end of crankshaft. To remove, disconnect lead, take out four flange mounting capscrews, remove generator from below.

CUTOUT RELAY:—**Model CB-4025.** Mounted on shelf on front of cowl between battery and gasoline tank.
For complete data, refer to Electrical Equipment Index.
Cuts In—6.5-7.25 volts.
Cuts Out—.5-2.5 ampere discharge current (after charging at 15 amperes).
Contact Gap—.015-.045".
Air Gap—.010-.030" with contacts closed.

LIGHTING:—**Headlamps**—Moto-lamp type with upper and lower beams controlled by lighting switch.
Headlamp Adjustment—Aim each headlamp so that hot spot centered on vertical line directly ahead of each lamp center and upper edge of hot spot on horizontal line at lamp center height.

Switches

Lighting—Douglas No. 5731.

Bulb Specfications

Position	Candlepower	Mazda No.
Headlights	32-21	2320C
Parking, Instrument	1.5	55
Stop & Tail	21-3	1158

FUSES:—**Lighting**—One 20 ampere. On switch.

HORN:—**Sparton.** Disc type vibrator horn.
Current—5 amperes.

HOOD LOCK—*See Chrysler Shop Notes in 'M' Section.*

SERIAL NUMBER:—On right front door hinge post. First number: Detroit—5,720,401 (Custom), 6,096,001 (Deluxe), Canada—9,373,196 (Custom).

ENGINE NUMBER:—First number S8-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—**Ratio**—6.8-1 cast-iron hd. std., 7.2-1 aluminum hd. optl. (7.2-1 std. on 7 pass.).
Pressure—145-155 lbs. at 1000 RPM or 115-125 lbs. at 125 RPM cranking speed (for 6.8-1 head). Reading should not vary more than 10 lbs. between cyls.

VACUUM READING:—Steady 18-20" idling (below 1000').

IGNITION:—**Auto-Lite Coil No. IG-4669 (Std.), IG-4671 (with Simplimatic Trans.).** Service winding (less switch and cable) IG-3224JS. Mounted on dash.
Ignition Current—2.25 amperes idling, 5 stopped.
Ignition Switch:—Mitchellock Model 30-R, No. 8794. NOTE—Switch has extra terminal for Transmission control (used with Simplimatic Transmission only).
Ignition Lock—Yale & Towne or Briggs & Stratton. B&S No. 80592. Key Series 1BP to 1000 BP. Groove 24.
Distributor Auto-Lite IGS-4113-1. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual adjustment.
Breaker Plate Identification—#7 stamped on plate
Breaker Gap—Set at .020".
Cam Angle or Dwell—38° closed, 22° open (distr. °).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

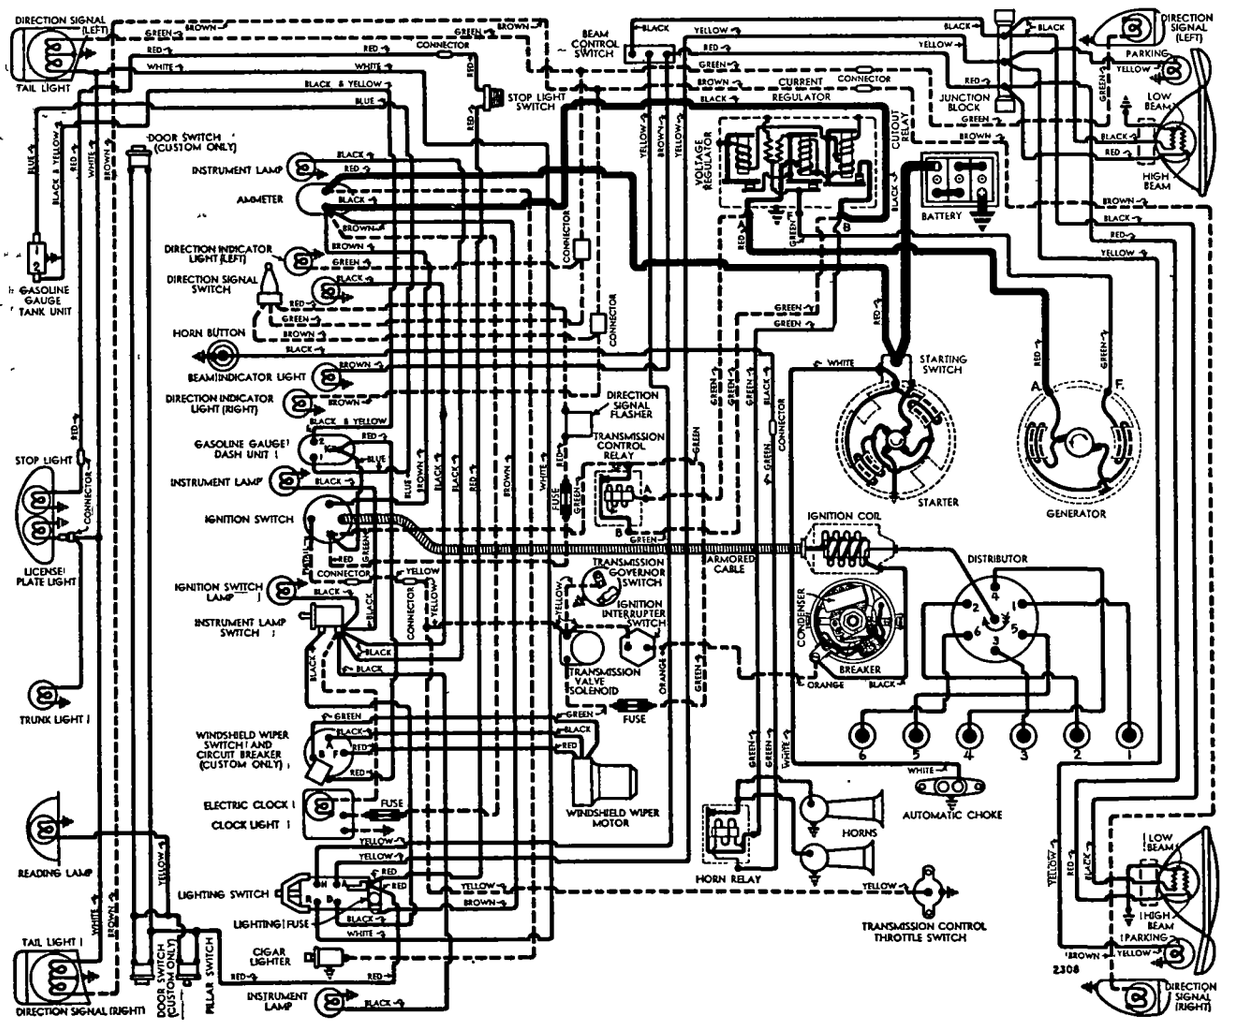
Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position (at TDC) and rotor opposite #1 segment in cap.

FIRING ORDER:—1-5-3-6-2-4. See diagram.



SPARK PLUGS:—Auto-Lite A-7B (Cast iron head), AL-7A (Aluminum head). 14 MM Metric type.
NOTE—Spark plug tightening tension 26-32 ft. lbs.
Spark Plug Gaps—Set at .025".

IGNITION TIMING:—Initial setting (correct for fuel of approx. 70 octane rating at low altitudes for all heads) shown below. See Manual Adjustment (following).

	Flywheel Degrees	Piston Position
All Engines	0° at TDC	.0000" at TDC.

NOTE—Impulse neutralizer marked 'DC' at TDC point with 15 (1°) graduations on either side.
Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).
Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine and adjust distributor (as directed above).
Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping), clockwise to retard spark (if too severe).

CARBURETION:—**Carburetor**—Carter (Ball & Ball) Models E6N3, E6S2, E6S3 (Std. Trans.), EB1 (Fluid Drive & Std. Trans.), E6V1, E6U1, E6U2 (With Simplimatic Trans.). 1½", single barrel, downdraft types. ***For complete data, refer to 1941 Carburetor Index.***
NOTE—EB1, E6V1, E6U1, E6U2 models have dashpot (slow-closing throttle) built in carburetor. Two types used (later type has solenoid control).
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for idle speed of 6 MPH min. (Std.), 450 RPM or 4 MPH max. (Cars with Simplimatic Transmission). Adjust idle adjusting screw for smooth idle (½-1½ turns open, turn screw in for leaner mixture). Recheck idle speed. NOTE—If vacuum gauge used, adjust for highest obtainable vacuum (see Vacuum Gauge data above).
Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows:
Inner Hole (minimum stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal summer setting.
Outer Hole (max. stroke)—Winter temperatures.

Float Level—5/64" (all except EB1), 1/16" (EB1), from top of float (not seam) to top edge of bowl with valve seated. Check with tool C-449 (exc. EB1).
Metering Jet—*See Carter (B&B) Jet Table in Carburetor Section for complete data.*
NOTE—If lean metering jet (High Altitude calibration) used at lower altitudes for increased economy, speed and power are reduced (not recommended).
Throttle Cracker:—Not adjustable.
Slow-closing Throttle (EB1, E6V1, E6U1, E6U2):—*For complete data, refer to 1941 Carb. Equip. Index.*
Adjustment (First type only)—Turn adjusting screw above dashpot plunger in as far as possible, then back screw out 5 full turns for 7/32" stroke.
Fast Idle:—Built-in type. Not adjustable.
Automatic Choke:—Sisson Type AC-758B.
For complete data, refer to 1941 Carb. Equip. Index.
Air Cleaner:—AC #1529938 heavy duty oil-bath type.
Fuel Pump:—AC diaphragm type pump. Replacement Exchange Pump No. 505.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—Auto-Lite electric. No. NG-9685D (dash unit), No. NG-9329T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve and shaft rotate freely. When installing coil, place inner end in slot in valve shaft, **wind free end up one turn only counter-clockwise**

VALVE TIMING:—To Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 12° or .059" BTDC with 12th graduation before DC mark on impulse neutralizer aligned with pointer. Reset tappet clearance at .008" hot.
Tappet Clearance:—.008" Intake, .010" Exh. (hot & idling). .002" add'l. exh. clearance desirable for sustained high speeds. NOTE—Self-locking tappet screws used. Remove right front wheel and lower wheel housing panel for access to valves.
Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed), 107-115 lbs. at 1⅜" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH & above.

COOLING SYSTEM:—Capacity—18 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9648.
For complete data, refer to 1941 Mech. Equip. Index.

SIMPLIMATIC (UNDERDRIVE TYPE) TRANSMISSION CONTROL:—*For adjustments, refer to 1941 Mech. Equip. Index for Simplimatic Underdrive Transmission.*

BATTERY:—Willard Type WHT-2-15R. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.9 minutes. Five second voltage 4.3 volts.
Grounded Terminal—Positive (+) to engine.
Dimensions—Length 10¼". Width 7". Height 9⅜".
Location—Under hood in left fender shield.

STARTER:—Auto-Lite MAW-4019, A. Arm. MAW-2030.
Drive—Overrunning clutch (manual pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM, 175 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.	505
18. "	Lock	4.	670

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wires (tape battery lead). Remove oil filter tubes, filter and 2 starter bolts.
Starting Switch:—A-L SW-2813. On starter. Manually operated by starter (pinion shift) pedal.

GENERATOR:—Auto-Lite GDZ-4801A (Std.), GEB-4801A (City Police), GEG-4818A (City Police & Taxicab), GEG-4818B (State Police). Two brush. With current and voltage regulation. Ventilated.
Armature Nos.—GDZ-2006F (GDZ-4801A), GEB-2006F (GEB-4801A), GEG-2006F (GEG-4818B).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—As given in tables below reached at approx. 24 MPH (GDZ Gen.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801A

40①	8.0	1520	40	8.0	1680

①—Current regulator setting. See Regulator data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ounces max. (GDZ Gen.), 64-68 ozs. (GEB & GEG Gen.) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amps. (GDZ Gen.), 4.0-4.5 amps. (GEB), 4.7-5.2 amps. (GEG) at 6.0 volts.
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.

REGULATOR:—Auto-Lite VRP-4001A (GDZ Gen.), VRP-4001B (GEB Gen.), VRP-4001F (GEG Gen.). Current-Voltage types. In case on dash.
NOTE—For negative battery ground, VRP-4005A (GDZ Gen.), VRP-4005B (GEB), VRP-4005E (GEG)
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts at approx. 1000 gen. RPM (VRP-4001A,5A), 600 RPM (1B,5B), 820 RPM (1F,5E).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" Min. **Air Gap**—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage steady. Voltage should agree with setting.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A, 5A)—34-36 amperes (marked '35' on cover). **(VRP-4001B, 5B)** 31-33 (marked '32' on cover). **(VRP-4001F, 5E)** 39-41 (marked '40').
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above.
Adjustment, Contact Gap, Air Gap—Same as for Voltage Regulator (above).

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on upper edge of panel above speedometer. Lighted with upper beams on.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—DeSoto No. 910506.
Beam Selector—DeSoto 859974.
Instrument—DeSoto No. 853371.
Direction Signal—DeSoto No. 865763, 910566 (RHD).

Front Direction Signal	21	1129
Beam & Dir. Ind., Ign. Sw.	1	51
Tail (without Dir. Signal)	3	63
Rear Dir. Sig. & Tail	21-3	1158
Stop	21	1129
Rear License	3	63
Reading or Dome	15	87

FUSES:—Lighting—30 amp. On back of light switch.
Clock—2 ampere. In connector behind clock.
Simplimatic Transmission Control—30 amp. In wire fuse connector on left side of engine dash.
Direction Signal (late cars)—30 amp. Behind instr. panel in wire from ign. switch to flasher.

HORNS:—Auto-Lite HO-5003 horn set. Electric, vibrator and air note type twin horns operated by relay.
Current Draw—35-40 amperes.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER (CUSTOM ONLY):—Auto-Lite EWD-5001, EWD-5003 (Conv. Coupe). Electric type
For complete data, refer to 1941 Mech. Equip. Index.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

CONVERTIBLE TOP CONTROL:—Electric type.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—*See Chrysler Shop Notes in 'M' Section.*

SERIAL NUMBER:—On right front door hinge post. First No.: 30,342,401 (Detroit), 9,422,901 (Canada).

ENGINE NUMBER:—First number D19-1001. Stamped on left side of block between #1 and #2 cylinders.

COMPRESSION:—**Ratio**—6.5-1 cast-iron head std. **Pressure**—140-150 lbs. at 1000 RPM or approx. 113 lbs. at cranking speed (std. head). Reading should not vary more than 10 lbs. between cylinders.

VACUUM READING:—Steady 18-20" idling (below 1000').

IGNITION:—**Auto-Lite Coil No. IG-4668.** Service winding (less switch & cable) IG-3224JS. On engine dash. **Ignition Current**—2.25 amperes idling, 5 stopped. **Ignition Switch:**—Mitchellock Model 24-R, No. 8197. **Ignition Lock**—Yale & Towne or Briggs & Stratton. B&S No. 80592. Key Series 1BP to 1000BP. Groove #24. **Distributor Auto-Lite IGS-4112-1, IGS-4113-1 (Canada).** Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and manual adjustment (at distributor). **Breaker Plate Identification**—#8 (IGS-4112-1), #7 (IGS-4113-1) stamped on plate. Maximum vacuum advance limited by slot in plate. **Breaker Gap**—Set at .020". **Cam Angle or Dwell**—38° closed, 22° open (distr. °). **Breaker Arm Spring Tension**—17-20 ounces. **Rotation**—Clockwise viewed from above. **Condenser**—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGS-4112-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	7¾"
4°	8°	10½"
6°	12°	13¼"
8°	16°	16"

Vacuum Advance—IGS-4113-1

Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing for adjustment.

Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position (at TDC) and rotor opposite #1 segment in cap.

FIRING ORDER:—1-5-3-6-2-4. See diagram.

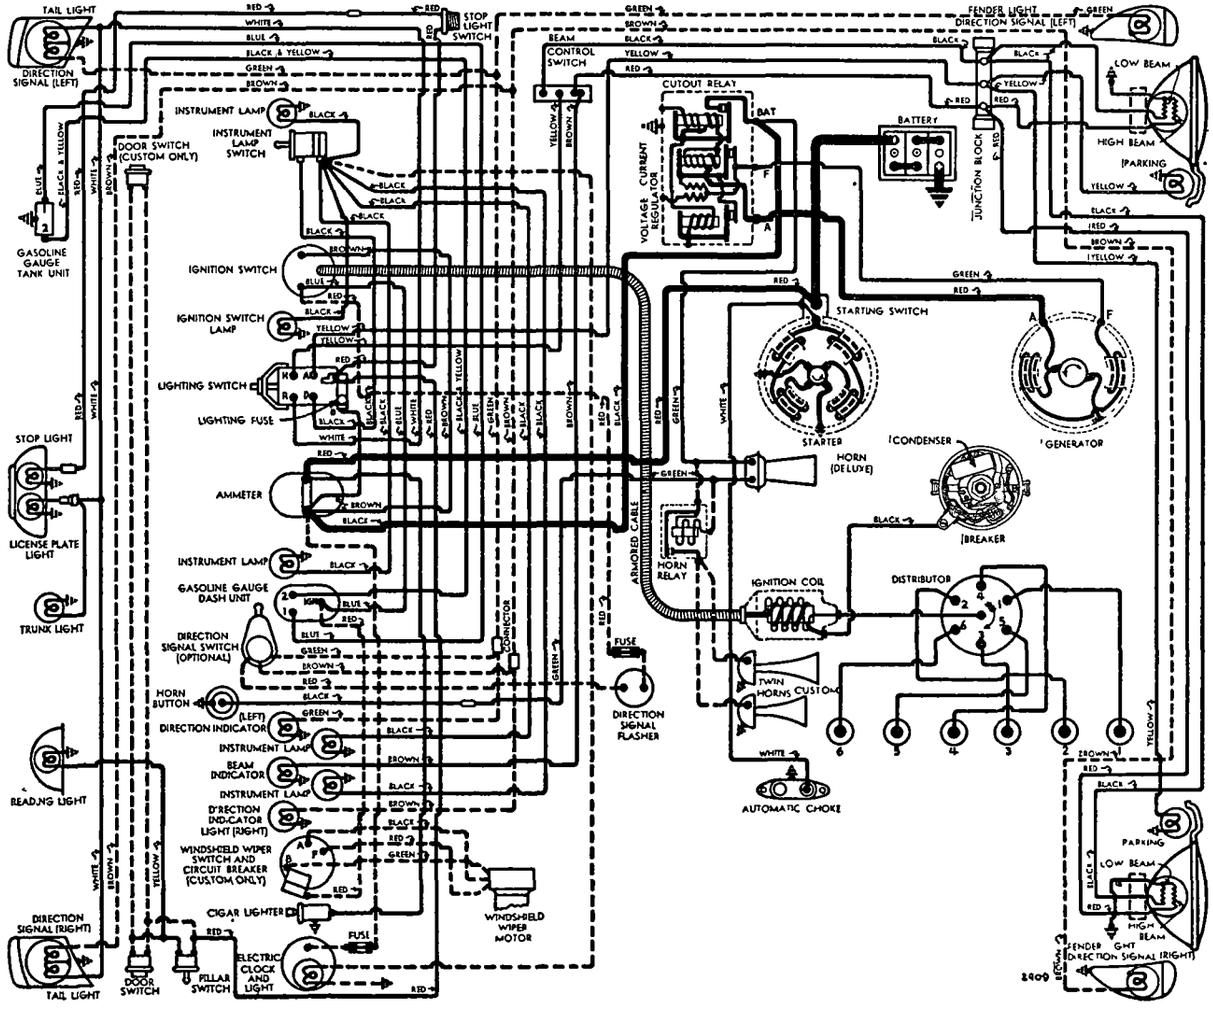
SPARK PLUGS:—Auto-Lite A-7B (Cast iron head), AL-7A (Aluminum head). 14 MM Metric type. NOTE—Spark plug tightening tension 26-32 ft. lbs. **Spark Plug Gaps**—Set at .025".

IGNITION TIMING:—Initial setting (correct for fuel of approx. 70 octane rating at low altitudes for all heads) shown below. See Manual Adjustment (following) for minor changes for local fuel & altitudes.

Flywheel Degrees	Piston Position
All cyl. heads 0°	at TDC .0000" at TDC

NOTE—Impulse neutralizer marked 'DC' at TDC point with 15 (1°) graduations on either side.

Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see setting above) with correct mark on impulse neutralizer aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).



Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on impulse neutralizer (mark correct graduation with paint), idle engine and adjust distributor (as above) until mark appears in line with pointer.

Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping noted), clockwise to retard spark (if ping too severe), tighten screw.

CARBURETION:—**Carburetor**—Stromberg Model BXV-3 (Std.), BXVD-3 (with Fluid Drive). 1½" downdraft types. NOTE—BXVD-3 has special 'dashpot' or slow closing throttle device.

For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for idle speed of 6 MPH min. Adjust idle adjusting screw for smooth idle (turn screw in for leaner mixture). Recheck idle speed. NOTE—If vacuum gauge used, adjust for maximum vacuum (see Vacuum Gauge data above). **Accelerating Pump Setting**—Pump lever has three holes for pump link engagement. Set as follows: Inner Hole (minimum stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal summer setting.
Outer Hole (max. stroke)—Winter temperatures.

Float Level—Fuel level 5/8" below top edge of bowl.
Metering Jet—*See Stromberg Jet Table in Carburetor Section for complete jet data.*
NOTE—If lean metering jet (High Altitude calibration) used at lower altitudes for increased economy, speed and power are reduced (not recommended).
Throttle Cracker:—Not adjustable.
Slow Closing Throttle (Dashpot) BXVD-3 Only:—*See Stromberg BXVD-3 carburetor article in Carburetor Section. Refer to 1941 Carburetor Index.*
Setting—With all slack removed from linkage, set adjusting screw on dash pot lever so that piston travel 5/16-11/32" (turn screw in to shorten stroke).
Fast Idle:—Not adjustable. Throttle stopscrew should rest on high point of cam with choke valve closed.
Automatic Choke:—Sisson Type AC-758B.
For complete data, refer to 1941 Carb. Equip. Index.
Air Cleaner:—AC #1529937 heavy duty oil bath type.
Fuel Pump:—AC diaphragm type pump. Replacement Exchange Pump No. 505.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—Auto-Lite electric. No. NG-9674D (dash unit), No. NG-9329T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve and shaft rotate freely. When installing coil, place inner end in slot in valve shaft, **wind free end up one turn only counter-clockwise**

VALVE TIMING:—**To Check**—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston 9° or .0343" BTDC with 9th graduation before DC mark on impulse neutralizer aligned with pointer. Reset tappet clearance at .008" hot.
Tappet Clearance:—.008" Intake, .010" Exh. (hot & idling). .002" add'l. exh. clearance desirable for sustained high speeds. NOTE—Self-locking tappet screws used. Remove right front wheel and lower wheel housing panel for access to valves.
Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed), 107-115 lbs. at 1⅜" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH & above.

COOLING SYSTEM:—**Capacity**—15 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. A-L No. H-9673.
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—**Auto-Lite Type PD-1-15R.** 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) to engine.
Location—Under hood in left fender shield.

STARTER:—**Auto-Lite MZ-4089,A. Armature MZ-2108. MAW-4019,A (Canada). Armature MAW-2030.**
See 1941 De Soto S8 'T&E' page for MAW-4019 data.
Drive—Overrunning clutch (manual pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150-175 amperes, 5.1 volts.

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4300	5.5	70
0.65	"	2500	5.5	100
2.55	"	1325	5.0	200
4.95	"	750	4.5	300
7.65	"	220	4.0	400
7.8	"	Lock	3.0	420
11.8	"	Lock	4.0	560

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wires (tape battery lead). Remove oil filter tubes, filter and 2 starter bolts.
Starting Switch:—A-L SW-2813. On starter. Manually operated by starter (pinion shift) pedal.

GENERATOR:—**Auto-Lite GDZ-4801B (Std.), GEB-4801A, GEG-4818A (City Police & Taxicab), GEG-4818B (State Police).** Two brush. With current and voltage regulation. Ventilated.
Armature Nos.—GDZ-2006F (GDZ-4801A), GEB-2006F (GEB-4801A), GEG-2006F (GEG-4818B).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—As given in tables below reached at approx. 24 MPH (GDZ Gen.) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Cold Performance Data—GDZ-4801B Hot

40①	8.0	1520	40	8.0	1680

①—Current regulator setting. See Regulator data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ounces max. (GDZ Gen.), 64-68 ozs. (GEB & GEG Gen.) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amps. (GDZ Gen.), 4.0-4.5 amps. (GEB), 4.7-5.2 amps. (GEG) at 6.0 volts.
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.

REGULATOR:—**Auto-Lite VRP-4001A (GDZ Gen.), VRP-4001B (GEB Gen.), VRP-4001F (GEG Gen.).**
Current-Voltage types. In case on dash.
NOTE—For negative battery ground, VRP-4005A (GDZ Gen.), VRP-4005B (GEB), VRP-4005E (GEG)
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts at approx. 1000 gen. RPM (VRP-4001A,5A), 600 RPM (1B,5B), 820 RPM (1F,5E).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min. **Air Gap**—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage steady. Voltage should agree with setting.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A, 5A)—34-36 amperes (marked '35' on cover). **(VRP-4001B, 5B)** 31-33 (marked '32' on cover). **(VRP-4001F, 5E)** 39-41 (marked '40').
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
Adjustment, Contact Gap, Air Gap—Same as for Voltage Regulator (above).

LIGHTING:—**Headlamps**—Corcoran-Brown 'Sealed Beam' type. *For data refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on upper edge of panel above speedometer. Lighted with upper beams on.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Dodge No. 863823.
Beam Selector—Dodge No. 859974.
Instrument—Dodge No. 903783.
Direction Signal—Dodge No. 865763.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instr., Trunk	1½	55
Front Direction Signal	21	1129
Beam & Dir. Ind., Ign. Sw.	1	51
Tail (without Dir. Signal)	3	63
Rear Dir. Sig. & Tail	21-3	1158
Stop	21	1129
Rear License	3	63
Reading or Dome	15	87

FUSES:—**Lighting**—30 amp. On back of light switch.
Clock—2 ampere. In connector behind clock.
Direction Signal (late cars)—30 amp. Behind instr. panel in wire from ign. switch to flasher.

HORNS:—**Single**—Delco-Remy No. 1999913 (low note) 1999914 high note), or Auto-Lite HA-4001 Std.
Dual—Auto-Lite HO-5003 horn set. HA-4026 (low pitch), HA-4027 (high pitch) operated by relay.
Current Draw—Approx. 7 amps. single, 35-40 dual.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

WINDSHIELD WIPER (CUSTOM ONLY):—**Auto-Lite EWD-5001, EWD-5003 (Conv. Coupe).** Electric type with circuit-breaker on back of switch.
For complete data, refer to 1941 Mech. Equip. Index.
Circuit Breaker—Vibrating, thermostatic type. Starts to operate with current of 12 amperes.

CONVERTIBLE TOP CONTROL:—Electric type.
For complete data, refer to 1941 Mech. Equip. Index.

MODEL DESIGNATION:—Model number indicates Engine—1N(4 Cyl.); 11, 111, 114, 118 (V8 85); 19, 194, 198 (V8 95) with suffix letter indicating body type
'A'—114" WB. Passenger Cars.
'C'—112" or 118" WB. Commercial Chassis.
'D'—¾ Ton, 122" WB. Truck Chassis.
'Y'—1 Ton, 134" WB. Truck Chassis.
'W'—101", 134", 158" WB. Cab-over-Engine Trucks.
'T' & 'U'—Other Trucks & School Bus.

ENGINE HOOD NOTE:—Passenger Cars—Hood is Alligator type with release knob under instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame rail (near gen.).

COMPRESSION:—Ratio—6.0-1 (4 Cyl.), 6.2-1 (V8 '85' Eng.—Pass. Cars, Comm'l., ¾ & 1 Ton), 5.9-1 (V8 '85' and '95' Eng.—Other Trucks).
Pressure—100 lbs. at 100 RPM. cranking speed.

VACUUM READING:—Steady 18-20" idling at 5-7 MPH.

IGNITION:—Coil Model 9N-12024 (4 Cyl.), 78-12024-A (V8). Part of Ignition Unit Assembly.
Resistor Unit—Connected in coil primary circuit. Mounted on Circuit Breaker Assembly No. 11A-12250 (V8 models only).
Ignition Current—4½-6 amperes (V8) with engine stopped. Ignition primary resistance 1-1⅓ ohms.
Ignition Switch:—Oakes Steering Column and Ignition Lock Assembly.

Steering Post & Ign. Lock Assem. Oakes No.	Ford No.	Ignition Switch Oakes No.

①—Floor mtd. Gearshift. ②—Strg. Col. Gearshift.
Lock Cylinder—Hurd or Briggs & Stratton No. 80935, Ford No. 91A-3686A (With Keys).
Key Series—FK000 to FK999. **Groove**—No. 17.

Distributor (V8)—No. 78-12127 (Less Coil, Distributor Caps, and Terminal Plates):—Double breaker, 8 lobe cam type with automatic advance and Vacuum Brake Control. Same as used on preceding V8's.
Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step 'go', .016" step 'no go'.
Cam Angle—36° closed, 9° open. For both sets operating together with correct coil-loading lead.
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewed from drive end.
Condenser—No. 78-12300. Capacity .33-.36 mfd.

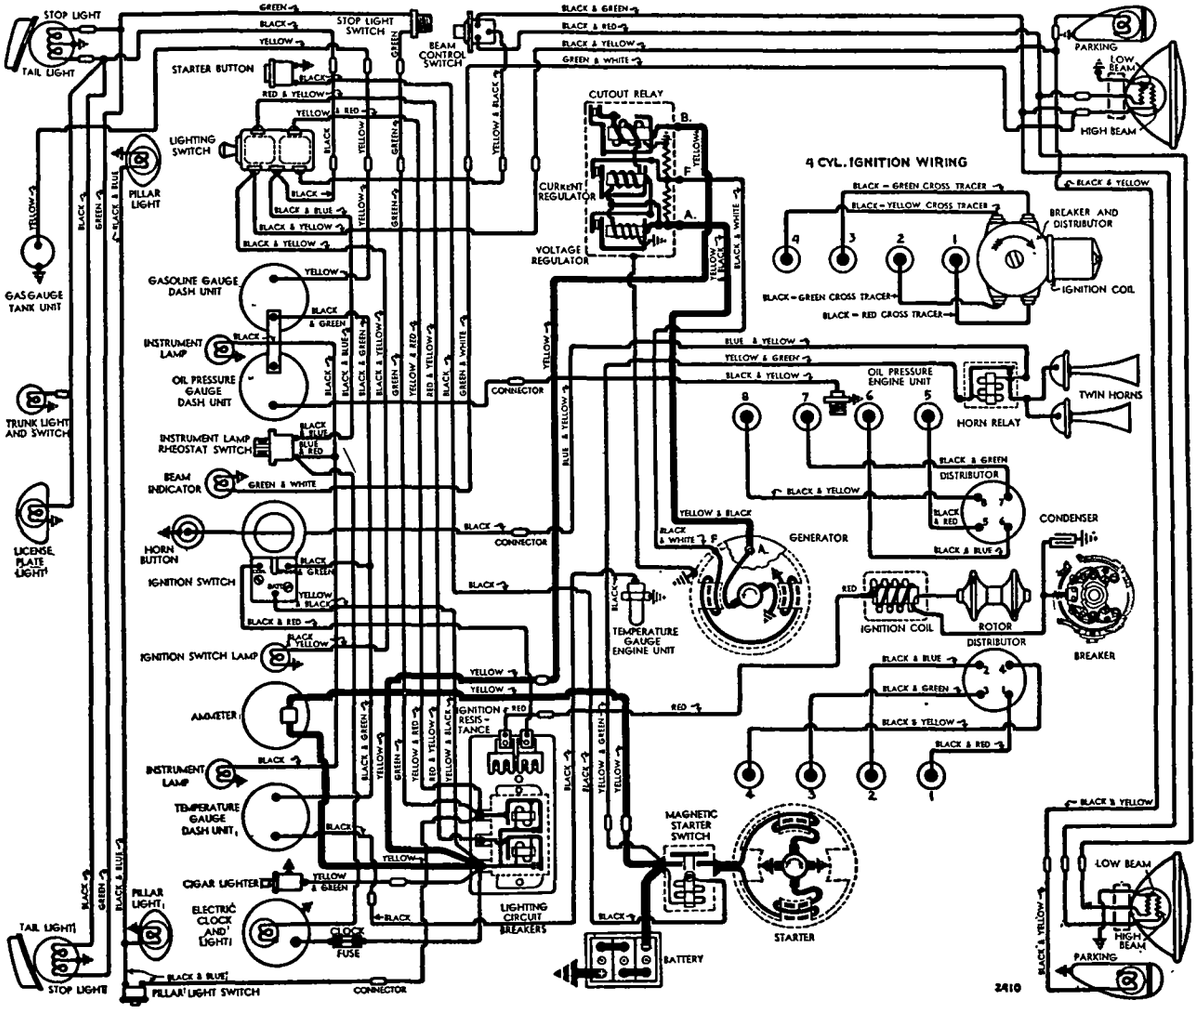
Distributor **Automatic Advance** Engine (High Vacuum or Vacuum Brake Inoperative)

Degrees	R.P.M.	Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1500	16	3000

Distributor (4 Cyl.)—No. 9N-12100 (Less Coil):—Same general design as V8 type (mounted on front of engine, driven from camshaft, Coil on top of unit), except 4 Cylinder type and no Vacuum Brake used.
Breaker Gap—.014-.016".
Rotation—Clockwise viewed from drive end.
Condenser—Part No. 91A-12300.

Removal:—Ignition unit mounted on front of engine. To remove, disconnect vacuum line, take off caps, take out screws in mounting flange.

FIRING ORDER:—1-2-4-3 (4 Cyl.), 1-5-4-8-6-3-7-2 (V8 Engs.). See diagram for cylinder numbering.



SPARK PLUGS:—Champion H-10. 14 MM. Metric.
Spark Plug Gaps—Set at .030-.034".

IGNITION TIMING:—For each engine as follows (see Vacuum Brake Setting below for adjustment depending on type of service and fuel (V8 only).

	Flywheel Degrees	Piston Position
4 Cyl. Engine	At TDC	.0000" TDC
All V8 Engines	4° BTDC	.0058" BTDC

Timing Note—Manufacturer recommends use of Laboratory Test Set with Stroboscope attachment or V-126 Timing Fixture for all ignition settings.
Timing (On Engine)—No flywheel marks provided and timing should be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left hand side of ignition unit housing, place screw in retard position at lower end of slot, move screw slowly up until timing contacts begin to open, note graduation on plate under screw head which is in line with reference mark on housing, move screw up one additional graduation **on V8 Engines only.**
Vacuum Brake Setting (V8 Engines)—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, turn screw in just enough to eliminate ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so advance 2° (distr.) at 950 RPM. or 38 MPH. with no vacuum.

CARBURETION:—Carburetor (4 Cyl.)—Marvel-Schebler Model TSX, Ford No. 9N-9510-A. Updraft type. ***For complete data, refer to 1941 Carburetor Index.***
Idle Adjustment—With engine warm, set throttle stopscrew for 5-7 MPH. idle speed. Turn idle adjusting screw in until engine rolls, then turn screw out until engine fires smoothly. Recheck idle speed.
Power (Main Metering Jet) Adjustment—Open throttle approx. ⅓, turn power adjusting screw in until engine begins to lose power and speed drops off, then turn screw out until speed picks up and

power is at maximum. Road test car and turn screw out slightly if engines falters when picking up load.
Float Level—9/32" from gasket surface on bowl cover to nearest point on float with valve seated (invert cover to check). Set both floats alike.

Carburetor (V8 Engines):—Chandler-Groves AA1, Ford No. 91A-9510-A. Dual, downdraft type.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 5-7 MPH. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-¾ turn of screw from inner seated position. Recheck idle speed.
NOTE—Vacuum gauge recommended for idling adjustment. Set for highest steady gauge reading.
Float Level—Fuel level 11/16" plus or minus 1/32" (21/32-23/32" below top edge of float. ***See Carburetor article for float level checking data.***
Accelerating Pump Setting—Three holes provided for pump link connection as follows:
Inner (#1)—Min. stroke, Summer Temperatures.
Center (#2)—Med. stroke, Winter Temperatures.
Outer (#3)—Max. stroke, Extreme Cold Weather.

Fast Idle:—Integral type. No adjustment required.

Air Cleaner:—Ford No. 91A-9600A (except Cab-over-Engine), 81W-9600 (Cab-over-Eng. models), oil-wetted type Std. Heavy duty oil-bath type Optl.

Gasoline Gauge:—King-Seeley Electric. Ford Nos. **Dash Unit**—No. 11A-9280A (Deluxe), 11A-9280B (Super Deluxe), 11C-9280B (Sedan Dlvry.), 11C-9280A (Comm'l. & Trucks exc. C-O-E), 91A-9280A(C-O-E Trucks). **Tank Unit**—99A-9275B (Pass. Cars), 01A-9275A (Comm'l.), 01A-9275B (Sedan Dlvry.), 01Y-9275 (Panel), 01T-9275 (Trucks exc. C-O-E), 01W-9275 (C-O-E Trucks).
For complete data, refer to 1941 Carb. Equip. Index.

Fuel Pump:—AC Type R, Ford No. 68-9350 (V8), ONY-9350 (4 Cyl.). AC Replacement Pump No. 541.
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check Timing—No flywheel marks or other means provided to check timing. #1 intake valve begins to open with piston at TDC.
Tappet Clearance:—.0125-.0135" all valves. No adj.
Valve Spring Pressure:—37-40 lbs. at 2.13" (valve closed), 76-80 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—4 qts. (4 Cyl.), 5 qts. (all V8 Engines).
Normal Oil Pressure:—25 lbs. (4 Cyl.), 30 lbs. (V8).
Oil Pressure Gauge:—King-Seeley Electric. Ford Nos. **Dash Unit**—No. 11A-9273A (Deluxe), 11A-9273B (Super Deluxe), 11C-9273B (Sedan Dlvry.), 11C-9273A (Comm'l. & Trucks). **Engine Unit**—48-9278
For complete data, refer to 1941 Mech. Equip. Index.

COOLING SYSTEM:—Capacity—14 qts. (all models with 4 Cyl. Engine), 26¼ qts. (Pass. Cars), 22 qts. (Comm'l, ¾ & 1 Ton), 24 qts. (C-O-E), 23 (other Trucks).
Thermostat:—In radiator top hose (4 Cyl.), in cylinder head outlet elbows (V8—two used).
Setting—Starts to open at 145° F. Fully open 180°.
Temperature Gauge:—King-Seeley Electric. Ford Nos. **Dash Unit**—11A-10883A (Deluxe), 11A-10883B (Super Deluxe), 11C-10883B (Sedan Dlvry.), 11C-10883A (Comm'l. & Trucks). **Engine Unit**—No. 99A-10884
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—Ford No. 01A-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes.
Grounded Terminal—Positive (+) grd. to dash.
Engine Ground—Strap connector between right rear cylinder head and dash.
Dimensions—Length 10.6". Width 7.3". Height 9.2".
Location—On right side in engine compartment.

STARTER:—No. 52-11002 (4 Cyl.), 18-11002 (V8 Eng.).
Armature—52-11005 (52-11002), 18-11005 (18-11002).
Drive—Barrel type Bendix No. A-1806, Ford No. 52-11350C (52-11005). Inboard Bendix No. L11FX-10, Ford No. B-11350 (18-11002).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 78-11450A. Magnetic switch mounted on dash and controlled by pushbutton on instrument panel R-B-M Model 3242, Ford No. 11A-11500 (Pass. Cars); R-B-M Model 3233, Ford No. 01A-11500A (Sedan Dlvry.), 11C-11500 (Comm'l. & Truck).
Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR:—Ford Nos. for each model:

	Generator	Armature No.
Pass. Cars, Comm'l.	01A-10000B	01A-10005A
All 4 Cyl. Models	S08T-10000	01A-10005A
V8 Trucks exc. C-O-E	01A-10000B	01A-10005A
Cab-over-Eng. (C-O-E)	81T-10000A	78-10005A
	81T-10000B	78-10005B

Two brush type with vibrating Current & Voltage Regulation (new 3 unit Regulator). Ventilated.
Charging Rate Adjustment—None (see Regulator).
Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, check output at 2 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	01A-10000B, S08T-10000	Engine RPM
Start		400
32		1100
32		3000

81T-10000A		81T-10000B	
Amperes	Eng. RPM.	Amperes	Eng. RPM.
Start	550	Start	350
28	1300	20	1050
28	3000	20	3000

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—Approximately 28 ozs.
Field Current—2.86 amperes at 6.0 volts (01A-10000B, S08T-10000—field resistance 2.1 ohms at 70°), 2.22 amperes at 6.0 volts (81T-10000A, B—field resistance 2.7 ohms at 70°).
Removal (4 Cyl.):—Generator pivot mounted at right of engine. To remove, take out mounting bolts.
Removal (V8 Eng.):—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt (on Cab-over-engine Trucks, fan mounted on generator shaft To remove, loosen nut on bracket stud.
Belt Adjustment:—Loosen pivot and clamp bolts, swing generator away from engine (4 Cyl.), loosen nut on bracket mounting stud and raise generator (V8), until side movement of belt with thumb and finger pressure is 1" midway between generator and crankshaft pulley (4 Cyl.), water pump pulley (V8).

REGULATOR:—Ford No. 01A-10505C. Three-Unit Type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case grounded through 'pigtail' to dash or separate ground wire to generator. This ground connection must be in place when regulator being operated or tested (disturbed by cover removal).

Cutout Relay

Cuts In—5.8-6.3 volts at operating temperature.
Cuts Out—8 amperes discharge current (maximum).

Voltage Regulator

Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Elec. Equip. Section for other temps.
Checking & Adjusting—***Refer to Electrical Equipment Index for article on 'Ford Regulator—3 Unit Type' for complete instructions.***

Current Regulator

Setting—28 amperes at 7.0 volts hot—after engine run for 5 minutes (196-200 watts maximum for continuous operation).
Checking & Adjusting—See Voltage Regulator

LIGHTING:—Headlamps—Ford Sealed Beam type. Controlled by Lighting Switch on instrument panel and Beam Selector Switch on toeboard.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim each headlamp straight ahead with upper beam hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—At left end of speedometer dial. Lighted whenever Upper Beams in use.

Switches

Lighting—R-B-M Model 2445, Ford No. 11A-11653 (Pass. Cars), 01C-11653 (Comm'l. & Trucks exc. C-O-E), 01W-11653 (C-O-E Trucks). With wiring.
Beam Selector—R-B-M 2487. Ford No. 81A-13532.
Instrument—Ford No. 11A-13740 (Pass. Cars), 01A-13740B (Sedan Dlvry.). **Stop Light** Ford 11A-13480.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Clock	1½	55
Parking (Truck)	3	63
Instrument, Ign. Lock	1	51
Beam Indicator	1	51
Dome (Pillar), Luggage Compt.	3	63
Stop & Tail	21-3	1154
Rear License	3	63

LIGHTING CIRCUIT BREAKER:—Ford No. 11A-12250 (V8). Combined with Ignition Resistor on block on dash under cowl. Consists of two separate circuit breaker units (one unit protects headlamp circuits, second unit protects other lighting circuits). Breakers are thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

FUSES:—Clock—2 ampere.

HORNS:—Air Electric dual horns (Pass. Cars & Sedan Dlvry.), Vibrator type Single Horn (Comm'l. & Trucks). Horn relay used with dual horns.
Horn Current—24-28 amperes (total—dual horns), 6-8 amperes (single horn).
Horn Relay:—R-B-M No. 50357, Ford No. 11A-13842B.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE HOOD NOTE:—Hood is Alligator type with latch at forward end. To raise hood, press toward left on hood latch handle in lower left front hood louvre, raise hood slightly, reach under lower edge of hood and release safety catch, raise hood.

SERIAL NUMBER:—First No. 700001 (109 '40), 700146 (109 '41), 900001 (113 '41). Stamped on plate on floor inside right rear door.

ENGINE NUMBER:—First No. 710001 (109 '40), 710222 (109 '41), 910001 (113 '41). On plate on right side of engine block and on Serial No. Plate (above).

COMPRESSION:—**Ratio**—6.65-1 Std. 7.0-1 & 7.25-1 Optl. **Pressure**—125 lbs. (113), 130 lbs. (109) at cranking speed (Std. Hd.).

VACUUM READING:—17" steady at idling speed.

IGNITION:—**Coil Model 1115127 (109), 1115022 (113).** On engine side of dash.

Ignition Current—2 amperes idling, 4 stopped.

Ignition Switch:—Delco-Remy Model 1116261. Connected to ignition coil by armored cable.

Ignition Lock—Chicago lock cylinder.

Distributor Model 623-S (109), 623-A (113). Single breaker, 6 lobe cam, full automatic advance type with separate auxiliary vacuum spark control.

Breaker Gap—Set at .018". Limits .018-.024".

Cam Angle or Dwell—35° closed, 25° open.

Breaker Arm Spring Tension—20 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—Part No. 829092. Capacity .18-.25 mfd.

Automatic Advance—623-A

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	400	2	800
9	1400	18	2800

Automatic Advance—623-S

Start	275	2	550
3	400	6	800
8	1000	16	2000

Vacuum Spark Control Model 1116006 (623-A Dist.), 1116003 (623-S Dist.). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Plunger Travel—5/32" (1116006), 7/64" (1116003).

Vacuum Advance—1116006.

Dist. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
5°	10°	14-18"

Vacuum Advance—1116003.

Start	0°	5-7"
5°	10°	12-16"

Distributor Removal:—Mounted on cylinder head. To remove, loosen advance arm clamp bolt and lift distributor out (not necessary to disconnect vacuum line).

FIRING ORDER:—1-5-3-6-2-4. See diagram.

SPARK PLUGS:—Champion J-10. 14 MM. Metric.

Spark Plug Gaps—.025".

IGNITION TIMING:—**Flywheel Degrees Piston Position**

109	4½° ATDC	.0088" ATDC
113	AT TDC	.0000" TDC

To Set Timing—With #1 piston on compression stroke, turn engine over until 'IGN' mark on flywheel lines up with indicator on housing (under cover on right front face of flywheel housing). Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt. See that rotor is opposite #1 segment in distributor cap.

CARBURETION:—**Carburetor (109)**—Carter WDO, Model 488-S. 1" dual, downdraft type with Climatic Control.

For complete data, refer to 1941 Carburetor Index.

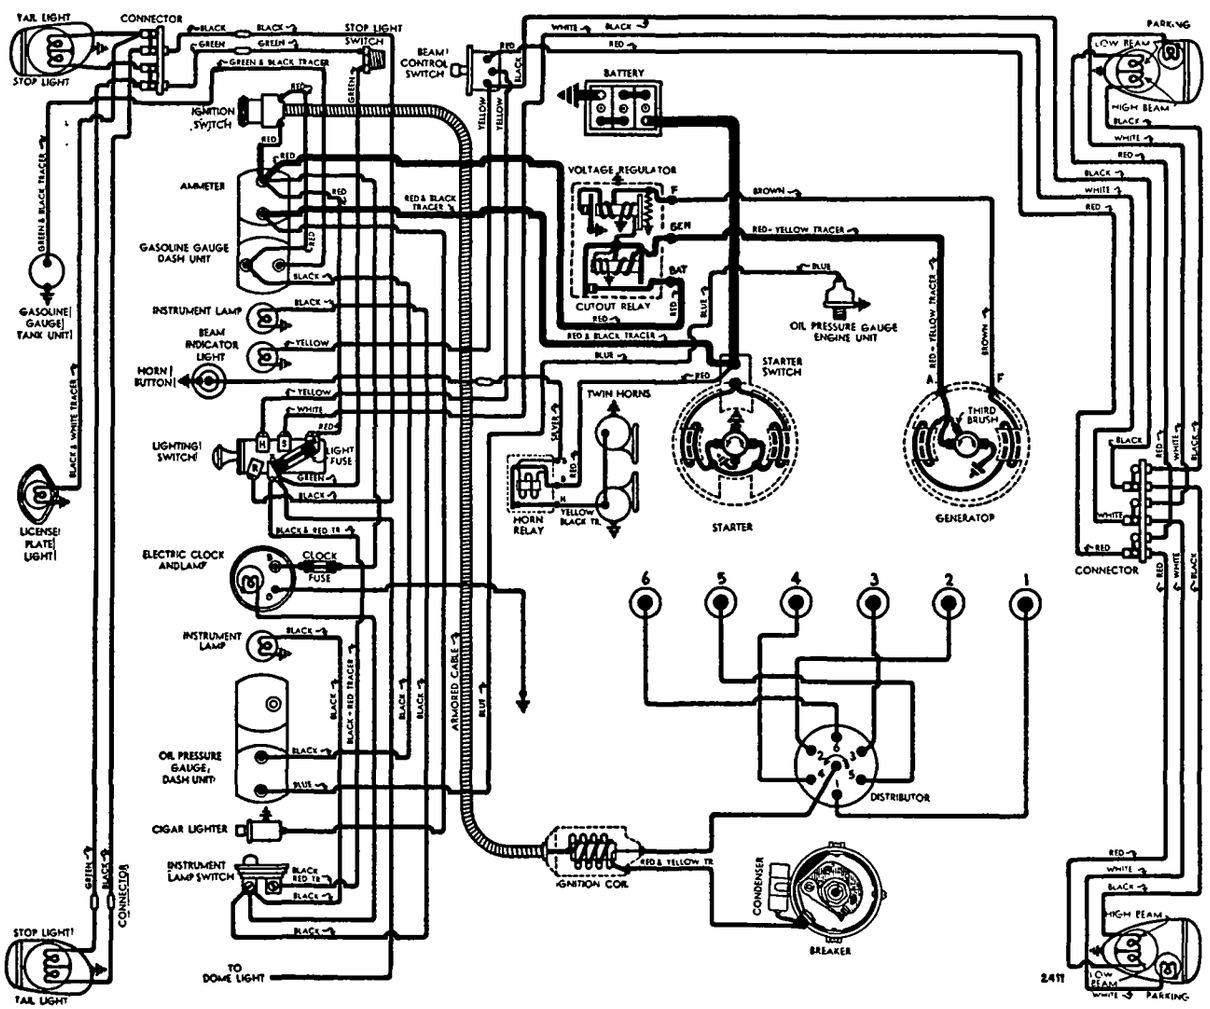
Idle Setting—Both idle screws set alike and approx. ½-1¼ turns open (turn screws in for leaner mixture). Idle speed 7-8 MPH. (hot or slow idle).

Accelerating Pump Setting—Two holes provided in pump arm for connector rod engagement. Connect rod in outer hole (long radius) for maximum stroke, inner hole (short radius) for minimum stroke.

Float Level—3/16" from top of float to bowl cover with valve seated (remove gasket & invert to check).

Metering Rods & Jets—***See Carter Jet Specification Table in Carburetor Section for complete data.***

Fast Idle Setting—Set fast idle screw for .026" throttle opening with choke valve closed.



Automatic Choke Setting—Center index mark in line with reference mark on housing.

Carburetor (113):—Carter WA-1, Model 472-S, 1¼" single, downdraft type with Climatic Control.

For complete data, refer to 1941 Carburetor Index.

Idle Setting—Idle screw approx. ½-1½ turns open (turn screw in for leaner mixture). Idle speed 7-8 MPH (hot or slow idle—fast idle inoperative).

Accelerating Pump Setting—Three holes provided in pump arm (under dustcover on bowl cover) for connector rod engagement. Connect rod in inner

hole (short radius) for minimum stroke, outer (upper hole) for maximum stroke, outer (lower) hole for medium stroke.

Float Level—3/8" from top of seam at free end to top of projection on bowl cover (invert to check).

Metering Rods & Jets—*See Carter Jet Specification Table in Carburetor Section for complete data.*

Fast Idle Setting—Adjust by bending connector rod offset so choke valve opening is 5/8" with stopscrew against (not on) first step of fast idle cam.

Automatic Choke Setting—At Center Index mark.

Fast Idle:—Integral type (built-in each carb.).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—See data for each carburetor (above).

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—See data for each carburetor (above).

Air Cleaner:—AC oil-wetted type Std., Heavy duty oil-bath type Optl.

Fuel Pump:—AC Type R, #1523731. Diaphragm type.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Model 109. Upper half of supercharger case and cross-passage between supercharger and manifold are water-jacketed for fuel mixture heating. No attention required.

Model 113. Heat control valve in manifold controlled by automatic thermostatic coil spring. No adjustment required.

VALVE TIMING:—To Check—With .012" tappet clearance, #6 exhaust valve closes with piston 4½° or .0088" past top dead center when flywheel mark 'EC-1' lines up with indicator on housing (inspection hole under cover on right front face of housing). Reset tappet clearance at .010" hot.

Tappet Clearance:—.010" all valves (hot).

Valve Spring Pressure:—44 lbs. at 1 21/32" (valve closed), 98 lbs. at 1 11/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—45 lbs. at 30 M.P.H.

Oil Pressure Gauge:—Stewart (Stewart-Warner) Electric type.
For complete data, refer to 1941 Mech. Equip. Index.

COOLING SYSTEM:—Capacity—16 quarts.

Thermostat—Detroit Lubricator. In cylinder head outlet. Starts to open at 150°F. Fully open 180°.

BATTERY:—Willard Type SWB-100. 6 volt, 17 plate, 100 ampere hour capacity (20 hour rate).

Starting Capacity—120 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.5 minutes at 0°. Five second voltage 4.3 volts.

Grounded Terminal—Positive (+) terminal.

Dimensions—Length 10½". Width 7⅛". Hgt. 8 7/16".

Location—Under left front seat or under rear compartment floor on left side.

Radio Battery—Willard Type HWB-110. 6 volt, 19 plate, 110 ampere hour capacity (20 hour rate).

Starting Capacity—134 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.5 minutes at 0°. Five second voltage 4.4 volts.

Grounded Terminal, Dimensions, Location—Same as for Std. battery (above).

STARTER:—Model 738-T, X (RHD). Armature 823881.

Drive—Manual pinion shift (738-T), solenoid pinion shift (738-X), with overrunning clutch.

Cranking Engine—140-145 amperes, 5 volts.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ounces each.

Performance Data

Torque	R.P.M	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (738-T):—Delco-Remy No. 820052. Mounted on starter field frame. Operated by pinion shift lever (starter pedal).

(738-X):—Solenoid Switch type 1546. Solenoid switch controlled through relay by push switch on instrument panel.
For complete data, refer to 1941 Elec. Equip. Index.

Solenoid Switch

Closes against 70 lbs. pull with ½" air gap drawing 65-71 amperes at 5 volts. Holds switch closed with draw of 12-14 amperes (hold-in coil only).

Solenoid Relay

Contacts Close—1.9 volts max. **Open**—1.0-1.2 volts.

Contact Gap—.035". **Air Gap**—.012" (closed).

GENERATOR:—Model 1100007. Armature No. 1966789. Fixed third brush control with external vibrating voltage regulator. Ventilated by fan on drive pulley.

Charging Rate Adjustment—Adjusted by changing voltage regulator setting. See Regulator data.
NOTE—Third brush clamped in position for maximum safe output and should not be disturbed.

Maximum Charging Rate—As given in table below. To check charging rate, connect test ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'BAT' terminal and ground, ground generator 'F' terminal to eliminate regulator action.
NOTE—Do not operate generator on open-circuit. Restore original connections after completing test.

Performance Data

	Amperes	Volts	R.P.M.
Cold	26-30	8.0	3400
Hot	25-28	8.0	3600

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—25 ozs. (all brushes).

Field Current—2.3-2.6 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot bolts and clamp bolt.

Belt Adjustment:—Loosen pivot bolts and clamp bolt, swing generator away from engine until belt deflection is 1" midway between generator and fan pulleys (use straightedge across pulleys).

REGULATOR:—Model 1118204 'Single Core' Type. Vibrating voltage regulator in case on dash.
For complete data, refer to 1941 Elec. Equip. Index.

CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.

Cuts Out—0-4.0 ampere discharge current.

Contact Gap—.020" (same for both sets).

Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Regulator over-compensated for temperature. Should be checked with cover in place and hot.

To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).

To Adjust—Change regulator armature spring tension slightly by bending lower spring hanger for **light (left) spring or one spring only (if both springs alike).** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for heavy (or other spring) adjustment.

Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

LIGHTING:—Headlamps—Hall. Upper and lower beams controlled by beam selector switch on toe-board.

Headlamp Adjustment—Aim each headlamp straight ahead with high intensity spot centered on vertical line directly ahead of each lamp center and upper edge of this high intensity spot on horizontal line at lamp-center height.

Beam Indicator—In knob at right of ignition switch. Lighted when upper beams in use.

Switches

Lighting—Soreng-Manegold.

Beam Selector—R-B-M Model 1050.

Instrument—Delco-Remy No. 1997706.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlights	32-32	2330
Parking	1½	55
Instrument, Beam Ind.	1	51
Stop & Tail	21-3	1158
License Plate, Dome	3	63

FUSES:—Lighting—20 ampere. In lighting switch.

Clock—SFE. 4 ampere. In clock lead.

HORNS:—Delco-Remy. Blended tone, twin horns No. 1999519 (109 Low Note), 1999520 (109 High Note), 1999531 (113 Low Note), 1999532 (113 High Note).

	Current (at 6 volts)	Air Gap
1999519, 31 (low note)	18-20	.044-.049"
1999520, 32 (high note)	19-21	.034-.039"

Horn Relay:—Delco-Remy No. 1116775.

Contact Gap—.025". **Air Gap**—.015" (closed).

C ntacts Close—2.75-4.0 volts.

HUDSON 1941

SIX, TRAVELER & DELUXE 10, SUPER SIX 11, COMMODORE 12, BUSINESS MODEL 10 & BIG BOY 18
AUTO-LITE ELECTRICAL SYSTEM

HOOD LOCK:—Reverse alligator type (same as 1940). Lock handle on instrument panel (on left side).

MODEL 10 NOTE:—3"x 5" engine optional (when this engine used **all equipment listed below for Model 11 used on these cars**). Serial No. plate carries identification prefixes as follows: **3"x4⅛" Eng.** 'T' (Traveler), 'D' (Deluxe), 'C' (Commercial). **3"x5" Engine** Additional letter 'L' thus: 'TL', 'DL', 'CL'.

SERIAL NUMBER:—First number 10101 (10), 11101 (11), 12101 (12), 18101 (18). First 2 figures indicate Model thus: 10-101. On plate on right front hoor hinge pillar post. See Model 10 Note above.

ENGINE NUMBER:—Same as Serial No. On top of cylinder block between #1 and 2 exhaust flanges.

COMPRESSION:—**Ratio**—7.25-1 (Model 10—3" x 4⅛" Eng.). 6.50-1 (11, 12, 18 & Model 10 with 3"x5" Eng.). **Pressure**—125 lbs. (7.25-1 Eng.), 120 lbs. (6.5-1 Eng.) at cranking speed of 125 RPM.

VACUUM READING:—18-21" steady idling at 600 RPM.

IGNITION:—**Coil Model IG-4098.** Mounted on dash.

Ignition Current—2.5 amperes idling, 4.5 stopped.

Ignition Switch:—Mitchellock Model 24-B, No. 8797.

Ignition Lock—Briggs & Stratton B & S No. 50184. **Key Series**—H601 to H1100. **Groove**—No. 1.

Distributor Auto-Lite IGW-4203A. Full automatic advance type with auxiliary vacuum spark control (separate unit) and Fuel Compensator adjustment.

Breaker Gap—.020".

Cam Angle or Dwell—35° closed, 25° open (distr. °).

Breaker Arm Spring Tension—17-20 ounces.

Rotation—Counter-clockwise viewed from above.

Condenser—No. IGW-3075C. Capacity .20-.25 mfd.

Distributor Degrees	R.P.M	**Automatic Advance** Degrees	Engine R.P.M.
Start	400	0	800
3	700	6	1400
6	1000	12	2000
9	1300	18	2600
11.75	1570	23.5	3140

Vacuum Spark Control—On distributor hold-down plate, linked to quadrant scale on distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring within unit).

Vacuum Advance Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	6¾"
2°	4°	7⅝"
4°	8°	8½"
6°	12°	9⅜"
7.5°	15°	10"

Fuel Compensator—Manual adjustment for octane rating of fuel used. See Ignition Timing for setting.

Distributor Removal:—Mounted at top rear of cylinder head. To remove, disconnect vacuum line, take out cyl. head stud nuts on hold-down plate.

FIRING ORDER:—1-5-3-6-2-4. See diagram.

SPARK PLUGS:—Champion Spec. J9 Hudson. 14 MM.

Optional Plugs—Champion J5 (hotter plug) for continuous low speed service or J10 Commercial (cooler plug) for continuous high speed service.

Spark Plug Gaps—.032".

IGNITION TIMING:—**Initial Setting**—½" (two spaces) BTDC. for fuel of approximately 72 Octane rating.

Flywheel Marks—'UDC.1-6/' at TDC with 4 graduations (¼" apart) ahead of this mark.

Timing—With #1 piston on compression, turn engine over until second graduation before flywheel mark 'UDC.1-6/' lines up with pointer on left front face of rear motor support above starter. Loosen vacuum advance diaphragm screw on quadrant scale, rotate distributor counter-clockwise to limit of slot, then slowly rotate clockwise until contacts begin to open, tighten diaphragm screw securely. Check Fuel Compensator Setting below.

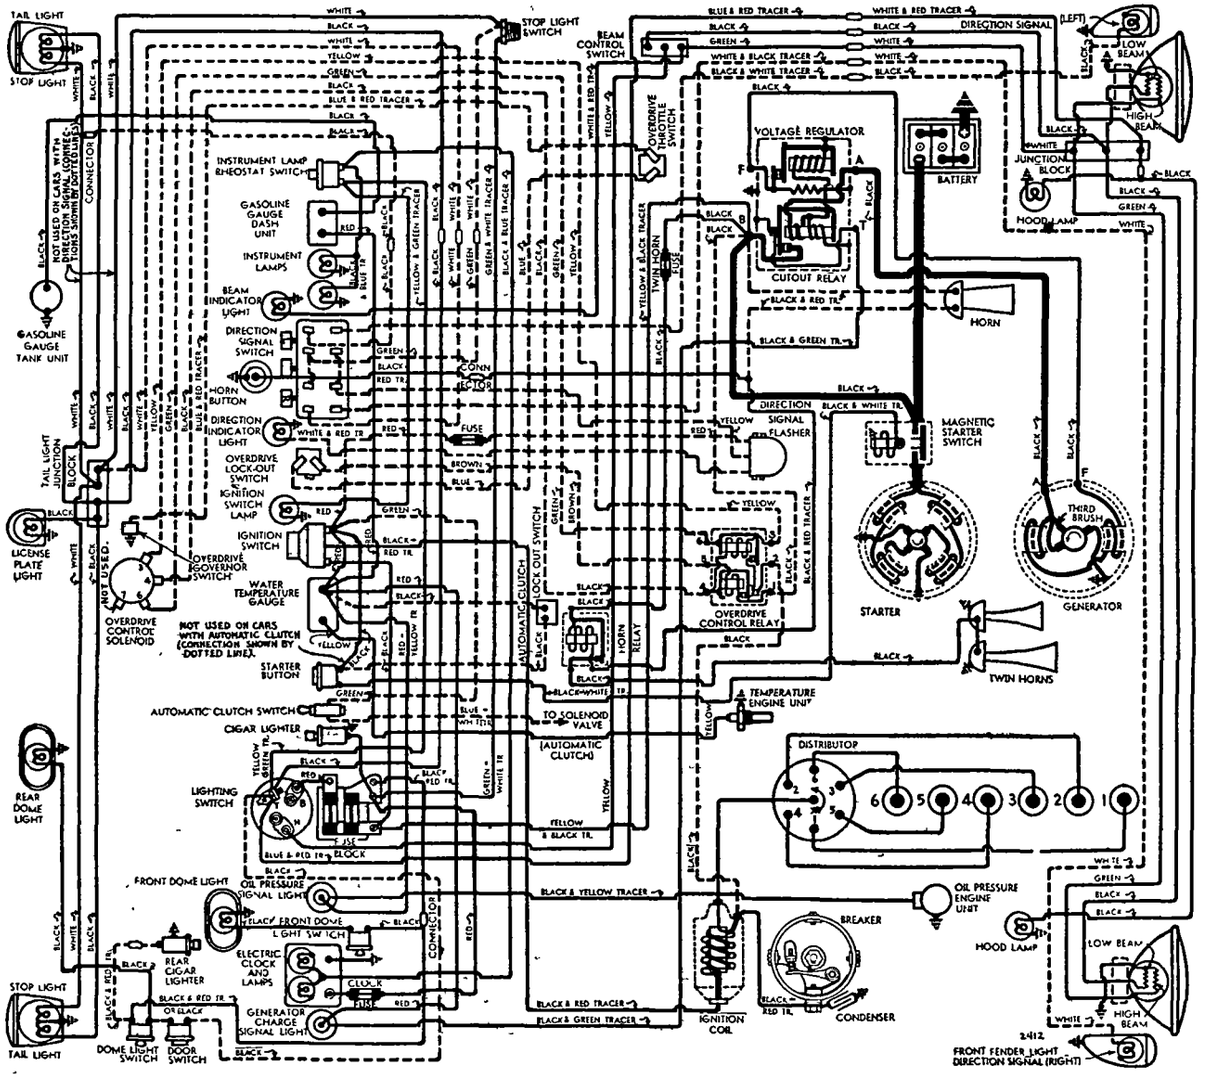
Timing (Using Synchroscope)—Recommended by car manufacturer. Mark flywheel with white chalk or paint. Idle engine, adjust distributor (above).

Fuel Compensator Setting—Road test car (engine warm). When running at 8 MPH slight ping should occur between 10-15 MPH when accelerating with wide open throttle. To adjust, loosen vacuum unit link screw on distributor quadrant, rotate distributor one graduation on quadrant scale clockwise (if no ping), counter-clockwise (if ping too severe). **Final setting must not be more than 1" (4th graduation) before 'UDC.1-6/' flywheel mark.**

CARBURETION:—**Carburetor (10—See Note, 18).** Carter WA-1 Model 454-S (No. 298 cast on face of flange). 1¼" single barrel, downdraft type.

For complete data, refer to 1941 Carburetor Index.

Model 10 Note—Cars with 3" x 5" Eng. use 501-S dual carburetor (same as Model 11, 12 below).



Carburetor (11, 12):—Carter dual type. ***See 1941 Hudson 8 'T&E' page following for all carburetor data.***

Idle Adjustment—With engine warm, set throttle stopscrew for 600 RPM hot or slow idle speed (fast idle inoperative), adjust idle adjusting screw so engine fires smoothly and vacuum reading at maximum (screw ¾-1½ turns open—turn screw in for leaner setting), recheck idle speed.

Accelerating Pump Setting—Pump arm has three holes for pump link engagement. Set as follows:
Lower Hole (med. stroke)—Normal setting.
Inner Hole (min.)—Hot weather or hi-test fuel.
Upper Hole (max.)—Cold weather or low-test fuel.

Float Level—⅜" from top of bowl cover projection to top of soldered seam on float at free end with valve seated (invert to check).

Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

Fast Idle:—Integral type (part of carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust by bending connecting link offset for 5/8" choke valve opening with throttle stopscrew against (not on) first step of fast idle cam.
Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Centered (at index mark).
Air Cleaner:—AC #1528159 (10, 18), #1528161 (11, 12) oil-wetted type std. United oil-bath type optl.
Fuel Pump:—AC Type AF (10, 18 Pass.), AP (all others). Pump Exchange Part No. 509 (10), 499 (all others). Type AJ fuel and vacuum pump Optl.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—King-Seeley Electric. K-S No. 8305 (Dash Unit—stamped 'G'), No. 7550 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.
MANIFOLD HEAT CONTROL (10, 18):—Manual type at center of manifold behind carburetor.
Setting—Arrow on valve cover pointing to 'W' cast on top of manifold **for summer and winter.**
11, 12:—Automatic thermostatic coil type. This type also used on Model 10 with dual carburetor.
VALVE TIMING:—**To Check**—With .010" tappet clearance, #1 intake valve opens 10°40' BTDC (see Note below for later Model 10 cars) or approx. 4 teeth on flywheel before 'UDC.1-6/' mark with piston .0441" (first Model 10), .0562" (11, 12) BTDC.
Model 10 Camshaft Change—On later engines (with specified tappet clearance of .010" Intake, .012" Exhaust) intake valve opens 28°30' BTDC.
Tappet Clearance:—.006" Int., .008" Exh. (hot and idling) **except later Model 10** with plate on valve cover specifying .010" Intake, .012" Exhaust Hot. Remove right front fender plate for access to valves.
See Hudson Shop Notes ('M' Section) for removal data.
Valve Spring Pressure:—40 lbs. at 2" (valve closed), 80 lbs. at 1 21/32" (valve open). Free length 2 17/64".
LUBRICATION:—**Crankcase Capacity**—4½ qts. (refill), 5½ qts. (dry). NOTE—Whenever pan installed, place 1½ qts. in upper tray, 4 qts. through filler.
Normal Oil Pressure—4-12 lbs. with hot oil.
Oil Pressure Indicator:—Hudson Teleflash indicator.
For complete data, refer to 1941 Elec. Equip. Index.
COOLING SYSTEM:—**Capacity**—13 quarts.
Thermostat—Fulton. In cylinder head outlet. Starts to open 150-155°F. Fully open 185°F. High reading type (for ethylene glycol type anti-freeze) starts to open 160-175°F. Fully open 190°F.
Temperature Gauge:—King-Seeley Electric. K-S No. 8310 (Dash Unit—stamped 'T'). 7000 (Eng. Unit). NOTE—Gauge reads HOT with ignition off.
For complete data, refer to 1941 Mech. Equip. Index.
AUTOMATIC CLUTCH CONTROL:—Electric type. Optl. NOTE—Governor Switch changed during production.
For complete data, refer to 1941 Mech. Equip. Index.
TRANSMISSION OVERDRIVE CONTROL:—New electric type (Solenoid & Governor—with 'kick-down').
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy. Hudson #163305.
Throttle Switch—Cole-Hersee. Hudson No. 162594. Adjust position of contact washer on accelerator pedal rod so that it just contacts switch plunger with carburetor throttle in wide open position.
Governor Switch—Bendix No. 162867. NOTE—Changed in production. New type has purple dots on terminals.

BATTERY:—**National, Type HT-17.** 6 volt, 17 plate, 96 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage—4.24 volts.
Grounded Terminal—Positive (+) to frame. **Engine Ground**—Strap (rear motor support to frame).
Dimensions—Lgth. 10 9/16". W. 7¼". Hght. 7 13/16".
Location—On left side under engine hood.

STARTER:—**Auto-Lite MZ-4092. Armature MZ-2138.**
Drive—Inboard Barrel type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 125 amperes, 5.4 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
2.55 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Removal:—On left front face of rear motor support. To remove, take out flange mounting screws.
Starting Switch:—A-L Model SS-4001. Magnetic type.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—**Auto-Lite GDS-4801A (10, 18) GEC-4801A (11, 12).** Third brush control with external vibrating voltage regulation. Ventilated type.
Armature—GDF-2006F (GDS), GDZ-2006F (GEC).
Maximum Charging Rate (GDS)—32-34 amperes (cold), 8.0 volts, 2900 RPM or approx. 35 MPH.
(GEC) 39-43 amperes (cold), 8.0 volts, 3350 RPM or approx. 43 MPH. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. See Regulator data following. When checking generator output, ground regulator 'F' terminal.
Charging Rate Adjustment—See Regulator. Third brush setting (GDS) 1 comm. bar minus 1 mica strip min., 1 comm. bar max. from insulated (nearest main brush). (GEC) 1 comm. bar min., 1 comm. bar plus 1 mica strip max. Adjust by shifting 3rd brush.

Performance Data—GDS-4801A

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M
0	6.4	920	0	6.4	960
4	6.6	1050	4	6.65	1120
8	6.8	1175	8	6.9	1280
12	7.0	1300	12	7.1	1430

20	7.4	1600	20	7.6	1900
24	7.6	1820	24	7.8	2320
28	7.8	2075	27.5	8.0	3400
33	8.0	2900			

Performance Data—GEC-4801A

0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280
12	6.85	1280	12	6.95	1440
16	7.0	1400	16	7.15	1600
20	7.15	1550	20	7.35	1820
24	7.25	1700	24	7.55	2090
28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
36	7.8	2375	34	8.0	3800
41	8.0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.65-1.82 amperes (GDS), 1.60-1.78 amperes (GEC) at 6.0 volts.
Motoring Current—5.10-5.45 (GDS), 4.85-5.4 (GEC) amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—¾" slack midway between pulleys.

REGULATOR:—**Auto-Lite VRR-4001A.** Cutout Relay and vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Teleflash Indicator control. NOTE—Regulator enclosed in close-fitting metal cover on dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay

Cuts In—6.4-6.6 volts, 825 RPM. 9.4 MPH.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min. ground contacts closed (ground contacts open when main contacts close).
Air Gap—.034-.038" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator

Setting—7.1-7.4 volts at 110°F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between this terminal and ground. Operate generator at speed of 30 MPH charging battery until voltage is constant. Voltmeter reading should be within limits of 7.1-7.4 volts at 70°F. See Electrical Equipment Section for other temperatures.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—Red pilot bulb on speedometer dial. Lighted with Country (upper) beam in use.
Direction Indicator—Optional equipment.
For complete data, refer to 1941 Elec. Equip. Index.

Switches

Lighting—Douglas. Hudson No. 147835.
Beam Selector—R-B-M Model 2484.
Instrument—R-B-M. Hudson No. 160092.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Side Panel (Parking)	1½	55
Fender Lamp (see Note)	3	63
Speedometer, Elec. Clock	1½	55
Generator & Oil Signals	1½	55
Ign. Lock, Mech. Clock	1	51
Beam & Direct. Indic.	1	51
Stop & Tail	21-3	1154
Rear License	3	63
Dome	15	87

NOTE—21 cp. No. 1129 for Direction Indicator.

SIGNAL LIGHTS:—Generator Charge and Oil Pressure Indicators used. Hudson Teleflash Electric type.
For complete data, refer to 1941 Elec. Equip. Index.

FUSES:—**Lighting**—30 ampere. Lower fuse on fuse block on lower edge of instrument panel to right of steering column. **Accessory**—30 amp. Top fuse on block. NOTE—Silver-plated fuses used. 30 amp. fuse supersedes 20 ampere fuse used on early cars.
Twin Horns—30 amp. In case on engine dash.
Direction Indicator—10 amp. near speedometer.
Electric Clock—2 amp. in case behind clock.
NOTE—Feed wire for electric clock on early cars connected to fuse block 'Bat' terminal. Should be changed to Lighting Switch (see diagram).

HORNS:—**Single**—Schwarze electric. Std. on 10T, 18.
Twin—Sparton air electric type operated by relay. Fuse on dash. **(Air Gap)** .026-.030" high pitch (short), .032-.035" low pitch (long).
Horn Relay:—R-B-M Model 6004. On dash. **Contacts Close** 3-4 volts (relay upright, terminals down).

CONVERTIBLE TOP CONTROL:—Hydro-electric type.
For complete data, refer to 1941 Mech. Equip. Index.

MODEL NOTATION:

	Model	Serial Nos.
Commodore Eight	14	14101 Up
Commodore 8 Custom Coupe	15	15101 Up
Commodore 8 Custom Sedan	17	17101 Up

HOOD LOCK:—Reverse alligator type (same as 1940). Lock handle on instrument (on left side).

SERIAL & ENGINE NUMBER:—See Model Notation for first Nos. (first 2 figures indicate model thus: 14-101). Stamped on plate on right front door hinge pillar post and on top of engine block between #1 and #2 exhaust manifold flanges.

COMPRESSION:—**Ratio**—6.5-1 Std. No Optl. ratios. **Pressure**—120 lbs. at 125 RPM cranking speed.

VACUUM READING:—18-21" steady idling at 600 RPM.

IGNITION:—**Coil Model CE-4029.** Mounted on dash. Service Coil (less switch & cable) CE-3224JS.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Mitchellock Model 24-B, No. 8797.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—H601 to H1100. **Groove**—No. 1.
Distributor Auto-Lite IGP-4008A. Full automatic advance type with Fuel Compensator Adjustment.
Breaker Gap—.017".
Cam Angle or Dwell—31° closed, 14° open (dist.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-2671. Capacity .20-.25 mfd.

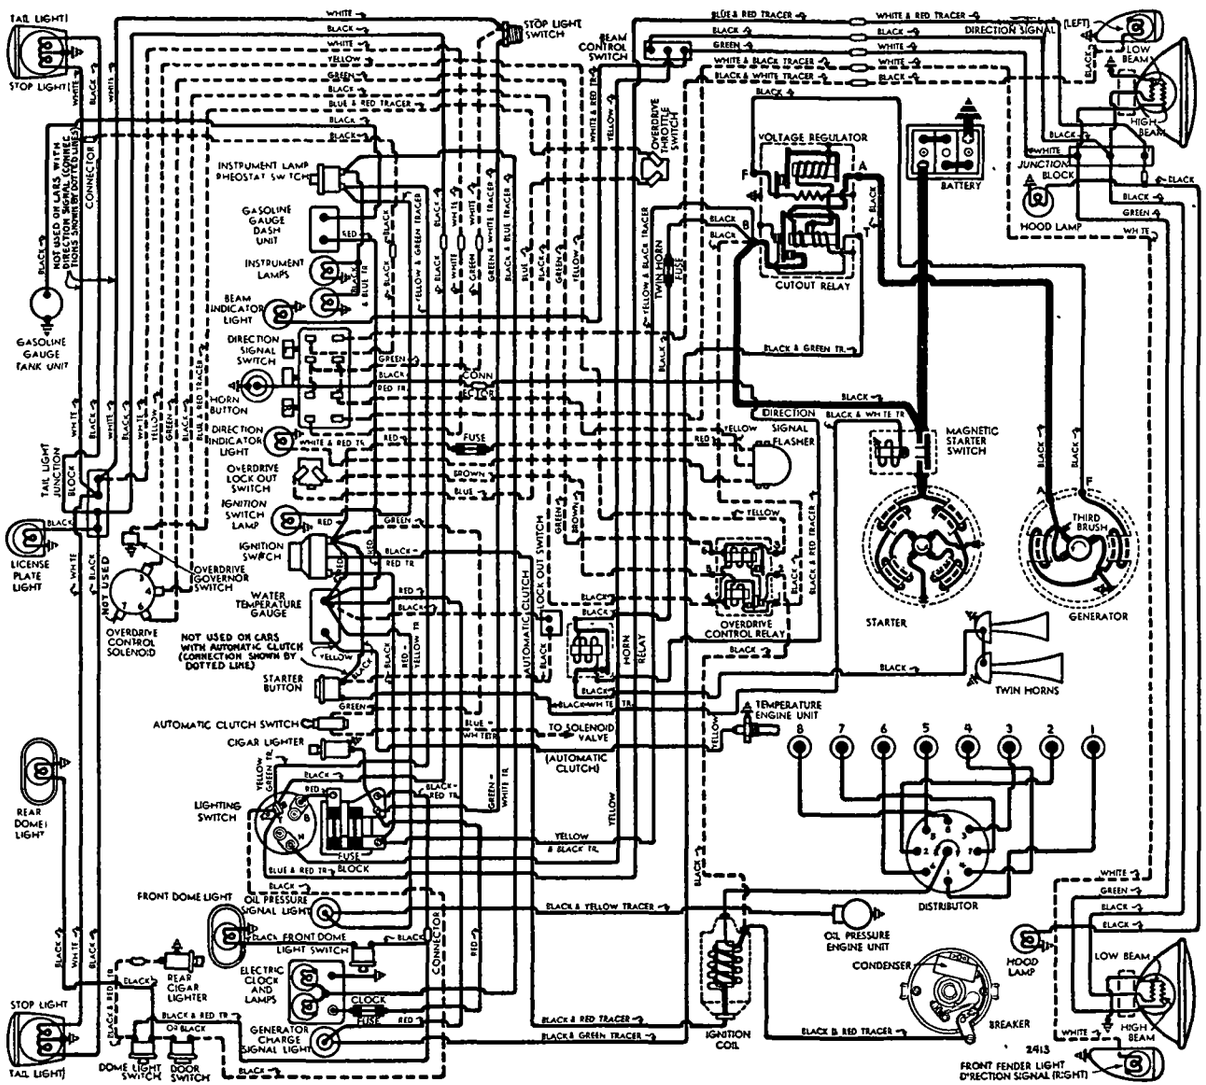
Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	400	6	800
8	850	16	1700
13	1300	26	2600
17.5	1700	35	3400

Fuel Compensator—Manual adjustment for octane rating of fuel used. See Ignition Timing for setting.
Removal:—Mounted on right side of crankcase. To remove take out hold-down screws in advance arm.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARK PLUGS:—Champion Spec. J9 Hudson, 14 MM. **Optional Plugs**—Champion J5 (hotter plug) for continuous low speed service or J10 Commercial (cooler plug) for continuous high speed service.
Spark Plug Gaps—.032".



IGNITION TIMING:—Initial Setting (for 72 octane rating fuel). See Fuel Compensator setting following.

	Flywheel Degrees	Piston Position
All Engines	0° at TDC	.0000" TDC

Flywheel Marks—'UDC.1-8/' at TDC with 4 graduations (¼" apart) ahead of this mark.
Timing—With #1 piston on compression, turn engine over until piston reaches top dead center when flywheel mark 'UDC.1-8/' lines up with pointer in left front face of rear motor support. Loosen hold-down screw in advance arm, rotate distributor clockwise to limit of advance arm slot, then slowly rotate distributor counter-clockwise until contacts begin to open, tighten hold-down screw. Check Fuel Compensator setting.
Timing (Using Synchroscope)—Recommended by manufacturer. Mark flywheel with white chalk or paint, connect at #1 spark plug. Idle engine and adjust distributor as directed above.
Fuel Compensator Setting—Road test car (engine warm). When running at 8 MPH slight ping should occur between 10-15 MPH when accelerating with wide open throttle. To adjust, loosen hold-down screw, rotate distributor one graduation on scale counter-clockwise (if no ping), clockwise (if ping to severe). **Final setting must not be more than ¾" (3rd graduation) before 'UDC.1-8/' mark.**

CARBURETION (SIX—DUAL TYPE):—Carburetor—Carter Type WDO Model 461-S (before Serial & Engine No. 2150), Model 501-S (Serial & Engine No. 2150 and up). 1" dual downdraft types. #268 cast on face of carburetor flange (both carburetors). Slow closing throttle 'dashpot' device used on Model 461-S only. **These carburetors used on Six cylinder Models 11, 12, and 10 (with 3" x 5" engine).** ***Carburetor tune up data listed below for 8 cylinder Models 14, 17 applies to these Six cylinder carburetor models also.***

CARBURETION (EIGHT):—Carburetor—Carter Type WDO Model 455-S (before Serial & Engine No. 7293), Model 502-S (Serial & Engine No. 7293 and up). 1¼" dual downdraft types. #279 cast on face of carburetor flange (both carburetors). Slow closing throttle 'dashpot' device used on Model 455-S only. ***For complete data, refer to 1941 Carburetor Index.***
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 600 RPM idle speed. Adjust idle adjusting screws (2 used, 1 for each barrel) in succession until engine fires smoothly. Final setting should be ½-1½ (455-S, 501-S, 502-S), ¼-1¼ (461-S) turns open for each screw (turn screws in for leaner mixture) for highest reading of vacuum gauge. Recheck idle speed.
Accelerating Pump Setting—Pump lever (under dust cover at top of carburetor) has 2 holes for pump link engagement. Adjust as follows:
Outer Hole (Max. stroke)—Normal setting.
Inner Hole (Min. stroke)—If less charge required.
Float Level—3/32" (455-S, 461-S), ⅛" (501-S, 502-S) from top of float to bowl cover with needle valve seated (remove gasket and invert to check).
Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

Fast Idle:—Integral type (part of carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting (455-S, 461-S)—With choke valve closed, turn fast idle screw in for .018" throttle opening.
Setting (501-S, 502-S)—With choke valve closed and fast idle screw on high lobe of fast idle cam, turn fast idle screw in until throttle opening is .045" 501-S—Six), .053" (502-S—Eight).
Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Centered (at index mark) for 455-S, 461-S. 1 Notch Lean for 501-S, 502-S (supersedes original 'Centered' setting on these models).
Air Cleaner:—AC #1528161 oil-wetted type Std. United heavy duty oil-bath type optional.
Fuel Pump:—AC Type AP (std.). Pump Exchange Part No. 499. Type AJ combination fuel-and-vacuum pump optional.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—King-Seeley Electric. K-S No. 8305 (Dash Unit—stamped 'G'), No. 7550 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.
MANIFOLD HEAT CONTROL:—Automatic thermostatic type. No adjustment required.
VALVE TIMING:—To Check—With .010" tappet clearance, #1 intake valve should open with #1 piston 10°40' or .0494" BTDC when a point on the flywheel approx. 3.94 teeth before 'UDC.1-8/' mark lines up with indicator in inspection hole above starter (left side). Reset tappet clearance .006" (hot and idling).
Tappet Clearance:—.006" Intake, .008" Exhaust (with engine hot and idling). Remove right front fender plate for access to valves. ***See Hudson Shop Notes ('M' Section) for fender plate removal.***
Valve Spring Pressure:—40 lbs. at 2" (valve closed), 80 lbs. at 1 21/32" (valve open). Free length 2 17/64".
LUBRICATION:—Crankcase Capacity—7 qts. (refill), 9 qts. (dry). NOTE—Whenever pan installed, place 2 qts. in upper tray, 7 qts. through filler.
Normal Oil Pressure—4-12 lbs. with hot oil.
Oil Pressure Indicator:—Hudson Teleflash indicator.
For complete data, refer to 1941 Elec. Equip. Index.
COOLING SYSTEM:—Capacity—18 quarts.
Thermostat—Fulton, By-pass type (15, 17), choke type (14), in cylinder head outlet. Starts to open 150-155°F. Fully open 185°F. NOTE—Special high temperature thermostats available for use with ethylene glycol type anti-freeze. Starts to open 165-170°F (15,17), 160-165°F (14). Fully open 195°F (15,17), 190°F (14).
Temperature Gauge:—King-Seeley Electric. K-S No. 8310 (Dash Unit—stamped'T'). 7000 (Eng. Unit). NOTE—Gauge reads HOT with ignition off.
For complete data, refer to 1941 Mech. Equip. Index.
AUTOMATIC CLUTCH CONTROL:—Electric type. Optl. NOTE—Governor Switch changed during production.
For complete data, refer to 1941 Mech. Equip. Index.
TRANSMISSION OVERDRIVE CONTROL:—New electric type (Solenoid & Governor with 'kick-down').
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy. Hudson #163305.
Throttle Switch—Cole-Hersee. Hudson No. 162594. Adjust position of contact washer on accelerator pedal rod so that it just contacts switch plunger with carburetor throttle in wide open position.
Governor Switch—Bendix No. 162867.
NOTE—Switch changed to Part No. 162867 during production (identified by purple dots on terminal screw heads & purple band around switch body).
BATTERY:—**National, Type HT-19.** 6 volt, 19 plate, 108 ampere hour capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes. Five second voltage—4.43 volts.
Grounded Terminal—Positive (+) to frame. **Engine Ground**—Strap (rear motor support to frame).
Dimensions—Lgth. 11¾". Width 7¼". Hght. 7 13/16".
Location—On left side under engine hood.
STARTER:—Auto-Lite MAB-4100. Armature MAB-2113.
Drive—Inboard Barrel type Bendix No. A-1684.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150 RPM, 120-125 amperes, 5 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
0.6 "	1910	5.5	100
3.4 "	1100	5.0	200
6.6 "	695	4.5	300
10.15 "	420	4.0	400
15.2 "	Lock	3.0	575
21.5 "	Lock	4.0	750

NOTE—Lock torque figures correct with switch.
Removal:—On left front face of rear motor support. To remove, take out flange mounting screws.
Starting Switch:—A-L Model SS-4001. Magnetic type. Mounted on starter, controlled by switch on instrument panel. Operative only with ignition on (and clutch disengaged on cars with Automatic Clutch). Starter pushbutton Douglas. Hudson No. 147834.
For complete data, refer to 1941 Elec. Equip. Index.
GENERATOR:—Auto-Lite GEC-4801A. Armature GDZ-2006F. Third brush control with voltage regulation. Ventilated by fan on drive pulley.
Maximum Charging Rate—39-43 amperes (cold), 3350 RPM or approx. 43 MPH. Actual charging rate controlled by Voltage Regulator and dependent on battery condition. See Regulator data. When checking generator output, ground 'F' terminal to eliminate regulator action.
Charging Rate Adjustment—See Regulator data. Third brush setting 1 commutator bar minimum, 1 commutator bar plus 1 mica strip maximum, from nearest (insulated) main brush. Setting adjustable by shifting third brush.

Cold Performance Data			Hot Performance Data		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M
0	6.4	960	0	6.4	1040
4	6.55	1060	4	6.6	1140
8	6.7	1160	8	6.8	1280
12	6.85	1280	12	6.95	1440
16	7.0	1400	16	7.15	1600
20	7.15	1550	20	7.35	1820
24	7.25	1700	24	7.55	2090
28	7.5	1890	28	7.75	2440
32	7.65	2100	32	7.9	3000
36	7.8	2375	34	8.0	3800
41	8.0	3350			

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.85-5.4 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until possible belt deflection midway between generator and fan pulley is ¾" (use straightedge across pulleys).
REGULATOR:—Auto-Lite VRR-4001A. Cutout Relay and vibrating Voltage Regulator in case on dash. Cutout Relay has extra set of contacts for Generator Teleflash Indicator control. NOTE—Regulator enclosed in tight fitting metal cover on dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover is sealed. Serviced on exchange basis if seals not broken.

Cutout Relay
Cuts In—6.4-6.6 volts, 825 RPM. 9.4 MPH.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" min. ground contacts closed (ground contacts open when main contacts close).
Air Gap—.034-.038" at hinge end of core with contacts open (ground contacts closed).

Voltage Regulator
Setting—7.1-7.4 volts at 110°F.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal, voltmeter between this terminal and ground. Operate generator at speed of 30 MPH charging battery until voltage is constant. Voltmeter reading should be within limits of 7.1-7.4 volts at 70°F. See Electrical Equipment Section for other temperatures.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" Min. (armature against stop).
Air Gap—.048-.052" with contacts just opening.
LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—Red pilot bulb on speedometer dial. Lighted with Country (upper) beam in use.
Direction Indicator—Std. on 15, 17. Optl. on 14.
For complete data, refer to 1941 Elec. Equip. Index.

Switches
Lighting—Douglas. Hudson No. 147835.
Beam Selector—R-B-M Model 2484.
Instrument—R-B-M. Hudson No. 160092.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Side Panel (Parking)	1½	55
Fender Lamp (see Note)	3	63
Speedometer, Elec. Clock	1½	55
Generator & Oil Signals	1½	55
Ign. Lock, Mech. Clock	1	51
Beam & Direct. Indic.	1	51
Stop & Tail	21-3	1154
Rear License	3	63
Dome	15	87

NOTE—21 cp. No. 1129 for Direction Indicator.
SIGNAL LIGHTS:—Generator Charge and Oil Pressure Indicators used. Hudson Teleflash Electric type.
For complete data, refer to 1941 Elec. Equip. Index.
FUSES:—Lighting—30 ampere. Lower fuse on fuse block on lower edge of instrument panel to right of steering column. **Accessory**—30 amp. Top fuse on block. NOTE—Silver-plated fuses used. 30 amp. fuse supersedes 20 ampere fuse used on early cars.
Twin Horns—30 amp. In case on engine dash.
Direction Indicator—10 amp. near speedometer.
Electric Clock—2 amp. in case behind clock.
NOTE—Feed wire for electric clock on early cars connected to battery 'B' terminal on fuse block. Car manufacturer recommends that feed be connected to accessory 'X' terminal (see diagram).
HORNS:—Sparton—Twin air electric type operated by relay. 30 amp. fuse in case on dash.
Air Gap—.026-.030" high pitch (short horn), .032-.035" low pitch (long horn).
Horn Relay:—R-B-M Model 6004. On engine dash.
Contacts Close—3 volts min., 4 volts, max.
Open—2 volts min. (relay upright, terminals down).
CONVERTIBLE TOP CONTROL:—Hydro-electric type.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—Alligator type. Hood lock button located below instrument panel on left side.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing (Body No. only on plate on dash).

COMPRESSION:—**Ratio**—7.0-1 Std.

Pressure—110 lbs. at cranking speed of 100 RPM.

VACUUM READING:—18-20" steady idling at 6 MPH.

IGNITION:—**Ignition Coil Ford No. H-12024** (2 coil unit in single case—part of ignition unit assembly). Mounted on distributor at front of engine.

Ignition Current—Approximately 3.2 amperes idling, 4.2 amperes stopped, per coil. Ignition primary circuit resistance 1.0-1.33 ohms.

Resistor Unit—One resistor connected in each coil primary circuit (2 used). Part of Lighting Circuit Breaker Assembly No. 16H-11624.

Ignition Switch:—Oakes steering column and ignition lock assembly. NOTE—Steering post and ignition lock assembly No. (below) includes lock cylinder and keys.

	Steering Post & Ign. Lock Assem. Oakes No.	Ford No.	Ignition Switch Oakes No.	Ford No.
Zephyr①	302490..	16H-3675A	302440..	16H-3680
Zephyr②	302545..	16H-3675B	302440..	16H-3680
Continental	302516..	16H-3675C	302440..	16H-3680
Custom Sedan	302599..168H-	3675A	302440..	16H-3680
Custom Lim.	..302565..168H-	3675B	302440..	16H-3680

①—Standard Trim; ②—Custom Trim.

Lock Cylinder—Hurd. Ford No. 16H-3686A (Zephyr—Std. Trim), 16H-3686B (Zephyr—Custom Trim, Continental, Custom Sedan & Limousine). Includes keys.

Distributor Model No. H-12127 (less coils, distributor plates and caps). Double breaker, 6 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Timing). Same design as used on previous Lincoln-Zephyr models.

Firing Interval—Movable contacts open 37½° after fixed set with unequal intervals of 37½° and 22½° (75° & 45° crankshaft rotation) caused by 75° included angle between cylinder banks.

Breaker Gap—.014-.016" (both sets set alike).

Cam Angle or Dwell—36.5° closed, 23.5° open (each set—operate independently).

Breaker Arm Spring Tension—20-24 ozs.

Rotation—Clockwise viewed from drive end.

Condenser—No. H-12300 (2 used). Cap. .30-.34 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake inoperative)

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	300	4	600
3	375	6	750
4	480	8	960
6	720	12	1440
8	950	16	1900

Distributor Removal:—Mounted on front of engine. To remove, remove generator, disconnect vacuum line and primary leads, remove distributor caps, take out 3 capscrews in mounting flange.

FIRING ORDER:—1-4-9-8-5-2-11-10-3-6-7-12. See diagram for cylinder numbering and spark plug distributor connections.

SPARK PLUGS:—Champion Type H-10. 14 MM. Metric.

Spark Plug Gaps—Set at .030-.034".

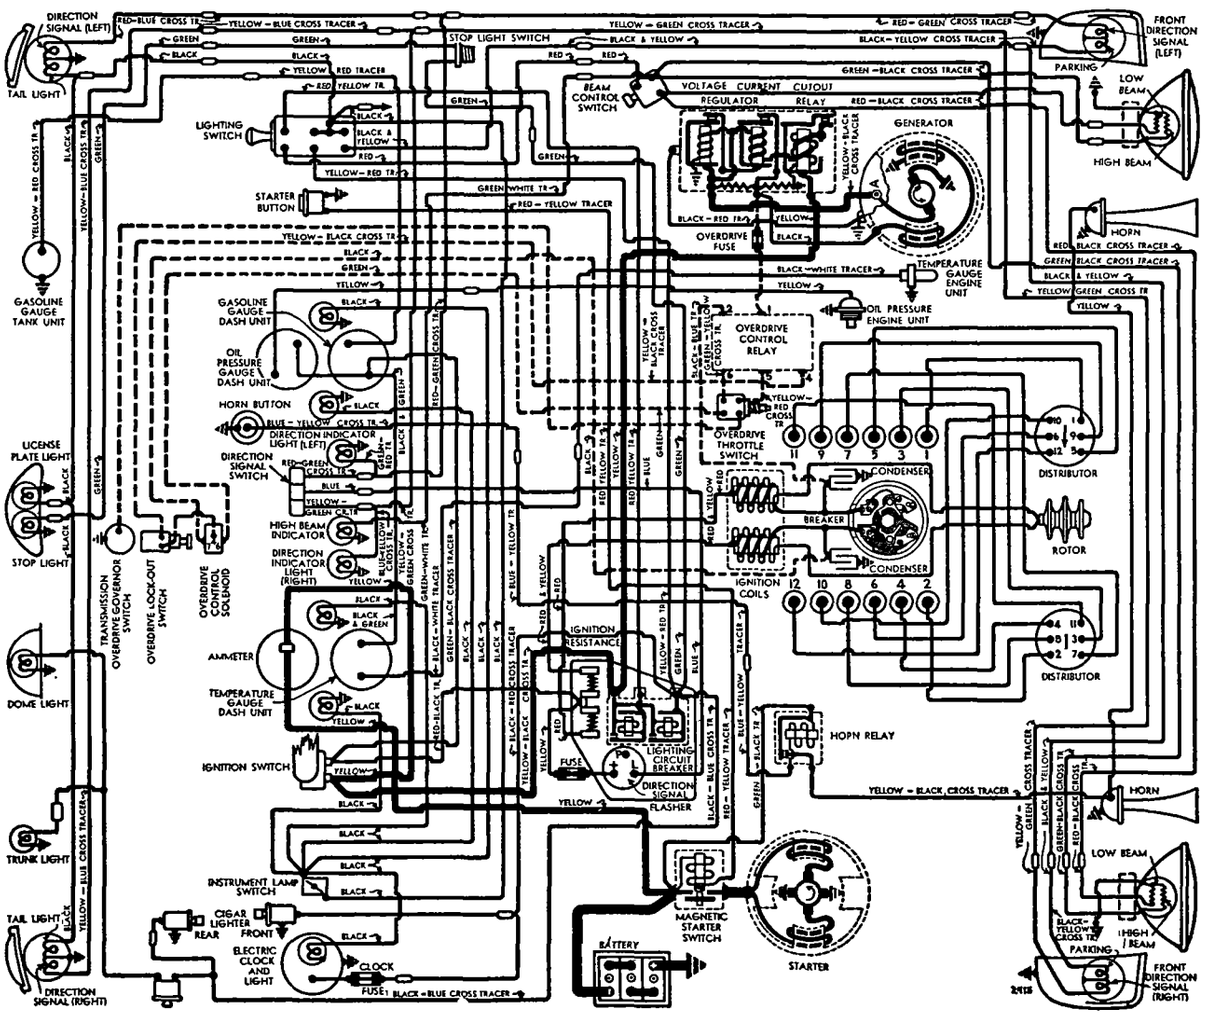
IGNITION TIMING:—See Vacuum Brake Setting below for correction dependent on fuel and operating conditions.

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

Timing & Synchronizing Note—Manufacturer recommends use of Stroboscope & Ford Test Set for this purpose. If V-126 Timing Fixture used, refer to 1937 Lincoln-Zephyr 'T&E' page for instructions. No flywheel marks or other means provided to synchronize distributor on engine.

Timing (On Engine)—With #2 piston on top dead center (starting power stroke), loosen adjusting screw on right side of ignition unit housing, move screw down to bottom of slot, then move screw up slowly until left hand (fixed contacts) begin to open, note graduation on plate under screw head in line with reference mark on housing, move screw up one additional graduation and tighten (this provides 4° BTDC. timing).

Synchronization (Movable Contacts)—No means provided for synchronization on engine (see note above). If Stroboscope, Timing Fixture, etc. used, set movable contacts to open exactly 37½° (distributor rotation) after fixed set. To adjust, remove timing adjusting screw and plate on side of housing, turn eccentric adjusting screw (visible in slot).



Vacuum Brake Setting:—Should be set for best performance with particular fuel and operating conditions. To adjust, loosen locknut and back off adjusting screw until engine pings when accelerated, then turn screw in just enough to eliminate this ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so that automatic advance is 2° (distr.) at 950 RPM. or 38 MPH. with no vacuum to release brake.

CARBURETION:—**Carburetor**—Chandler-Groves Model AA-1, Ford No. 06H-9510. Dual, downdraft type.

For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm, choke valve wide open and Fast Idle inoperative, set throttle lever stopscrew for 6 M.P.H. idle speed. Turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. Final setting should be approximately ⅞ turn out from the inner seated position. Re-adjust throttle stopscrew for correct idling speed of 6 MPH.

NOTE—Manufacturer recommends use of vacuum gauge for idling adjustment. Set for highest steady reading of gauge.

Float Level—Fuel level should be 19/32" plus or minus 1/32" (9/16-10/16") below top edge of bowl.
Accelerating Pump Adjustment—Three holes provided in throttle lever for pump link connection. Adjust for seasonal requirements as follows:
Inner (#1)—Min. stroke, Summer temperatures.
Center (#2)—Med. stroke, Winter temperatures.
Outer (#3)—Max. stroke, Extreme cold weather.
NOTE—Pump link locked in pump rod by snap lock. Pull link shaft out of pump rod to disengage lock.

Fast Idle:—Integral with carburetor. Operated by choke lever. No adjustment required.

Air Cleaner:—Ford No. 06H-9600-E (Zephyr), 06H-9600-D (Continental) oil-wetted type Std. No. 16H-9625 (Optl. Zephyr, Std. Custom 168H), 06H-9625-C (Optl. Continental) heavy duty oil-bath type.

Gasoline Gauge:—King-Seeley Electric. Ford No. 16H-9280 (Dash Unit—Zephyr & Custom 168H), 06H-9280-B (Dash Unit—Continental). No. 16H-9275 (Tank Unit—all models).
For complete data, refer to 1941 Carb. Equip. Index.

Fuel Pump:—AC Type R. Ford No. 68-9350. Diaphragm type. AC Replacement Exchange Pump No. 541.
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check. No flywheel marks provided. If dead center position for any cylinder established on flywheel, intake valve for this cylinder should open approximately 3.24 teeth before this point with piston .0389" before top dead center.

Tappet Clearance:—None (hydraulic type lifters). Wilcox-Rich 'Zero-Lash' type.
For complete data, refer to 1941 Mech. Equip. Index.

Valve Spring Pressure:—51-57 lbs. at 2.13" (valve closed), 111-121 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—40-45 lbs. at 2000 RPM.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 16H-9273 (Dash Unit—Zephyr & Custom 168H), 06H-9273-B (Dash Unit—Continental). No. 48-9278 (Engine Unit—all models).
For complete data, refer to 1941 Mech. Equip. Index.

COOLING SYSTEM:—Capacity—27 quarts.

Thermostat:—In outlet hose for each bank (2 used). Starts to open at 145° F. Fully open at 180° F.

Temperature Gauge:—King-Seeley Electric. Ford No. 16H-10883 (Dash Unit—Zephyr & Custom 168H), 06H-10883-B (Dash Unit—Continental). No. 99A-10884 (Engine Unit—all models).
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Gauge reads 'Hot' when turned off.

TRANSMISSION OVERDRIVE CONTROL:—New electric type (solenoid operated) with Governor Switch and accelerator pedal control. Direct drive 'kick-down' also controlled by accelerator pedal.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Ford No. 16H-6916.
Throttle 'Kick-down' Switch—Ford No. 16H-6918-A (Zephyr & Custom), 16H-6918-B (Continental). Adjust switch so that it closes when carburetor throttle valve is wide open.
Lock-out Switch—Ford No. 16H-6917. Mounted on Overdrive case.
Governor Switch—Ford No. 16H-6919.
Control Relay—Ford No. 16H-6915.

BATTERY:—Ford No. 06H-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.0 minutes.
Grounded Terminal—Positive (+) grounded to cylinder head stud of right hand bank.
Location—On right side in engine compartment.
Dimensions—Length 10.6". Width 7.3". Height 9.2".

STARTER:—Ford No. 18-11002. Armature No. 18-11005.
Drive—Inboard Bendix No. L11FX-10. Ford No. B-11350.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—2 lbs. each.
Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 01A-11450-A magnetic switch mounted on dash and controlled by pushbutton on instrument panel R-B-M 3234, Ford No. 16H-11500-C (Zephyr—Std. Trim), 3234-B, Ford No. 16H-11500-D (Zephyr—Custom Trim, All Continental & Custom).

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, remove through-bolts on commutator end plate.

GENERATOR:—Ford No. 01A-10000-B. Armature No. 01A-10005-A. Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.
Charging Rate Adjustment—No adjustment. See Regulator data below.
Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine, check output at 2 speeds given in performance table below. Restore original connections after completing test. **Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.**

Performance Data

Amperes	Engine R.P.M.
Start	400
32	1100
32	3000

Rotation—Counter-clockwise at commutator end.
Field Current—2.86 amperes at 6.0 volts (field resistance 2.1 ohms at 70° F.).
Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between stud, raise generator up until side movement on cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting belt midway between generator and water pump pulleys is 1" (thumb and finger pressure).

REGULATOR:—Ford No. 01A-10505-C4. Three-Unit type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case is grounded through braided wire 'pigtail' or separate ground wire extending from regulator to generator frame. This ground connection must be in place when regulator being operated or tested (disturbed by removal of regulator cover).

Cutout Relay
Cuts In—5.8-6.3 volts at operating temperature.
Cuts Out—8 ampere discharge current (maximum).

Voltage Regulator
Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Electrical Equipment Section for voltages at other temperatures.
Checking & Adjusting—*Refer to Electrical Equipment Index for article on 'Ford Regulator—3-unit Type' for complete instructions.*

Current Regulator
Setting—28 amperes at 7.0 volts hot—after engine run for 5 minutes (196-200 watts maximum for continuous operation).
Checking & Adjusting—See Voltage Regulator

LIGHTING:—Headlamps—Ford Sealed Beam Type. Controlled by Lighting Switch on instrument panel and Beam Selector Switch on toeboard.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.
Beam Indicator—Red jewel at top of instrument cluster (Zephyr & Custom), above clock (Continental) between Right & Left Direction Signal Indicators. Lighted whenever Upper Beams in use.
Direction Signal—Std. on all models (switch built in steering wheel).
For complete data refer to 1941 Elec. Equip. Index.

Switches
Lighting—R-B-M Model 2445, Ford No. 11A-11654 (Switch only). Light Switch Knob No. 16H-11661-C (all models).
Beam Selector—R-B-M Model 2486. Ford No. 16H-11653-A (Zephyr & Custom—with Horn wiring), 16H-11653-B (Continental—with Horn wiring). No. 16H-13532 (Switch only—all models).
Instrument—Ford No. 16H-13740-C (Zephyr with Std. Trim), 16H-13740-D (Zephyr with Custom Trim, all Continental & Custom).
Stop Light—Ford No. 11A-13480 (hydraulic type).
Direction Signal—Ford No. 16H-13335 (Switch Assembly).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Park & Frt. Direc. Signal	21-3	1154
Instrument, Clock	1.5	55
Beam & Direc. Sig. Indicators	1	51
Tail & Rear Direc. Signal	21-3	①
Stop	21	1129
Dome & Quarter	6	81
Rear License	3	63
Trunk (Luggage Comp't.)	6	81

①—No. 1154 (Zephyr & Custom), 1158 (Continental).

LIGHTING CIRCUIT BREAKER:—R-B-M Model 6740, Ford No. 16H-11624. Combined with Ignition Resistor (twin unit) on block on dash under cowl (Direction Signal Flasher also mounted on same block). Consists of two separate circuit breaker units (one unit protects headlight circuits, second unit protects other lighting circuits) of the thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

FUSES:—Overdrive—20 ampere. In relay lead.
Direction Signal—20 ampere. In Flasher lead.

HORNS:—Air electric type dual horns. Ford No. 06H-13832 (Right Hand—high note), 06H-13833 (Left Hand—low note). Horns operated by horn relay.
Horn Current—24-28 amperes (total).

Horn Relay:—R-B-M Model 4750, Ford No. 96H-13842.
Contact Closing Voltage—3.5-4.5 volts.
Current Draw—Approximately ¾ ampere.

ENGINE HOOD NOTE:—Hood is Alligator Type with release knob under instrument panel to left of steering column. To raise hood, pull out on release knob (hood will raise slightly), press in on safety catch under front edge of hood, lift hood up.

SERIAL & ENGINE NUMBER:—Stamped on top of clutch housing and on left frame side member near generator.

COMPRESSION:—**Ratio**—6.3-1 Std. Cast iron hd.
Pressure—100 lbs. at cranking speed of 100 RPM.

VACUUM READING:—Steady 18-20" at 5-7 MPH.

IGNITION:—**Coil Model 78-12024-A** (part of ignition unit assembly). Mounted on top of distributor.
Resistor Unit—Connected in coil primary circuit. Mounted on Circuit Breaker Assembly No. 11A-12250.
Ignition Current—4½-6 amperes (engine stopped). Ignition primary circuit resistance 1-1⅓ ohms.
Ignition Switch:—Oakes Steering Column & Ignition Lock Assembly No. 302370 (First Cars), 302595 (After approx. Nov. 15, '40); Ford No. 19A-3676A (First), 19A-3676B (Later). Ignition Switch Oakes No. 302513 (First), 302606 (Later). NOTE—These switches same except for color of enamel on switch body.
Lock Cylinder—Hurd or Briggs & Stratton #80935. Ford No. 19A-3686A (With Keys).
Key Series—FK000 to FK999. **Groove**—No. 17.
Distributor Model 78-12127. (Less coil, distributor caps, and distributor plates). Double breaker, 8 lobe cam, full automatic advance type with Vacuum Brake Control (see Ignition Timing for adjustment). Same design as used on preceding V8 models.
Breaker Gap—.014-.016" (both sets). Use special two step feeler—.014" step 'go', .016" step 'no go'.
Cam Angle—36° closed, 9° open. For both sets operating together with correct coil-loading lead.
Breaker Arm Spring Tension—20-24 ozs.
Rotation—Clockwise viewed from drive end.
Condenser—No. 78-12300. Capacity .33-.36 mfd.

Automatic Advance
(High Vacuum or Vacuum Brake Inoperative)

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	200	0	400
2	325	4	650
3	425	6	850
5	825	10	1650
8	1500	16	3000

Removal:—Ignition unit mounted on front of engine. To remove, disconnect vacuum line, take off caps, take out screws in mounting flange.

FIRING ORDER:—1-5-4-8-6-3-7-2. See diagram for cylinder numbering order.

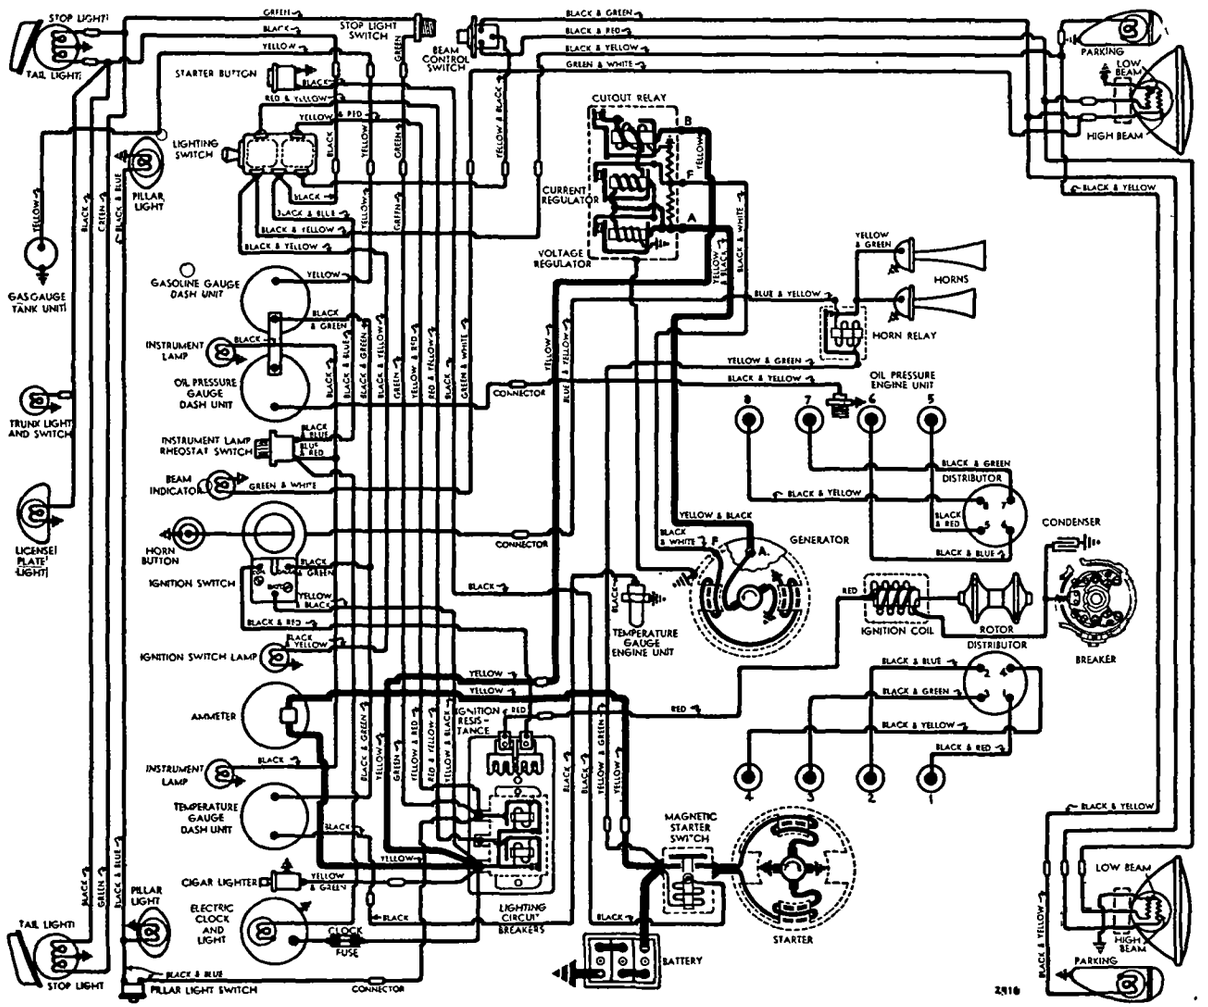
SPARK PLUGS:—Champion H-10. 14 MM. Metric.
Spark Plug Gaps—Set at .030-.034".

IGNITION TIMING:—For each engine as follows (see Vacuum Brake Setting below for adjustment depending on type of service and fuel used).

	Flywheel Degrees	Piston Position
All Engines	4° BTDC	.0058" BTDC.

Timing Note—Manufacturer recommends use of Laboratory Test Set with Stroboscope attachment or V-126 Timing Fixture for all ignition settings.

Timing (On Engine)—No flywheel marks provided and timing should be set with piston on top dead center. With #1 piston on top dead center entering power stroke, loosen timing adjusting screw on left hand side of ignition unit housing, place screw in retard position at lower end of slot, move screw slowly up until timing contacts begin to open, note graduation on plate under screw head which is in line with reference mark on housing, move screw up exactly one additional graduation, tighten screw. NOTE—Dead center position can be determined by inserting gauge rod in cylinder or by measuring to tops of #2 and #3 pistons (should be equal).



Vacuum Brake Setting:—Should be adjusted to eliminate pinging when engine operated with load. To adjust, loosen locknut, back off adjusting screw until engine pings with load, turn screw in just enough to eliminate ping, tighten locknut. When adjusted on Stroboscope, vacuum brake should retard spark so that automatic advance is 2° (distr.) at 950 R.P.M. or 38 M.P.H. with no vacuum.

CARBURETION:—**Carburetor**—Chandler-Groves Model AA-1, Ford No. 91A-9510-A. Dual, downdraft type.
For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm, choke valve wide open, and Fast Idle inoperative, set throttle lever stopscrew for 5-7 MPH. idling speed, turn each idle adjusting screw (one for each barrel, adjust in succession) in until engine begins to miss, then out until engine begins to roll, finally turn screw in until engine fires smoothly. Final setting should be approximately ⅝-¾ turn of screw from inner seated position. Readjust stopscrew for correct idling speed of 5-7 MPH.

NOTE—Vacuum gauge recommended for idling adjustment. Set for highest steady gauge reading.

Float Level—Fuel level 11/16" plus or minus 1/32" (21/32-23/32") below top edge of bowl. ***See Carburetor article (refer to Carburetor Index) for float level data and checking directions.***

Accelerating Pump Setting—Three holes provided for pump link connection as follows:

Inner (#1)—Min. stroke, Summer Temperatures.

Center (#2)—Med. stroke, Winter Temperatures.

Outer (#3)—Max. stroke, Extreme Cold Weather.

NOTE—Link locked in pump rod by snap-lock. Pull link shaft out of pump rod to disengage this lock.

Fast Idle:—Integral with carburetor. Operated by choke valve lever. No adjustment required.

Air Cleaner:—Ford No. 19A-9600-A oil-wetted type Std. Heavy Duty oil-bath type Optl.

Gasoline Gauge:—King-Seeley Electric. Ford No. 19A-9280 (Dash Unit), No. 99A-9275-B (Tank Unit).

For complete data, refer to 1941 Carb. Equip. Index.

Fuel Pump:—AC Type R. Ford No. 68-9350. Diaphragm type. AC Replacement Exchange Pump No. 541.

For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check Timing. No flywheel marks or other means provided to check timing. If dead center position for piston #1 is established on flywheel, intake opening for this cylinder should occur with piston on top dead center and flywheel mark at dead center point.

Tappet Clearance:—.0125-.0135" all valves. Not adj.

Valve Spring Pressure:—37-40 lbs. at 2.13" (valve closed), 76-80 lbs. at 1.84" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.

Normal Oil Pressure—30 lbs. at 2000 RPM.

Oil Pressure Gauge:—King-Seeley Electric. Ford No. 19A-9273 (Dash Unit), No. 48-9278 (Engine Unit).

For complete data, refer to 1941 Mech. Equip. Index.

COOLING SYSTEM:—Capacity—25½ quarts.

Thermostat:—In each cylinder head outlet (2 used). Starts to open at 145° F. Fully open at 180° F.

Temperature Gauge:—King-Seeley Electric. Ford No. 19A-10883 (Dash Unit), No. 99A-10884 (Eng. Unit).

For complete data, refer to 1941 Mech. Equip. Index.

NOTE—Gauge reads 212 (Hot) with ignition off.

BATTERY:—Ford No. 01A-10655-A. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).

Starting Capacity—150 amperes for 20 minutes.

Zero Capacity—300 amperes for 4.0 minutes.

Grounded Terminal—Positive (+) grounded to dash.

Engine Ground—Strap connector between right rear cylinder head and dash.

Dimensions—Length 10.6". Width 7.3". Height 9.2".

Location—On right side in engine compartment.

STARTER:—Ford No. 18-11002. Armature No. 18-11005.

Drive—Inboard Bendix No. L11FX-10. Ford No. B-11350.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—2 lbs. each.

Cranking Engine—100 RPM., 190-215 amperes.

Performance Data

Torque	R.P.M.	Volts	Amperes
4 ft. lbs.	1070	4.6	200
8 "	660	4.3	340
12 "	300	3.65	465
14 "	Lock	3.5	500

Starting Switch:—R-B-M Model 5604, Ford No. 01A-11450A. Magnetic Switch mounted on dash and controlled by pushbutton on instrument panel R-B-M No. 3232, Ford No. 19A-11500.

Removal:—Starter mounted on right front face of flywheel housing. To remove, take off pan at right of engine, free starter-to-oil pan support bracket, take out through-bolts on commutator end plate.

GENERATOR:—Ford No. 01A-10000-B. Armature No. 01A-10005-A. Two brush (shunt) type with vibrating type voltage and current regulation. Ventilated by fan on drive pulley.

Charging Rate Adjustment—No adjustment. See Regulator data below.

Maximum Charging Rate—Controlled by regulator and dependent on battery condition and load. To check generator output, disconnect generator field lead at generator, connect both generator terminals together (use short insulated wire). Use 'BRS' set or rheostat connected across battery terminals and apply load until voltage is exactly 6 volts. Connect ammeter in charging line, run engine, check output at 2 speeds given in performance table below. Restore original connections after completing test.

Do not operate generator in service with both terminals connected together. This eliminates all regulator action and will damage generator.

Performance Data

Amperes	Engine R.P.M.
Start	400
32	1100
32	3000

Rotation—Counter-clockwise at commutator end.

Field Current—2.86 amperes at 6.0 volts (field resistance 2.1 ohms at 70° F.).

Brush Spring Tension—Approximately 28 ozs.

Removal:—Generator mounted on bracket between cylinder banks at front of engine, driven in tandem with water pumps by Vee belt. To remove, loosen nut on bracket stud.

Belt Adjustment:—Loosen nut on bracket mounting stud, raise generator up until side movement on belt midway between generator and water pump pulleys is 1" (thumb and finger pressure).

REGULATOR:—Ford No. 01A-10505-C. Three-Unit Type. Consists of Cutout Relay, vibrating Voltage Regulator and vibrating Current Regulator (separate units) in single case on engine side of dash.

For complete data, refer to 1941 Elec. Equip. Index.

NOTE—Regulator case is grounded through braided wire 'pigtail' or separate ground wire extending from regulator to generator frame. This ground connection must be in place when regulator being operated or tested (disturbed by removal of regulator cover).

Cutout Relay

Cuts In—5.8-6.3 volts at operating temperature.

Cuts Out—8 ampere discharge current (maximum).

Voltage Regulator

Setting—6.9-7.2 volts at 70-80° F. See Ford Regulator article in Electrical Equipment Section for voltages at other temperatures.

Checking & Adjusting—***Refer to Electrical Equipment Index for article on 'Ford Regulator—3-unit Type' for complete instructions.***

Current Regulator

Setting—28 amperes at 7.0 volts hot—after engine run for 5 minutes (196-200 watts maximum for continuous operation).

Checking & Adjusting—See Voltage Regulator (above).

LIGHTING:—Headlamps—Ford Sealed Beam Type. Controlled by Lighting Switch on instrument panel and Beam Selector Switch on toeboard.

For complete data, refer to 1941 Elec. Equip. Index.

Headlamp Adjustment—Aim upper beam of each headlamp straight ahead with hot spot centered on horizontal line 3" below lamp center height.

Beam Indicator—Red jewel on instrument panel directly above speedometer dial lighted whenever upper beams in use.

Switches

Lighting—R-B-M Model 2445, Ford No. 11A-11653 (with wiring). Light Switch Knob and Insert Ford No. 19A-11661.

Beam Selector—R-B-M Model 2487, Ford No. 81A-13532.

Instrument—Ford No. 19A-13740.

Stop Light—Ford No. 11A-13480.

Bulb Specifications

Rear License	3	63

LIGHTING CIRCUIT BREAKER:—Ford No. 11A-12250. Combined with Ignition Resistor on block on dash under cowl. Consists of two separate circuit breaker units (one unit protects headlight circuits, second unit protects other lighting circuits) of the thermostatic and wound-coil type. Contacts open with current of 50 amperes and vibrate rapidly to control current.

HORNS:—Air Electric type dual horns. Ford No. 91A-13832 (High Note), 91A-13833 (Low Note). Horns operated by relay.

Horn Current—24-28 amperes (total).

Horn Relay:—R-B-M No. 50357, Ford No. 11A-13842B.

Contact Closing Voltage—3.5-4.5 volts.

Current Draw—Approximately ¾ ampere.

HOOD LOCK:—Alligator type. Hood lock handle located under left side of instrument panel. To raise hood, pull out on control handle (hood will raise slightly), reach under front edge of hood and press up on safety catch tab to free hood, lift hood up.

SERIAL NUMBER:—First No. K-5001. On plate on right side of cowl under engine hood.

Service Serial No. Note—Stamped on plate on left front door hinge pillar. First No. N4-5001.

ENGINE NUMBER:—Stamped on left side of engine block at front end. First No. 5001 (same as Serial #).

COMPRESSION:—**Ratio**—6.7-1 Std.

Pressure—120 lbs. at 350 RPM. cranking speed.

VACUUM READING:—Steady 18-20" idling at 6 MPH.

IGNITION:—**Delco-Remy Coil 1115028.** On dash.

Ignition Current—2 amperes idling, 5 stopped.

Ignition Switch:—Delco-Remy No. 1116310. Connected to ignition coil by armored cable.

Ignition Lock—Briggs & Stratton No. 45792.

Key Series—N-1201 to N-1449. Groove—No. 15.

Distributor Delco-Remy No. 1110512. Single breaker, 6 lobe cam, full automatic advance type with separate vacuum spark control and Octane Selector adjustment.

Breaker Gap—.020". Limits .018-.024".

Cam Angle or Dwell—35° closed, 25° open.

Breaker Arm Spring Tension—17-21 ozs.

Rotation—Counter-clockwise viewed from above.

Condenser—Part No. 1869705. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	2	800
10	1200	20	2400

Vacuum Spark Control No. 1116029. Mounted on distributor mounting plate and linked to advance arm. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Plunger Travel—23/64" (total).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3-5"
8½°	17°	14-17"

Removal:—Distributor mounted on left side of engine and driven by inclined shaft. To remove, loosen advance arm clamp bolt or disconnect vacuum line and take out hold-down screw in advance arm.

Installation Note—When installing distributor, crank engine to firing position for #1 cylinder (piston at TDC), see that oil pump drive gear meshed so that slot in shaft points across engine with wide half of shaft toward front (slot is offset), turn rotor to #1 segment in distributor cap, install distributor and check timing.

FIRING ORDER:—1-5-3-6-2-4. See diagram.

SPARK PLUGS:—Auto-Lite AN-7. 14 MM. Metric.

Spark Plug Gaps—.025".

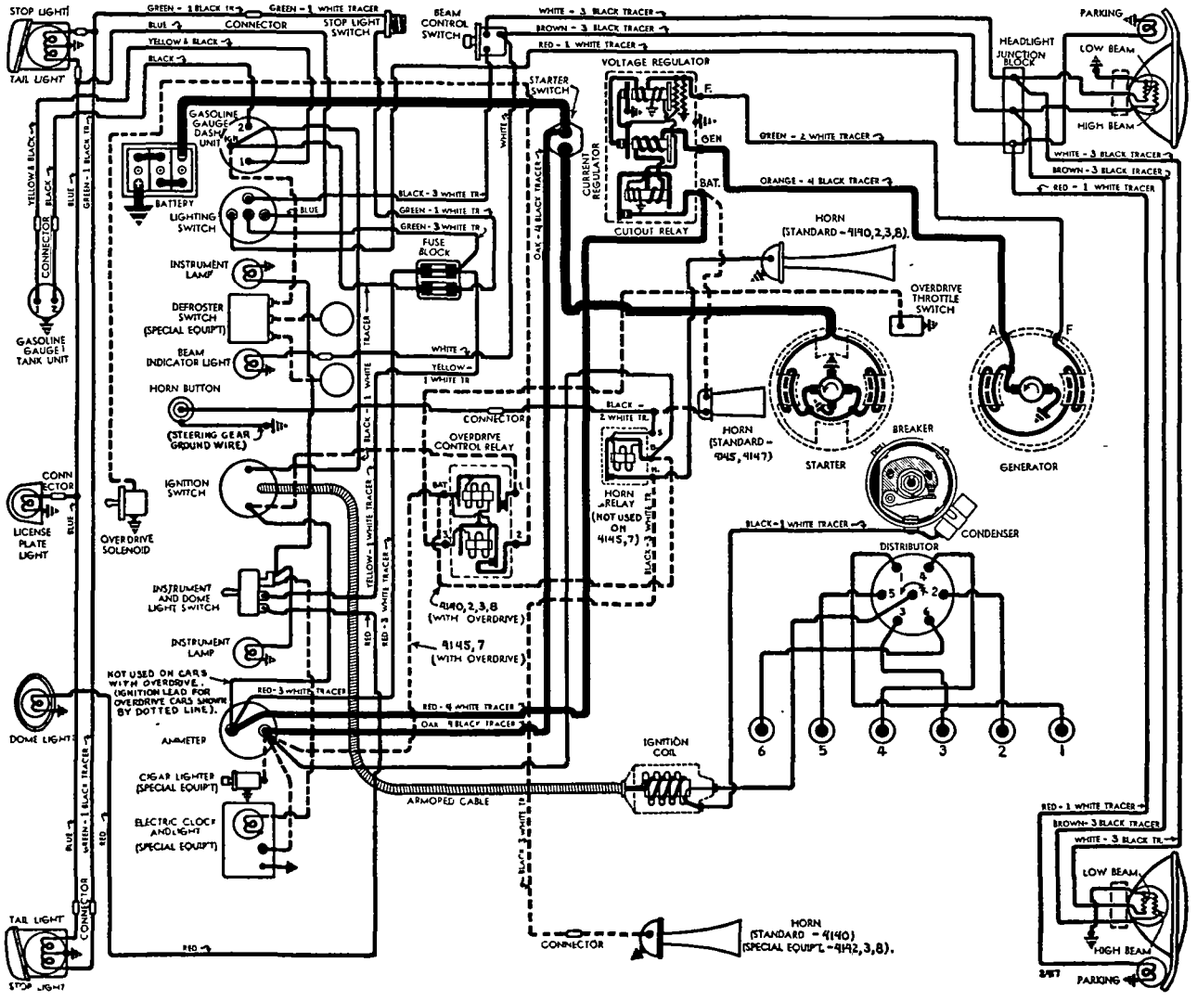
IGNITION TIMING:—**Flywheel Degrees Piston Position**
All Engines .....At TDC.....000" TDC.

Timing Note—Vacuum advance must be latched out by aligning holes in advance arm and hold-down plate and inserting ⅛" pin through these holes while timing is being set.

To Set Timing—Turn engine over until #1 piston reaches top dead center on compression stroke with 'IGN/DC' mark on vibration dampener in line with pointer on chain case cover. Latch out vacuum control (see note above), loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor at #1 segment in distributor cap, check Octane Selector setting.

Octane Selector Setting—Should be set for slight ping when accelerating with wide open throttle at speeds between 10-15 MPH. To adjust, loosen hold-down screw, rotate distributor one graduation at a time counter-clockwise (if ping too severe), clockwise (if no ping noted) until correct performance secured.

CARBURETION:—**Carburetor**—Carter (B & B) Model 513-S, 1¼" downdraft type with manual choke control.



For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and choke valve wide open, set throttle stopscrew for 6 MPH. idle speed. Adjust idle adjusting screw for smooth idle (screw ½-1¼ turns open from inner seated position—turn screw in for leaner mixture), recheck idle speed.

Accelerating Pump Setting—Throttle lever has 3 holes for pump rod link engagement as follows:
Inner (Min. stroke)—Hot Summer weather.
Center (Med. stroke)—Normal temperatures.
Outer (Max. stroke)—Cold Winter weather.

Float Level—Top of float (not soldered seam) 5/64" (plus or minus 1/64") below top edge of bowl with valve seated.

Metering Jet—***See Carter (B&B) Jet Table in Carburetor Section for complete data.***

Fast Idle:—No adjustment provided (linked to choke valve so throttle opened to fast idle position when choke valve closed).

Air Cleaner:—AC No. 1542037 oil-wetted type Std. Heavy duty oil-bath type Optl.

Fuel Pump:—AC Type W (Std.), Type AJ Fuel-&-Vacuum Pump (Cars with Overdrive). Pump Exchange Part No. 532.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite Electric type. No. NG-9645D (Dash Unit), No. NG-9637T (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check—With .015" tappet clearance, #1 intake valve opens 19° BTDC. with 'DC' mark on vibration dampener at front of engine 1 3/16" ahead of pointer on chain case cover. #1 exhaust valve closes 23° ATDC. with 'DC' mark 1 15/16" past the pointer.

Tappet Clearance:—.015" all valves. Engine Hot. NOTE—May be set at .018" max. for sustained high speed driving.

Valve Spring Pressure:—80 lbs. at 1 7/16".

LUBRICATION:—Crankcase Capacity—5 qts.
Normal Oil Pressure—25-30 lbs. at 25 MPH.

COOLING SYSTEM:—Capacity—14 qts. (1 qt. additional for heater).

Thermostat:—Fulton or Dole. In water outlet elbow on cylinder head.
Setting—Starts to open at 160°F.

Temperature Gauge:—Auto-Lite H-9706 (not elec.).

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' or automatic overtake.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118004.
Throttle Switch—Adjust switch position on mounting bracket so that contacts close with throttle valve wide open and spring on carburetor throttle valve pulley just starting to compress.
Control Relay—Delco-Remy Model 1116798.

BATTERY:—Auto-Lite CTL-1-13. 6 volt, 13 plate, 90 Ampere Hour capacity (20 hour rate).
Zero Capacity—300 amperes for 3.0 minutes.
Grounded Terminal—Positive (+) terminal to body.
Engine Ground—Separate strap connector to body.
Location—Under left front seat.

STARTER:—Delco-Remy 1109451. Armature No. 1882547.
Drive—Inboard Barrel Type Bendix No. A-2033.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	6000	5.7	60
11.5 "	Lock	3.3	540

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—Mounted on toeboard and operated by clutch pedal when clutch fully disengaged.

GENERATOR:—Delco-Remy 1102684. Armature 1882588. Two brush (shunt) type with Current-voltage control.
Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator and maximum output controlled by Current Regulator. See Regulator data.
Maximum Charging Rate—32-34 amperes, 8 volts, not. Actual charging rate controlled by voltage regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

①Not maximum output. See Current Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ozs. each.
Field Current—1.67-1.82 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive (water pump driven by extension of generator shaft). To remove, disconnect water pump, loosen fan belt, remove generator clamp band, lift generator out.
Belt Adjustment:—Adjust whenever belt deflection exceeds 1½" (light pressure midway between fan and generator pulley). To adjust, loosen fan mounting bracket capscrews, raise fan (pivots on one screw, other screw hole slotted) until belt deflection is ¾", tighten screws.

REGULATOR:—Delco-Remy 1118202. Single Core Type. Vibrating Current & Voltage Regulator on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Regulator over-compensated for temperature. Should be checked with cover in place and hot.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for adjustment directions for the other (second) spring.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—In center of speedometer dial. Lighted when Country (upper) beams in use.

Switches

Lighting—Douglas. Nash No. 3107032.
Beam Selector—Douglas.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking	3	63
Instrument, Clock	1½	55
Beam Indicator	1½	55
Stop & Tail	21-3	1158
Rear License	3	63
Dome	6	81

FUSES:—Lighting—30 ampere. On fuse block on left hand front face of dash.
Accessory—30 ampere. On fuse block.

HORNS:—Delco-Remy. No. 1999917 (Spec. 4145, 7), No. 1999565 (Deluxe 4142, 3, 8), No. 1999565 Low Note & 1999566 High Note Twin Horns (Deluxe Torpedo 4140). Deluxe Single Horn & Torpedo Deluxe Twin Horns operated by horn relay.
Deluxe 4142, 3, 8 Note—No. 1999566 High Note Horn Optl. with Std. 1999565 Low Note Horn as twin horn, blended tone equipment (Relay is Std.).

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047-.052"
1999566 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HOOD LOCK:—Alligator type hood. Lock button below instrument panel on left side. To raise hood, pull out on lock control button (hood will raise slightly), reach under front edge of hood and press up on safety catch tab to release safety catch, raise hood up.

SERIAL NUMBER:—First number R-353001. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number N6-45001. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number R-353001. Stamped on right side of engine block at front.

COMPRESSION:—**Ratio**—6.3-1 std. cast-iron head.
Pressure—125 lbs. at cranking speed of 350 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—**Coil Model CE-4025A (2 used).** Coils are mounted on right side of engine.
Ignition Current—2 amperes idling, 5 amperes stopped for each coil (2 used).
Ignition Switch:—Oakes Steering Column and Ignition Lock No. 302382. Ignition Switch No. 302440.
Ignition Lock—Briggs & Stratton. B & S No. 85347.
Key Series—5 digits. **Groove**—No. 1.
Distributor Auto-Lite IGE-4024. 'Twin Ignition' double breaker, 6 lobe cam, full automatic advance type with Torquematic Spark Control. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant and must be synchronized (see Ignition Timing). NOTE—Distributor rotation reversed from previous models).
Breaker Gap—Set at .020".
Cam Angle or Dwell—35° closed, 25° open (distr.). For each set of contacts (operate independently).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above. NOTE—Rotation reversed from previous models.
Condenser—No. IG-2671 (2 used). Cap. .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	275	0	550
3	370	6	740
7	500	14	1000
9	665	18	1330
11.5	875	23	1750

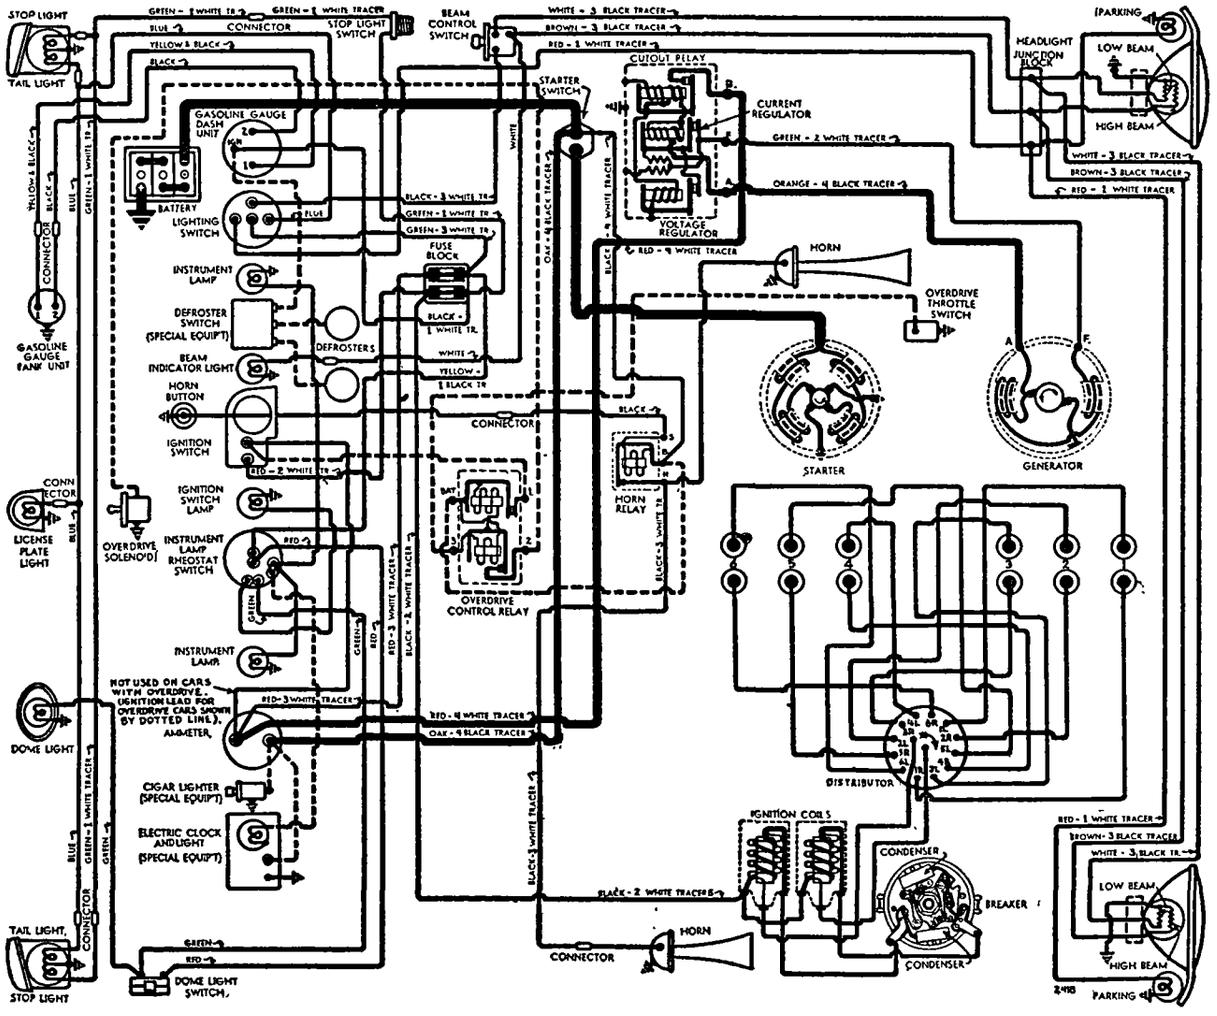
Torquematic Spark Control—Consists of cable anchored at dash and connected to distributor body by a travel limiting spring. Retards distributor through engine movement caused by torque action. Maximum retard 2½° (engine movement in excess of 2½° taken up by travel limiting spring). See Ignition Timing for setting.
Removal:—Mounted on right side of engine. To remove, take out hold-down screw in advance arm, disconnect torquematic control, lift distributor off.

FIRING ORDER:—1-5-3-6-2-4. See diagram for spark plug cable connections on distributor cap. NOTE—Rotation now clockwise (reversed from previous models).

SPARK PLUGS:—AC No. 45. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
6° BTDC	.0150" BTDC



To Set Timing—Car manufacturer recommends use of Nash Timing Light SE-569. Synchronize breaker points (see Synchronization following). With Timing Light connected as for Synchronization (see below), slacken torquematic cable by loosening locknuts on anchor bracket at dash. With #1 piston on compression, turn engine over until piston is 6° or .0150" BTDC, stop when 'IGN' mark on vibration dampener lines up with pointer on chain case cover (this mark is 6° or 23/64" before top dead center mark 'DC'). Loosen advance arm clamp bolt, rotate distributor until points just break (lights go on) with stop pin (hold-down bolt and nut) in advance position in slot in advance arm, tighten clamp bolt. Adjust cable locknuts at anchor bracket on dash to leave torquematic cable without slack or tension and stop pin in advance position in slot.

Synchronization—Use Nash Timing Light SE-569 (consists of two lights—one for each set of contacts) connected between each primary terminal and ground. Turn on ignition, turn engine over until fixed points just open (light for stationary contacts on). If both lights go on, synchronization correct. If not, loosen 3 lockscrews on movable subplate, shift plate by prying with screwdriver in notch on edge of plate until this set of contacts begin to open (both lights on), tighten sub-plate lockscrews, and set Ignition Timing as directed above. If other methods used, set contacts to open simultaneously at 60° (distributor) intervals.

Torquematic Spark Control Check—Distributor must be free in bracket and cable pulleys positioned to prevent cable interference with engine. Advance spring and cable take-up spring must be properly located and spring resistance centralized. Car manufacturer recommends use of Nash Synchro Light SE-417 to check torquematic retard by means of dead center mark on vibration dampener.

CARBURETION:—**Carburetor**—Carter Type WA-1, Model 435-S (#253 cast on face of flange). Single barrel, 1¼" downdraft type.
For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (¾-1½ turns open—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—Pump arm under dust cover at top of carburetor has three holes for pump link engagement. Set as follows:
Upper Hole (max. stroke)—Cold weather.
Lower Hole (med. stroke)—Moderate weather.
Inner Hole (min. stroke)—Hot weather.
Float Level—⅜" from projection on cover to top of soldered seam at front end of float with needle valve seated (invert to check).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust by bending connecting link offset for ⅝" choke valve opening with stopscrew against (not on) first step of fast idle cam.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—1 Notch Rich (supersedes setting of 2 Notches Rich originally specified for this model).

Air Cleaner:—AC #1529112 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type W (Std.), Type AD Fuel-&-Vacuum Pump (Cars with Overdrive). Pump Exchange Part No. 533.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric. No. NG-9645D (dash unit), No. NG-9637T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check—With regular running tappet clearance of .015", #1 intake valve opens 11.6° after top dead center with 'DC' mark on front flywheel 23/32" past the pointer on the chain case cover.

Valve Spring Pressure:—Total for inner and outer springs 59 lbs. (closed), 146 lbs. (open). See 'M' page for specifications on each spring.

Tappet Clearance:—.015" all valves (see Adjustment Note following) with engine hot and idling (may be set .018" max. for sustained high speed driving). ADJUSTMENT NOTE—Due to redesigned cylinder head and increased angle of engine, a new oil plug (in drilled passage in cylinder head between lead from oil filter and lead to rocker arm shafts) is used and must be removed if valves adjusted with engine running (cutting off oil supply to rocker arm shafts). IMPORTANT—Replace plug after adjusting valves to provide proper lubrication for overhead mechanism after cover installed (if plug not replaced overhead valve mechanism will not be lubricated, oil will be by-passed in head).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—25-30 lbs. at 25 MPH and above with warm oil. NOTE—Gauge not electric.

COOLING SYSTEM:—Capacity 17 qts. (18 with heater).
Thermostat:—Fulton or Dole. In water outlet elbow on cylinder head.
Setting—Starts to open 160°F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. A-L No. H-9644.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' or Automatic Overtake.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118004.
Throttle Switch—Adjust switch position on mounting bracket so that contacts close with throttle valve wide open and spring on carburetor throttle valve pulley just starting to compress.
Control Relay—Delco-Remy Model 1116798.

BATTERY:—Auto-Lite Type CTL-1-15. 6 volt, 15 plate, 105 ampere hour capacity (20 hour rate).
Starting Capacity—133 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes.
Grounded Terminal—Positive (+) grounded to body. Separate body to engine ground strap used.
Dimensions—Length & Height 9 1/16". Width 7⅛".
Location—Under front seat.

STARTER:—Auto-Lite MAB-4076. Armature MAB-2057.
Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM, 150-160 amps., 5.2 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
0.6 " "	1910	5.5	100
3.4 " "	1100	5.0	200
6.6 " "	695	4.5	300
10.15 " "	420	4.0	400
15.8 " "	Lock	3.0	582
22.5 " "	Lock	4.0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—A-L #SW-4012. Mounted on body floor below clutch pedal. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR:—Auto-Lite GDZ-4806A. Armature GDZ-2079F. 2 brush type with Current-Voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1900 RPM (generator) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band and lift generator off.

Belt Adjustment:—Adjust whenever belt deflection is over 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) for ¾" belt deflection, tighten screws.

REGULATOR:—Auto-Lite VRP-4004F. Current-Voltage type. In case on left side of engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—In center of speedometer dial. Lighted whenever Country (upper) beams in use.

Switches

Lighting—Douglas. Nash No. 3107032.
Beam Selector—Douglas.
Instrument—Douglas.

FUSES:—Lighting—30 ampere. On fuse block mounted on left hand side of engine dash.
Accessory—30 ampere. On fuse block.

HORNS:—Delco-Remy. No. 1999565 (left horn—low note), No. 1999566 (right horn—high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047-.052"
1999566 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HOOD LOCK:—Alligator type hood. Lock button below instrument panel on left side. To raise hood, pull out on lock control button (hood will raise slightly), reach under front edge of hood and press up on safety catch tab to release safety catch, raise hood up.

SERIAL NUMBER:—First number B-110001. Stamped on plate on right frame side member under hood.

SERVICE SERIAL NUMBER:—First number N8-17001. On 'Caution Plate' on left front door hinge post.

ENGINE NUMBER:—First number B-110001. Stamped on right side of engine block at front.

COMPRESSION:—**Ratio**—6 3-1 std. cast-iron head. **Pressure**—110 lbs. at cranking speed of 350 RPM.

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—**Coil Model CE-4025A (2 used).** Coils are mounted on right side of engine.
Ignition Current—2 amperes idling, 5 amperes stopped for each coil (2 used).
Ignition Switch:—Oakes Steering Column and Ignition Lock No. 302382. Ignition Switch No 302440.
Ignition Lock—Briggs & Stratton. B & S No. 85347. **Key Series**—5 digits. **Groove**—No. 1.
Distributor Auto-Lite IGK-4102. 'Twin Ignition' double breaker, 8 lobe cam, full automatic advance type with Torquematic Spark Control. Contacts open simultaneously to fire both spark plugs in each cylinder at the same instant and must be synchronized (see Ignition Timing).
Breaker Gap—Set at .017" (alike for both sets).
Cam Angle or Dwell—28° closed, 17° open (distr.). For each set of contacts (operate independently).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IG-2671 (2 used). Cap. .20-.25 mfd.

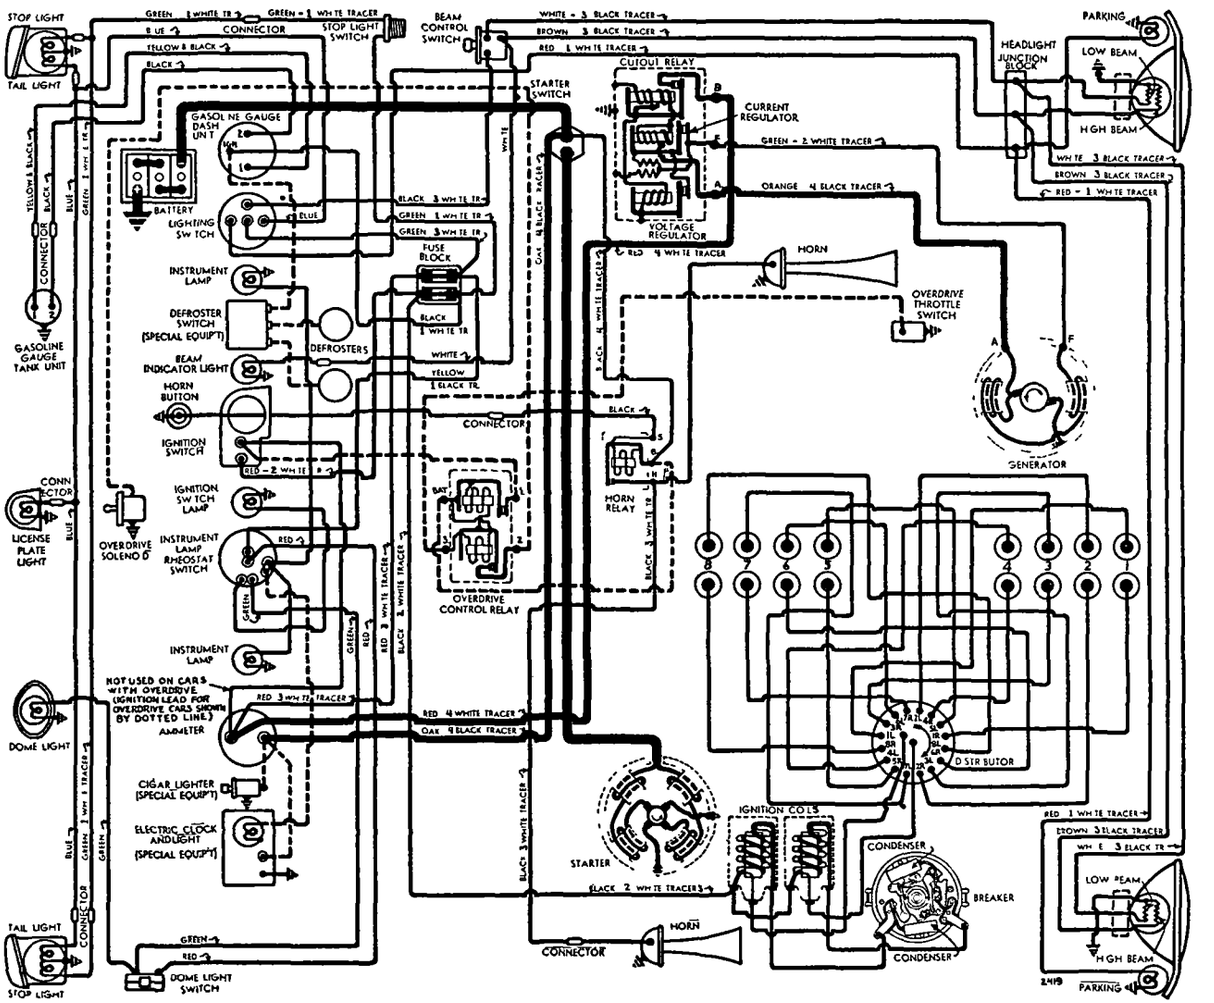
Automatic Advance

Distributor		Engine	
Degrees	R.P.M.	Degrees	R.P.M.
Start	275	0	550
4	400	8	800
6	575	12	1150
9	840	18	1680
12	1100	24	2200

Torquematic Spark Control—Consists of cable anchored at dash and connected to distributor body by a travel limiting spring. Retards distributor through engine movement caused by torque action. Maximum retard 2½° (engine movement in excess of 2½° taken up by travel limiting spring). See Ignition Timing for setting.
Removal:—Mounted on right side of engine. To remove, take out hold-down screw in advance arm, disconnect torquematic control, lift distributor off.
Installation Note—When installing distributor, crank engine to firing position for #1 cylinder (piston 9° BTDC), see that oil pump and distributor drive gear meshed with camshaft gear so that oil pump drive pin (at lower end of distributor drive shaft) is crossways of the engine.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram for spark plug cable connections on distributor cap.

SPARK PLUGS:—AC No. 45. 14 MM. Metric.
Spark Plug Gaps—Set at .025".



IGNITION TIMING:—Setting for all engines as follows:

Flywheel Degrees	Piston Position
9° BTDC	.0325" BTDC

To Set Timing—Car manufacturer recommends use of Nash Timing Light SE-569. Synchronize breaker points (see Synchronization following). With Timing Light connected as for Synchronization (see below), slacken torquematic cable by loosening locknuts on anchor bracket at dash. With #1 piston on compression, turn engine over until piston is 9° or .0325" BTDC, stop when 'IGN' mark on vibration dampener lines up with pointer on chain case cover (this mark is 9° or .725" before top dead center mark 'DC'). Loosen advance arm clamp bolt, rotate distributor until points just break (lights go on) with stop pin (hold-down bolt and nut) in advance position in slot in advance arm, tighten clamp bolt. Adjust cable locknuts at anchor bracket on dash to leave torquematic cable without slack or tension and stop pin in advance position in slot.

Synchronization—Use Nash Timing Light SE-569 (consists of two lights—one for each set of contacts) connected between each primary terminal and ground. Turn on ignition, turn engine over until fixed points just open (light for stationary contacts on). If both lights go on, synchronization correct. If not, loosen 3 lockscrews on movable subplate, shift plate by prying with screwdriver in notch on edge of plate until this set of contacts begin to open (both lights on), tighten sub-plate lockscrews, and set Ignition Timing as directed above. If other methods used, set contacts to open simultaneously at 45° (distributor) intervals.
Torquematic Spark Control Check—Distributor must be free in bracket and cable pulleys positioned to prevent cable interference with engine. Advance spring and cable take-up spring must be properly located and spring resistance centralized. Car manufacturer recommends use of Nash Synchro Light SE-417 to check torquematic retard by means of dead center mark on vibration dampener.

CARBURETION:—**Carburetor**—Carter Type WDO, Model 511-S (#360 cast on face of flange). 1" dual downdraft type.
For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 7-8 MPH idle speed. Adjust idle adjusting screw for each barrel (in sucession) until engine fires smoothly (½-1½ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump—Pump arm under dust cover at top of carburetor has 2 holes for pump link engagement. Set as follows:
Upper Hole (max. stroke)—Cold weather.
Lower Hole (min. stroke)—Hot weather.
Float Level—3/16" from top of float to machined surface of bowl cover (remove gasket, invert to check).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust fast idle screw for .015" throttle opening with choke valve closed.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Centered (at index mark). This setting supersedes 1 Notch Rich setting (original specification).

Air Cleaner:—AC # 1529113 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type W (Std.), Type AD Fuel-&-Vacuum Pump (Cars with Overdrive). Pump Exchange Part No. 534.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric. No. NG-9645D (dash unit), No. NG-9637T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

VALVE TIMING:—To Check—With regular running tappet clearance of .015", #1 intake valve opens 16° after top dead center with 'DC' mark on front flywheel 1 5/16" past the pointer on the chain case cover.

Valve Spring Pressure:—Total for inner and outer springs 59 lbs. (closed), 146 lbs. (open). See 'M' page for specifications on each spring.

Tappet Clearance:—.015" all valves with engine hot and idling (may be set .018" max. for sustained high speed driving).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—25-30 lbs. at 25 MPH and above with warm oil. NOTE—Gauge not electric.

COOLING SYSTEM:—Capacity 16 qts. (17 with heater).
Thermostat:—Fulton or Dole. In water outlet elbow on cylinder head.
Setting—Starts to open 160°F.

Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. A-L No. H-9644.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal operated 'kick-down' or Automatic Overtake.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118004.
Throttle Switch—Adjust switch position on mounting bracket so that contacts close with throttle valve wide open and spring on carburetor throttle valve pulley just starting to compress.
Control Relay—Delco-Remy Model 1116798.

BATTERY:—Auto-Lite Type CTL-2-17. 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Starting Capacity—152 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.5 minutes.
Grounded Terminal—Positive (+) grounded to body. Separate body to engine ground strap used.
Dimensions—Lgth. 10 5/16". Width 7⅛". Hgt. 9 1/16".
Location—Under front seat.

STARTER:—Auto-Lite MAB-4104. Armature MAB-2057.
Drive—Inboard Bendix Type LCD11FX-10.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 RPM, 150-160 amps., 5.2 v.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	3700	5.5	60
0.6 " "	1910	5.5	100
3.4 " "	1100	5.0	200
6.6 " "	695	4.5	300
10.15 " "	420	4.0	400
15.8 " "	Lock	3.0	582
22.5 " "	Lock	4.0	775

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch:—A-L #SW-4012. Mounted on body floor below clutch pedal. Operated by depressing clutch pedal fully. No adjustment required.

GENERATOR:—Auto-Lite GDZ-4803B. Armature GDZ-2079F. Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1900 RPM (generator) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Generator cradle mounted at left side of engine with fan belt drive. Water pump driven by generator shaft extension. To remove, disconnect water pump, loosen fan belt, remove generator clamp band and lift generator off.

Belt Adjustment:—Adjust whenever belt deflection is over 1½" (when pressed lightly midway between generator and fan pulleys). To adjust, loosen two capscrews on fan bracket, lift fan up (one screw hole slotted) for ¾" belt deflection, tighten screws.

REGULATOR:—Auto-Lite VRP-4004F. Current-Voltage type. In case on left side of engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—In center of speedometer dial. Lighted whenever Country (upper) beams in use.

Switches

Lighting—Douglas. Nash No. 3107032.
Beam Selector—Douglas.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking	3	63
Instrument, Clock	1½	55
Beam Indicator	1½	55
Stop & Tail	21-3	1158
Rear License	3	63
Dome	6	81

FUSES:—Lighting—30 ampere. On fuse block mounted on left hand side of engine dash.
Accessory—30 ampere. On fuse block.

HORNS:—Delco-Remy. No. 1999565 (left horn—low note), No. 1999566 (right horn—high note). Vibrator type, blended tone, operated by horn relay.

Type	Current (at 6 volts)	Air Gap
1999565 (Low Note)	19-21 amperes	.047-.052"
1999566 (High Note)	18-20 amperes	.039-.044"

Horn Relay:—Delco-Remy Model 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

MODEL NOTATION:—	Model	Series
Special Six	F-41	66
Dynamic Cruiser Six	G-41	76
Custom Cruiser Six	H-41	96

HOOD LOCK:—Hood is Alligator type. To raise hood, pull out on control knob on instrument panel (hood will raise slightly), push up on 'Safety Hook' tab under front end of hood, lift hood up.

SERIAL NUMBER:—On plate on upper left corner of dash in engine compartment. First Nos.

Series	Lansing	Linden, N. J.	California
66	66-1001	66L1001	66C1001
76	76-1001	76L1001	76C1001
96	96-1001	96L1001	96C1001

ENGINE NUMBER:—First No. G-225001. Stamped on top left corner of engine block back of water pump. NOTE—Prefix on cars with Hydra-Matic Drive is 'GA'.

COMPRESSION:—Ratio—6.1-1 Std., 5.74-1 Optl.
Pressure—115 lbs. plus or minus 10 lbs. at cranking speed of 100 RPM. for Std. 6.1-1 head.

VACUUM READING:—Steady 17" min. at idling speed.

IGNITION:—Delco-Remy Coil No. 1115129. On dash.
Ignition Current—2 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy No. 1116305 (66, 96), 1116311 (76). Connected to ignition coil by armored cable.
Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.
Distributor Delco-Remy Model 647-F. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—35° closed, 25° open.
Breaker Arm Spring Tension—17-21 ozs.
Rotation—Counter-clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	200	2	400
3	400	6	800
14	1900	28	3800

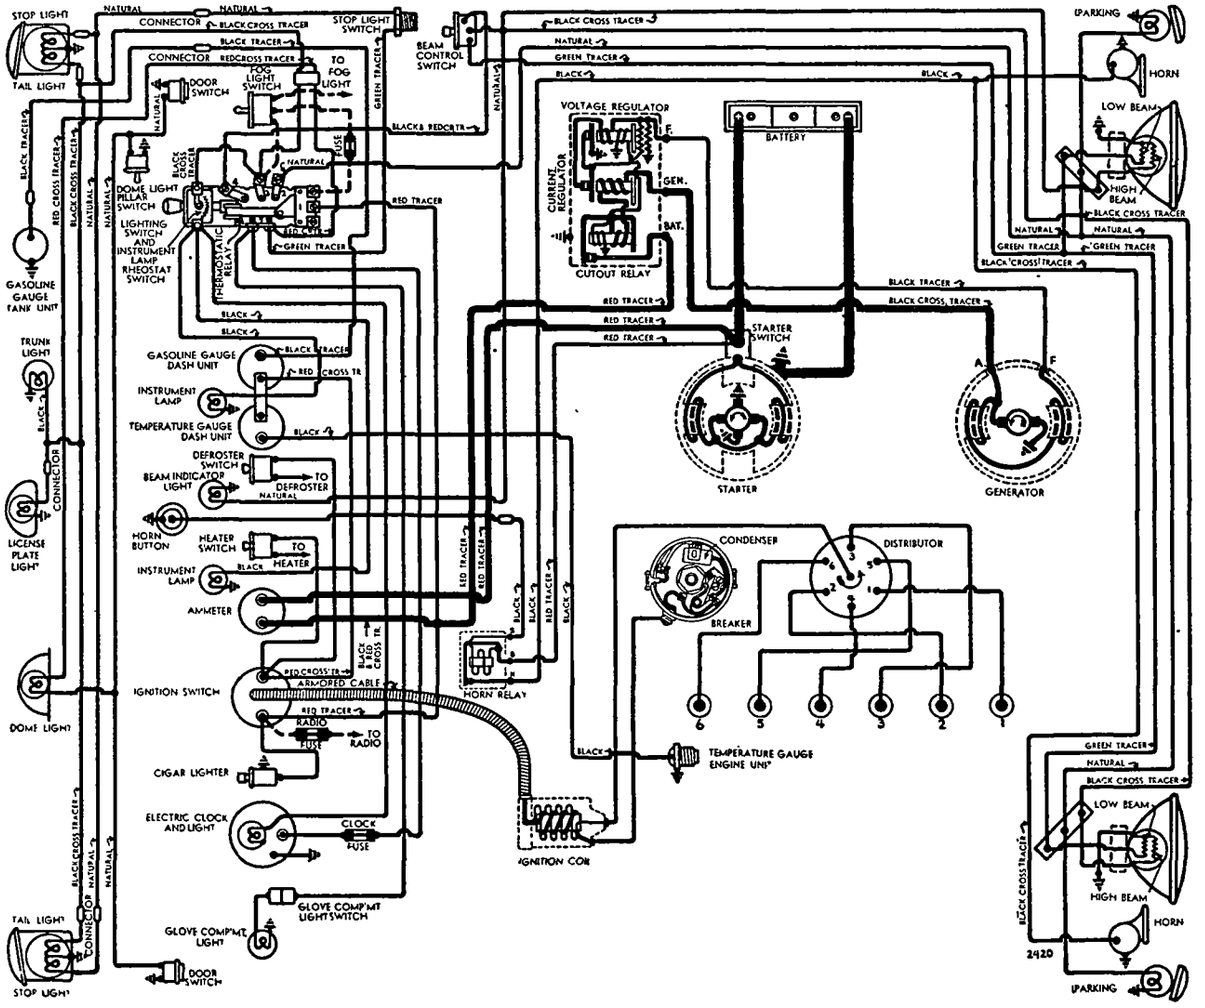
Vacuum Spark Control Model 681-P—On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.
Plunger Travel—3/16" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
10°	20°	15.5-18.5"

Octane Selector—Adjustment permits 10° advance or retard from center '0' position. See Ignition Timing for adjustment directions.
Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

FIRING ORDER:—1-5-3-6-2-4. See diagram.



SPARK PLUGS:—AC No. 44. 14 MM. Metric.
Spark Plug Gaps—.040".

IGNITION TIMING:—See Octane Selector Setting for correction dependent on fuel used.

	Flywheel Degrees	Piston Position
Std. Trans. Cars	At TDC	.000" TDC.
Hydra-Matic Trans.		.001" BTDC.

Timing (With Synchroscope)—Recommended method. Loosen hold-down screw in advance arm, center Octane Selector scale ('0' at indicator line), tighten hold-down screw. Clip synchroscope lead to #1 spark plug, direct synchroscope light on flywheel through inspection hole in left front face of housing above starter. Idle engine, loosen advance arm clamp bolt, rotate distributor until ignition mark (steel ball insert) on flywheel lines up with indicator on housing, tighten clamp bolt, check Octane Selector setting (below).
NOTE—On cars with Hydra-Matic drive, use dial indicator and set distributor so contacts open with piston .001" before top dead center.
Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston with steel ball insert in flywheel at indicator in inspection hole in left front face of flywheel housing (or with piston .001" BTDC. on cars with Hydra-Matic drive). Loosen hold-down screw in advance arm, center pointer on scale ('0' mark at indicator), tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt and check Octane Selector setting.
Octane Selector Setting—Set for slight ping when accelerating engine with wide open throttle at speeds below 15 MPH. To adjust, loosen distributor hold-down screw, rotate distributor clockwise toward 'Adv' end of scale (if no ping noted), counter-clockwise toward 'Ret' end of scale (if ping too severe) one graduation at a time until correct performance secured.

CARBURETION:—Carburetor—Carter WA1 Model 504-S (Std. Trans.), 481-S (Hydra-Matic Drive). 1½" downdraft type with Climatic Control.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for idle speed of 425 RPM. (Std), 375 RPM. (Hydra-Matic Drive cars). Adjust idle adjusting screw for smooth idle (screw should be ½-1½ turns open from inner seated position—turn screw in for leaner mixture). Recheck idle speed. ***See 'Hydra-Matic Drive' article in Mechanical Equipment Section for throttle linkage adjustment on cars with Hydra-Matic Drive.***
Accelerating Pump Setting—Pump arm (under dust cover) has three holes for pump connector link engagement. Set as follows:
Lower (Med. Stroke)—Normal all-year setting.

Inner (Min. Stroke)—Hot weather or High Alt.
Outer (Max. Stroke)—Cold weather, low-test fuel.
Float Level—½" from top of projection on bowl cover to top of float seam at free end with valve seated (invert cover to check—use Gauge T109-83).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Throttle Cracker Adjustment:—Must be set for correct throttle opening for starting. To adjust, disconnect starter cable at starter switch, depress starter button fully (hold in this position while adjusting), loosen adjusting screw on throttle cracker cam (on accelerator linkage bellcrank on left side of engine block), adjust cam so that clearance between carburetor throttle valve stopscrew and highest step of fast idle cam is .0625-.0825" (1/16").

Fast Idle:—Integral (built-in each carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—With fast idle cam in hot or slow idle position, close choke valve until throttle stopscrew is against (not on) first step of cam, adjust by bending connector rod offset so that choke valve opening is 5/8".

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Mark on thermostat case centered on housing scale.

Air Cleaner:—AC No. 1529861 oil-wetted type Std., Heavy duty oil-bath type Optl.

Fuel Pump:—AC Type AJ Fuel-&-Vacuum Pump Std. Replacement Exchange Pump No. 536.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—AC Electric type. No. 1516298 (Dash Unit), No. 1516285 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve operates freely.
Setting—Coil wind-up should be 125° (approx. ⅓ turn) at room temperature. NOTE—To check valve for correct position on shaft, use feeler gauge in slot on rear end of valve shaft. With valve closed, gauge should contact stop pin (slot 6° to left or toward engine from up-and-down position) with ⅛" clearance between valve tip and manifold. Valve welded to shaft in this position.

VALVE TIMING:—**To Check**—With tappet clearance of .0124", #1 intake valve opens 5° BTDC. with piston .0163" BTDC. and point on flywheel approx. 2 teeth before top dead center mark (steel ball insert) at indicator (inspection hole in left front face of flywheel housing). Reset tappet clearance at .008" with engine warm.

Tappet Clearance:—.008" Int., .011" Exh. Warm.

Valve Spring Pressure:—50½ lbs. at 2¼" (valve closed), 95½ lbs. at 1 15/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—5 qts.
Normal Oil Pressure—30 lbs.

COOLING SYSTEM:—**Capacity**—17¾ qts.

Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open at 152° F.

Temperature Gauge:—AC Electric type. No. 1511043 (Dash Unit), No. 1510772 (Engine Unit).
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—**Delco Model 15E-2.** 6 volt, 15 plate, 100 Ampere Hour Capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage 4.25 volts.
Grounded Terminal—Negative (—) to Starter.
Location—On left side in engine compartment.

Police Battery Delco Model 19E-1. 6 volt, 19 plate, 130 Ampere Hour Capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage 4.55 volts.
Grounded Terminal and Location—Same as above.

STARTER:—**Delco-Remy 1107034, Armature No. 1867897 (LHD cars); 1107019, Armature 810601 (RHD cars).** NOTE—Mounting holes provided on all starters for Hydra-Matic Drive Interlock mounting (holes plugged when Hydra-Matic Drive not used). *See Hydra-Matic Drive article in Mechanical Equipment Section for Interlock adjustment.*
Drive—Overrunning clutch with manual pinion shift (LHD. 1107034), solenoid pinion shift (RHD. 1107019).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—100 RPM., 125-135 amperes, 5 volts (Summer Temperature) for LHD. starter.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out mounting screws.

Starting Switch (1107034):—No. 820052. Mounted on starter. Operated by pinion shift lever.
(1107019)—Solenoid Switch No. 1546. Mounted on starter. Operated through relay (in switch case) by Pushbutton Switch No. 1996008 on instrument panel.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—**Delco-Remy 1102664, Armature 1879002 (Std.), Model 1102680 (Hydra-Matic Drive Cars).** Two brush type with Current & Voltage Control.
Pulley Note—Cars with Std. Trans. (1102664 Gen.) have regular 3 9/16" pulley. Hydra-Matic Drive cars (1102680 Gen.) have smaller 3 1/16" pulley to compensate for lower engine speed (max. output reached at approx. 210 Eng. RPM. less). NOTE—This pulley can be installed on cars with 3.9-1 Axle ratio for special service if output inadequate.
Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator. See Regulator data below.
Maximum Charging Rate—33 amperes, 8.0 volts, 2400 RPM. (hot) or 23 MPH. (66), 21 MPH. (76,96) and above (Current Regulator setting) with load or discharged battery. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

①—Not maximum output. See Current Regulator.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ozs. each.
Field Current—1.67-1.82 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Check with straightedge across pulleys. Belt deflection should be ¾" inward from straightedge with light pressure at point midway between generator and fan pulleys.

REGULATOR:—**Delco-Remy 1118201. Single Core Type.** Vibrating Current & Voltage Regulator on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Should be checked with cover in place and hot.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Small red indicator in upper edge of speedometer. Lighted when Upper Beams in use.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Delco-Remy No. 1995017 (LHD Cars), No. 1995020 (RHD Cars). Switch has instrument light rheostat mounted on control knob stem.
Beam Selector—Delco-Remy No. 1997002.
Stop Light—Delco-Remy No. 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking	3	63
Instrument, Clock	1½	55

Dome	6	82

THERMOSTATIC RELAY:—On lighting switch. Contacts remain closed with 30 ampere current, open in 3 minutes with current of 42 amperes at 70° F. Limits current to 18 amperes with dead short-circuit. Not adjustable.

FUSES:—**Clock**—2 ampere. In clock lead connector.

HORNS:—**Delco-Remy No. 1999535 (Low Note), 1999536 (High Note).** Vibrator type, blended tone, twin horns operated by relay.
NOTE—Horns not marked but Low Note horn mounted on left side, High Note horn on right side, in front of radiator behind grille (mounting designed so horns cannot be interchanged).

Type	Current (at 6 volts)	Air Gap
1999535 (low note)	19-21 amperes	.045-.049"
1999536 (high note)	17-19 amperes	.035-.039"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

MODEL NOTATION:—	Model	Series
Special Eight	E-41	68
Dynamic Cruiser Eight	J-41	78
Custom Cruiser Eight	L-41	98

HOOD LOCK:—Hood is Alligator type. To raise hood, pull out on control knob on instrument panel (hood will raise slightly), push up on 'Safety Hook' tab under front end of hood, lift hood up.

SERIAL NUMBER:—On plate on upper left corner of dash in engine compartment. First Nos.

Series	Lansing	Linden, N. J.	California
68	68-1001	68L1001	68C1001
78	78-1001	78L1001	78C1001
98	98-1001	98L1001	98C1001

ENGINE NUMBER:—First No. L-379001. Stamped on top left corner of engine block back of water pump. NOTE—Prefix on cars with Hydra-Matic Drive is 'LA'.

COMPRESSION:—**Ratio**—6.3-1 Std., 5.7-1 Optl.
Pressure—105 lbs. plus or minus 10 lbs. at cranking speed of 100 RPM. for Std. 6.3-1 head.

VACUUM READING:—Steady 17" min. at idling speed.

IGNITION:—**Delco-Remy Coil No. 1115129.** On dash.
Ignition Current—2 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy No. 1116305 (68, 98), 1116311 (78). Connected to ignition coil by armored cable.
Ignition Lock—Briggs & Stratton No. 45792. Key Series—8000 to 9499. Groove—No. 15.
Distributor Delco-Remy Model 1110802. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and Octane Selector adjustment.
Breaker Gap—.015". Limits .0125-.0175".
Cam Angle or Dwell—31° closed, 14° open.
Breaker Arm Spring Tension—19-23 ozs.
Rotation—Counter-clockwise at commutator end.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	300	2.5	600
3.5	500	7	1000
15	2000	30	4000

Vacuum Spark Control Model 681-R. On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.
Plunger Travel—11/64" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
7.5°	15°	14-17"

Octane Selector—Adjustment permits 10° advance or retard from center '0' position. See Ignition Timing for adjustment directions.
Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in advance arm.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARKS PLUGS:—AC No. 44. 14 MM. Metric.
Spark Plug Gaps—.030".

IGNITION TIMING:—See Octane Selector Setting for correction dependent on fuel used.

	Flywheel Degrees	Piston Position
Std. Trans. Cars	2° BTDC	.002" BTDC.
Hydra-Matic Trans.		.001" BTDC.

Timing (With Synchroscope)—Recommended method. Loosen hold-down screw in advance arm, center Octane Selector scale ('0' at indicator line), tighten hold-down screw. Clip synchroscope lead to #1 spark plug, direct synchroscope light on flywheel through inspection hole in left front face of housing above starter. Idle engine, loosen advance arm clamp bolt, rotate distributor until ignition mark (steel ball insert) on flywheel lines up with indicator on housing, tighten clamp bolt, check Octane Selector setting (below).
NOTE—On cars with Hydra-Matic drive, use dial indicator and set distributor so contacts open with piston .001" before top dead center.

Timing (Without Synchroscope)—Turn engine over to firing position for #1 piston with steel ball insert in flywheel at indicator in inspection hole in left front face of flywheel housing (or with piston .001" BTDC. on cars with Hydra-Matic drive). Loosen hold-down screw in advance arm, center pointer on scale ('0' mark at indicator), tighten hold-down screw. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt and check Octane Selector setting.

Octane Selector Setting—Set for slight ping when accelerating engine with wide open throttle at speeds below 15 MPH. To adjust, loosen distributor hold-down screw, rotate distributor clockwise toward 'Adv' end of scale (if no ping noted), counter-clockwise toward 'Ret' end of scale (if ping too severe) one graduation at a time until correct performance secured.

CARBURETION:—**Carburetor**—Carter WDO Model 503-S (Std. Trans.), 480-S (Hydra-Matic Drive). 1¼" dual downdraft type with Climatic Control.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for idle speed of 425 RPM. (Std), 375 RPM. (Hydra-Matic Drive cars). Adjust both idle adjusting screws (one for each barrel, set screws alike) for smooth idle. Screws should be ½-2¼ turns open from inner seated position (turn screws in for leaner mixture). Recheck idle speed.
See 'Hydra-matic Drive' article in Mechanical Equipment Section for throttle linkage adjustment on cars with Hydra-Matic Drive.
Accelerating Pump Setting—Not adjustable.

Float Level—3/16" from top of float to machined surface of bowl cover with valve seated (remove gasket, invert cover, use gauge T109-28 to check).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Throttle Cracker Adjustment:—Must be set for correct throttle opening for starting. To adjust, disconnect starter cable at starter switch, depress starter button fully (hold in this position while adjusting), loosen adjusting screw on throttle cracker cam (on accelerator linkage bellcrank on left side of engine block), adjust cam so that clearance between carburetor throttle valve stopscrew and highest step of fast idle cam is .0625-.0825" (1/16").

Fast Idle:—Integral (built-in each carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—With choke valve closed, adjust fast idle screw for .015" throttle valve opening or for clearance of .030" (503-S), .025" (480-S) between throttle lever stopscrew and stop on carburetor casting with stopscrew set for correct hot or slow idle speed.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Mark on thermostat case centered on housing scale (503-S), 2 Notches Rich (480-S).

Air Cleaner:—AC No. 1529862 oil-wetted type Std., Heavy duty oil-bath type Optl.

Fuel Pump:—AC Type AJ Fuel-&-Vacuum Pump Std. Replacement Exchange Pump No. 535.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—AC Electric type. No. 1516298 (Dash Unit), No. 1516285 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve operates freely.
Setting—Coil wind-up should be 160° (approx. ½ turn) at room temperature. NOTE—To check valve for correct position on shaft, use feeler gauge in slot on rear end of valve shaft. With valve closed, gauge should contact stop pin (slot 6° to left or toward engine from up-and-down position) with ⅛" clearance between valve tip and manifold. Valve welded to shaft in this position.

VALVE TIMING:—**To Check**—With tappet clearance of .0124", #1 intake valve opens at TDC. with piston on top dead center and flywheel mark 'TDC/' at indicator in inspection hole in left front face of flywheel housing beside starter. CAUTION—Steel ball insert (ignition mark) is not top dead center.
Tappet Clearance:—.008" Int., .011" Exh. Warm.
Valve Spring Pressure:—50½ lbs. at 2¼" (valve closed), 95½ lbs. at 1 15/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 qts.
Normal Oil Pressure—30 lbs.

COOLING SYSTEM:—**Capacity**—21½ qts.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open at 152° F.
Temperature Gauge:—AC Electric type. No. 1511043 (Dash Unit), No. 1510772 (Engine Unit).
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—**Delco Model 17E-2.** 6 volt, 17 plate, 120 Ampere Hour Capacity (20 hour rate).
Starting Capacity—140 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.5 minutes. Five second voltage 4.4 volts.
Grounded Terminal—Negative (—) to Starter.
Location—On left side in engine compartment.
Police Battery Delco Model 19E-1. 6 volt, 19 plate, 130 Ampere Hour Capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage 4.55 volts.
Grounded Terminal and Location—Same as above.

STARTER:—**Delco-Remy 1107922, Armature No. 1867897 (LHD cars), Model 1107924 (RHD cars).**
NOTE—Mounting holes provided on all starters for Hydra-Matic Drive Interlock mounting (holes plugged when Hydra-Matic Drive not used). *See Hydra-Matic Drive article in Mechanical Equipment Section for Interlock adjustment.*
Drive—Overrunning clutch with manual pinion shift (1107922), solenoid pinion shift (RHD. 1107924).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ounces each.
Cranking Engine—100 RPM., 140-150 amperes, 5 volts (Summer Temperatures) for LHD. starter.

Performance Data—1107922

Torque	R.P.M.	Volts	Amperes
0 ft. lbs	6000	5.0	60
15 "	Lock	3.0	600

Performance Data—1107924

0 ft. lbs	5500	5.0	65
15 "	Lock	3.0	600

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out mounting screws.
Starting Switch (1107922):—No. 820052. Mounted on starter. Operated by pinion shift lever.
(1107924)—Solenoid Switch No. 1546. Mounted on starter. Operated through relay (in switch case) by Pushbutton Switch No. 1996008 on instrument panel.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—**Delco-Remy 1102664, Armature 1879002 (Std.), Model 1102680 (Hydra-Matic Drive Cars).** Two brush type with Current & Voltage Control.
Pulley Note—Cars with Std. Trans. (1102664 Gen.) have regular 3 9/16" pulley. Hydra-Matic Drive cars (1102680 Gen.) have smaller 3 1/16" pulley to compensate for lower engine speed (max. output reached at approx. 210 Eng. RPM. less). NOTE—This pulley can be installed on cars with 3.9-1 Axle ratio for special service if output inadequate.
Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator. See Regulator data below.
Maximum Charging Rate—33 amperes, 8.0 volts, 2400 RPM. (hot) or 23 MPH. (68), 21 MPH. (78, 98) and above (Current Regulator setting) with load or discharged battery. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

①—Not maximum output. See Current Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—25 ozs. each.
Field Current—1.67-1.82 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Check with straightedge across pulleys. Belt deflection should be ¾" inward from straightedge with light pressure at point midway between generator and fan pulleys.

REGULATOR:—**Delco-Remy 1118201. Single Core Type.** Vibrating Current & Voltage Regulator on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Regulator over-compensated for temperature. Should be checked with cover in place and hot.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulator 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Small red indicator in upper edge of speedometer dial. Lighted when Country (upper) Beam in use.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Delco-Remy No. 1995017 (LHD Cars), No. 1995020 (RHD Cars). Switch has instrument light rheostat mounted on control knob stem.
Beam Selector—Delco-Remy No. 1997002.
Stop Light—Delco-Remy No. 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Parking	3	63
Instrument, Clock	1½	55
Beam Ind., Glove Compt.	1	51
Stop & Tail	21-3	1154
Rear License Plate	3	63
Dome	6	82

THERMOSTATIC RELAY:—On lighting switch. Contacts remain closed with 30 ampere current, open in 3 minutes with current of 42 amperes at 70° F. Limits current to 18 amperes with dead short-circuit. Not adjustable.

FUSES:—**Clock**—2 ampere. In clock lead connector.

HORNS:—**Delco-Remy No. 1999535 (Low Note), 1999536 (High Note).** Vibrator type, blended tone, twin horns operated by relay.
NOTE—Horns not marked but Low Note horn mounted on left side, High Note horn on right side, in front of radiator behind grille (mounting designed so horns cannot be interchanged).

Type	Current (at 6 volts)	Air Gap
1999535 (low note)	19-21 amperes	.045-.049"
1999536 (high note)	17-19 amperes	.035-.039"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.025". **Air Gap**—.015" (closed).
Contacts Close—2.75-4.0 volts.

HOOD LOCK NOTE:—Hood is one-piece, side-hinge type with instrument panel lock knobs and may be lifted from either side after lock released on that side. To raise hood, press down and back on control knob on side on which hood is to be raised, raise hood about 1", press in on safety rod (under lower edge of hood approximately 2' forward of rear of engine) to release safety catch, lift hood up and engage support prop in opening on underside of hood (prop pivoted on dash).

SERIAL NUMBER:—Stamped on plate on left side of dash under engine hood. First number 1401-2001.

ENGINE NUMBER:—Stamped on upper left side of engine block between #3 and #4 cylinders. First number D-400051.

COMPRESSION:—**Ratio**—6.85-1 Std. cast iron head. **Pressure**—118 lbs. at cranking speed.

VACUUM READING:—Steady 18-20" idling at 6 MPH.

IGNITION:—**Coil Model CE-4659.** On left hand side of engine near distributor. Service Coil CE-3224VS.
Ignition Current—2.4 amperes idling, 5 stopped.
Ignition Switch:—Mitchellock Model 24-B, No. 8781.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—P1250 to P1500. **Groove**—No. 2.
Distributor Auto-Lite IGP-4502. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control and Fuel Compensator Adjustment.
Breaker Gap—Set at .015".
Cam Angle or Dwell—27° clsd., 18° open (.017" gap).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—No. IG-2671K. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	0	500
3	525	6	1050
6	800	12	1600
9	1210	18	2420
11.5	1550	23	3100

Vacuum Spark Control—Separate unit mounted on hold-down plate and linked to adjusting quadrant on distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	10"
1°	2°	11⅛"
3°	6°	13½"
5°	10°	15⅞"
6°	12°	17"

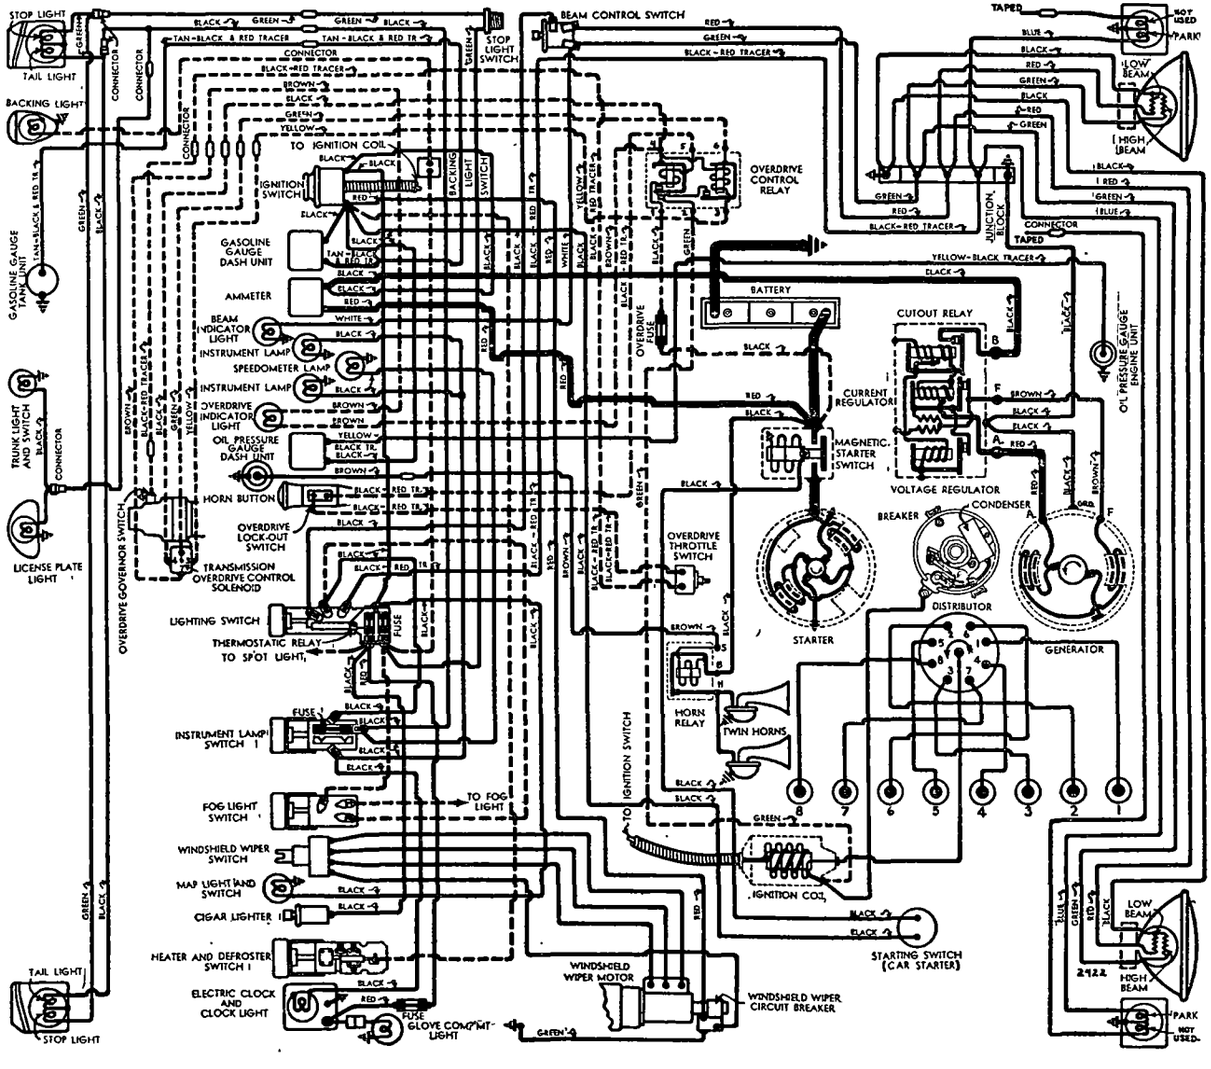
Fuel Compensator Adjustment—Permits 40° range of adjustment by loosening vacuum unit link screw at distributor quadrant. See Ignition Timing below.
Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out screw in hold-down plate, lift entire unit out.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARK PLUGS:—AC No. 104 or Champion Y4A. 10 MM. Metric type. NOTE—Do not use more than 50 in. lb. (10 lb. pull on 5" wrench) when tightening plugs.
Spark Plug Gaps—.028" (.0255-.0305").

IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
All Engines	5° BTDC	.0103" BTDC



Timing Mark Note—Marks on vibration dampener at front of engine. Dampener marked '#1 UP.DC' with fifteen 1° graduations before this point.

Timing—With #1 piston on compression, turn engine over until piston reaches firing position with correct mark on dampener in line with pointer on chain case cover (see table above). Loosen vacuum unit link screw in distributor quadrant, rotate distributor until contacts begin to open, tighten screw. Check Fuel Compensator Setting (below).

Timing (Neon Timing Light)—Mark correct graduation on vibration dampener, clip neon timing light to #1 spark plug and direct light on vibration dampener, idle engine and adjust distributor as directed above.

Fuel Compensator Setting—Should be set for slight ping when accelerating engine with wide open throttle. To adjust, loosen vacuum unit link screw in distributor quadrant, rotate one graduation at a time counter-clockwise (if ping too severe), clockwise (if no ping), until correct performance secured.

CARBURETION:—**Carburetor**—Carter Type WDO, Model 512-S. 1" dual, downdraft type with Climatic Control. No. 371 cast on face of flange.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH. idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (½-1½ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump—Pump arm under dust cover at top of carburetor has two holes for pump link engagement. Set as follows:
Inner (min. stroke)—Hot weather or hi-test fuel.
Outer (max. stroke)—Cold weather or low-test fuel.

Float Level—5/32" from top of float to bowl cover with valve seated (remove gasket & invert to check).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust fast idle screw for .030" throttle opening with choke valve closed.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Set thermostat coil housing at Index mark.

Throttle Guard (Cars with Aero-Drive):—Vacuum operated throttle kicker to prevent engine stalling when free-wheeling. Kicks in at 4 MPH., kicks out at 9 MPH.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Set gap between plunger and carburetor throttle lever at .020" (carburetor set for 6 MPH. slow idle speed), set spring tension adjusting screw 3/16" out beyond face of locknut.

Air Cleaner:—AC #1542094 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type AH. Inverted, diaphragm type. Pump Replacement Exchange Part No. 525.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—**To Check**—With tappet clearance of .0125", #1 intake valve opens with piston 1° or .0004" BTDC when 1st graduation before top dead center mark '#1 UP.DC' on vibration dampener lines up with pointer (permissible variation 4° either way). Reset tappet clearance at .007" hot.

Tappet Clearance:—.007" Int., .010" Exh. Warm. Adjusting screws are self-locking (no locknuts).

Valve Spring Pressure:—47-52 lbs. at 1⅝" (valve closed), 114-124 lbs. at 1 5/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—40 lbs. at 45 MPH.

COOLING SYSTEM:—**Capacity**—17 quarts.
Pressure Valve:—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning Equipment).
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 147½°.

TRANSMISSION (ECONO-DRIVE) CONTROL:—Electric type with solenoid operated kick-down through accelerator switch and Governor Switch.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118005.
Overdrive Indicator Light—Green light on right side of speedometer dial. Lighted whenever overdrive is ready to engage (light goes out when accelerator pedal is released so that overdrive can engage).
Throttle Switch—Cole-Hersee. Packard No. 347496. Adjust tappet screw on throttle lever to just contact switch plunger with throttle valve wide open.
Governor Switch—Bendix No. 364782.
Control Relay—Delco-Remy Model 1116801.

BATTERY:—**Willard Type WH-2D-120 or Auto-Lite Type P-17-2R 'End-to-end' type.** 6 volt, 17 plate, 120 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) terminal.
Engine Ground—Strap from transmission to frame.
Location—On bracket to left of engine in engine compartment.

STARTER:—**Auto-Lite MAW-4024, Armature MAW-2128.**
Drive—Outboard Barrel Type Bendix No. A-1792.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM., 175 amperes, 5.1 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
0.6 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.
Starting Switch:—A-L Model SS-4017. Magnetic type. Mounted on starter and controlled by Carter Car Starter No. 192-11U on carburetor (accelerator pedal starting).
For complete data, refer to 1941 Elec. Equip. Index for Auto-Lite Magnetic Starter Control and Carter Car Starter.

GENERATOR:—**Auto-Lite GDZ-4801F, Armature GDZ-2006F.** Two brush type with Current & Voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—35 amperes, 8.0 volts hot. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
*35	8.0	1900	35	8.0	2250

*—Current Regulator setting.
Rotation—Counter-clockwise at commutator end.
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.15-4.60 amperes at 6.0 volts.
Brush Spring Tension—53 ozs. max. (new brushes).
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—50 lbs. tension on spring scale hooked to generator frame, or ½" thumb-pressure deflection midway between generator and pump pulleys.

REGULATOR:—**Auto-Lite VRP-4002C.** Current-voltage type. In case on left side of engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay
Cuts In—6.4-6.6 volts, 920 generator RPM (cold).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin.)
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH, charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs, etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on left side of speedometer dial. Lighted when Country (upper) beam in use.

Switches
Lighting—Delco-Remy.
Beam Selector—Delco-Remy.

Dome	6	81

①—3 cp. The 21 cp. filament is not used.

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. at 70° F. Not adj.

FUSES:—**Stop Light, Cigar Lighter and Accessories**—Two 20 ampere. On back of lighting switch.
Instrument & Tail Light—20 ampere. In connector in Lighting Switch to Panel Light Switch feed wire.
Clock—2 ampere. In feed wire near clock.
Econo-drive—30 ampere. In relay lead near starter.
Windshield Wiper—No fuse (circuit-breaker).

HORNS:—**Sparton**—Vibrator type, air tone, twin horns operated by relay.
Horn Current—22-25 amperes (total both horns).
Horn Relay:—R-B-M Model 6006.
Contacts Close—3-4 volts (with relay upright).

WINDSHIELD WIPER:—**Stewart-Warner Series 645-E.** Electric type. NOTE—'Klixon' type circuit-breaker mounted on unit (no fuse used).
For complete data, refer to 1941 Mech. Equip. Index.

EQUIPMENT NOTE:—Both Delco-Remy & Auto-Lite Electrical Equipment are used on this model.
HOOD LOCK:—Conventional center hinge hood. Hood latch handles located on side panels.
SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First No. D-1551. Stamped on left side of engine block between #2 and #3 cylinders.
COMPRESSION:—**Ratio**—6.39-1 Std., 6.71-1 Optl.
Pressure—110 lbs. at 125 RPM. (Std. Hd.).
VACUUM READING:—18-20" steady idling at 6 MPH.
IGNITION (AUTO-LITE):—**Coil Model CE-4644.** Mounted on left side of engine near distributor. Service Coil (less switch & cable) CE-3224VS.
Ignition Current—2.75 amperes idling, 5 stopped.
Ignition Switch:—Mitchellock Model 24-B, No. 8781.
Ignition Lock—Briggs & Stratton No. 50184.
Key Series—P-1250 to P-1500. Groove—No. 2.
Distributor Auto-Lite Model IGC-4505. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Fuel Compensator adjustment.
Breaker Gap—.020".
Cam Angle or Dwell—38° closed, 22° open.
Breaker Arm Spring Tension—17-20 ozs.
Rotation—Counter-clockwise viewed from above.
Condenser—No. IGW-3128. Capacity .28-.32 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	0	600
3	590	6	1180
5	780	10	1560
7	1150	14	2300
9.5	1600	19	3200

Vacuum Spark Control—Separate unit mounted on hold-down plate and linked to adjusting quadrant on distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	6"
4°	8°	11⅞"
7.5°	15°	17"

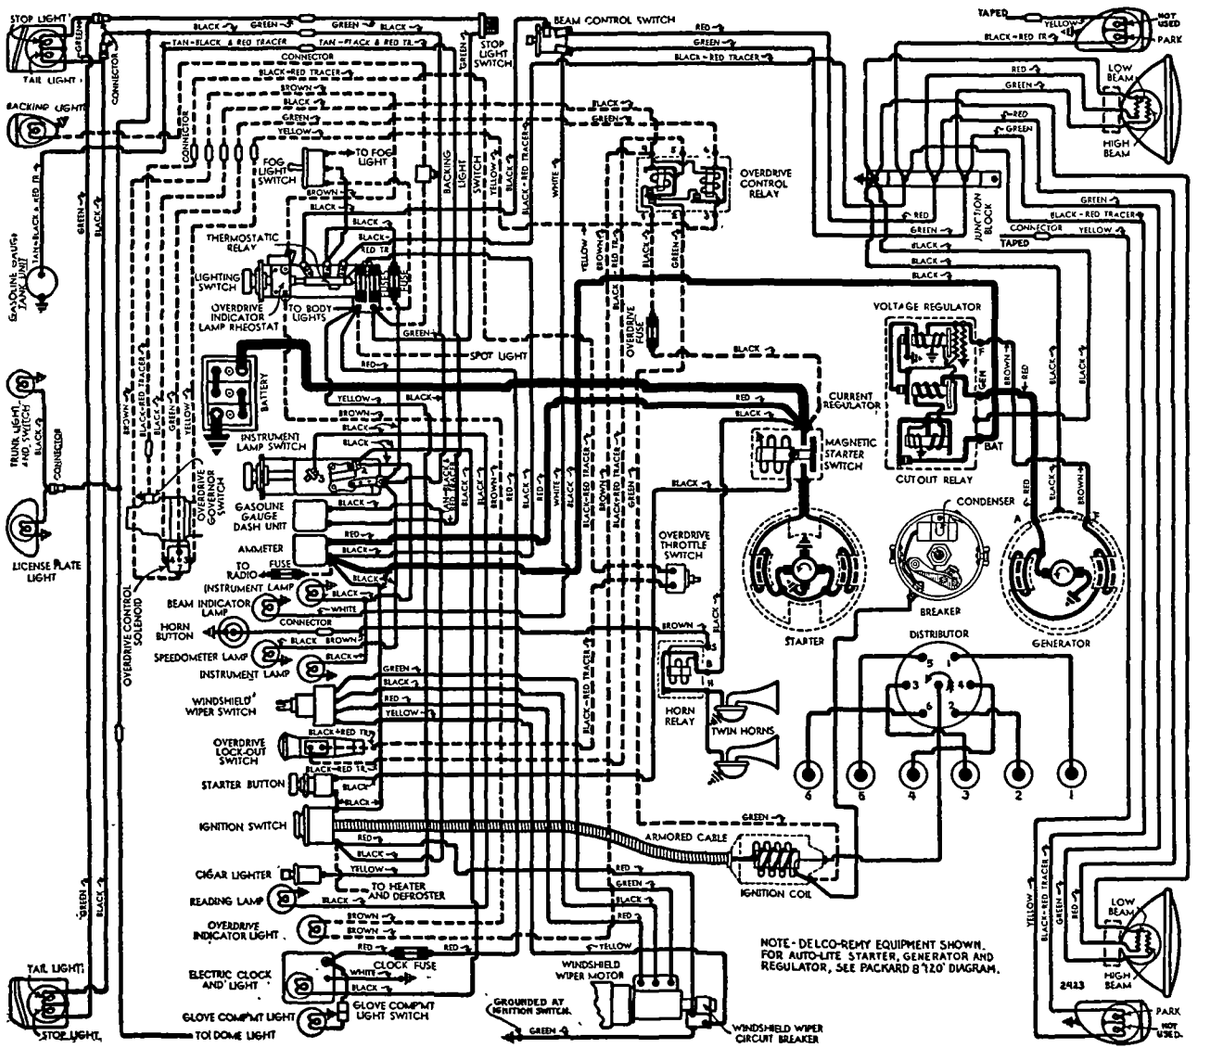
Fuel Compensator Adjustment—Permits 40° range of adjustment by loosening vacuum unit link screw at distributor quadrant. See Ignition Timing below.
Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out screw in hold-down plate, lift entire unit out.
IGNITION (DELCO-REMY):—**Coil No. 1115027.** On left side of engine. Switch connection is armored.
Ignition Current—2.75 amperes idling, 5 stopped.
Ignition Switch:—Delco-Remy No. 1116308 (Std.), 1116318 (RHD). Coil connection armored.
Ignition Lock—Briggs & Stratton No. 50184.
Key Series—P-1250 to P-1500. Groove—No. 2.
Distributor Delco-Remy No. 1110092. Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and Fuel Compensator adjustment.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—35° closed, 25° open.
Breaker Arm Spring Tension—19-23 ozs.
Rotation—Counter-clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	300	1.5	600
5	700	10	1400
10.25	1600	20.5	3200

Vacuum Spark Control—Separate unit mounted on hold-down plate and linked to distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance



Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5-7"
7.5°	15°	15-19"

Fuel Compensator Adjustment—Slot in advance plate permits distributor to be advanced or retarded from center point on scale when hold-down screw loosened. See Ignition Timing for setting.
Removal:—Same as for Auto-Lite model (above).
FIRING ORDER:—1-5-3-6-2-4. See diagram.
SPARK PLUGS:—AC No. 104 or Champion Y4. 10 MM. Metric. NOTE—Do not tighten these small plugs excessively (50 in. lbs.).
Spark Plug Gaps—.028 (.0255-.0305").

IGNITION TIMING:—See Fuel Compensator setting also.

	Flywheel Degrees	Piston Position
All Engines	6° BTDC	.0149" BTDC

Timing Mark Note—Marks now on vibration dampener at front of engine. Dampener marked '#1 UP.-DC' with fifteen 1° graduations before this point.
Timing—With #1 piston on compression, turn engine over until piston reaches firing position with correct mark on dampener in line with pointer on chain case cover (see table above). Loosen vacuum unit link screw in distributor quadrant (Auto-Lite Distributors), hold-down screw in advance arm (Delco-Remy Distributors), rotate distributor until contacts begin to open, tighten screw. Check Fuel Compensator setting (below).
Timing (Neon Timing Light)—Mark correct graduation on vibration dampener, clip neon timing light to #1 spark plug and direct light on vibration dampener, idle engine and adjust distributor as directed above.

Fuel Compensator Setting—Should be set for slight ping when accelerating engine with wide open throttle. To adjust, loosen vacuum unit link screw in distributor quadrant (Auto-Lite Distributors), advance arm hold-down screw (Delco-Remy Distributors), rotate distributor one graduation at a time counter-clockwise (if ping too severe), clockwise (if no ping), until correct performance secured.

CARBURETION:—Carburetor—Stromberg Model BXOV-26 (Code 10-45). 1¼" downdraft type with Automatic Choke.

For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for 6 MPH hot or slow idle speed. Adjust idle adjusting screw for smooth idling performance (screw should 1-1⅛ turns open from inner seated position—turn screw in for leaner mixture). Recheck idle speed.

Accelerating Pump Setting—Throttle lever has 3 holes for pump rod link connection as follows:
Inner (Min. stroke)—Hot weather or high-test fuel.
Center (Med. stroke)—Normal temperatures & fuel.
Outer (Max. stroke)—Cold weather or low test fuel.

Float Level—Fuel level ⅝" below top edge of bowl with engine idling (3 lbs. pressure).

Metering Jets—***See Stromberg Jet Table in Carburetor Section for complete data.***

Fast Idle:—Integral (operated by Automatic Choke).

For complete data, refer to 1941 Carb. Equip. Index.

Setting—To check, hold stopscrew against lowest step of fast idle cam, move choke valve toward closed position as far as possible, check choke valve opening with 11/32" drill. Adjust by bending connector rod.

Automatic Choke:—Stromberg BXOV-26 type.

For complete data, refer to 1941 Carb. Equip. Index.

Setting—'V' mark on thermostat case in line with reference mark on housing. May be varied not more than two graduations to improve warming up.

Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when free-wheeling. Kicks in at 4 MPH, kicks out at 9 MPH.

For complete data, refer to 1941 Carb. Equip. Index.

Setting—Set gap between plunger and carburetor throttle lever at .060" (carburetor set for 6 MPH slow idle speed), set spring tension adjusting screw 3/16" out beyond face of locknut.

Air Cleaner:—AC No. 1542093 oil-wetted type Std., Heavy duty oil-bath type Optl.

Fuel Pump:—AC Type AT. Inverted, diaphragm type. Pump Replacement Exchange No. 524G.

For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric. ***See article in Carburetion Equipment Section.***

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Marke certain that valve operates freely and does not bind or stick. Do not oil control.

VALVE TIMING:—To Check—With tappet clearance of .0125", #1 intake valve opens with piston 1° or .0004" BTDC. when first graduation before top dead center mark '#1 UP.DC' on vibration dampener lines up with pointer (permissible variation 4° either way). Reset tappet clearance at .007" hot.

Tappet Clearance:—.007" Int., .010" Exh. Warm. Adjusting screws are self-locking (no locknuts). Remove plate under right front fender for access to valves.

Valve Spring Pressure:—47-52 lbs. at 1⅝" (valve closed), 114-124 lbs. at 1 5/16" (valve open).

LUBRICATION:—Crankcase Capacity—5 qts.

Normal Oil Pressure—40 lbs. at 45 M.P.H.

COOLING SYSTEM:—**Capacity**—15 qts.

Pressure Valve:—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning Equipment).

Thermostat:—Bishop & Babcock. In cylinder head outlet. Starts to open at 147½°F.

TRANSMISSION (ECONO-DRIVE) CONTROL:—***Same as on '120' Eight. See Packard Eight page (following)***

BATTERY:—Willard Type SW-1-95. 6 volt, 15 plate, 95 Ampere Hour Capacity (20 hour rate).

Starting Capacity—117 amperes for 20 minutes.

Zero Capacity—300 amperes for 3.1 minutes. Five second voltage 4.2 volts.

Grounded Terminal—Positive (+) to frame 'X' member. **Engine Ground**—Separate strap connector from transmission to frame 'X' member.

Location—Under left front seat.

Dimensions—Length 9". Width 7". Height 8¾".

STARTER (AUTO-LITE):—Model MAW-4021 (First Cars), MAW-4024 (Later Cars). ***All data same as for Packard '120' Eight (see following page).***

STARTER (DELCO-REMY):—No. 1107037. Arm. No. 1878077.

Drive—Barrel Type Bendix No. A-1792.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—24-28 ozs. each.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, disconnect wires, take out flange mounting screws, remove starter and switch as an assembly.

Starting Switch:—Delco-Remy No. 1452. Magnetic type mounted on starter and controlled by push-button switch on instrument panel.

GENERATOR (AUTO-LITE):—Model GDZ-4801F(Std.), GEB-4802C-2 (Taxicab). ***All data same as for Packard '120' Eight (see following page).***

GENERATOR (DELCO-REMY):—No.1102682. Armature No. 1879002. Two brush (shunt) type with Current & Voltage Control.

Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output controlled by Current Regulator. See Regulator

Maximum Charging Rate—32-34 amperes, 8.0 volts hot. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

① Not maximum output. See Current Regulator.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—25 ozs. each.

Field Current—1.67-1.82 amperes at 6.0 volts.

Removal:—Generator pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—50 lbs. tension on spring scale hooked to generator frame, or ½" thumb-pressure deflection midway between gen. and pump pulleys.

REGULATOR (AUTO-LITE):—Model VRP-4002C,D. ***All data same as Packard '120' Eight (see next page).***

REGULATOR (DELCO-REMY):—No. 1118202. Single Core Type. Current & Voltage Regulator on dash.

For complete data, refer to 1941 Elec. Equip. Index.

CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot, 900 RPM.

Cuts Out—0-4.0 ampere discharge current.

Contact Gap—.020" (same for both sets).

Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts hot (operating temperature). Should be checked with cover in place and hot.

To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).

To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.

Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes hot (operating temp.).

To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).

To Adjust—Same as for Voltage Regulator (above).

Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.

For complete data, refer to 1941 Elec. Equip. Index.

Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).

Beam Indicator—Red light on left side of speedometer. Lighted when Upper Beams in use.

Switches

Lighting—Delco-Remy No. 1995011 (Std.), 1995019 (With Econo-drive—has dimmer switch for Econo-drive Indicator light controlled by switch knob).

Beam Selector—Delco-Remy No. 1997001 (LHD cars), 1997002 (RHD cars).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Front Fender	21-3	1154
Instr., Speed'mtr., Clock	1½	55
Front Reading, Econo Dr. Ind.	1½	55
Glove Compt., Beam Indicator	1	51
Stop & Tail	21-3	1154
Rear License	3	63
Dome	6	81

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70°F. Not adj.

FUSES:—Stop Light, Cigar Lighter & Accessories—Two 20 ampere. On back of lighting switch.

Instrument & Tail Light—20 ampere. In connector in lead near ammeter.

Clock—4 ampere. In lead near clock.

Econo-drive—30 ampere. In relay lead near starter.

Windshield Wiper—No fuse (circuit- breaker).

HORNS:—Sparton. Vibrator type, air tone, twin horns operated by relay.

Horn Current—22-25 amperes (total both horns).

Horn Relay:—R-B-M Model 6006.

Contacts Close—3-4 volts (with relay upright).

WINDSHIELD WIPER:—Stewart-Warner Series 645-E. Electric type. NOTE—'Klixon' type circuit-breaker mounted on unit (no fuse used).

For complete data, refer to 1941 Mech. Equip. Index.

PACKARD 1941

'120' EIGHT, MODEL 1901, 1A
AUTO-LITE ELECTRICAL SYSTEM

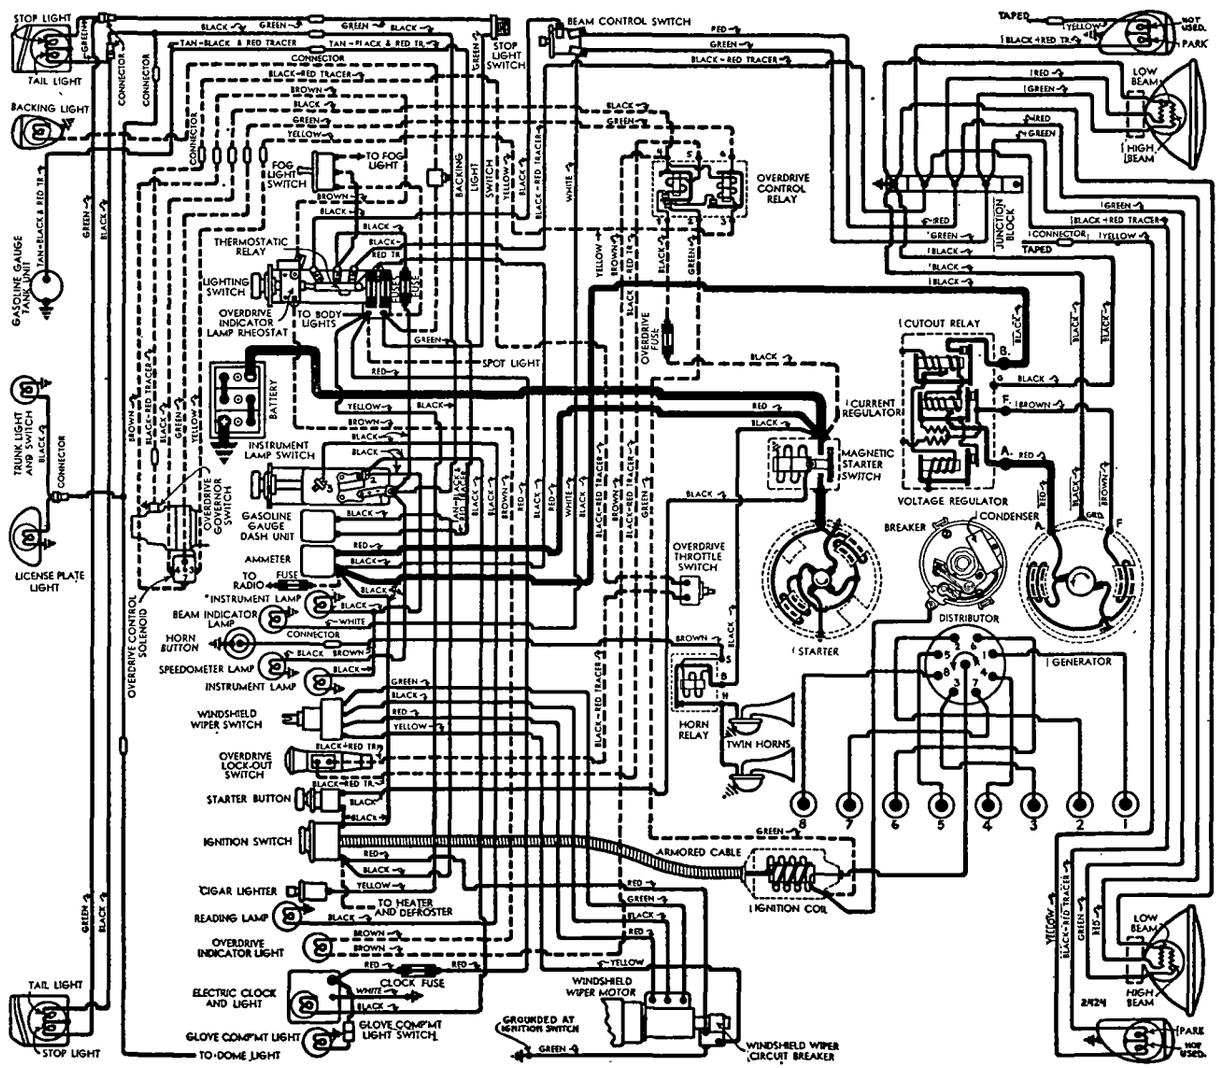
SERIAL NUMBER:—On left side of cowl (use Eng. No.).
ENGINE NUMBER:—First number D-300051. On left side of engine block between #2 and #3 cylinders.
COMPRESSION:—**Ratio**—6.41-1 Std., 6.85-1 HC Optl. **Pressure**—110 lbs. (6.41-1 Std. cast-iron hd.), 118 lbs. (6.85-1 HC Optl. cast-iron hd.) at cranking speed.
VACUUM READING:—Steady 18-20" idling at 6 MPH.
IGNITION:—**Coil Model CE-4644.** On left hand side of engine near distributor. Service Coil CE-3224VS. **Ignition Current**—2.4 amperes idling, 5 stopped.
Ignition Switch:—Mitchellock Model 24-B, No. 8781. **Ignition Lock**—Briggs & Stratton. B & S No. 50184. **Key Series**—P1250 to P1500. **Groove**—No. 2.
Distributor Auto-Lite IGP-4502. Single breaker, 8 lobe cam, full automatic advance type with vacuum spark control and Fuel Compensator Adjustment. **Breaker Gap**—Set at .015". **Cam Angle or Dwell**—27° clsd., 18° open (.017" gap). **Breaker Arm Spring Tension**—17-20 ounces. **Rotation**—Counter-clockwise viewed from above. **Condenser**—No. IG-2671K. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	0	500
3	525	6	1050
6	800	12	1600
9	1210	18	2420
11.5	1550	23	3100

Vacuum Spark Control—Separate unit mounted on hold-down plate and linked to adjusting quadrant on distributor. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance



Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	10"
1°	2°	11⅛"
3°	6°	13½"
5°	10°	15⅞"
6°	12°	17"

Fuel Compensator Adjustment—Permits 40° range of adjustment by loosening vacuum unit link screw at distributor quadrant. See Ignition Timing below.
Removal:—Distributor mounted on left side of crankcase. To remove, disconnect vacuum line, take out screw in hold-down plate, lift entire unit out.
FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.
SPARK PLUGS:—AC No. 104 or Champion Y4. 10 MM. Metric. NOTE—Do not tighten these small plugs excessively (50 in. lbs.). **Spark Plug Gaps**—.028" (.0255-.0305").
IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
All Heads	7° BTDC	.0202" BTDC.

Timing Mark Note—Marks now on vibration dampener at front of engine. Dampener marked '#1 UP. DC' with fifteen 1° graduations before this point. **Timing**—With #1 piston on compression, turn engine over until piston reaches firing position with correct mark on dampener in line with pointer on chain case cover (see table above). Loosen vacuum unit link screw in distributor quadrant, rotate distributor until contacts begin to open, tighten screw. Check Fuel Compensator Setting (below). **Timing (Neon Timing Light)**—Mark correct graduation on vibration dampener, clip neon timing light to #1 spark plug and direct light on vibration dampener, idle engine and adjust distributor as directed above.

Fuel Compensator Setting—Should be set for slight ping when accelerating engine with wide open throttle. To adjust, loosen vacuum unit link screw distributor quadrant, rotate one graduation at a time counter-clockwise (if ping too severe), clockwise (if no ping), until correct performance secured.
CARBURETION:—**Carburetor**—Carter Type WDO, Model 478-S (#327 cast on face of flange). 1" dual downdraft type with Climatic Control.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH. idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (½-1½ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump—Pump arm under dust cover at top of carburetor has two holes for pump link engagement. Set as follows:
Inner (min. stroke)—Hot weather or hi-test fuel.
Outer (max. stroke)—Cold weather or low-test fuel.
Float level—5/32" from top of float to bowl cover with valve seated (remove gasket & invert to check).
Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***
Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust fast idle screw for .030" throttle opening with choke valve closed.
Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Set thermostatic coil housing 1 Notch Rich.
Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when free-wheeling. Kicks in at 4 MPH., kicks out at 9 MPH.
For complete data, refer to 1941 Carb. Equip. Index.

Setting—Set gap between plunger and carburetor throttle lever at .020" (carburetor set for 6 MPH. slow idle speed), set spring tension adjusting screw 3/16" out beyond face of locknut.

Air Cleaner:—AC #1542094 oil-wetted type standard. Heavy duty oil-bath type optional.

Fuel Pump:—AC Type AH. Inverted, diaphragm type. Pump Replacement Exchange Part No. 525.

For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Stewart (Stewart-Warner) Electric.

For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—**To Check**—With tappet clearance of .0125", #1 intake valve opens with piston 1° or .0004" BTDC when 1st graduation before top dead center mark '#1 UP.DC' on vibration dampener lines up with pointer (permissible variation 4° either way). Reset tappet clearance at .007" hot.

Tappet Clearance:—.007" Int., .010" Exh. Warm. Adjusting screws are self-locking (no locknuts).

Valve Spring Pressure:—47-52 lbs. at 1⅝" (valve closed), 114-124 lbs. at 1 5/16" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 quarts.
Normal Oil Pressure—40 lbs. at 45 MPH.

COOLING SYSTEM:—**Capacity**—17 quarts.

Pressure Valve:—In filler cap. Opens at 4½ lbs. (Std.), 12 lbs. (with Air Conditioning Equipment).

Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 147½°.
NOTE—1901A equipped with radiator shutters controlled by thermostat in top radiator tank. Starts to open 135° (if cylinder head type thermostat also used, starts to open 162½°).

TRANSMISSION (ECONO-DRIVE) CONTROL:—Electric type with solenoid operated 'kick-down' through accelerator switch and governor switch.

For complete data, refer to 1941 Mech. Equip. Index.

Overdrive Solenoid—Delco-Remy Model 1118005.
Overdrive Indicator Light—Green light on right side of speedometer dial. Lighted whenever overdrive is ready to engage (light goes out when accelerator pedal is released so that overdrive can engage). See Lighting Switch under Switches (following).
Throttle Switch—Cole-Hersee. Packard No. 347946. Adjust tappet screw on throttle lever to just contact switch plunger with throttle valve wide open.
Governor Switch—Bendix No. 364782.
Control Relay—Delco-Remy Model 1116801.

BATTERY:—**Auto-Lite Type PN-17P.** 6 volt, 17 plate, 114 ampere hour capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.1 minutes.
Grounded Terminal—Positive (+) to frame.
Engine Ground—Strap from transmission to frame.
Dimensions—Length 10¼". Width 7". Height 8⅝".
Location—Under left front seat.

STARTER:—**Model MAW-4041 (early), MAW-4024 (later).**
Armature—MAW-2006 (MAW-4021), MAW-2128 (MAW-4024).
Drive—Outboard Barrel Type Bendix No. A-1718 (with MAW-4021), A-1792 (with MAW-4024 starter).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—125 RPM, 175 amperes, 5.1 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4900	5.5	65
0.6 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.

Starting Switch:—A-L Model SS-4017. Magnetic type. Mounted on starter and controlled by R.B.M. #5380 pushbutton switch on instrument panel.

For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—**Auto-Lite GDZ-4801F (Std.), GEB-4802C-2 (Police). Armature GDZ-2006F (GDZ), GEB-2006F (GEB).** Two brush types with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—35 amperes, 8.0 volts hot. Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data—GDZ-4801F

Cold			Hot

*35	8.0	1200	35	8.0	1520

*—Current Regulator setting.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (GDZ Gen.), 64-68 ozs. (GEB Generator) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.15-4.60 amperes (GDZ Gen.), 4.0-4.5 amperes (GEB Generator) at 6.0 volts.

Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.

Belt Adjustment:—50 lbs. tension on spring scale hooked to generator frame, or ½" thumb-pressure deflection between generator and pump pulleys.

REGULATOR:—**Auto-Lite VRP-4002C (GDZ Gen.), VRP-4002D (GEB Generator).** Current-voltage type. In case on left side of engine dash.

For complete data, refer to 1941 Elec. Equip. Index.

NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts, 920 generator RPM (cold).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" Min. **Air Gap**—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage steady. Voltage should agree with setting.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
Adjustment, Contact Gap, Air Gap—Same as for Voltage Regulator (above).

LIGHTING:—**Headlamps**—Hall 'Sealed Beam' type.

For complete data, refer to 1941 Elec. Equip. Index.

Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on left side of speedometer. Lighted when Country (Upper) beams in use.

Switches

Lighting—Delco-Remy No. 1995011 (Std.), 1995019 (Cars with Econo-drive—has dimmer switch for Econo-drive Indicator Light controlled by switch
Beam Selector—Delco-Remy No. 1997001 (LHD cars), 1997002 (RHD cars).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam	
Front Fender	21-3	1154
Instr., Speed'mtr., Clock	1½	55
Front Reading, Econo Dr. Ind.	1½	55
Glove Compt., Beam Indicator	1	51
Stop & Tail	21-3	1154
Rear License	3	63
Dome	6	81

THERMOSTATIC RELAY:—**Delco-Remy.** On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70° F. Not adj.

FUSES:—**Stop Light, Cigar Lighter and Accessories**—Two 20 ampere. On back of lighting switch.
Instrument & Tail Light—20 ampere. In connector in Lighting Switch to Panel Light Switch feed wire.
Clock—3 ampere. In feed wire near clock.
Econo-Drive—30 ampere. In relay lead near starter.
Windshield Wiper—No fuse (circuit-breaker).

HORNS:—**Sparton**—Vibrator type, air tone, twin horns operated by relay.
Horn Current—22-25 amperes (total both horns).
Horn Relay:—R-B-M Model 6006.
Contacts Close—3-4 volts (with relay upright).

WINDSHIELD WIPER:—**Stewart-Warner Series 645-E.** Electric type. NOTE—'Klixon' type circuit-breaker mounted on unit (no fuse used).

For complete data, refer to 1941 Mech. Equip. Index.

SERIAL NUMBER:—On left side of cowl (use Eng. No.).

ENGINE NUMBER:—First No. D-500051 ('160' 1903, 4, 5), CD-500051 ('180' 1906, 7, 8). Stamped on left side of cylinder block between #3 and #4 cylinders.

COMPRESSION:—**Ratio**—6.45-1 Std., 6.85-1 HC. Optl. Both heads are cast-iron type.

Pressure—118 lbs. at cranking speed (Std. head). 133 lbs. at 300 RPM. (Optl. 6.85-1 HC. head).

VACUUM READING:—Steady 18½" idling at 6 MPH.

IGNITION:—**Coil Model CE-4645.** On left side of engine near distributor. Service Coil CE-3224RS.
Ignition Current—2.4 amperes idling, 5 stopped.

Ignition Switch:—Mitchellock Model 24-B, No. 8779.
Ignition Lock—Briggs & Stratton. B & S No. 50184.
Key Series—P1250 to P1500. **Groove**—No. 2.

Distributor Auto-Lite IGT-4102. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum spark control and Fuel Compensator adj.
Breaker Plate Identification—Maximum vacuum advance limited by slot and marked by number (#5½) on plate.
Breaker Gap—Set at .015".
Cam Angle or Dwell—27° clsd., 18° open (.017" gap).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from the top.
Condenser—No. IG-2671J. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	250	0	500
3	475	6	950
6	700	12	1400
9	1300	18	2600
11½	1800	23	3600

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7"
1°	2°	8⅝"
3°	6°	12"
4°	8°	13½"
5½°	11°	16"

Fuel Compensator—Manual adjustment at distributor providing 10° advance or retard from center '0' position. See Ignition Timing for setting.

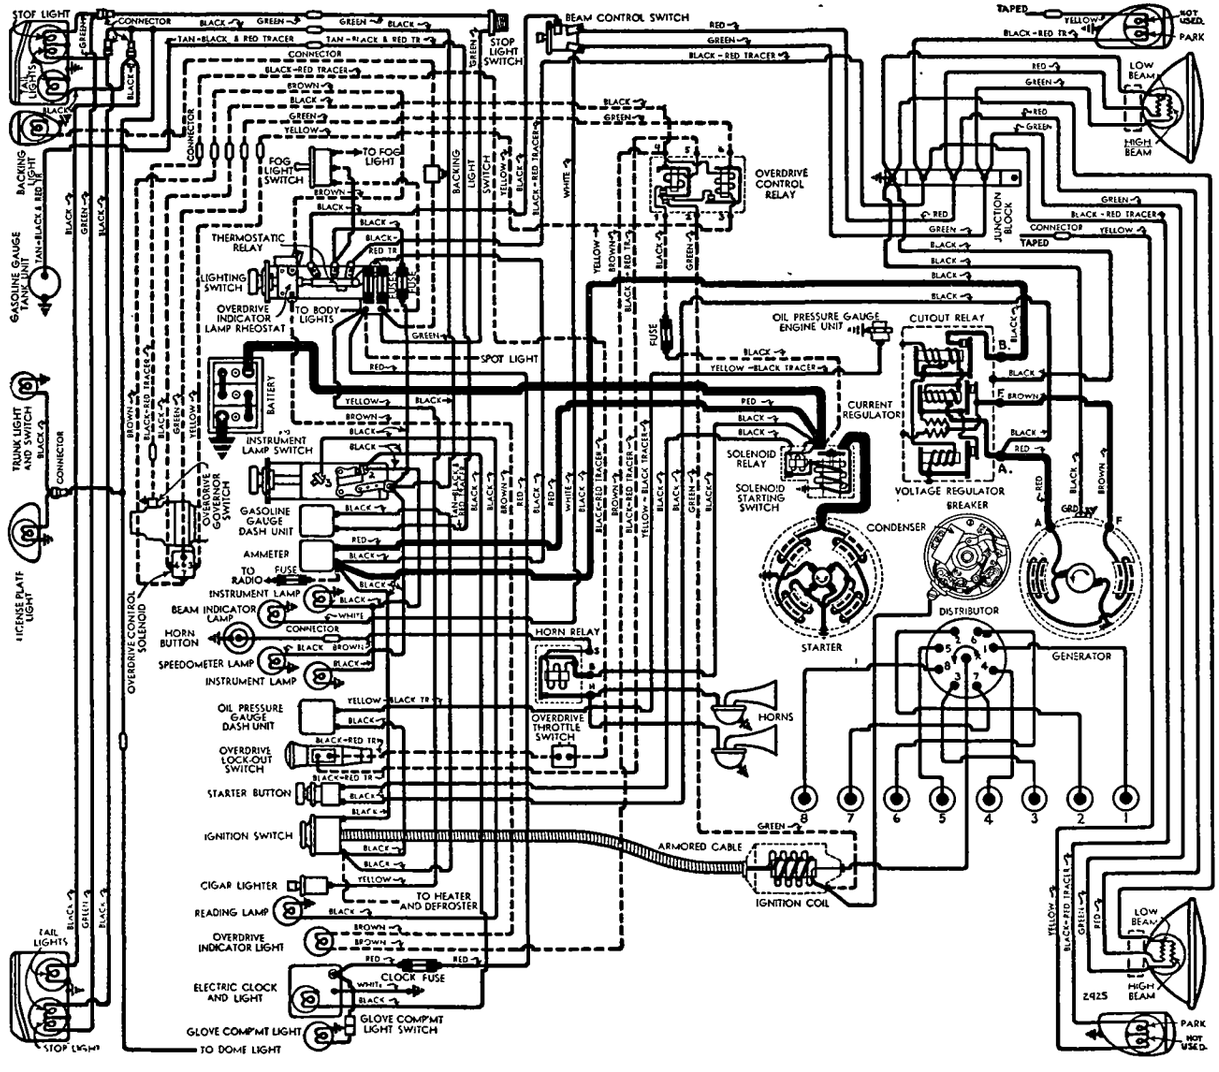
Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line and take out hold-down screw in advance arm.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

SPARK PLUGS:—AC No. 104 or Champion Y4. 10 MM. Metric. NOTE—Do not tighten these small plugs excessively (50 in. lbs.).
Spark Plug Gaps—.028" (.0255-.0305").

IGNITION TIMING:—Standard setting listed below (see Fuel Compensator Setting following):

	Flywheel Degrees	Piston Position
6.45-1 Std. hd.	3½-5° BTDC	.0053-.0110" BTDC
6.85-1 Optl. HC hd.	2½-4° BTDC.	.0027-.0070" BTDC



NOTE—Vibration dampener marked 'UDC' at TDC with 15 (1°) graduations before this point.

Timing—Loosen thumbnut, set Fuel Compensator pointer at '0', tighten thumbnut. With #1 piston on compression, turn engine over until piston reaches firing position (see table above), stop when correct graduation on vibration dampener at front of engine lines up with pointer on chain case cover. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open, tighten clamp bolt, see that rotor opposite #1 segment in distributor cap, check Fuel Compensator setting.

Timing (Neon Timing Light)—Mark vibration dampener with white paint at proper point, idle engine below 500 RPM, adjust distributor (above).

Fuel Compensator Setting—Should be set for slight ping when accelerating with wide open throttle. To adjust, loosen thumbnut, rotate distributor counter-clockwise (if ping too severe), clockwise (if no ping noted), tighten thumbnut and recheck performance.

CARBURETION:—**Carburetor**—Stromberg Model AAV-26. No. 380037 (Code marked 10-44). 1¼" dual downdraft type with Automatic Choke.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 6 MPH idle speed. Adjust idle adjusting screw (one for each barrel) in succession until engine fires smoothly. (1-1⅛ turns open for each screw—turn screws in for leaner mixture). Readjust idle speed.
Accelerating Pump Setting—Two holes provided in throttle lever for pump link engagement as follows:
Outer (max. stroke)—Normal setting.
Inner (min. stroke)—If less charge required.
Float Level—Fuel level ⅝" below top edge of bowl with engine idling (5 lbs. pressure).
Metering Jets—***See Stromberg Jet Table in Carburetor Section for complete data.***

Fast Idle: Integral (operated by Automatic Choke).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—To check, hold throttle stopscrew against high lobe of fast idle cam, move choke valve toward closed position as far as possible, check choke valve opening. Adjust by bending fast idle connector rod for 7/64" choke valve opening.
Automatic Choke:—Stromberg AAV-26 type (integral).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—'V' mark on thermostat cover lined up with mark on housing. May be varied not more than 2 graduations to improve warming up.
Throttle Guard (Cars with Econo-Drive):—Vacuum operated throttle kicker to prevent engine stalling when free-wheeling. Kicks in at 4 MPH., kicks out at 9 MPH.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Set gap between plunger and carburetor throttle lever at .020" (carburetor set for 6 MPH slow idle speed), set spring tension adjusting screw 7/32" out beyond face of locknut.
Air Cleaner:—AC #1542095 oil-bath type standard.
Fuel Pump:—AC Type AJ combination fuel-&-vacuum pump. Replacement Exchange Part No. 537.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—Stewart (Stewart-Warner) Electric.
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. Make certain that valve operates freely (valve must not bind or stick). Do not oil control.

VALVE TIMING:—To Check—#1 exhaust valve closes 10° or .0438" past top dead center with hydraulic lifter dry (all oil drained out) and built up with feeler stock for zero tappet clearance.
Tappet Clearance:—None in service (Wilcox-Rich 'zero lash' hydraulic tappet take-up used).
For complete data, refer to 1941 Mech. Equip. Index.
Valve Spring Pressure:—55-61 lbs. at 1¾" (valve clsd.), 130-140 lbs. at 1 13/32" (valve open).

LUBRICATION:—Crankcase Capacity—7 quarts.
Normal Oil Pressure—50 lbs. at 45 MPH.

COOLING SYSTEM:—Capacity—20 quarts.
Pressure Valve:—In filler cap. Opens at 7 lbs. (Std.), 12 lbs. (with Air Conditioning Equipment).
Thermostat:—In cylinder head water outlet and radiator top tank (operates shutters).
Setting—Starts to open 162½° (cylinder head type), starts to open 135° (radiator shutter type).

TRANSMISSION (ECONO-DRIVE) CONTROL:—Electric type with solenoid operated 'kick-down' through accelerator switch and governor switch.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118005.
Overdrive Indicator Light—Green light on right side of speedometer dial. Lighted whenever overis ready to engage (light goes out when accelerator pedal is released so that overdrive can engage). See Lighting Switch under Switches (following).
Throttle Switch—Cole-Hersee, Packard No. 347496. Adjust tappet screw on throttle lever to just contact switch plunger with throttle valve wide open.
Governor Switch—Bendix No. 364782.
Control Relay—Delco-Remy Model 1116801.

BATTERY:—Auto-Lite Type PN-17P. 6 volt, 17 plate, 114 ampere hour capacity (20 hour rate).
Starting Capacity—135 amperes for 20 minutes.
Zero Capacity—300 amperes for 4.1 minutes.
Grounded Terminal—Positive (+) to frame.
Engine Ground—Strap from transmission to frame.
Dimensions—Length 10¼". Width 7". Height 8⅝".
Location—Under left front seat.

STARTER:—Auto-Lite MAX-4041. Armature MAW-2069.
Drive—Overrunning clutch (solenoid pinion shift) through reduction gears.
Rotation—Clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque		**R.P.M.	Volts	Amperes
0	ft. lbs.	2695	5.5	77
33.5	"	Lock	3.0	652
45.9	"	Lock	4.0	906

**—Pinion shaft R.P.M.

Removal:—Flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws, lift out starter and switch assembly.
Starting Switch:—Solenoid Switch Type SS-4205. Controlled through relay by R-B-M #5380 push-button switch on instrument panel.
For complete data, refer to 1941 Elec. Equip. Index.

GENERATOR:—Auto-Lite GEA-4802A. Armature GDZ-2006F. Two brush with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes (hot or cold), 8.0 volts, 1570 RPM and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	780	0	6.4	840
4	6.6	870	4	6.6	935
8	6.8	960	8	6.8	1025
12	6.95	1050	12	6.95	1120
16	7.15	1140	16	7.15	1220
20	7.3	1230	20	7.3	1320
24	7.6	1320	24	7.6	1420
28	7.7	1410	28	7.7	1550
32	7.85	1500	32	7.85	1685
35	8.0	1570	35	8.0	1800

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.57-1.75 amperes at 6.0 volts.
Motoring Current—4.45-4.9 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Swing generator out until 50 lb. reading secured on scale hooked to clamp bolt lug parallel to clamp link or until belt deflection midway between generator and water pump pulley is ½" with thumb pressure.

REGULATOR:—Auto-Lite VRP-4002C. Current-Voltage Type. Mounted in single case on engine side of dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay
Cuts In—6.4-6.6 volts, 780 generator RPM (cold).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—Headlamps—Hall 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on left side of speedometer dial. Lighted when Country (upper) beam in use.

Switches
Lighting—Delco-Remy No. 1995011 (Std.), 1995019 (Cars with Econo-drive—has dimmer switch for Econo-drive Indicator Light controlled by switch knob).
Beam Selector—Delco-Remy No. 1997001 (LHD cars), 1997002 (RHD cars).

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	Sealed Beam

Dome	6	81

THERMOSTATIC RELAY:—Delco-Remy. On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with 42 amps. @ 70° F. Not adj.

FUSES:—Stop Light, Cigar Lighter and Accessories—Two 20 ampere. On back of lighting switch.
Instrument & Tail Light—20 ampere. In connector in Lighting Switch to Panel Light Switch feed wire.
Clock—4 ampere. In feed wire near clock.
Econo-Drive—30 ampere. In relay lead near starter.
Radio—14 amp. In feed wire (factory-equipped).

HORNS:—Sparton—Vibrator type, air tone, twin horns operated by relay.
Horn Current—33-36 amperes (total both horns).
Horn Relay:—R-B-M Model 6036.
Contacts Close—3-4 volts (with relay upright).

WINDOW REGULATORS:—Hydro-electric type.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—*See Chrysler Shop Notes in 'M' Section.*

SERIAL NUMBER:—On right front door hinge post.

	Detroit	Los Angeles	Evansville	Canada
P11	15,000,101	3,121,501	22,001,001	9,821,241
P12	11,123,001	3,269,301	20,105,001	9,616,761

ENGINE NUMBER:—P11-1001 & up (P11), P12-1001 & up (P12). On left side of block between #1 & #2 cyls. **Economy Engine Note**—Economy models (with special carburetor & rear axle ratio) marked by 'E' in Eng. No. as follows: P11-E-1001 or P12-E-1001.

COMPRESSION:—**Ratio**—6.7-1 cast-iron head std. **Pressure**—145-155 lbs. at 1000 RPM or approx. 115 lbs. at cranking speed (std. head). 10 lbs. maximum variation between cylinders.

VACUUM READING:—Steady 18-20" idling (below 1000').

IGNITION:—**Auto-Lite Coil No. IG-4661.** Service winding (less switch & cable) IG-3224JS. On engine dash. **Ignition Current**—2.25 amperes idling, 5 stopped. **Ignition Switch:**—Mitchellock Model 24-R, No. 8197. **Ignition Lock**—Yale & Towne or Briggs & Stratton. B&S No. 80592. Key Series 1BP to 1000BP. Groove #24. **Distributor Auto-Lite IGS-4111-1, IGS-4113-1 (Canada).** Single breaker, 6 lobe cam, full automatic advance type with vacuum spark control and manual adjustment. **Breaker Plate Identification**—#10 (IGS-4111-1), #7 (IGS-4113-1) stamped on plate. Maximum vacuum advance limited by slot in plate. **Breaker Gap**—Set at .020". **Cam Angle or Dwell**—38° closed, 22° open (distr. °). **Breaker Arm Spring Tension**—17-20 ounces. **Rotation**—Clockwise viewed from above. **Condenser**—No. IG-3927A. Capacity .25-.28 mfd.

Automatic Advance—IGS-4111-1

Distributor Degrees	Distributor R.P.M.	Engine Degrees	Engine R.P.M.
Start	350	0	700
3	400	6	800
6	950	12	1900
9	1500	18	3000
11	1850	22	3700

Automatic Advance—IGS-4113-1

Start	350	0	700
3	400	6	800
6	850	12	1700
9	1300	18	2600
12	1750	24	3500

Vacuum Spark Control—Integral type (on distributor, linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance—IGS-4111-1

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	5"
2°	4°	7⅜"
5°	10°	11"
8°	16°	14⅝"
10°	20°	17"

Vacuum Advance—IGS-4113-1

Start	0°	5"
1°	2°	6½"
3°	6°	9¼"
5°	10°	12⅛"
7°	14°	15"

Manual Adjustment—Provides for minor changes in ignition timing at distributor. See Ignition Timing for adjustment.

Distributor Removal:—Mounted on left side of crankcase. To remove, disconnect vacuum line, take out hold-down screw in lock plate. **Installation Note**—Install distributor with #1 piston in firing position (at TDC) and rotor opposite #1 segment in cap.

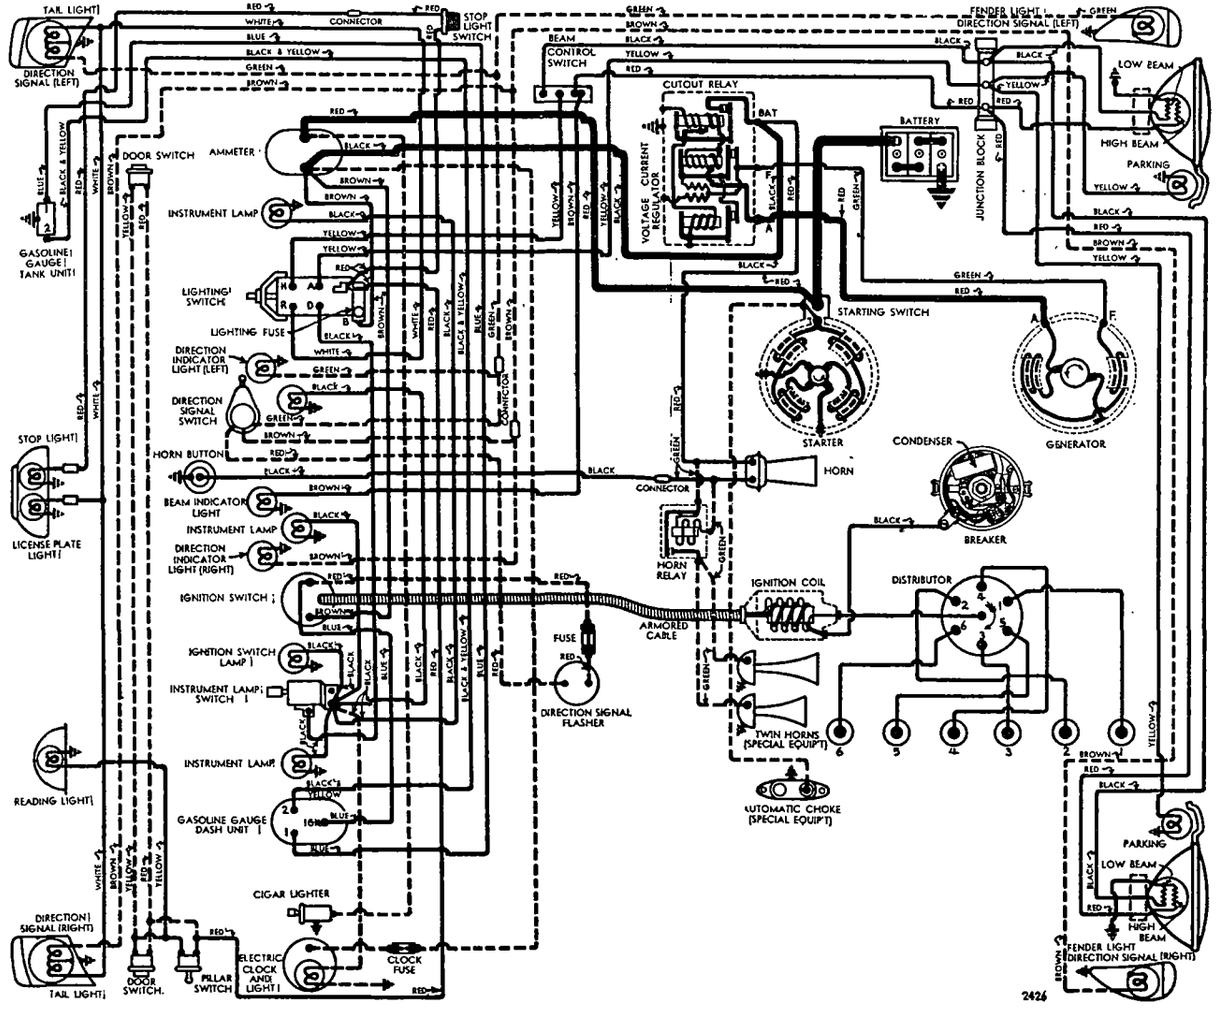
FIRING ORDER:—1-5-3-6-2-4. See diagram.

SPARK PLUGS:—Auto-Lite A-7B. 14 MM. metric. NOTE—Spark plug tightening tension 26-32 ft. lbs. **Spark Plug Gaps**—Set at .025".

IGNITION TIMING:—Initial setting (correct for fuel of approx. 70 octane rating at low altitudes for all heads) shown below. See Manual Adjustment (following) for minor changes for local fuel & altitudes.

	Flywheel Degrees	Piston Position
All cyl. heads	0° at TDC	.0000" at TDC

NOTE—Crankshaft pulley marked 'DC' at TDC point with 15 (1°) graduations on either side.



Timing (Using Timing Light)—Connect timing light between distributor primary terminal and battery terminal on generator regulator. Set #1 or #6 piston in firing position (see setting above) with correct mark on crankshaft pulley aligned with pointer on chain case cover. Loosen lock-plate hold-down screw, center pointer on scale, tighten screw. Loosen lock-plate clamp bolt, rotate distributor until timing light just goes out, tighten clamp bolt. Check Manual Adjustment (following).

Timing (Using Synchroscope)—Tool C-374. Clip lead to #1 spark plug, direct light on crankshaft pulley (mark correct graduation with paint), idle engine and adjust distributor (as above) until mark appears in line with pointer.

Manual Adjustment—Set to give slight ping from 10-30 MPH accelerating with wide open throttle from 10 MPH. To adjust, loosen lock-plate hold-down screw, move plate (not more than 4° or .007" before or after initial setting) counter-clockwise (if no ping noted), clockwise to retard spark (if ping too severe), tighten screw.

CARBURETION:—**Carburetor**—Carter (Ball & Ball) Models D6A2 (Std.), D6C2 (with Automatic Choke). 1½" single barrel, downdraft types.

For complete data, refer to 1941 Carburetor Index.

Economy Carburetor—Carter (Ball & Ball) Model B6P1. 1¼" single barrel, downdraft type.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative on D6A2 & D6C2), set throttle stopscrew for 6 MPH min. idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1¼ turns open D6A2 & D6C2, ½-1½ turns open B6P1—turn screw in for leaner mixture). Readjust idle speed. NOTE—If vacuum gauge used, adjust carburetor for highest obtainable vacuum (see Vacuum Gauge data
Accelerating Pump Setting—Pump lever has three holes for pump link engagement. Set as follows: Inner Hole (minimum stroke)—Extreme hot temperatures or altitudes above 3000 feet.
Center Hole (med. stroke)—Normal summer setting.
Outer Hole (max. stroke)—Winter setting.
Float Level—5/64" from top of float (not seam) to top edge of bowl with valve seated. Use Tool C-449.
Metering Jet—***See Carter (B&B) Jet Tables in Carburetor Section for complete data.***
NOTE—If lean metering jet (High Altitude calibration) used at lower altitudes for increased economy, speed and power are reduced (not recommended).
Fast Idle:—D6A2 & D6C2 only. Not adjustable.
Throttle Cracker:—Not adjustable.
Automatic Choke:—Sisson AC-758B (on optl. D6C2).
For complete data, refer to 1941 Carb. Equip. Index.
Air Cleaner:—AC #1529937 heavy duty oil-bath type.
Fuel Pump:—AC diaphragm type pump. Replacement Exchange Pump No. 505.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—Auto-Lite electric. No. NG-9651D (dash unit), No. 9329T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.
MANIFOLD HEAT CONTROL:—Thermostatic coil type. See that valve and shaft rotate freely. When installing coil, place inner end in slot in valve shaft, **wind free end up one turn only counter-clockwise**
VALVE TIMING:—To Check—With .014" (cold) tappet clearance #6 intake valve should open with #6 piston **12° or .060" BTDC (Approx. first 20,000 cars), 9° or .0343" BTDC (Approx. after 20,000 cars)** with 12th graduation (first cars), 9th graduation (later cars) before DC mark on crankshaft pulley aligned with pointer. Reset tappet clearance at .008" hot.
Tappet Clearance:—.008" Intake, .010" Exh. (hot & idling). .002" add'l. exh. clearance desirable for sustained high speeds. NOTE—Self-locking tappet screws used. Remove right front wheel and lower wheel housing panel for access to valves.
Valve Spring Pressure:—40-45 lbs. at 1¾" (valve closed), 107-115 lbs. at 1⅜" (valve open).
LUBRICATION:—Crankcase Capacity—5 qts. (refill).
Normal Oil Pressure—30-45 lbs. at 30 MPH & above.
COOLING SYSTEM:—Capacity—14 quarts.
Thermostat—Bishop & Babcock or Fulton. In outlet on head. Starts to open 157-162°. Fully open 183°.
Temperature Gauge—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9650.
For complete data, refer to 1941 Mech. Equip. Index.
BATTERY:—Auto-Lite CF-1-13 (P11), CF-1-13R (P12). 6 volt, 13 plate, 90 ampere hour (20 hour rate).
Grounded Terminal—Positive (+) to engine.
Location—Under hood in left fender shield.
STARTER:—Auto-Lite MZ-4089,A. Armature MZ-2108. MAW-4019,A (Canada). Armature MAW-2030.
See 1941 De Soto S8 'T&E' page for MAW-4019 data.
Drive—Overrunning clutch (manual pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—150-175 amperes, 5.1 volts.

Performance Data

Torque		R.P.M.	Volts	Amperes
0	ft. lbs.	4300	5.5	70
2.55	"	1325	5.0	200
4.95	"	750	4.5	300
7.65	"	220	4.0	400
7.8	"	Lock	3.0	420
11.8	"	Lock	4.0	560

Removal:—Flange mounted on left front face of flywheel housing. Disconnect wires (tape battery lead). Remove oil filter tubes, filter and 2 starter bolts.
Starting Switch:—A-L SW-2813. On starter. Manually operated by starter (pinion shift) pedal.
GENERATOR:—Auto-Lite GDZ-4801B (Std.), GEB-4801A, GEG-4818A (City Police & Taxicab), GEG-4818B (State Police). Two brush. With current and voltage regulation. Ventilated.
Armature Nos.—GDZ-2006F (GDZ-4801A), GEB-2006F (GEB-4801A), GEG-2006F (GEG-4818B).
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
Maximum Charging Rate—35 amperes (GDZ Gen.), 40 amperes (GEG Gen.), 8.0 volts, 2200 Gen. RPM (GDZ), 1680 RPM (GEG), at approx. 24 MPH (GDZ) and above with load or discharged battery (Current Regulator setting). Actual charging rate controlled by voltage regulator, dependent on battery condition.

Cold Performance Data—GDZ-4801B Hot

40①	8.0	1520	40	8.0	1680

①—Current regulator setting. See Regulator data.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (GDZ Gen.), 64-68 ozs. (GEB & GEG Gen.) with new brushes.
Field Current—1.60-1.78 amperes at 6.0 volts (all).
Motoring Current—4.16-4.60 amperes (GDZ Gen.), 4.5 amps. (GEB), 4.7-5.2 amps. (GEG) at 6.0 volts.
Removal:—Pivot mounted at left side of engine at front. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, pull out on generator until belt is snug or 40-50 lbs. tension secured on scale attached to field frame.
REGULATOR:—Auto-Lite VRP-4001A (GDZ Gen.), VRP-4001B (GEB Gen.), VRP-4001F (GEG Gen.). Current-Voltage types. In case on dash.
NOTE—For negative battery ground, VRP-4005A (GDZ), VRP-4005B (GEB), VRP-4005E (GEG) used.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts at approx. 1000 gen. RPM (VRP-4001A,5A), 600 RPM (1B,5B), 820 RPM (1F,5E).
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" Min. **Air Gap**—.031-.034" with contacts open (measure at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage steady. Voltage should agree with setting.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting (VRP-4001A,5A)—34-36 amperes (marked '35' on cover). **(VRP-4001F,5E)**—39-41 (marked '40').
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at max. rate with regulator operating. Current reading should agree with setting above.
Adjustment, Contact Gap, Air Gap—Same as for for Voltage Regulator (above).
LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. ***For data refer to Elec. Equip. Index.***
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center height).
Beam Indicator—Red light on upper edge of panel above speedometer. Lighted with upper beams on.
Direction Signal—***Refer to 1941 Elec. Equip. Index.***

Switches

Lighting—Plymouth No. 863823.
Beam Selector—Plymouth No. 859974.
Instrument—Plymouth No. 853371.
Direction Signal—Plymouth No. 865763.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Park., Instr., Dir. Ind.	1½	55
Front Direction Signal	21	1129
Beam Ind., Ign. Switch	1	51
Rear Dir. Sig. & Tail	21-3	1158
Stop	21	1129
Rear License, Tail (No Sig.)	3	63
Reading or Dome	15	87

FUSES:—Lighting—30 amp. On back of light switch.
Direction Signal (late cars)—30 amp. Behind instr. panel in wire from ign. switch to flasher.
HORNS:—Single—Auto-Lite HA-4001 or Delco-Remy 1999911 (low note) or 1999918 (high). P11 Std.
Dual (Optl.)—HO-5003 (P11,12 Dom. & Can.), HO-5005 (P11,12), HO-5007 (P12 only) Horn Sets or HA-4026, 28, 30 (Low Pitch), HA-4027, 29, 31 (High Pitch) horn (P12).
Current Draw—Approx. 7 amps. single, 35-40 dual.
Horn Relay:—Auto-Lite Model HRC-4001 (no fuse).
Contacts Close—1.5-3.0 volts. **Open**—.5 volt.
Contact Gap—.026". **Air Gap**—.016-.020" (closed).

HOOD LOCK:—Hood is Alligator type with instrument panel lock. To raise hood, pull the control knob on instrument panel (hood will raise slightly), push up on Safety Catch tab under front edge of hood to release safety catch, lift hood up.

SERIAL NUMBER:—Stamped on plate on left side of dash under engine hood. First number for each model and plant as follows:

	Pontiac	Linden	California
Deluxe 41-25	P6JA-1001	L6JA-1001	C6JA-1001
Str'mlnr. 41-26	P6JB-1001	L6JB-1001	C6JB-1001
Custom 41-24	P6JC-1001	L6JC-1001	C6JC-1001

ENGINE NUMBER:—First number 6-761501. Stamped on boss on left front corner of engine block.

COMPRESSION:—**Ratio**—6.5-1 Std., 7.5-1 Optl. HC. (HC head requires Ethyl fuel at low altitudes).
Pressure—155 lbs. at 1000 RPM. or approximately 118-120 lbs. at cranking speed (Std. Head).

VACUUM READING:—18-20" steady idling at 7-8 MPH.

IGNITION:—**Delco-Remy Coil No. 1115023.** On dash.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy No. 1116306 (LHD), 1116312 (RHD.). Connected to coil by armored cable.
Ignition Lock Cylinder—Briggs & Stratton 45792. Key Series—8000 to 9499. Groove—No. 15.
Distributor Delco-Remy Model 647-D. Single breaker, 6 lobe cam, full automatic advance type with auxiliary vacuum control and Gaselector adjustment.
Breaker Gap—.020". Limits .018-.024".
Cam Angle or Dwell—35° closed, 25° open.
Breaker Arm Spring Tension—17-21 ozs.
Rotation—Counter-clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M	Engine Degrees	R.P.M.
Start	400	4	800
8	1050	16	2100
8.5	1450	17	2900
14.25	2000	28.5	4000

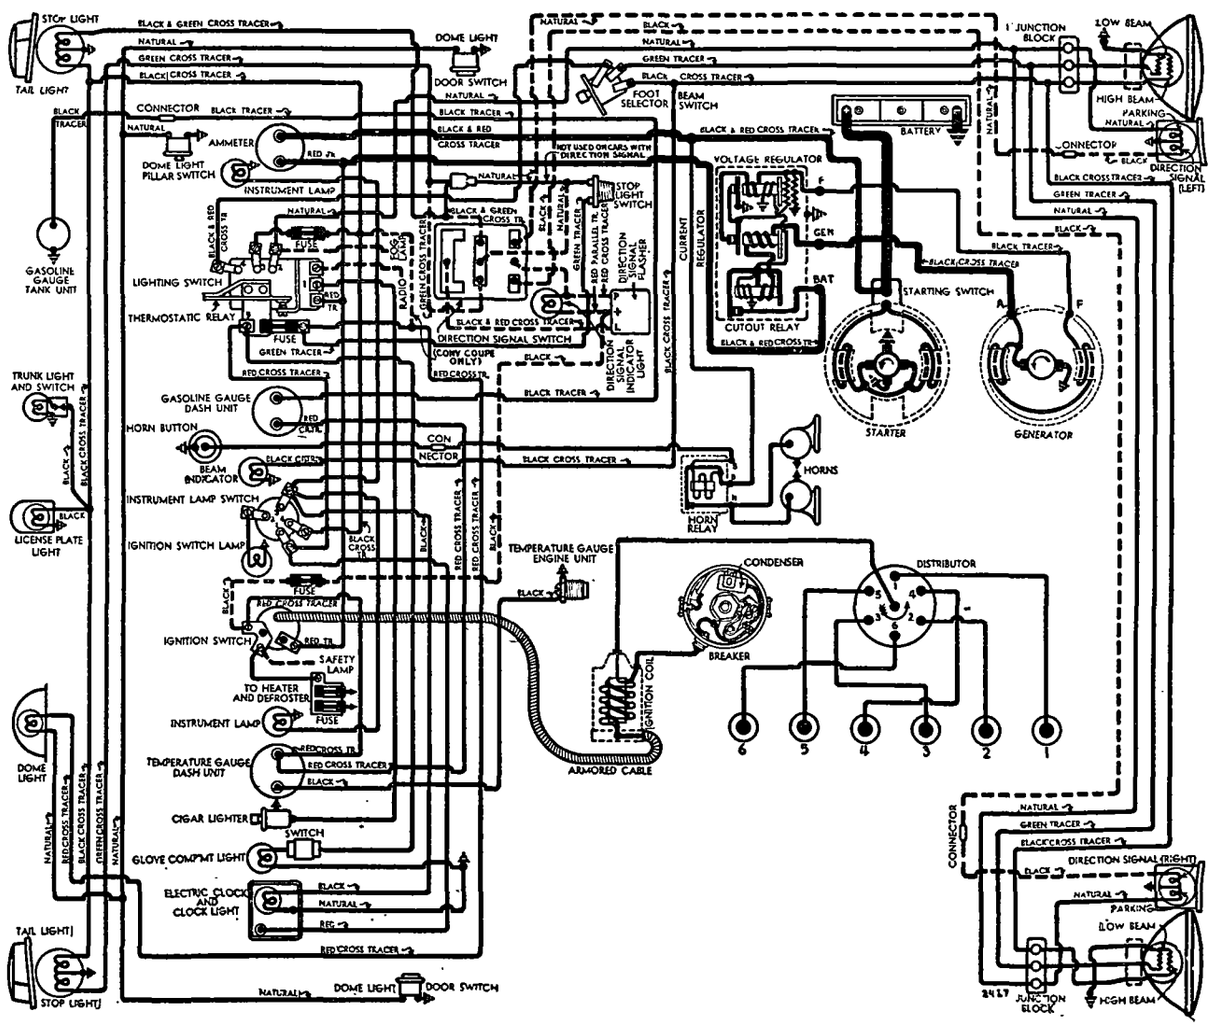
Vacuum Spark Control Model 681-M. On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. **Plunger Travel**—9/64" total.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG).
Start	0°	7-9"
6.5°	13°	13-16"
7.5-8.5°	15-17°	16-18"

Gaselector—Manual adjustment providing 10° advance or retard from center '0' position. See Ignition Timing for Gaselector Adjustment.
Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out screw in Gaselector arm, lift distributor out.

FIRING ORDER:—1-5-3-6-2-4. See diagram.



SPARK PLUGS:—AC No. 45. 14 MM. Metric.
Spark Plug Gaps—.025".

IGNITION TIMING:—Standard setting given below (regular fuel Std. Head, Ethyl fuel HC. Head). See Gaselector Setting (following) for correction and final setting.

Flywheel Degrees	Piston Position
All Engines 6° BTDC	.0138" BTDC

Timing Mark Note—Two straight lines of ignition mark '/IGN.ONE/' indicate allowable timing range of 4° on flywheel. Use first (6°) line for setting ignition (second line is 2° before top dead center mark). NOTE—Manufacturer recommends use of HM-494 Timing Light or J-578 Synchroscope for Timing.
To Set Timing (With Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0138" before top dead center with first line of ignition mark '/IGN.ONE/' lined up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen Gaselector screw, center pointer scale ('0' mark at reference line), tighten screw. Loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts just opening), tighten clamp bolt. Check Gaselector setting.
To Set Timing (With Synchroscope)—Connect synchroscope in series with #1 spark plug, fill in first line of ignition mark '/IGN.ONE/' with chalk or white paint, direct synchroscope light on flywheel (inspection hole on left side), idle engine at 6 MPH., adjust distributor as directed above.
Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen Gaselector arm screw, move arm clockwise (toward 'ADV' end of scale) to advance spark, counter-clockwise (toward 'RET' end of scale) to retard spark, tighten locking screw.

CARBURETION:—**Carburetor**—Carter WA-1 Model 494-S, 1¼" downdraft type with Climatic Control. NOTE—Casting No. 348 on face of flange.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for idle speed of 7-8 MPH (450-475 RPM.). Adjust idle adjusting screw so that engine fires smoothly (turn screw in for leaner mixture). Final setting should be ½-1½ turns of screw from inner seated position. Recheck idle speed. NOTE—Vacuum gauge recommended for this adjustment
Accelerator Pump Setting—Pump arm and plunger under dustcover on top of float bowl have two holes for connector link engagement as follows:
Upper Holes (inner hole in arm, upper hole in plunger)—Short stroke for all normal service.
Lower Holes (outer hole in arm, lower hole in plunger)—Long stroke for extremely cold climates.

Float Level—½" from top of projection on cover to top of soldered seam at free end of float (remove cover and invert to check). NOTE—This setting supersedes 7/16" setting (original specification).
Metering Rod & Jet—*See Carter Jet Table in Carburetor Section for complete data.*
Accelerator Linkage Adjustment:—Must be set to provide correct 'throttle cracking' action for starting. To adjust, after carburetor set for correct 7-8 MPH. hot or slow idle speed, disconnect battery cable at starting motor (to prevent starter cranking engine), insert 9/64" drill rod (or .138" diameter round steel rod) between throttle lever stopscrew and stop, fully depress starting pedal, loosen locknut and adjust eccentric throttle cracker pin on starter motor lever so that all clearance between pin and lever on accelerator cross-shaft is taken up,
Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—With fast idle cam in hot or slow idle position, close choke valve until throttle stopscrew is against (not on) first step of fast idle cam, adjust by bending connector rod offset so that choke valve opening is ⅝" (check opening with gauge T109-85).
Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—3 notches Rich.
Air Cleaner:—AC No. 1529871 oil-wetted type Std., heavy duty oil-bath type Optl. Copper-gauze type cleaner installed on oil filler and crankcase ventilator cap (and on ventilator outlet pipe on cars with heavy duty oil-bath type air cleaner).
CAUTION—Filler cap must be installed with air opening in cap toward front of car and seam in line with groove in tube (may cause excessive oil consumption if installed backward).
Fuel Pump:—AC Type AH diaphragm type Std. Replacement exchange pump No. 496. Combination fuel-and-vacuum pump Type AJ Optl.
For complete data, refer to 1941 Carb. Equip. Index.
Gasoline Gauge:—AC Electric. No. 1516295 (Dash Unit), No. 1516316 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.
MANIFOLD HEAT CONTROL:—Thermostatic coil type, non-adjustable (fixed anchor pin). Counterweight should be securely clamped to shaft in approximately vertical position with valve closed (cold).
VALVE TIMING:—To Check—With .015" tappet clearance, #1 intake valve opens with piston 5° or .0096" before top dead center and first line of ignition mark '/IGN.ONE/' on flywheel slightly past indicator (left side—mark is 6° BTDC).
Tappet Clearance:—.011-.013" all valves Hot (.011" gauge 'go', .013" 'no go'). NOTE—.013" exhaust clearance recommended for sustained high speed.
Valve Spring Pressure:—56-63 lbs. at 1 29/32" (valve closed), 97-105 lbs. at 1 19/32" (valve open).
LUBRICATION:—Crankcase Capacity—6 qts.
Normal Oil Pressure—35-40 lbs. with warm oil.
COOLING SYSTEM:—Capacity—18 qts.
Pressure Valve—In filler cap. Opens at 3¾ lbs.
Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 151°. Fully open at 173°.
NOTE—Special thermostat (for use with permanent anti-freeze) opens at 160°.
Temperature Gauge:—AC Electric. No. 1511053 (Dash Unit), No. 1510772 (Engine Unit).
For complete data, refer to 1941 Mech. Equip. Index.
BATTERY:—Delco Type 15-EZ-W. 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage 4.25 volts.
Grounded Terminal—Negative (—) on left side of engine block. Engine Ground (Cars with Radio)—strap connector from cylinder head to steering gear
Location—On left side in engine compartment.
Police Battery Delco Model 19E-1. 6 volt, 19 plate 130 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage 4.55 volts.
Grounded Terminal & Location—Same as for Type 15-EZ-W above.
STARTER:—Delco-Remy 1107032, Armature No. 1867897
Drive—Overrunning clutch with manual pinion shift operated by starting pedal on toeboard.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.
Cranking Engine—200 amperes at 5 volts.

Performance Data—1107032

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5000	5.0	65
12 "	Lock	3.37	525

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.
Starting Switch (1107032):—No. 820052. Mounted on starter and operated by starting pedal.
GENERATOR:—Delco-Remy 1102665, Armature 1879002 (Std.), Model 1106403 (Police). Two brush type with current and voltage regulation.
Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator. See Regulator data below.
Maximum Charging Rate—30 amperes, 8.0 volts, 1700 RPM (1102665 Gen.), 1040 RPM (1106403 Gen.) and above (Current Regulator Setting) with load or discharged battery. Actual charging rate controlled by Voltage Regulator and dependent on battery

Performance Data—1102665

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

Performance Data—1106403

Cold	35①	8.0	1040

①Not maximum output. See Current Regulator.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ounces each.
Field Current—1.67-1.82 amperes (1102665), 1.77-2.0 amperes (1106403) at 6.0 volts.
Removal:—Generator pivot mounted on left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Belt deflection or sideplay midway between generator & pump pulley should be 1½".
REGULATOR:—Delco-Remy 1118201 (1102665 Gen.), 1118229 (1106403 Gen.). Single Core Type. Vibrating Current & Voltage Regulator in case on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay

Cuts In—6.2-6.7 volts hot.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator

Setting—7.2-7.4 volts (1118201), 7.0-7.2 volts (1118229) hot (operating temperature). Regulator should be checked Hot and with cover in place.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator

Setting—32-34 amperes (1118201), 34-36 amperes (1118229) hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).
LIGHTING:—Headlamps—Guide 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).
Beam Indicator—Pontiac emblem on face of speedometer dial. Lighted when upper beams in use.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches

Lighting—Delco-Remy 1995018.
Beam Selector—Delco-Remy 1997002 (LHD cars), 465-V (RHD cars).
Instrument—Delco-Remy 1997740.
Stop Light—Delco-Remy 1997725.

Bulb Specifications

THERMOSTATIC RELAY:—On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with current of 42 amperes at 70°F. Not adj.
FUSES:—Tail & Instrument Light—9 ampere. In connector in lead near lighting switch.
Stop & Dome Light—9 ampere. On lighting switch.
Heater & Defroster— 9 ampere each. On fuse block on instrument panel brace to left of ignition switch.
Direction Signal—9 ampere. In connector in feed wire between flasher and ignition switch.
Radio—9 ampere (Master), 14 ampere (Deluxe), 20 ampere (Super Deluxe type).
HORNS:—Delco-Remy No. 1999519 (Low Note), 1999520 (High Note). Vibrator type, blended tone, twin horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999519 (low note)	19-21 amperes	.045-.049"
1999520 (high note)	17-19 amperes	.035-.039"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.015-.020". **Air Gap**—.015" (closed). **Contacts Close**—2.5-3.5 volts.

HOOD LOCK:—Hood is Alligator type with instrument panel lock. To raise hood, pull the control knob on instrument panel (hood will raise slightly), push up on safety catch tab under front edge of hood to release safety catch, lift hood up.

SERIAL NUMBER:—Stamped on plate on left side of dash under engine hood. First number for each model and plant as follows:

Model	Pontiac	Linden	California
Deluxe 41-27	P8JA-1001....	L8JA-1001....	C8JA-1001
Streamlnr. 41-28	P8JB-1001....	L8JB-1001....	C8JB-1001
Custom 41-29	P8JC-1001...	L8JC-1001....	C8JC-1001

ENGINE NUMBER:—First Number 8-246501. Stamped on boss on left front corner of engine block.

COMPRESSION:—**Ratio**—6.5-1 Std., 7.5-1 Optl. HC. (HC. head requires Ethyl fuel at low altitudes).
Pressure—155 lbs. at 1000 RPM. or approximately 118-120 lbs. at cranking speed (Std. Head).

VACUUM READING:—18-20" steady idling at 7-8 MPH.

IGNITION:—**Delco-Remy Coil No. 1115129.** On dash.
Ignition Current—2.5 amperes idling, 4.5 stopped.
Ignition Switch:—Delco-Remy No. 1116306 (LHD), 1116312 (RHD). Connected to coil by armored cable.
Ignition Lock Cylinder—Briggs & Stratton 45792. Key Series—8000 to 9499. Groove—No. 15.
Distributor Delco-Remy No. 1110804. Single breaker, 8 lobe cam, full automatic advance type with auxiliary vacuum control and Gaselector adjustment.
Breaker Gap—.015". Limits .0125-.0175".
Cam Angle or Dwell—31° closed, 14° open.
Breaker Arm Spring Tension—19-23 ozs.
Rotation—Counter-clockwise viewed from above.
Condenser—Part No. 1869704. Capacity .18-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	4	800
7	1100	14	2200
8.5	1550	17	3100
14	2100	28	4200

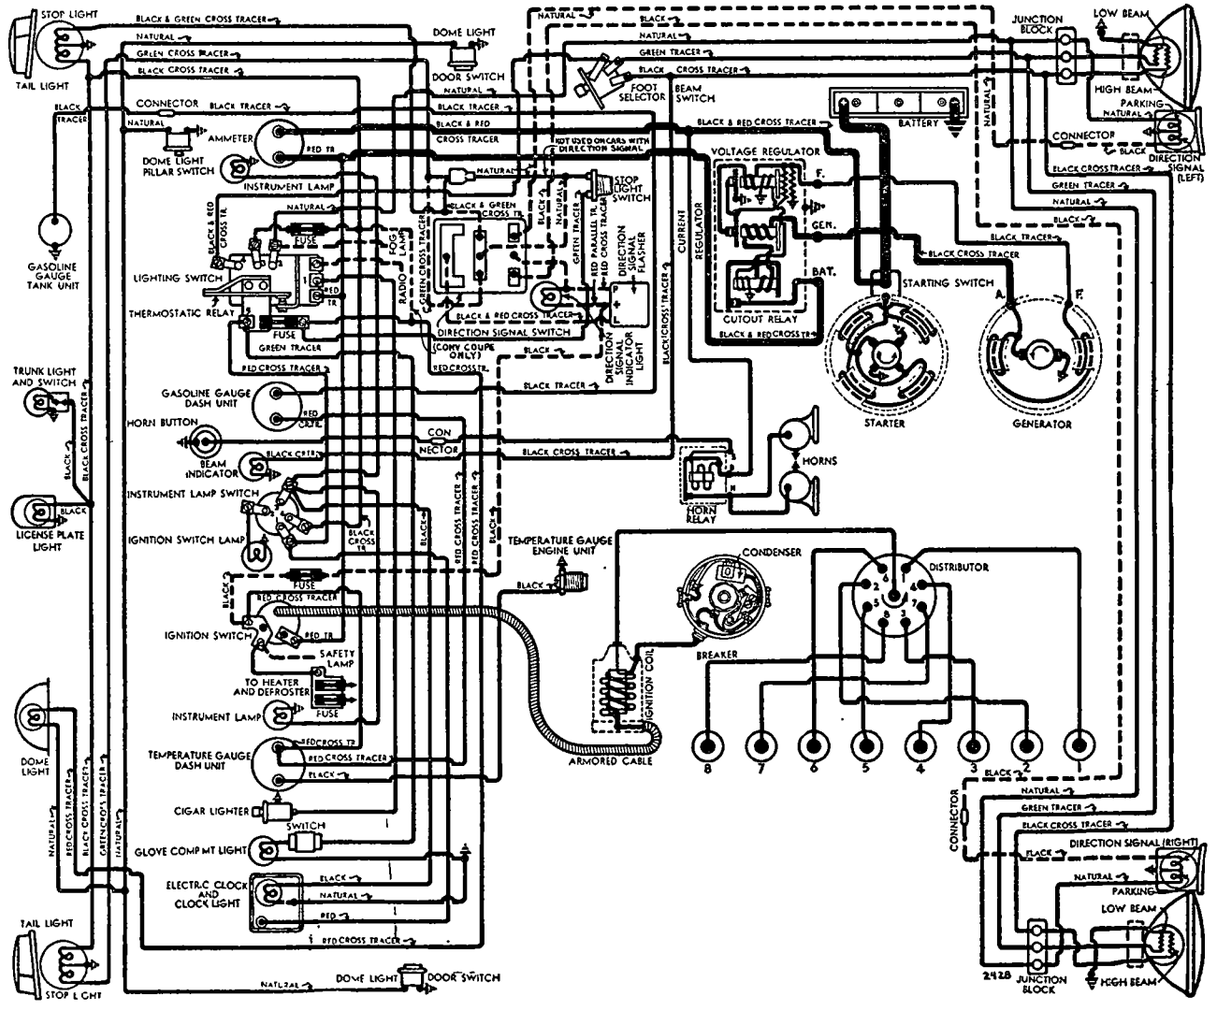
Vacuum Spark Control Model 1116021. On distributor (integral type linked directly to breaker plate). Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit. **Plunger Travel**—7/32".

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	7-9"
7.5	15°	14.5-17.5"
9-10°	18-20°	16-21"

Gaselector—Manual adjustment providing 10° advance or retard from center '0' position. See Ignition Timing for Gaselector adjustment.
Removal:—Distributor mounted on left side of engine. To remove, disconnect vacuum line, take out hold-down screw in Gaselector arm, lift distributor out.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.



SPARK PLUGS:—AC No. 45. 14 MM. Metric.
Spark Plug Gaps—.025".

IGNITION TIMING:—Standard setting given below (regular fuel Std. Head, Ethyl fuel HC. Head). See Gaselector Setting (following) for correction and final setting.

	Flywheel Degrees	Piston Position
All Engines	6° BTDC	.0128" BTDC

Timing Mark Note—Two straight lines of ignition mark '/IGN.ONE/' indicate allowable timing range of 4° on flywheel. Use first (6°) line for setting ignition (second line is 2° before top dead center mark). NOTE—Manufacturer recommends use of HM-494 Timing Light or J-578 Synchroscope for Timing.
To Set Timing (With Timing Light)—Connect timing light between distributor terminal and ground, turn on ignition. With #1 piston on compression, turn engine over until piston is 6° or .0128" before top dead center with first line of ignition mark '/IGN.ONE/' lined up with pointer in inspection hole in left front face of flywheel housing above starter. Loosen Gaselector screw, center pointer scale ('0' mark at reference line), tighten screw. Loosen advance arm clamp bolt, rotate distributor until timing lamp lights (contacts just opening), tighten clamp bolt. Check Gaselector setting.
To Set Timing (With Synchroscope)—Connect synchroscope in series with #1 spark plug, fill in first line of ignition mark '/IGN.ONE/' with chalk or white paint, direct synchroscope light on flywheel (inspection hole on left side), idle engine at 6 MPH., adjust distributor as directed above.
Gaselector Setting—Should be set to provide best performance without spark knock or ping for particular operating conditions and octane rating of fuel used. To adjust, loosen Gaselector arm screw, move arm clockwise (toward 'ADV' end of scale) to advance spark, counter-clockwise (toward 'RET' end of scale) to retard spark, tighten locking screw.

CARBURETION:—**Carburetor**—Carter WDO Model 469-SM, 1¼" dual, downdraft type with Climatic Control. NOTE—Casting No. 306 on face of flange.
For complete data, refer to 1941 Carburetor Index.
Idle Adjustment—With engine warm so that choke valve wide open and fast idle inoperative, set throttle stopscrew for idle speed of 7-8 MPH (450-475 RPM). Adjust idle adjusting screw so that engine fires smoothly (one screw for each barrel, adjust both screws alike). Final setting for each screw should be ½-1¼ turns open from inner seated position (turn screws in for leaner mixture). Recheck idle speed. NOTE—Vacuum gauge recommended for this adjustment (see Vacuum Gauge data above).
Accelerator Pump Setting—Not adjustable.
Float Level—5/16" from top of float to machined surface of cover (remove gasket, invert to check.
Metering Rod & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

Accelerator Linkage Adjustment:—Must be set to provide correct 'throttle-cracking' action for starting. To adjust, after carburetor set for correct 7-8 MPH hot or slow idle speed, disconnect battery cable at starting motor (to prevent starter cranking engine), insert .115" flat gauge between throttle lever stopscrew and carburetor stop, fully depress starter pedal, loosen locknut and adjust eccentric throttle cracker pin on starter motor lever so that all clearance between pin and lever on accelerator crossshaft taken up, tighten locknut.

Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—With throttle stopscrew set for correct 7-8 MPH hot or slow idle speed, hold choke valve tightly closed, turn fast idle adjusting screw in until clearance between throttle lever stopscrew and stop on carburetor casting is .032". NOTE—This adjustment can also be made by backing off throttle stopscrew so that throttle valves tightly closed, then hold choke valve closed, turn fast idle screw in until it contacts high point of fast idle cam, then turn screw in 5/8 turn addtl. for .010" throttle opening.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—2 Notches Rich.

Air Cleaner:—AC No. 1529473 oil-wetted type Std., heavy duty oil-bath type Optl. Copper gauze type cleaner installed on oil filler and crankcase ventilator cap (and in ventilator outlet pipe on cars with heavy-duty oil-bath type air cleaner). CAUTION—Filler cap must be installed with air opening in cap toward front of car and seam in line with groove in tube (may cause excessive oil consumption if installed backward).

Fuel Pump:—AC Type AJ. Diaphragm type combination fuel-and-vacuum pump.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—AC Electric. No. 1516295 (Dash Unit), No. 1516316 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type, non-adjustable (fixed anchor pin). Counterweight should be securely clamped to shaft in approximately vertical position with valve closed (cold).

VALVE TIMING:—**To Check**—With .015" tappet clearance #1 intake valve opens with piston 5° or .0089" before top dead center when first line of ignition mark '/IGN.ONE/' on flywheel is slightly past indicator (on left side—mark is 6° BTDC).

Tappet Clearance:—.011-.013" all valves Hot (.011" gauge 'go', .013" 'no go'). NOTE—.013" exhaust clearance recommended for sustained high speed.

Valve Spring Pressure:—56-63 lbs. at 1 29/32" (valve closed), 97-105 lbs. at 1 19/32" (valve open).

LUBRICATION:—**Crankcase Capacity**—6 qts.
Normal Oil Pressure—35-40 lbs. with warm oil.

COOLING SYSTEM:—**Capacity**—19½ qts.
Pressure Valve—In filler cap. Opens at 3¾ lbs.

Thermostat:—Harrison. In cylinder head outlet.
Setting—Starts to open 151°. Fully open at 173°. NOTE—Special thermostat (for use with permanent anti-freeze) opens at 160°.

Temperature Gauge:—AC Electric. No. 1511053 (Dash Unit), No. 1510772 (Engine Unit).
For complete data, refer to 1941 Mech. Equip. Index.

BATTERY:—**Delco Type 15-EZ-W.** 6 volt, 15 plate, 100 ampere hour capacity (20 hour rate).
Starting Capacity—120 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.5 minutes. Five second voltage 4.25 volts.
Grounded Terminal—Negative (—) on left side of engine block. Engine Ground (Cars with Radio)—strap connector from cylinder head to steering gear
Location—On left side in engine compartment.
Police Battery Delco Model 19E-1. 6 volt, 19 plate 130 ampere hour capacity (20 hour rate).
Starting Capacity—150 amperes for 20 minutes.
Zero Capacity—300 amperes for 5.3 minutes. Five second voltage 4.55 volts.
Grounded Terminal & Location—Same as for Type 15-EZ-W above.

STARTER:—**Delco-Remy 1107921, Armature No. 1867897**
Drive—Overrunning clutch with manual pinion shift operated by starting pedal on toeboard.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24-28 ozs. each.
Cranking Engine—220-225 amperes at 5 volts.

Performance Data—1107921

Torque	R.P.M	Volts	Amperes
0 ft. lbs	6000	5.0	60
16 "	Lock	3.0	600

Removal:—Starter flange mounted on left front face of flywheel housing. To remove, take out flange mounting screws.

Starting Switch (1107921):—No. 820052. Mounted on starter and operated by starting pedal.

GENERATOR:—**Delco-Remy 1102665, Armature 1879002 (Std.), Model 1106403 (Police).** Two brush type with current and voltage regulation.
Charging Rate Adjustment—None. Charging rate controlled by Voltage Regulator, maximum output by Current Regulator. See Regulator data below.
Maximum Charging Rate—30 amperes, 8.0 volts, 1700 RPM (1102665 Gen.), 1040 RPM (1106403 Gen.) and above (Current Regulator Setting) with load or discharged battery. Actual charging rate controlled by Voltage Regulator and dependent on battery

Performance Data—1102665

	Amperes	Volts	R.P.M.
Cold	30①	8.0	1750

Performance Data—1106403

Cold	35①	8.0	1040

①Not maximum output. See Current Regulator.

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—24 ounces each.
Field Current—1.67-1.82 amperes (1102665), 1.77-2.0 amperes (1106403) at 6.0 volts.

Removal:—Generator pivot mounted on left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Belt deflection or sideplay midway between generator & pump pulley should be 1½".

REGULATOR:—**Delco-Remy 1118201 (1102665 Gen.), 1118229 (1106403 Gen.). Single Core Type.** Vibrating Current & Voltage Regulator in case on dash.
For complete data, refer to 1941 Elec. Equip. Index.
CAUTION—Check generator for grounded field coils and leads before changing regulator settings to correct High Charging Rate or High Voltage.

Cutout Relay
Cuts In—6.2-6.7 volts hot.
Cuts Out—0-4.0 ampere discharge current.
Contact Gap—.020" (same for both sets).
Air Gap—.020" (with contacts just closed).

Voltage Regulator
Setting—7.2-7.4 volts (1118201), 7.0-7.2 volts (1118229) hot (operating temperature). Regulator should be checked Hot and with cover in place.
To Check—Connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between this terminal and ground. Operate generator at 2800 RPM., adjust charging rate to 8-10 amperes (use variable rheostat or AVR set). With regulator hot (150°F.), decrease generator speed until cutout relay contacts open, then increase speed to 2800 RPM. and check hot voltage setting (above).
To Adjust—Change regulator armature spring tension slightly by bending hanger at lower end of **one spring only.** If further adjustment required, see Single Core Regulator article in Electrical Equipment Section for other (2nd.) spring adjustment.
Air Gap—.070" between center of core and armature with contacts just closing (press down on armature to open contacts, release pressure, check gap at point where contacts just close).

Current Regulator
Setting—32-34 amperes (1118201), 34-36 amperes (1118229) hot (operating temp.).
To Check—Remove regulator cover, connect short jumper between Voltage Regulator frame and upper contact support bracket (to short out Voltage Regulator), connect ammeter in charging line at regulater 'BAT' terminal, turn on car lights and accessories. Operate generator and increase speed until output remains constant. With regulator hot (150°F), current reading should agree with setting (above).
To Adjust—Same as for Voltage Regulator (above).
Air Gap—.080" (check same as Voltage Regulator).

LIGHTING:—**Headlamps**—Guide 'Sealed Beam' type.
For complete data, refer to 1941 Elec. Equip. Index.
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).
Beam Indicator—Pontiac emblem on face of speedometer dial. Lighted when upper beams in use.
Direction Signal—*Refer to 1941 Elec. Equip. Index.*

Switches
Lighting—Delco-Remy 1995018.
Beam Selector—Delco-Remy 1997002 (LHD cars), 465-V (RHD cars).
Instrument—Delco-Remy 1997740.
Stop Light—Delco-Remy 1997725.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Park & Frt. Direc. Signal	21-3	1154
Park (Without Signal)	3	63
Instrument, Ign. Lock	1½	55
Beam & Direc. Signal Ind.	1	51
Stop & Tail	21-3	1154
Rear License Plate	3	63
Dome	6	82
Dome (Convertible)	1½	55

THERMOSTATIC RELAY:—On lighting switch. Contacts remain closed with 30 amperes, open in 3 minutes with current of 42 amperes at 70°F. Not adj.

FUSES:—**Tail & Instrument Light**—9 ampere. In connector in lead near lighting switch.
Stop & Dome Light—9 ampere. On lighting switch.
Heater & Defroster— 9 ampere each. On fuse block on instrument panel brace to left of ignition switch.
Direction Signal—9 ampere. In connector in feed wire between flasher and ignition switch.
Radio—9 ampere (Master), 14 ampere (Deluxe), 20 ampere (Super Deluxe type).

HORNS:—**Delco-Remy No. 1999519 (Low Note), 1999520 (High Note).** Vibrator type, blended tone, twin horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999519 (low note)	19-21 amperes	.045-.049"
1999520 (high note)	17-19 amperes	.035-.039"

Horn Relay:—Delco-Remy No. 1116775.
Contact Gap—.015-.020". **Air Gap**—.015" (closed).
Contacts Close—2.5-3.5 volts.

HOOD LOCK:—Alligator type hood. Button under instrument panel on left side (right side on RHD cars). Pull button out (hood will raise slightly), pull forward on safety catch under front end of hood.

SERIAL NUMBER:—First number 90101 (South Bend), 811201 (Los Angeles). Stamped on plate on left front door hinge pillar post.

ENGINE NUMBER:—First number 101201. Stamped on pad on upper left front corner of engine block.

COMPRESSION:—**Ratio**—6.5-1 std. cast-iron head.
Pressure—105 lbs. at cranking speed of 150 RPM.

VACUUM READING:—Steady 17-18" at 8 MPH idle spd.

IGNITION:—**Coil Model CE-4646.** Mounted on engine. Service coil (less switch & cable) CE-3224WS.
Ignition Current—½-1½ amps. idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8771.
Ignition Lock—Yale & Towne. Mitchell No. 8414.
Distributor Auto-Lite IGW-4154. Single breaker, 6 lobe cam, full automatic advance type with separate vacuum spark control and Octane Selector.
Breaker Gap—Set at .020".
Breaker Arm Spring Tension—17-20 ounces.
Cam Angle or Dwell—35° closed, 25° open (distr.).
Rotation—Counter-clockwise viewed from the top.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M	Engine Degrees	R.P.M.
Start	400	0	800
2	680	4	1360
4	975	8	1950
6	1265	12	2530
7	1400	14	2800

Vacuum Spark Control VC-4011—Mounted on hold-down plate and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

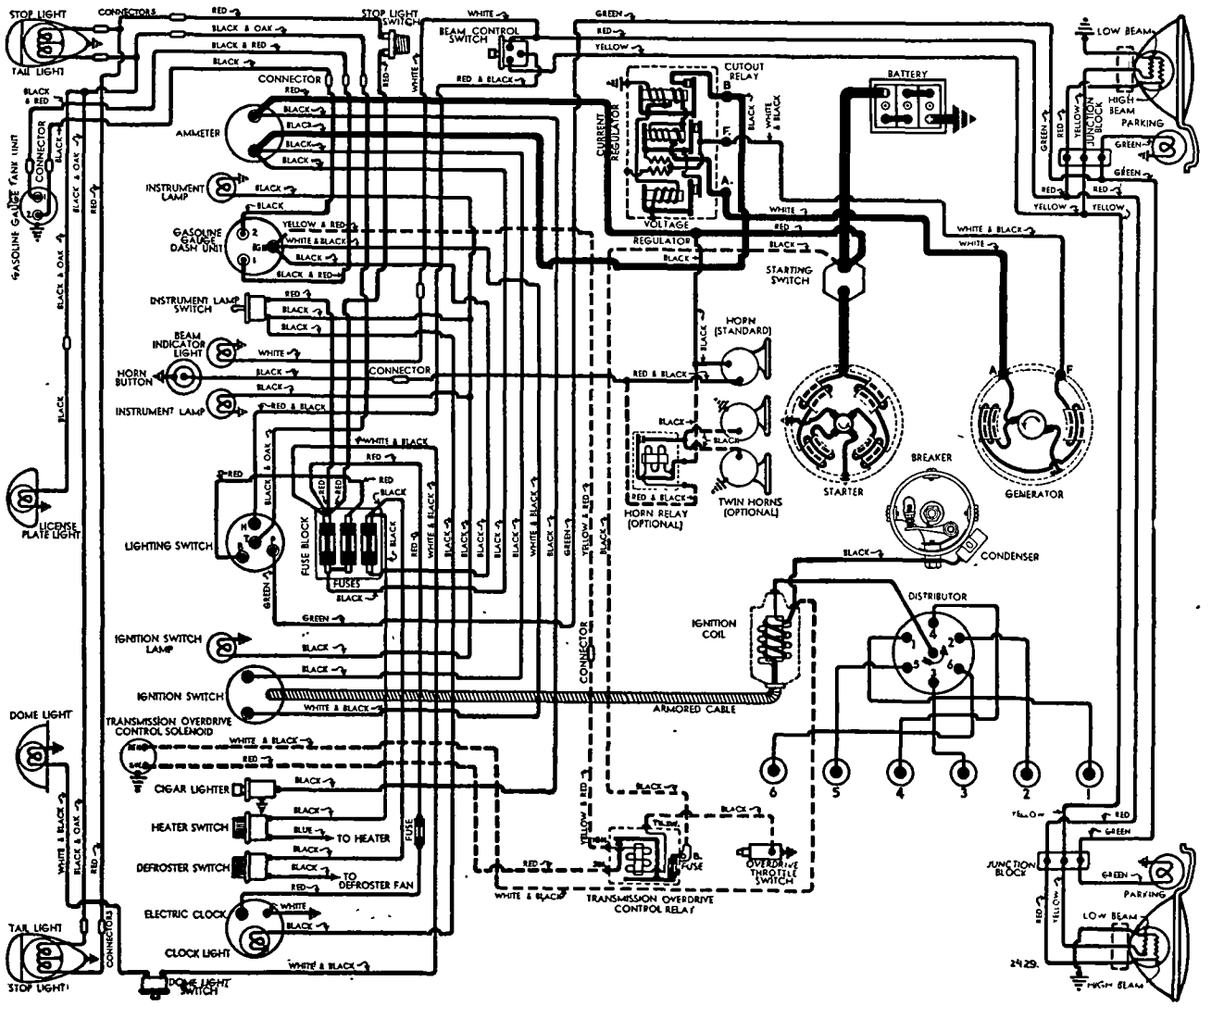
Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	4"
2°	4°	5½"
5°	10°	7¾"
7°	14°	11¼"
9°	18°	14¾"

Octane Selector—Provides manual adjustment at distributor (hold-down plate marked with scale) for variation in timing depending on fuel regularly used. See Ignition Timing following for adjustment.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out bolt in clamp arm, lift distributor off.

Installation Note—When installing distributor, crank engine to firing position for #1 cylinder (flywheel mark 'IGN' in line with pointer on left rear engine plate), sight down distributor shaft hole (distributor out) and see that distributor drive tongue in oil pump drive gear is parallel to and narrow half of offset toward camshaft, turn rotor to #1 segment, install distributor (insert .020" feeler between modifier control arm and clamp arm before tightening the clamp, to prevent binding), check timing.

FIRING ORDER:—1-5-3-6-2-4. See diagram.



SPARK PLUGS:—Champion No. J-8. 14 MM. Metric.
Spark Plug Gaps—Set at .025".

IGNITION TIMING:—Initial setting for regular fuel (see Octane Selector Setting following for correction dependent on fuel regularly used).

Flywheel Degrees	Piston Position
2° BTDC	.0016" BTDC

Timing (with Neon Timing Light)—Neon Light No. 890 recommended. Clip Neon light lead in series with #1 spark plug, idle engine and direct Neon light on flywheel inspection hole on left rear motor support. Loosen hold-down plate screw, center scale on pointer, tighten screw. Loosen clamp arm, rotate distributor until 'IGN' mark on flywheel (approx. 13/64" before top dead center mark 'U.D.C.1-6') lines up with pointer on engine rear plate. Insert .020" feeler between modifier control arm and clamp arm before tightening clamp (to insure clearance for modifier control arm). Check Octane Selector Setting (following).
Timing (without Neon Timing Light)—Turn engine over to firing position for #1 piston with 'IGN' mark on flywheel in line with pointer on inspection hole on left rear motor support and distributor rotor at #1 segment in distributor cap. Adjust distributor as directed above.
Octane Selector Setting—After setting ignition timing (above), loosen selector hold-down screw, advance selector (move toward 'A' end of scale) until motor 'pings' when it is hot and pulling hard. Then retard (move selector pointer toward 'R' end of scale) until 'ping' just disappears.

CARBURETION:—**Carburetor**—Carter Type WA-1 Model 496-S (#356 cast on face of flange). 1¼" single barrel downdraft type with Carter Climatic Control.
For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative, set throttle stopscrew for 8 MPH idle speed. Adjust idle adjusting screw until engine fires smoothly (½-1½ turns open—turn screw in for leaner mixture). Readjust idle speed.
Accelerating Pump—Non-adjustable type.
Float Level—5/16" from top of projection on bowl cover to top of soldered seam on float at free end with needle valve seated (invert cover assembly to check level).
Metering Rods & Jets—*See Carter Jet Table in Carburetor Section for complete data.*

Fast Idle:—Integral type (built-in carburetor).
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Adjust by bending connector rod offset for ⅝" choke valve opening with throttle stopscrew against (not on) first step of fast idle cam.

Automatic Choke:—Carter Climatic Control.
For complete data, refer to 1941 Carb. Equip. Index.
Setting—Coil housing centered (at index mark).

Air Cleaner:—AC #1529210 oil-wetted type standard. Heavy duty oil-bath type optional. Oil filler cap equipped with copper mesh type cleaner.

Fuel Pump:—AC Type AE, diaphragm type. Replacement Part No. 527.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric type. No. NG-9594D (dash unit), No. NG-9197T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. **Setting**—To test coil tension, unhook coil from pin. With valve closed (counterweight up), hooked end of coil should be approximately 90° away from pin with coil at 70°F. Replace coil if angle incorrect. If valve sticks, shaft should be lubricated with kerosene and baking soda solution (for shafts which are badly stuck, remove shaft and turn shaft down to give .005" clearance—shaft bore in manifold should not be disturbed).

VALVE TIMING:—To Check—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0893" BTDC with flywheel mark 'IN.OP.1-6/' aligned with pointer on left rear engine plate. Reset tappet clearance at .016" (cold).

Tappet Clearance:—.016" all valves with engine cold. NOTE—Self-locking tappet screws used (no locknuts).

Valve Spring Pressure:—49-53 lbs. at 1 21/32" (valve closed), 90-94 lbs. at 1 11/32" (valve open).

LUBRICATION:—Crankcase Capacity—5 quarts.
Normal Oil Pressure—40 lbs. at 25-30 MPH.

COOLING SYSTEM:—Capacity—10½ quarts.
Thermostat:—Bishop & Babcock. In cylinder head water outlet. **Setting**—Starts to open 151-155°F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9593.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' control.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118013.
Throttle Switch—Cole-Hersee No. 1687-S. Adjust so that shoe on accelerator linkage just contacts switch plunger with throttle valve wide open.
Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—Willard, Type WHT-1-13R. 6 volt, 13 plate, 90 Ampere Hour capacity (20 hour rate).
Starting Capacity—114 amperes for 20 minutes.
Zero Capacity—300 amperes for 3.0 minutes. Five second voltage 4.1 volts.
Grounded Terminal—Positive (+) to frame.
Engine Ground—Strap at right front motor support.
Dimensions—Length 9". Width 7". Height 9⅜".
Location—On left side under engine hood.

STARTER:—Auto-Lite MZ-4090. Armature MZ-2130.
Drive—Barrel type Bendix. Special inboard type A-2033 (marked 'D' on pinion barrel).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—160 amperes, 5.2 volts, 130 RPM.

Performance Data

Torque	R.P.M	Volts	Amperes
0 ft. lbs.	4300	5.5	70
0.65 " "	2500	5.5	100
2.55 " "	1325	5.0	200
4.95 " "	750	4.5	300
7.65 " "	220	4.0	400
7.8 " "	Lock	3.0	420
11.8 " "	Lock	4.0	560

Removal:—Starter flange mounted on right rear engine plate. To remove take out mounting bolts and lift starter off.

Starting Switch:—A-L Model SW-4011. Mounted on left side of car below clutch pedal. Operated by depressing clutch pedal fully.

GENERATOR:—Auto-Lite GDZ-4804A. Armature GDZ-2006F. Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes, 8.0 volts, 1600 gen. RPM or approx. 18.3 MPH and above with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.

Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, move generator out until ⅜-½" belt deflection midway between generator and fan pulleys is obtained.

REGULATOR:—Auto-Lite VRP-4004F. Current-Voltage type. In a single case mounted on engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay
Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. *For data, refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).
Beam Indicator—At top center of speedometer dial. Lighted whenever Country (upper) beam in use.

Switches
Lighting—Douglas.
Beam Selector—Delco-Remy Model 1997002.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—Lighting—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Instrument, Dome, and Stop Lamps. **Center**—Head & Tail lamps. **Lower**—Heater and Defroster.
Transmission Overdrive Control—14 amp. On relay.
Clock—2 ampere. In clock lead connector.

HORNS:—Single—Delco-Remy 1999807 standard.
Dual—Delco-Remy 1999511 (low note), 1999512 (high note), electric, air tone horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999807	7-9 amperes	.027-.033"
1999511 (low note)	19-21 amperes	.044-.049"
1999512 (high note)	18-20 amperes	.034-.039"

Horn Relay:—R-B-M Model 6003.
Contacts Close—3-4 volts (with relay upright).

STUDEBAKER 1941

COMMANDER, MODEL 11A
AUTO-LITE ELECTRICAL SYSTEM

HOOD LOCK:—Alligator type hood. Button under instrument panel on left side (right side on RHD cars). Pull button out (hood will raise slightly), pull forward on safety catch under front end of hood.

SERIAL NUMBER:—First number 4178801 (South Bend), 4811901 (Los Angeles). Stamped on plate on left front door hinge pillar post.

ENGINE NUMBER:—First number H-122201. Stamped on upper left side of cylinder block at center.

COMPRESSION:—**Ratio**—6.5-1 Std., 7.0-1 Optl. hds. **Pressure**—105 lbs. at 150 RPM (for Std. head).

VACUUM READING:—Steady 18-20" idling at 7-8 MPH.

IGNITION:—**Coil Model IG-4667.** Mounted on engine. Service coil (less switch and cable) IG-3224VS.

Ignition Current—½-1½ amps. idling, 4-5 stopped.

Ignition Switch:—Mitchellock Model 24-R, No. 8775.

Ignition Lock—Yale & Towne. Mitchell No. 8414.

Distributor Auto-Lite IGW-4101. Single breaker, 6 lobe cam, full automatic advance type with separate vacuum spark control and Octane Selector.

Breaker Gap—Set at .020".

Breaker Arm Spring Tension—17-20 ounces.

Cam Angle or Dwell—35° closed, 25° open (distr.).

Rotation—Counter-clockwise viewed from the top.

Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M.	Engine Degrees	R.P.M.
Start	400	0	800
2	600	4	1200
5	900	10	1800
8	1200	16	2400
10	1400	20	2800

Vacuum Spark Control VC-4004—Mounted on hold-down plate and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit).

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3"
2°	4°	5"
3°	6°	6"
5°	10°	10"
6°	12°	12"

Octane Selector—Provides manual adjustment at distributor (hold-down plate marked with scale) for variation in timing depending on fuel regularly used. See Ignition Timing following for adjustment.

Distributor Removal:—Mounted on left side of engine. To remove, disconnect vacuum line, take out bolt in clamp arm, lift distributor off.

Installation Note—When installing distributor, crank engine to firing position for #1 cylinder ('IGN' on vibration dampener in line with pointer on timing gear cover), sight down distributor shaft hole (distributor out) and see that distributor drive tongue in oil pump drive gear is 30° from the horizontal and offset toward the top, turn rotor to #1 segment, install distributor (insert .020" feeler between modifier control arm and clamp arm before tightening the clamp, to prevent binding), check timing.

FIRING ORDER:—1-5-3-6-2-4. See diagram.

SPARK PLUGS:—Champion No. 8. 18 MM. Metric.

NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.

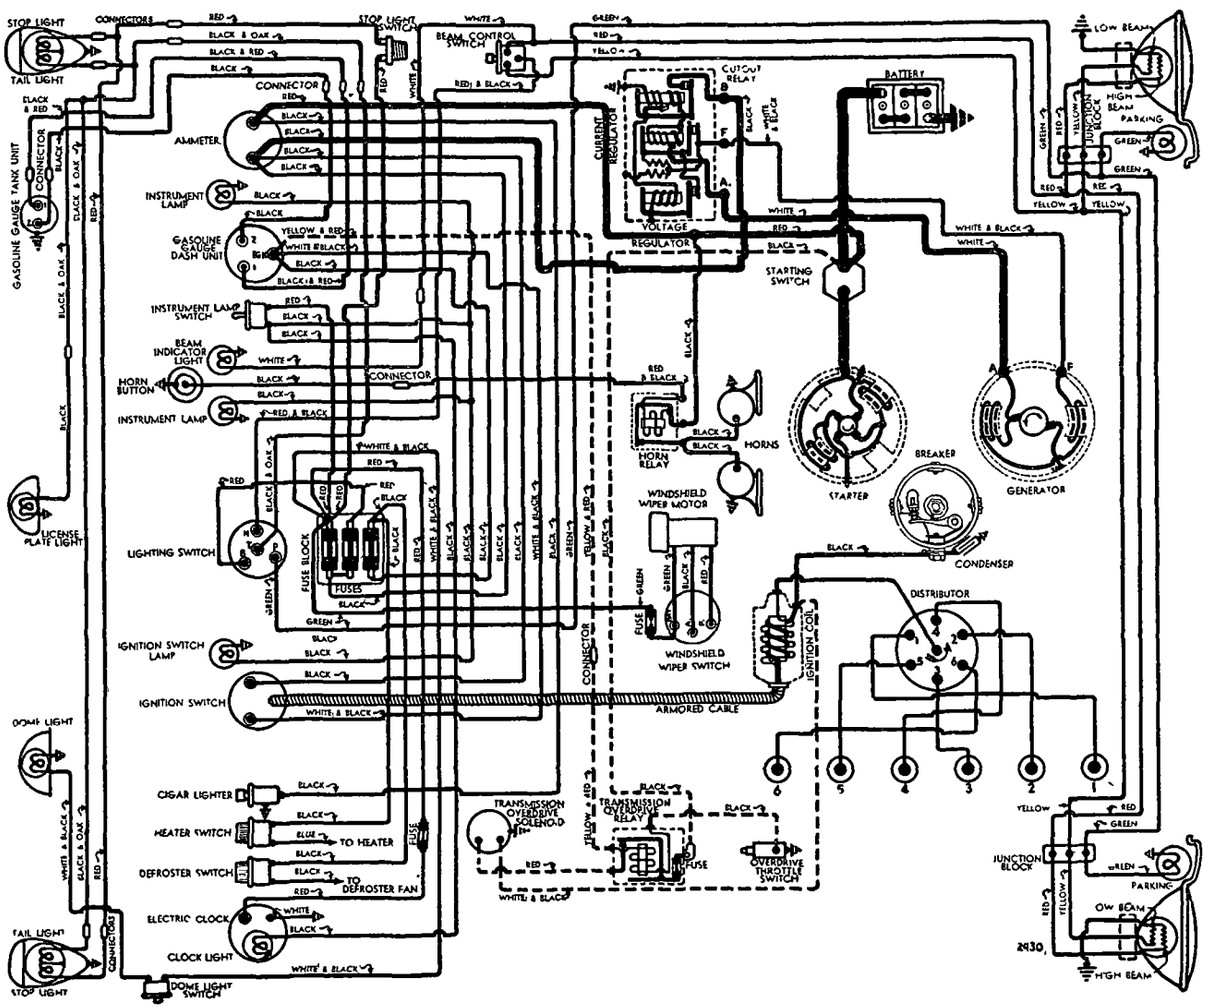
Spark Plug Gaps—Set at .025" (.0225-.0275").

IGNITION TIMING:—Initial setting for regular fuel (see Octane Selector Setting following for correction dependent on fuel regularly used).

	Flywheel Degrees	Piston Position
All Engines	2° BTDC	.0016" BTDC

Timing (with Neon Timing Light)—Neon Light No. 890 recommended. Clip Neon light lead in series with #1 spark plug, idle engine and direct light on vibration dampener (at pointer on timing gear cover). Loosen hold-down plate screw, center scale on pointer, tighten screw. Loosen clamp arm, rotate distributor until 'IGN' mark on vibration dampener lines up with pointer on timing gear cover. Insert .020" feeler between modifier control arm and clamp arm before tightening clamp (to insure clearance for modifier control arm). Check Octane Selector Setting (following).

Timing (without Neon Timing Light)—Turn engine over to firing position for #1 piston with 'IGN' mark on vibration dampener in line with pointer on timing gear cover and distributor rotor opposite #1 segment in distributor cap. Adjust distributor as directed above.



Octane Selector Setting—After setting ignition timing (above), loosen selector hold-down screw, advance selector (move toward 'A' end of scale) until motor 'pings' when it is hot and pulling hard. Then retard (move selector with pointer toward 'R' end of scale) until 'ping' just disappears.

CARBURETION:—**Carburetor**—Carter Type WA-1 Model 410-S or Stromberg Model BXOV-26 (code marked 6-98). 1¼" single barrel, downdraft types. ***For complete data, refer to 1941 Carburetor Index.***

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 8 MPH idle speed. Adjust idle screw until engine fires smoothly (½-1¼ turns open for Carter—turn screw in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—3 holes provided in pump arm (Carter), pump lever (Stromberg) for pump rod engagement. Set as follows:

Inner—Min.: Hot weather, hi-test gasoline.
Center—Med.: Std. all-year setting.
Outer—Max.: Cold weather, low-test gasoline.

Float Level (All Carburetors)—As follows:
Carter—¼" from top of projection on bowl cover to top of soldered seam on float at free end with needle valve seated (invert cover assembly to check).
Stromberg—Fuel level ⅝" below top edge of bowl with engine idling (3 lbs. pressure).
Metering Jets & Rods—*See Carter & Stromberg Jet Tables in Carburetor Section for data.*

Fast Idle (All Carburetors):—Integral types.
For complete data, refer to 1941 Carb. Equip. Index.
Setting (Carter)—Adjust by bending connector link offset for ⅝" choke valve opening with throttle stopscrew against (not on) first step of fast idle cam.
Setting (Stromberg)—To check, hold throttle stopscrew against lowest step of fast idle cam, close choke valve until lip of next step on cam touches screw, check valve opening with 11/32" drill. Adjust by bending connector link.

Automatic Choke (All Carburetors):—Climatic Control (Carter), BXOV-26 Type (Stromberg). Built-in carburetor.
For complete data, refer to 1941 Carb. Equip. Index.
Setting (Carter)—Set coil housing 1 Notch Rich.
Setting (Stromberg)—'R' mark on thermostat cover in line with highest projection on housing. Shift to 'M' if engine loads up or overchokes. Use 'H' setting only if highly volatile fuels used.

Air Cleaner:—AC #1528630 oil-wetted type standard. Heavy duty oil-bath type optional. Oil filler cap equipped with copper mesh type cleaner.

Fuel Pump:—AC Type AE, diaphragm type. Replacement Part No. 540.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric type, No. NG-9594D (dash unit), No. NG-9659T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type.
Setting—To test coil tension, free outer end of coil from bracket on manifold. With valve closed, hooked end of coil should be approx. 90° from bracket with coil at 70°F. Replace coil if angle incorrect. If valve sticks, shaft should be lubricated with kerosene and baking soda solution (for shafts which are badly stuck, remove shaft and turn shaft down to give .005" clearance—shaft bore in manifold should not be disturbed). See that tension spring (from shaft to clip on manifold) is in place.

VALVE TIMING:—To Check—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0942" BTDC with vibration dampener mark 'IN.OP.1-6/' aligned with pointer on timing gear cover. Reset tappet clearance at .016" (cold).
Tappet Clearance:—.016" all valves with engine cold.
Valve Spring Pressure:—54-60 lbs. at 2 3/32" (valve closed). 125-135 lbs. at 1¾" (valve open).

LUBRICATION:—Crankcase Capacity—6 quarts.
Normal Oil Pressure—40 lbs. at 25-30 MPH.

COOLING SYSTEM:—Capacity—13 quarts.
Thermostat:—Bishop & Babcock or Fulton. In cylinder head water outlet.
Setting—Starts to open 151-155°F.
Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9593.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' control.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118013.
Throttle Switch—Cole-Hersee No. 1687-S. Adjust so that shoe on accelerator linkage just contacts switch plunger with throttle valve wide open.
Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—Willard Type WHT-1-15R. 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) grounded to frame.
Engine Ground—Strap at right front motor support.
Location—In engine compartment on left side.

STARTER:—Auto-Lite MAW-4020. Armature MAW-2091.
Drive—Outboard Barrel Type Bendix No. A-1729.
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).
Cranking Engine—130 RPM, approx. 175 amperes at 5.0-5.5 volts.

Performance Data

Torque	R.P.M	Volts	Amperes
0 ft. lbs.	4900	5.5	65
0.60 "	3300	5.5	100
2.75 "	1480	5.0	200
5.45 "	820	4.5	300
8.50 "	400	4.0	400
11.55 "	110	3.5	500
11.5 "	Lock	3.0	505
18.0 "	Lock	4.0	670

Removal:—Starter flange mounted on engine rear plate, on left side. To remove, take out flange mounting screws, remove starter assembly.
Starting Switch:—A-L Model SW-4011. On left side of car below clutch pedal. Operated by depressing clutch pedal fully. RHD cars starters operated by pushbutton switch on instrument panel.

GENERATOR:—Auto-Lite GDZ-4805A. Armature GDZ-2006F. Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator.
See Regulator data following.
Maximum Charging Rate—35 amperes, 8.0 volts, 1800 gen. RPM or approx. 20 MPH and above with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235
12	6.95	1250	12	6.95	1350
16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, move generator out until ⅜-½" belt deflection midway between generator and fan pulleys is obtained.

REGULATOR:—Auto-Lite VRP-4004F. Current-Voltage type. In a single case mounted on engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay
Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator
Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator
Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—Headlamps—Corcoran-Brown 'Sealed Beam' type. *For data, refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).
Beam Indicator—At top center of speedometer dial. Lighted whenever Country (upper) beam in use.

Switches
Lighting—Douglas.
Beam Selector—Delco-Remy Model 1997002.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—Lighting—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument Lamps and Windshield Wiper (see below). **Center**—Head & Tail lamps. **Lower**—Heater and Defroster.
Overdrive Relay—14 ampere. In clip on relay.
Windshield Wiper—14 ampere. In feed wire.
Clock—2 ampere. In clock lead connector.

HORNS:—Delco-Remy—Electric type, air tone, dual horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999511 (low note RH)	19-21 amperes	.044-.049"
1999512 (high note LH)	18-20 amperes	.034-.039"

Horn Relay:—R-B-M Model 6003.
Contacts Close—3-4 volts (with relay upright).

WINDSHIELD WIPER:—Auto-Lite Model EWD-5002. Electric type with 14 amp. fuse in feed wire.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—Alligator type hood. Button under instrument panel on left side (right side on RHD cars). Pull button out (hood will raise slightly), pull forward on safety catch under front end of hood.

SERIAL NUMBER:—First number 7139101 (South Bend), 7803901 (Los Angeles). Stamped on plate on left front door hinge pillar post.

ENGINE NUMBER:—First number B-45001. Stamped on upper left side of cylinder block at center.

COMPRESSION:—Ratio—6.5-1 Std. cast-iron head. **Pressure**—105 lbs. at 150 RPM cranking speed.

VACUUM READING:—Steady 18-20" idling at 8 MPH.

IGNITION:—Coil Model CE-4647. Mounted on dash. Service coil (less switch and cable) CE-3224JS.
Ignition Current—½-1½ amps. idling, 4-5 stopped.
Ignition Switch:—Mitchellock Model 24-R, No. 8777.
Ignition Lock—Yale & Towne. Mitchell No. 8414.
Distributor Auto-Lite IGH-4029. Double breaker, 4 lobe cam with automatic advance and vacuum spark control (separate vacuum unit) and Octane Selector.
NOTE—Contacts must be synchronized.
Firing Interval—Movable contacts open 45° (distributor degrees) after fixed set.
Breaker Gap—Set at .020".
Cam Angle or Dwell—32° closed, 13° open (both sets operating together when properly synchronized).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Clockwise viewed from above.
Condenser—No. IGB-1025C. Capacity .20-.25 mfd.

Automatic Advance

Distributor		Engine	
Degrees	R.P.M	Degrees	R.P.M.
Start	300	0	600
3	630	6	1260
7	1070	14	2140
10	1410	20	2820
13.5	1800	27	3600

Vacuum Spark Control VC-4012—Mounted on hold-down plate and linked to advance plate. Provides additional advance at speeds above idling except when engine accelerated or operated with wide open throttle (spark retarded by return spring in unit). Max. advance 6° (distr.), 12° (eng.) with 12" of HG.
Octane Selector—Provides manual adjustment at distributor for timing variation. See Ignition Timing following for adjustment for fuel regularly used.
Distributor Removal:—Mounted on right side of cylinder head. To remove, disconnect vacuum line, take out bolt in clamp arm, lift distributor off.
Installation Note—When installing distributor, crank engine to firing position for #1 cylinder ('U.D.C1-8' mark on vibration dampener in line with pointer on timing gear cover), sign down distributor shaft hole (distributor out), groove in upper end of distributor drive shaft should be at right angles with camshaft and offset to rear, turn rotor to #1 segment, install distributor (insert .020" feeler between modifier control arm and clamp arm before tightening clamp, to prevent binding), check timing.

FIRING ORDER:—1-6-2-5-8-3-7-4. See diagram.

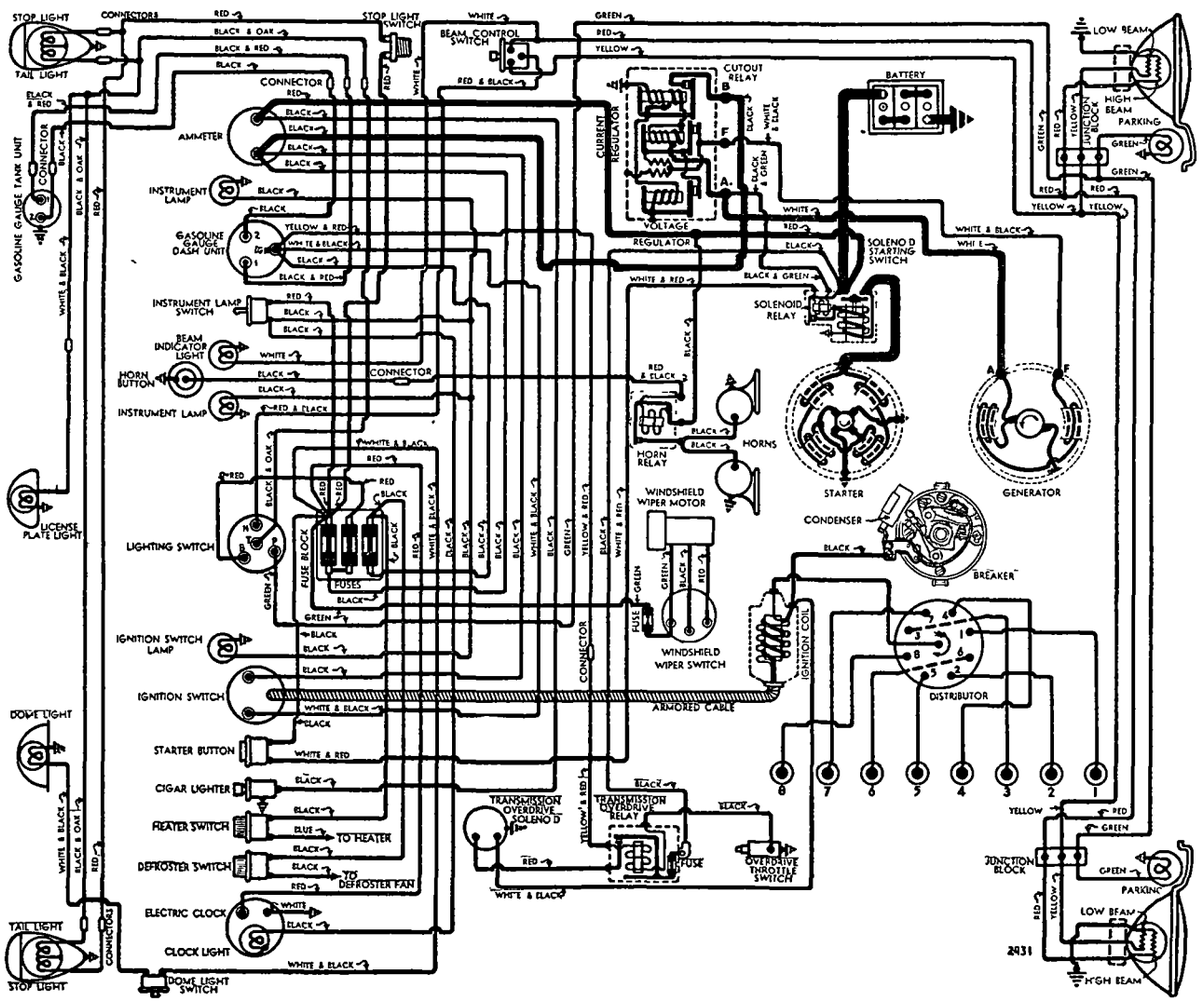
SPARK PLUGS:—Champion No. 8. 18 MM. Metric.
NOTE—Champion No. 7 or 13 (colder plugs) may be used for extremely fast driving in hot weather.
Spark Plug Gaps—Set at .025" .0225-.0275").

IGNITION TIMING:—Standard setting as follows (see Octane Selector Setting following for correction dependent on fuel regularly used):

Flywheel Degrees	Piston Position
0° (at TDC)	.0000" TDC

Timing (Stationary Contacts)—With #1 piston on compression, turn engine over until 'U.D.C.1-8' mark on vibration dampener lines up with pointer on timing gear cover. Loosen hold-down plate screw, center pointer on scale, tighten screw. Loosen advance arm clamp bolt, rotate distributor until contacts just open, tighten clamp bolt. Then synchronize movable contacts.

Timing (with Neon Timing Light)—Neon Light No. 890 recommended by car manufacturer. Clip Neon Light lead in series with #1 spark plug. Idle engine and adjust distributor as directed above.



Synchronization (On Engine)—Turn engine over 90° to #6 firing position with vibration dampaner mark 'U.D.C.3-6' lined up with pointer on timing gear cover. Loosen 2 lockscrews on movable subplate carrying second set of contacts, shift subplate by placing screwdriver between knob and plate and turning screwdriver until contacts begin to open, tighten lockscrews.

Synchronization (Other Methods)—Car manufacturer recommends use of approved electrical analyzer.

Octane Selector Setting—After setting ignition timing, loosen selector screw, advance pointer toward 'A' end of scale until motor 'pings' when it is hot and pulling hard, then retard (toward 'R') until 'ping' disappears.

CARBURETION:—Carburetor—Carter Type WDO Model 409-S or Stromberg Model AAV-26. 1¼" dual, downdraft types with Automatic Choke.
For complete data, refer to 1941 Carburetor Index.

Idle Adjustment—With engine warm and running at slow idle speed (choke valve wide open, fast idle inoperative), set throttle stopscrew for 8 MPH idle speed. Adjust idle adjusting screw for each barrel (in succession) until engine fires smoothly (¼-1¼ turns open for each screw on Carter—turn screws in for leaner mixture). Readjust idle speed.

Accelerating Pump Setting—2 holes provided in both carburetors. Set as follows:
Inner Hole (min. stroke)—Normal Setting.
Outer Hole (max.)—If greater charge required.

Float Level (All Carburetors)—As follows:

Carter—3/16" from top of float to machined surface of bowl cover (remove gasket, invert to check).

Stromberg—Fuel level 5/8" below top edge of bowl with engine idling (3 lbs. pressure) or even with bottom of inspection plug hole on side of bowl.

Metering Jets & Rods—*See Carter & Stromberg Jet Tables in Carburetor Section for complete data.*

Fast Idle:—Integral (built-in each carburetor).
For complete data, refer to 1941 Carb. Equip. Index.

Setting (Carter)—Adjust fast idle screw for .018" throttle valve opening with choke valve closed.

Setting (Stromberg)—Hold throttle stopscrew against high lobe of fast idle cam, move choke valve toward closed position as far as possible, check valve opening. Adjust by bending fast idle connector rod for 7/64" choke valve opening.

Automatic Choke:—Climatic Control (Carter), AAV-26 type (Stromberg). Built-in carburetor.
For complete data, refer to 1941 Carb. Equip. Index.

Setting (Carter)—Set coil housing 1 Notch Rich.

Setting (Stromberg)—'R' mark on thermostat cover in line with highest projection on housing. Shift to 'M' if engine loads up or overchokes. Use 'H' setting only if highly volatile fuels used.

Air Cleaner:—AC #1529907 oil-wetted type standard. Heavy duty oil-bath type optional. Oil filler cap equipped with copper mesh type cleaner.

Fuel Pump:—AC Type AE, diaphragm type. Replacement Part No. 528.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—Auto-Lite electric type, No. NG-9594D (dash unit), No. NG-9659T (tank unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Thermostatic coil type. **Setting**—To test coil tension, free outer end of coil from bracket on manifold. With valve closed, hooked end of coil should be approx. 90° from bracket with coil at 70°F. Replace coil if angle incorrect. If valve sticks, shaft should be lubricated with kerosene and baking soda solution (for shafts which are badly stuck, remove shaft and turn shaft down to give .005" clearance—shaft bore in manifold should not be disturbed). See that tension spring (from shaft to clip on manifold) is in place.

VALVE TIMING:—**To Check**—With .020" tappet clearance #1 intake valve should open with #1 piston 15° or .0915" BTDC with vibration dampener mark 'IN.OP.1-8' aligned with pointer on timing gear cover. Reset tappet clearance at .016" (cold).

Tappet Clearance:—.016" all valves with engine cold.

Valve Spring Pressure:—54-60 lbs. at 2 3/32" (valve closed), 125-135 lbs. at 1¾" (valve open).

LUBRICATION:—**Crankcase Capacity**—8 quarts.
Normal Oil Pressure—40 lbs. at 25-30 MPH.

COOLING SYSTEM:—**Capacity**—15 quarts.

Thermostat:—Fulton. In cyl. hd. water outlet.

Setting—Starts to open 151-155°F.

Temperature Gauge:—Auto-Lite (Motometer) Vapor tension type. A-L Part No. H-9593.
For complete data, refer to 1941 Mech. Equip. Index.

TRANSMISSION OVERDRIVE CONTROL:—Electric type with accelerator pedal 'kick-down' control.
For complete data, refer to 1941 Mech. Equip. Index.
Overdrive Solenoid—Delco-Remy Model 1118013.
Throttle Switch—Cole-Hersee No. 1687-S. Adjust so that shoe on accelerator linkage just contacts switch plunger with throttle valve wide open.
Control Relay—Auto-Lite HR-4201S. 14 ampere fuse mounted in holder on relay.

BATTERY:—**Willard Type WHT-1-15R.** 6 volt, 15 plate, 95 ampere hour capacity (20 hour rate).
Grounded Terminal—Positive (+) grounded to frame.
Engine Ground—Separate strap connector.

STARTER:—**Auto-Lite MAX-4044. Armature MAW-2030.**
Drive—Overrunning clutch (solenoid pinion shift).
Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—42-53 ozs. (new brushes).

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	5300	5.5	65
0.65 "	3300	5.5	100
2.75 "	1630	5.0	200
5.5 "	970	4.5	300
8.7 "	600	4.0	400
12.0 "	300	3.5	500
16.5 "	Lock	3.0	640
25.0 "	Lock	4.0	880

Removal:—Flange mounted on engine rear plate at left side. To remove, take out flange mounting screws, take off starter and switch assembly.
Starting Switch:—Solenoid Switch Type SS-4702. Controlled through relay by puhsbutton on instrument panel. *For data, refer to Elec. Equip. Index.*

GENERATOR:—**Auto-Lite GDZ-4805A. Armature GDZ-2006F.** Two brush type with current-voltage control.
Charging Rate Adjustment—No adjustment at generator. Charging rate controlled by Voltage Regulator and maximum output by Current Regulator. *See Regulator data following.*
Maximum Charging Rate—35 amperes, 8.0 volts, 1800 gen. RPM or approx. 20 MPH and above with load or discharged battery (Current Regulator Setting). Actual charging rate controlled by Voltage Regulator and dependent on battery condition.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	925	0	6.4	1000
4	6.6	1035	4	6.6	1120
8	6.75	1140	8	6.75	1235

16	7.15	1370	16	7.15	1460
20	7.3	1480	20	7.3	1590
24	7.5	1590	24	7.5	1730
28	7.7	1710	28	7.7	1900
32	7.9	1820	32	7.9	2090
35	8.0	1900	35	8.0	2250

Rotation—Counter-clockwise at commutator end.
Brush Spring Tension—53 ozs. max. (new brushes).
Field Current—1.60-1.78 amperes at 6.0 volts.
Motoring Current—4.16-4.60 amperes at 6.0 volts.
Removal:—Pivot mounted at left front of engine. To remove, take out pivot and clamp bolts.
Belt Adjustment:—Loosen pivot and clamp bolts, move generator out until 3/8-1/2" belt deflection midway between generator and fan pulleys is obtained.

REGULATOR:—**Auto-Lite VRP-4004F. Current-Voltage type.** In a single case mounted on engine dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.031-.034" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.2-7.5 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

Current Regulator

Setting—34-36 amperes (marked '35' on the cover).
To Check (without breaking seals)—Connect test meters as for voltage check (above). Operate generator at speed equivalent to 30 MPH. charging battery, turn on car lights and accessories or connect load (bank of headlamp bulbs etc.) between ammeter and battery so that generator charges at peak rate and Current Regulator operates. Current reading should agree with setting given above. If more than slight excess noted, regulator is defective.
To Adjust (with cover removed)—Same as for Voltage Regulator (above).
Contact Gap & Air Gap—Same as Voltage Regulator.

LIGHTING:—**Headlamps**—Corcoran-Brown 'Sealed Beam' type. *For data, refer to Elec. Equip. Index.*
Headlamp Adjustment—Aim upper beam straight ahead (hot spot center 3" below lamp center hght.).
Beam Indicator—At top center of speedometer dial. Lighted whenever Country (upper) beam in use.

Switches

Lighting—Douglas.
Beam Selector—Delco-Remy Model 1997002.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps		Sealed Beam
Parking, Instrument	1½	55
Beam Indicator	1	51
Stop & Tail	21-3	1158
Rear License	3	63
Dome	15	87

FUSES:—**Lighting**—Three 20 ampere. On fuse block on back of instrument panel at center. Protects circuits as follows: **Top**—Clock, Dome, Stop, Instrument Lamps and Windshield Wiper (see below). **Center**—Head & Tail lamps. **Lower**—Heater and Defroster.
Overdrive Relay—14 ampere. In clip on relay.
Windshield Wiper—14 ampere. In feed wire.

HORNS:—**Delco-Remy**—Electric type, air tone, dual horns operated by relay.

Type	Current (at 6 volts)	Air Gap
1999511 (low note RH)	19-21 amperes	.044-.049"
1999512 (high note LH)	18-20 amperes	.034-.039"

Horn Relay:—R-B-M Model 6003.
Contacts Close—3-4 volts (with relay upright).

WINDSHIELD WIPER:—**Auto-Lite Model EWD-5002.** Electric type with 14 amp. fuse in feed wire.
For complete data, refer to 1941 Mech. Equip. Index.

HOOD LOCK:—Alligator type hood with instrument panel lock to left of light switch on Americar.

SERIAL NUMBER:—First No. 441-50001 (Americar, Plainsman, Willys Pick-up), 441P-50001 (Willys Panel Delivery). Stamped on plate on frame front cross-member (all models), and on right side of cowl under hood (Pass. Cars & Pick-up), or on right front door riser (Panel Delivery).

ENGINE NUMBER:—First number same as Serial No. Stamped on right front upper corner of engine.

COMPRESSION:—**Ratio**—6.48-1 (Americar Std.), 6.81-1 (Americar Optl. High Alt.), 7.0-1 (Americar Optl., Plainsman Std.), 6.1-1 (Pick-up & Panel Delivery).
Pressure—111 lbs. (6.48, 6.81, 7.0 Hds.), 107 lbs. (6.1-1 Head) at cranking speed of 185 RPM.
NOTE—All heads cast iron except 7.0-1 Head which is Aluminum.

VACUUM READING:—Steady 21-23" idling at 8 MPH.

IGNITION:—**Coil Model IG-4090A.** Mounted on right side of engine. Service Coil IG-4070.
Ignition Current—2.5 amperes idling, 5 amperes at 6.4 volts stopped.

Ignition Switch:—Douglas No. 2975. Coil connection not armored.
Ignition Lock—Yale & Towne.

Distributor Auto-Lite IGW-4129. Full automatic advance type with auxiliary vacuum spark control.
Breaker Gap—.020".
Cam Angle or Dwell—41° closed, 49° open (distr.).
Breaker Arm Spring Tension—17-20 ounces.
Rotation—Counter-clockwise viewed from above.
Condenser—No. IGB-1025. Capacity .20-.25 mfd.

Automatic Advance

Distributor Degrees	R.P.M	Engine Degrees	R.P.M.
Start	300	0	600
2	550	4	1100
5	930	10	1860
7	1190	14	2380
9.5	1500	19	3000

Vacuum Spark Control VC-4010. Mounted on distributor bracket and linked to advance arm. Provides additional advance at all speeds above idling except when engine accelerated or operated with wide open throttle when spark retarded by return spring within unit.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0°	3½"
2°	4°	5¾"
5°	10°	9¼"
8°	16°	12¾"
10°	20°	15"

Distributor Removal:—Mounted on right side of engine. To remove (without disturbing vacuum unit), loosen the advance arm clamp bolt. **Installation**

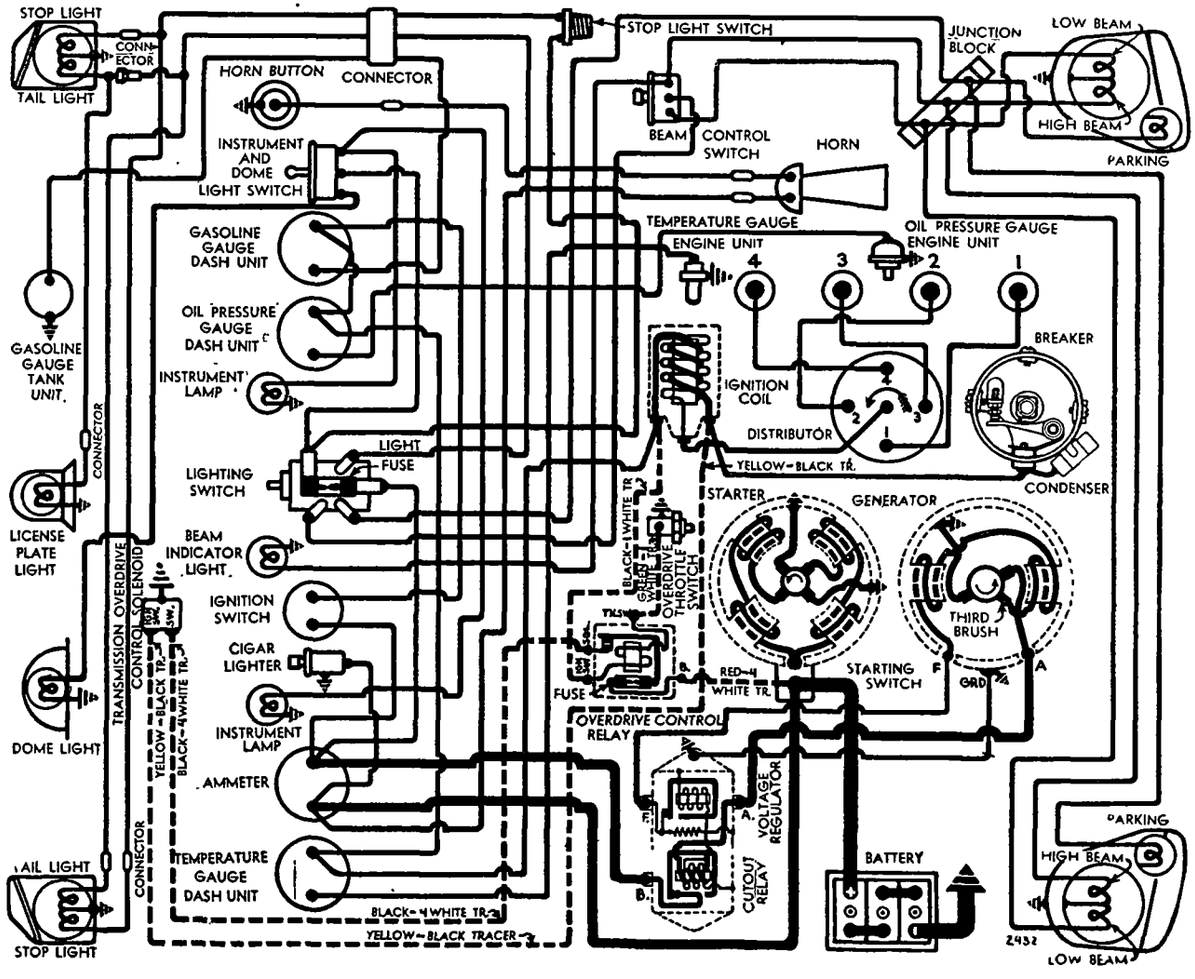
Note—If oil pump removed, turn crankshaft so that #1 piston on compression and flywheel mark 'TC-IGN' at indicator on housing, turn distributor shaft so that rotor at #1 terminal in cap, install oil pump and mesh gears so that shaft engages distributor tongue-and-slot coupling without disturbing distributor shaft position. Check ignition timing.

FIRING ORDER:—1-3-4-2. See diagram.

SPARK PLUGS:—Champion J-8 or Auto-Lite A-7F (All engines except with 7.0-1 Aluminum Head), Champion J-9 (Eng. with 7.0-1 Al. Head). 14 MM. Metric.
Spark Plug Gaps—Set at .030".

IGNITION TIMING:— **Flywheel Deg. Piston Pos.**
All engines ..... at TDC ..... .0000" TDC
Timing—With #1 piston on compression, turn engine over until piston reaches firing position (see above) with flywheel mark 'TC-IGN' centered in inspection hole in front face of engine right rear support. Loosen advance arm clamp bolt, rotate distributor until contacts begin to open (eliminate backlash in drive gears by pressing on rotor in clockwise direction), tighten clamp bolt, see that rotor is at #1 terminal in distributor cap.

CARBURETION:—**Carburetor**—Carter Type WO Model 507-S (No. 229 cast on face of flange). 1¼" single barrel, downdraft type.
For complete data, refer to 1941 Carburetor Index.



Idle Adjustment—If preliminary adjustment required (to warm up engine), turn idle adjusting screw in until just seated, then turn screw out 1¼ turns, start engine and run until warm. With engine warm, set throttle stopscrew for slightly faster than normal idling speed, turn idle adjusting screw out until engine begins to roll, then turn screw in until engine fires smoothly. Final setting should be 1-1½ turns open. Adjust throttle stopscrew for 8 MPH idle speed pulling in high gear.
Accelerating Pump—No seasonal adjustment.
Float Level—⅜" from top of float to gasket seat on cover with needle valve seated (invert to check—do not compress spring in valve stem).
Metering Rods & Jets—***See Carter Jet Table in Carburetor Section for complete data.***

Fast Idle:—Choke valve inter-connected to throttle valve to open throttle to fast idle position with choke valve in use.

Air Cleaner:—AC #1529870 oil-wetted type standard. heavy duty oil-bath type optional.

Fuel Pump:—AC Type AF, diaphragm type. Pump Replacement Part No. 538.
For complete data, refer to 1941 Carb. Equip. Index.

Gasoline Gauge:—King-Seeley Electric. K-S No. 8186 (Dash Unit), No. 8318 (Tank Unit).
For complete data, refer to 1941 Carb. Equip. Index.

MANIFOLD HEAT CONTROL:—Automatic thermostatic coil type. No adjustment required.

VALVE TIMING:—**To Check**—With .020" tappet clearance #1 intake valve should open with #1 piston 9° or .039" before top dead center when flywheel mark 'I.0' centered in inspection hole in right front side of engine rear support (¼" variation permissible). Reset tappet clearance at .014" cold.

Tappet Clearance:—.014" all valves with engine cold.

Valve Spring Pressure:—50 lbs. at 2 7/64" (valve closed), 116 lbs. at 1¾" (valve open). Spring free length 2½".

LUBRICATION:—**Crankcase Capacity**—4 quarts.

Normal Oil Pressure—40 lbs. at 30 MPH.

Oil Pressure Gauge:—King-Seeley Electric type. K-S No. 8190 (Dash Unit), No. 6425 (Engine Unit). *For complete data, refer to 1941 Mech. Equip. Index.*

COOLING SYSTEM:—**Capacity**—11¾ quarts.

Thermostat:—Harrison. In cyl. hd. water outlet.

Setting—Starts to open 148-155°F. Fully open 173°.

Temperature Gauge:—King-Seeley Electric type. K-S No. 8184 (Dash Unit), No. 7000 (Engine Unit). *For complete data, refer to 1941 Mech. Equip. Index.*

TRANSMISSION OVERDRIVE CONTROL (OPTL.):—Electric type with accelerator pedal 'kick-down' control.

For complete data, refer to 1941 Mech. Equip. Index.

Overdrive Solenoid—Delco-Remy No. 1569.

Throttle Switch—Cole-Hersee No. 9016. Adjust position of switch on bracket so that switch plunger just contacts end of accelerator rod (max. clearance 1/32") when carburetor throttle is wide open.

Overdrive Relay—Auto-Lite Model HR-4201AS.

BATTERY:—**Auto-Lite, Type AB-13.** 6 volt, 13 plate, 80 ampere hour capacity (20 hour rate).
Starting Capacity—96 amperes for 20 minutes.
Zero Capacity—300 amperes for 2.0 minutes.
Grounded Terminal—Negative (—) grounded to front frame cross-member. **Engine Ground**—Strap connector at front engine mounting on left side.
Dimensions—Length 8 15/16". Width 7". Hght. 8⅝".
Location—In engine compartment on right side.

STARTER:—**Auto-Lite—Americar & Pick-up MZ-4093 (early), MZ-4099 (later)—Panel Delivery MZ-4049 (early), MZ-4100 (later). Armature No. MZ-2089 (all).**

Drive—Two types used: Special Outboard Bendix type RC10HD used on MZ-4049 & MZ-4093 motors; Special Barrel type A-2233 used on MZ-4099 & MZ-4100 motors. **Service Note**—Later type Bendix A-2233 can be used for servicing motors originally equipped with RC10HD type Bendix.

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—42-53 ozs. (new brushes).

Cranking Engine—185 RPM, 150-175 amps., 5 volts.

Performance Data

Torque	R.P.M.	Volts	Amperes
0 ft. lbs.	4300	5.5	70
.65 "	2500	5.5	100
2.65 "	1325	5.0	200
4.95 "	750	4.5	300
7.65 "	220	4.0	400
7.8 "	Lock	3.0	420
11.8 "	Lock	4.0	560

Removal:—Starter flange mounted on right front face of rear motor support. To remove, take out two flange capscrews and one capscrew in bracket at commutator end, remove starter and switch as an assembly.

Starting Switch (MZ-4093, 4099):—Type SW-3737S. On starter, cable operated by button on instrument panel. Pull required to close switch should be 2.3 lbs. min. (at right angles to hole at end of lever). **(MZ-4049)**—Type SS-4001. Magnetic switch mounted on starter, controlled by pushbutton on instrument panel. *See article in Electrical Equipm't Section.*

GENERATOR:—**Auto-Lite GCJ-4811-A. Armature GCJ-2006-F.** Third brush control in conjunction with vibrating type voltage regulator. Ventilated by fan on drive pulley.

Maximum Charging Rate—25 amperes (cold), 8.0 volts, 2500 RPM. Actual charging rate controlled by voltage regulator and dependent on battery condition. See Regulator data below. When checking generator output, ground 'F' terminal to eliminate regulator action.

Charging Rate Adjustment—See Regulator data. Third brush setting 2 commutator bars minus 2 mica strips minimum, 2 bars minus 1 mica strip maximum from insulated (nearest) main brush. Setting adjustable by removing commutator cover band and moving third brush by hand counter-clockwise to increase, clockwise to decrease output. Maximum output given above must not be exceeded.

Performance Data

Cold			Hot		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	760	0	6.4	850
4	6.65	920	4	6.7	1020
8	6.9	1080	8	7.0	1240
12	7.2	1240	12	7.3	1400
16	7.45	1400	16	7.6	1650
20	7.7	1580	20	7.9	2100
25	8.0	2500	22	8.0	2700

Rotation—Counter-clockwise at commutator end.

Brush Spring Tension—53 ozs. max. (new brushes).

Field Current—1.9-2.1 amperes at 6.0 volts.

Motoring Current—4.0-4.4 amperes at 6.0 volts.

Removal:—Conventional pivot mounting at right front of engine. To remove, take out pivot and clamp bolts.

Belt Adjustment:—Loosen pivot and clamp bolts, swing generator out until fan can be turned with belt stationary.

REGULATOR:—**Auto-Lite VRR-4004A. Voltage type.** In single case on engine side of dash.
For complete data, refer to 1941 Elec. Equip. Index.
NOTE—Regulator case cover sealed. Serviced on exchange basis if seals not broken (to remove cover).

Cutout Relay

Cuts In—6.4-6.6 volts.
Cuts Out—4.8-5.6 volts (approx. 4-6 amps. disch.).
Contact Gap—.015" minimum.
Air Gap—.034-.038" with contacts open (check at hinge end of core).

Voltage Regulator

Setting—7.3-7.6 volts at 70° F. See Electrical Equipment Section for settings at other temperatures.
To Check (without breaking seals)—Connect ammeter in charging line at regulator 'B' terminal (use short heavy leads), voltmeter between 'B' terminal and ground. Operate generator at speed equivalent to 30 MPH., charging fully charged battery, until voltage is steady. Voltage reading should agree with setting given above.
To Adjust (with cover removed)—Change regulator armature spring tension by bending lower spring hanger slightly. See Electrical Equipment Section.
Contact Gap—.012" min. (armature against stop pin).
Air Gap—.048-.052" with contacts just opening.

LIGHTING:—**Headlamps**—Corcoran-Brown pre-focused double filament type with upper and lower beams controlled by Beam Selector Switch on toeboard.
Headlamp Adjustment—With upper beam lighted and car 25' from screen, aim each headlamp so that beams centered on vertical line directly ahead of lamp center, and upper edge at horizontal line at lamp-center height, with lamp door and lens in place. To adjust, remove door and lens, turn 3 adjusting screws on reflector rim.
Beam Indicator—Red jewel in upper edge of speedometer dial. Lighted when upper beams in use.

Switches

Lighting—Douglas No. 5864.
Beam Selector—Douglas.
Instrument—Douglas.

Bulb Specifications

Position	Candlepower	Mazda No.
Headlamps	32-21	2320
Parking	1.5	55
Instrument, Beam Ind.	1	51
Stop & Tail	21-3	1158
Dome, License Plate	3	63

FUSES:—**Lighting**—20 ampere. On lighting switch.
Overdrive Control Relay—20 ampere. On Overdrive Control Relay.

HORNS:—**Schwarze.** Vibrating, disc type.
Horn Current—8 amperes.

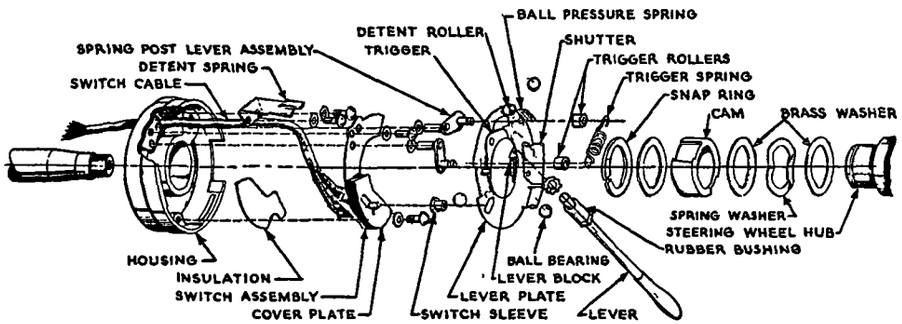
BUICK TYPE



Std. Equipment On:

BUICK, SERIES 41-40, 40A, 50, 60, 70, 90 (1941)

DESCRIPTION:—Same design as used on 1940 cars, except that location of rear signal lights has been changed and these are now located in the lower section of the Stop & Tail Light assemblies on the rear of the car (Signal illuminates Red Arrow below stop and tail light on right or left side of car).

Wiring Diagram—See Buick wiring diagram on 'T&E' page for complete Direction Signal circuit wiring and fuse data.

OPERATION:—Switch is operated manually to indicate a turn, and is turned off automatically by the steering wheel movement when the turn is completed (switch can also be turned off manually if desired). If turn is made in opposite direction than that for which the switch has been set, switch is turned off automatically as the turn is begun. Switch handle should be moved in same direction as wheel is rotated for the intended turn (move handle up for left turn, down for right turn).

Control Switch—When switch is operated to indicate a turn, circuit is completed through flasher unit to right or left Front Signal Light, Rear Signal Light, and Pilot Light. If pilot light on instrument panel does not flash when switch operated, check all bulbs (pilot light will not flash if front or rear signal bulbs burned out). Operation of the switch also presses the spring-loaded pawl or trigger on the lever plate against the notched cam on the steering wheel hub. When the steering wheel is moved in the same direction to turn the car, the trigger ratchets over the notch in the cam, however when the wheel is turned in the opposite direction after the turn has been completed, the trigger engages the cam notch and the switch is carried around to the off position. The trigger is then released so that the switch is ready for further operation.

ADJUSTMENT:—Important Note—Steering wheel must be installed so that lower spoke points straight down with wheels in straight ahead position (see Saginaw Steering Gear article for servicing directions). Whenever steering wheel removed or installed, direction signal switch lever must be placed in 'off' position to prevent damage to switch assembly.

To Adjust Switch—With correct adjustment, automatic release will occur only when wheel returned to center position after being rotated at least one-third revolution. To adjust switch, set switch lever for Right Hand Turn, turn steering wheel to right until first click is heard or slight movement felt in switch lever after right hand spoke on steering wheel has passed lower center position. Hold switch lever down firmly and turn steering wheel back slowly until right hand spoke is approximately 2" past or to right of lower center position, release switch lever and return wheel to straight ahead position which will return switch to off position. This adjustment causes switch cam to shift on steering wheel hub by slipping the friction clutch. No further adjustment is required for left turn switch release (positioning cam for right turn release as above will automatically regulate left return release also).

SERVICING:—Disassembly—Make certain that switch lever set in 'off' position, remove steering wheel. Switch will then be accessible for inspection and servicing. To correct complaints of switch getting out of adjustment (adjustment changing in service), check tension of crimped steel spring washer assembled between two brass washers on steering wheel hub above switch cam). Pressure of 125-150 lbs. should be required to flatten washer to ⅛" height. Replace spring washer if pressure is less than this amount. See illustration for correct assembly of switch cam washers and other switch parts.

DIRECTION SIGNAL LAMPS & FUSE:—See Buick 'T&E' page for complete data.

CADILLAC TYPE

Std. Equipment On:

CADILLAC, SERIES 41-60S, 61, 62, 63, 67, 75 (1941)

DESCRIPTION:—New design (not same as type used on 1940 cars) with control switch built in steering wheel (switch has automatic turn-off feature) and pilot indicator light on instrument panel for Right and Left turn. Direction Signals consist of a special 21 cp. filament combined with the Parking Lamp in the front Radiator Grille (front of car), separate bulbs located above the stop & tail light bulb in the Rear Light assembly (rear of car), and pilot indicator bulb which is located in the upper right corner of the speedometer dial on the instrument panel. Flasher Unit and Direction Signal Fuse are located on the instrument panel brace near the steering column.

Control Switch—Mounted within housing below steering column with switch lever extending out to left side. Automatic shut-off mechanism consists of ratchet and cam pinned to steering column. With switch set to operate signal, steering wheel cam passes over ratchet without engaging when steering wheel rotated to turn car in that direction. When wheel is rotated back after turn completed, cam engages ratchet and turns switch off automatically.

Wiring Diagram—See Cadillac wiring diagram on 'T&E' page for complete Direction Signal circuit wiring and all light bulb and fuse data.

OPERATION:—Switch must be operated manually to indicate a turn and is turned off automatically when steering wheel straightened out after the turn is completed. Switch handle should be moved in same direction as wheel is rotated for desired turn (up for right turn, down for left turn). Operating switch completes circuit through flasher unit to Right or Left Front Signal Light, Rear Signal Light, and Pilot Indicator Light on instrument panel. All lights flash and flasher clicks audibly while operating.

SERVICING:—If instrument panel indicator light does not flash when switch operated, check all bulbs (pilot light will not flash if either front or rear signal light bulbs burned out). Flasher is sealed and cannot be serviced (replace if defective). To service switch, remove steering wheel (see Saginaw Steering Gear article for data) which will expose switch assembly.

DIRECTION SIGNAL LAMPS & FUSE:—See Cadillac 'T&E' page for all data.

CHEVROLET TYPE

Optional Equipment On:

CHEVROLET, MASTER DELUXE MODEL AG, SPECIAL DELUXE AH (1941)

Direction Signal is Guide type. See Guide Direction Signal article on next page for complete data.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH TYPES

Std. Equipment On:

CHRYSLER, SIX MODEL C28, EIGHT MODELS C30, C33 (1941)

Optional On:

DE SOTO, MODEL S8 (1941)

DODGE, MODEL D19 (1941)

PLYMOUTH, MODELS P11, P12 (1941)

PRODUCTION CHANGE NOTE:—On first cars, Direction Signal feed wire was connected to lighting switch and protected by circuit breaker or fuse on switch. On later cars, Direction Signal was connected to gauge terminal of Ignition Switch and protected by a separate fuse in cartridge type fuse connector (fuse in line between ignition switch and flasher).

Chrysler C28—On some first cars, Front Direction Signal (fender mounted light) may be a single filament 21 cp. bulb (with separate Parking Light bulb directly above headlamp). On later cars, Front Direction Signal and Parking Light combined in one bulb (21-3 cp. double filament bulb) in fender light.

DESCRIPTION:—Direction Signals consist of a special 21 cp. filament combined with the parking lamp in the front fender lamps (Chrysler models), separate single filament bulbs in front fender lamps (De Soto, Dodge, Plymouth models

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

with separate parking bulbs combined with headlamp assembly) at the front of the car, special 21 cp. filament combined with tail lamp at rear of car (all models—stop lamp is separate 21 cp. bulb in assembly with rear license lamp at center of body at rear), and pilot indicator lights which illuminate arrows on the instrument panel. Flasher unit is located on bottom flange of instrument panel at left side.

Control Switch—Mounted on steering column beneath steering wheel hub with switch lever extending out on left side of wheel. Switch has automatic turn-off mechanism which consists of a pronged ring pressed in the steering wheel hub which engages two specially shaped pawls on the switch when the switch is set to indicate a turn (with switch off, pawls clear prongs so that switch not operated when steering wheel is turned). When the steering wheel is rotated to turn the car in the direction for which the Direction Signal Control Switch has been set, the prongs ratchet over the switch pawl without disturbing the switch but when the steering wheel is rotated back after the turn has been completed, the prongs engage the pawl and return the switch to the off position automatically.

Wiring Diagram—See Chrysler, De Soto, Dodge, and Plymouth wiring diagrams on 'T&E' pages for complete Direction Signal wiring circuits.

OPERATION:—Switch must be operated manually to indicate a turn but is turned off automatically when steering wheel straightened out after the turn completed. Switch handle should be moved in same direction steering wheel is rotated for the desired turn (up for right turn, down for left turn). Operating the switch completes the circuit through the flasher to the right or left Front Signal Light, Rear Signal Light, and instrument panel Pilot Indicator. All lights flash until the turn has been completed. If Pilot Indicator does not flash when switch is operated, check for burned out bulbs, defective flasher, or blown fuse.

SERVICING:—Flasher Unit—Cannot be serviced, replace defective units.
Control Switch—Switch mounted on clamp attached to steering column. Clamp must be properly positioned on column so that switch pawls engage prongs on ring in steering wheel hub. If clamp disturbed, see that rim on clamp is 1/16" higher than steering wheel hub. Pronged ring should be pressed squarely in steering wheel hub with bulge in ring registering with indentation on wheel hub (this ring must be installed in steering wheel hub if Direction Signals installed on car in the field).

DIRECTION SIGNAL LAMPS & FUSE:—See Chrysler, De Soto, Dodge, and Plymouth 'T&E' pages for complete data (see Production Change Note above for differences on first cars).

HUDSON TYPE

Optional Equipment On:

HUDSON, SIX MODELS 10, 11, 12, 18; EIGHT MODELS 14, 15, 17 (1941)

DESCRIPTION:—Direction Signals consist of a special 21 cp. filament combined with the parking lamp (double filament bulb) in the Bonnet Panel Lamps (front of car), and the Stop Lights at the rear of car (stop light switch is hooked up to Direction Signal Switch so that both stop lights operate in usual manner when brake applied, one lamp only flashes when direction signal switch operated to indicate a turn). The control switch is mounted on the steering column directly below the steering wheel and has three buttons—'L' left turn, 'off' center, 'R' right turn—and an indicator bulb under a jewel below the center button which flashes while the signals are operating.

Wiring Diagram—See Hudson wiring diagrams on 'T&E' pages for complete direction signal circuit wiring and fuse data.

OPERATION:—Control is operated manually and 'L' (left) or 'R' (right) button is pressed to indicate a turn. This completes circuit through flasher, and Front & Rear Signals and indicator bulb on switch flash until the center 'off' button of the switch is pressed which releases the operating button and turns the switch off. If indicator bulb does not flash when switch operated, check for burned out bulbs.

SERVICING:—Indicator Bulb Replacement—Switch cover retained by screws concealed under button on switch case. To remove cover, pull buttons off, remove screws located on flat terminals under buttons, lift switch cover off. Take out mounting screws in switch and lift switch out. Indicator bulb and switch can then be inspected and serviced.

DIRECTION SIGNAL LAMPS & FUSE:—See Hudson 'T&E' pages for data.

LINCOLN TYPE

Std. Equipment On:

LINCOLN, ZEPHYR & CONTINENTAL 16H, CUSTOM MODEL 168H (1941)

DESCRIPTION:—Direction Signals consist of a special 21 cp. filament combined with the parking lamps in the front Fender Lamp (21-3 cp. bulb) at the front of the car, 21 cp. filament combined with tail lamps in the Rear Lamp Assembly (21-3 cp. bulb) at the rear of the car (Stop lamp is separate 21 cp. bulb in assembly with Rear License lamp at center of body in rear), and pilot indicator lamps on instrument panel. Pilot indicator lamps are mounted in top of instrument cluster (Zephyr and Custom) to right of speedometer dial (Continental). Flasher unit is mounted on Ignition Resistor and Lighting Circuit Breaker unit in back of instrument panel with fuse in connector in line between flasher and feed terminal of ignition resistor unit.

Control Switch—Built in housing on steering column below steering wheel with switch lever extending out toward left side. Switch has automatic turn-off mechanism by which switch is returned to off position when steering wheel rotated back to straight ahead position after a turn has been completed.

Wiring Diagram—See Lincoln wiring diagram on 'T&E' page for circuits.

OPERATION:—Switch must be operated manually to indicate a turn but is turned off automatically when steering wheel straightened out after turn has been completed. Switch handle should be moved in same direction steering wheel is rotated to make a desired turn (up for right turn, down for left turn). Operating the switch completes the circuit through the flasher to the right or left Front Direction Signal, Rear Signal, and Pilot Indicator on instrument panel (arrow at top of instrument cluster on Zephyr & Custom, jewel on instrument panel to right of speedometer on Continental). All lights flash until turn has been completed.

SERVICING:—If pilot indicator does not flash when switch operated to indicate a turn, check for burned out bulbs, defective flasher, or blown fuse. For access to switch, remove steering wheel.

DIRECTION SIGNAL LAMPS & FUSE:—See Lincoln 'T&E' page for all data.

OLDSMOBILE TYPE

Optional Equipment On:

OLDSMOBILE SIX, MODELS 66, 76, 96 (1941)

OLDSMOBILE EIGHT, MODELS 68, 78, 98 (1941)

Direction Signal is Guide type. See Guide Direction Signal article (following) for data.

PONTIAC TYPE

Optional Equipment On:

PONTIAC SIX, MODELS 41-24, 25, 26 (1941)

PONTIAC EIGHT, MODELS 41-27, 28, 29 (1941)

Direction Signal is Guide type. See Guide Direction Signal article (following) for data.

Optional Equipment On:
CHEVROLET, OLDSMOBILE, PONTIAC & OTHER 1941 MODELS

DESCRIPTION:—Direction Signals consist of right and left hand Front and Rear flashing lamps which light up when steering column control switch is operated to indicate that a turn is to be made. These signals operate in conjunction with a Pilot Light or indicator on the switch which serves to remind the car operator to turn off the Direction Signal after the turn has been completed in addition to indicating that the signal is operating satisfactorily.

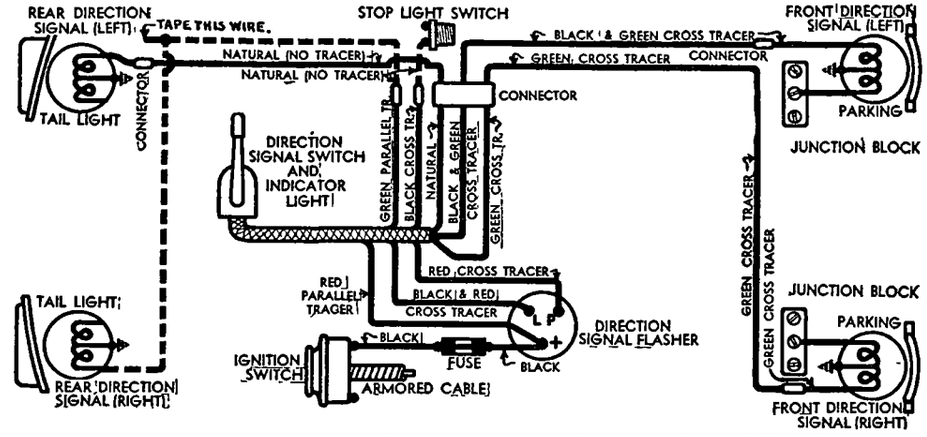
Front Direction Signal—Consists of a 21 cp. filament combined with the parking lamp filament (21-3 cp. bulb) in the parking lights at the front of the car. When Direction Signals installed on cars in service, regular parking lights must be modified by installation of new socket designed for this double filament bulb (see Installation data below).

Rear Direction Signal—Special signal lights are not used but the regular car wiring is modified so that the direction signal flashes the right or left Stop Light. Stop lights are wired so that both stop lights operate in the usual manner when brakes are applied with the Direction Signal off, and the one stop light, which is not being flashed for a direction signal, operates as usual when the brakes are applied with the Direction Signal set to indicate a turn.

Control Switch—Direction Signal Switch is mounted in a case which is designed to be clamped on the steering column directly below the steering wheel so that the switch lever extends out toward the left hand rim of the wheel. Switch lever has three positions—Normal or Off with lever horizontal. Right Turn with lever moved up, Left Turn with lever moved down. Switch is operated manually and lever remains in any position in which it is placed.

Flasher Unit—Flasher is a sealed unit and is usually mounted on the lower flange of the instrument panel brace behind the instrument panel. Flashers cannot be serviced and should be replaced if defective.

Direction Signal Fuse—Fuse is mounted in a cartridge type holder or connector in the feed wire between the ignition switch and the flasher unit (Direction Signals connected to 'gauge' terminal of ignition switch so that they are operative only with the ignition turned on).



OPERATION:—Switch must be operated manually to indicate a turn and must be returned to the normal or 'off' position manually after the turn has been completed. Switch handle should be moved in same direction as steering wheel is rotated for a desired turn (up for Right Turn, down for Left Turn). Operating the switch completes the circuit through the flasher to the right or left Front Signal Light, Rear Stop Light, and Pilot Indicator Light. All lights flash until switch lever is moved to normal or off position. If Pilot Indicator does not flash when switch is operated, check for burned out bulbs, defective flasher or blown fuse.

INSTALLATION:—When installing Direction Signals on cars in service, units should be installed, and car wiring modified as directed below. ***Refer to car wiring diagram on particular car model 'T&E' page for wire colors and location of junction blocks and connectors.***

Front Direction Signal—Disconnect Parking Light wire at front junction block on hood, dismantle parking light and remove old parking bulb socket and wire, install new socket and wires furnished for each model, install new double filament signal and parking bulb (see bulb data below). Connect parking bulb lead (natural wire) to same terminal on junction block from which old parking light wires removed. On Chevrolet and Oldsmobile, connect new long wire (Natural with Green Cross Tracer) to Right Hand Signal Light wire which is same color, connect new short wire (Black and Green Cross Tracer) to Left Hand Signal Light wire, run these wires back along regular car wiring harness to dash and connect through three-way connector to same color wires in Direction Signal wiring harness (third wire runs to rear of car—see Rear Signals). On Pontiac, Direction Signal wiring harness is of sufficient length to extend to front signal lights and this harness cable should be run along regular car wiring harness and connected to signal lights as follows: Connect shorter (Natural) wire to Left Hand Signal Light (Black) wire, run longer (Black) wire across front of car and connect to same color (Black) Right Hand Signal Light wire.

Rear Direction Signal—On Chevrolet and Oldsmobile, additional wire must be run along left hand frame rail to rear of car so that Stop Lights can be connected individually to Direction Signal Switch. This wire (Natural) supplied with other signal parts. Connect forward end of wire to same color (Natural) wire in Direction Signal wiring harness through three-way connector (other wires run to front of car—see Front Signals above). Connect rear end of this wire to Left Hand Stop Light, disconnecting and taping lead in regular car wiring harness which ran to this light (on Chevrolet, disconnect connector near the left stop light; on Oldsmobile, wire must be cut and new wire soldered to light lead). Regular car wiring harness lead is used for Right Hand Stop Light and this is connected to switch at instrument panel (see Switch data). On Pontiac models, individual leads are provided for each Stop Light and it is only necessary to rearrange connections at forward end (see Switch data).

Direction Signal Switch Installation—Switch is mounted on steering column by clamp band with concealed attaching screw. Form clamp band around steering column with threaded side up, install clamp-screw loosely. Dismantle switch by taking out two lower cover screws, install switch housing on clamp band (engage band in slots in housing so that lugs and screw inside housing), position housing so that switch lever horizontal in Normal or off position, tighten clamp band screw. See that switch assembly is in off position, reassemble switch and tighten lower cover screws securely. Run switch wiring harness down along steering column to instrument panel. Mount Flasher by loosening one nut on steering column bracket below instrument panel and slipping slotted end of flasher bracket under nut. Connect switch wiring harness as follows:

Direction Signal Switch Wiring—On Chevrolet and Oldsmobile, disconnect connector joining two Natural wires under left hand corner of instrument panel (this is stop light lead of regular car wiring harness), connect the Natural wire running into body (Stop Light wire) to the Natural with Green Parallel Tracer wire of the Direction Signal wiring harness, connect the other Natural wire (Stop Light Switch wire) to the Natural with Black Cross Tracer wire of the Direction Signal wiring harness. On Pontiac, disconnect the three wires joined by a connector under left hand corner of instrument panel (Natural from Stop Light Switch, Natural with Green Cross Tracer to Right Hand Stop Light, Natural with Black & Green Cross Tracer to Left Hand Stop Light), connect these wires to same color wires of Direction Signal wiring harness. On all models, connect Flasher unit, and feed wire to ignition switch (remove fuse while making this connection) as shown on wiring diagram.

SERVICING:—No service operations required. Replace defective flasher units and burned out bulbs. To disassemble switch for replacement of Pilot Indicator bulb, take out screws in lower switch cover, withdraw cover and switch assembly.

DIRECTION SIGNAL LAMP BULBS & FUSES:—**Fuse**—9 ampere. In cartridge type holder in wire between flasher unit and ignition switch behind instrument panel.

Front Direction Signal—21-3 cp. Mazda No. 1154 (3 cp. filament used for parking light and connected to lighting switch through regular car wiring harness).
Rear Direction Signal—21-3 cp. Mazda No. 1154 (3 cp. filament used for tail light and connected to lighting switch through regular car wiring harness).
NOTE—21 cp. filament used both for Stop Light and Direction Signal.
Pilot Indicator—1½ cp. Mazda No. 55. Located in switch housing.
Flasher Unit—Mallory Type 10. Service by replacement.

GENERATOR CHARGE TELL-TALE:—The cutout relay is provided with an extra set of ground contacts above the armature and the tell-tale lamp lead is connected to this contact 'T' terminal on the regulator case. The lamp circuit is completed to ground through these contacts. See 'T&E' page wiring diagram for wiring circuit.

Operation:—The ground contacts are normally closed with the main contacts open and open when the main contacts close. When the ignition is turned on, the tell-tale lamp lights and remains lighted until the main contacts close and the generator begins to charge the battery. The lamp should not remain lighted after the car speed is brought up beyond the cut-in point (approximately 10 MPH).

Trouble Shooting:—If the tell-tale lamp does not light when ignition is turned on, ground tell-tale lamp lead 'T' terminal on regulator to the engine (not to 'B' terminal). If lamp does not light, check for burned out bulb or loose wiring connections (see 'T&E' page wiring diagram). If lamp lights (indicating that ground contacts open), main contacts are fused or armature spring is weak or broken. If tell-tale lamp does not go out at speeds above cut-in point, ground contacts are not opening when main contacts close. Check generator performance by connecting accurate test ammeter in charging line. If trouble in regulator, car manufacturer recommends that a new or replacement regulator be installed (regulator case is sealed, do not break seal).

OIL PRESSURE TELL-TALE:—The oil line check valve on the right side of the crankcase is provided with an insulated terminal pin which is grounded by the check-valve plunger when no pressure exists in the oil line. The oil pressure tell-tale lamp lead is connected to this terminal. A small hole in the check-valve plunger and a by-pass in the body allow the passage of sufficient oil so that the plunger alternately opens and closes the circuit at idling speeds, causing the tell-tale lamp to flash.

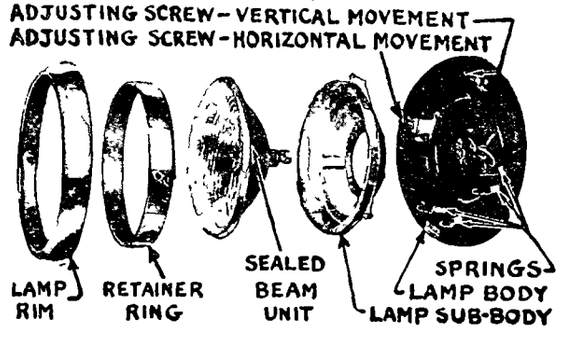
Operation:—The plunger rests normally against the pin when no pressure exists in the oil line so that the tell-tale lamp will light when the ignition is turned on. At idling speeds the plunger alternately opens and closes the circuit so that tell-tale lamp flashes. At speeds above idling (approximately 7 M.P.H.), the oil pressure holds the check-valve plunger off its seat so that the tell-tale lamp does not burn or flash.

Trouble Shooting:—If the tell-tale lamp does not light when the ignition is turned on, ground check-valve terminal to engine. If lamp does not light, replace bulb. If lamp does light, remove terminal pin and see that it is straight and clean. Take off plug on top of check-valve housing, remove plunger and see that it is clean and moves freely up and down. Examine spring above plunger. If tell-tale lamp does not flash at idling speeds, see that small hole in plunger is clean and open.

1941 SEALED BEAM HEADLAMPS

REPLACEMENT NOTE:—Two types of Sealed Beam Lamp Units are available for replacement: (1) Composite Type with metal reflector and glass lens (has conventional lamp bulb assembled in unit) and (2) All Glass Type with hard glass reflector and lens (no lamp bulb used, filaments mounted directly on reflector). ***Both types and all makes are fully interchangeable on all car models equipped with Sealed Beam Headlamps.***

DESCRIPTION:—Sealed Beam Headlamps, as used on 1940 car models, consist of a reflector, lens, and lamp filaments assembled as a single sealed unit. This excludes all dirt and moisture so that the original effciency of the lamp is retained throughout the life of the filaments. When replacement is required, the entire sealed beam unit is discarded and a new unit is installed. No attempt should be made to disassemble the sealed beam unit.



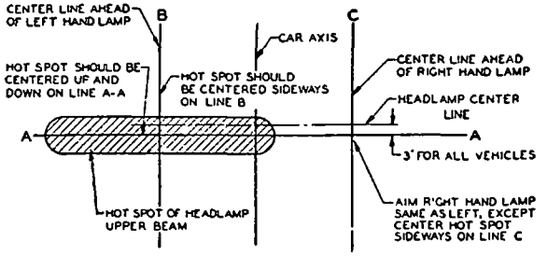
OPERATION:—Sealed Beam lamps have double "bar" type filaments (filaments parallel and slightly offset so that lower "Traffic" beam deflected slightly toward right side of road) with an upper "Country Beam" of 40-45 watts intensity and a lower "Traffic Beam" of 30-35 watts (these lamps not rated by candlepower but upper beam is approximately 50% brighter than former 32 cp. headlamps). Beams are controlled by a Beam Selector Switch on the toeboard in the usual manner.

INSTALLATION & REMOVAL:—On all cars, a sub-body or housing is provided in the headlamp for the sealed beam unit mounting. This sub-body is retained in the headlamp by the two adjusting screws and by two sets of two springs which are hooked to the sub-body diametrically across from each screw. The sealed beam unit seats directly in the sub-body and is positioned by three heavy lugs which fit into slots in the sub-body. A retainer ring is fitted over the outer edge of the sealed beam unit. This retainer ring has three lugs which engage three clamp screws on the sub-body rim so that the retainer ring and sealed beam unit are securely clamped in place when the clamp screws are tightened (on some cars a gasket is used between the retainer ring and the sealed beam unit). A lamp rim which fits over the retainer ring in such a manner as to conceal the clamp screws and adjusting screws completes the assembly.

Removing Sealed Beam Units—Remove headlamp rim (retained by one or more screws and clips). Loosen, but do not remove, three clamp screws which engage retainer ring lugs (use care not to turn adjusting screws located at top and one side of lamp). Rotate retainer ring counter-clockwise until lugs disengage from clamp screws, lift retainer ring off. Pull sealed beam unit out to disengage lugs from slots in sub-body, disconnect cable plug from clips on sealed beam unit.

Installing Sealed Beam Units—Terminal clips on sealed beam units and cable plug are designed so that plug can be connected only in correct position. Plug terminals (facing end of plug) are as follows: **Left Side**—Upper Country Beam. **Center (Top)**—Lower Traffic Beam. **Right Side**—Ground wire connected to lamp sub-body or lamp housing. When installing new sealed beam unit, connect plug, see that sealed beam unit lugs properly engage slots in sub-body, install retainer ring and rotate ring clockwise until lugs on ring engage under clamp screw heads on sub-body, tighten clamp screws securely. Then adjust headlamps as directed below.

"SEALED BEAM" HEADLAMP



ADJUSTMENT:—All sealed beam lamp units are "prefocused" type so that the only adjustment required is to aim the lamp beam for correct horizontal and vertical position.

Headlamp Adjustment (All Cars)—Use conventional headlamp adjusting screen with vertical lines drawn directly ahead of each lamp center-line and horizontal line drawn 3" **below** and parallel to lamp center-line. Place car at 25 feet distance from screen, turn on lights and make certain that Upper Country Beam (lower filament) is lighted. Aim each headlamp as follows:

Horizontal Adjustment—With headlamp rim removed, turn adjusting screw at one side of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on vertical line directly ahead of this lamp. Adjust other headlamp in same manner (both lamps aimed straight ahead).

Vertical Adjustment—With headlamp rim removed, turn adjusting screw at top or bottom of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on horizontal line 3" below lamp center height. IMPORTANT—Beam may be directed downward as required by state laws, but should never be aimed higher than 3" below lamp center height.

AIMING INSTRUCTIONS

1941 CHEVROLET REVERSING SWITCH

Used On:

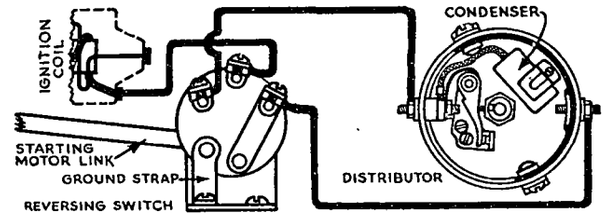
CHEVROLET, ALL PASSENGER CAR & TRUCK MODELS (1941)

PRODUCTION CHANGE NOTE:—Two different switch assemblies used as follows:

First Type—Reversing switch lever travel must be checked on first type switches to obtain proper switch action. A solid connecting rod used between switch lever and starter drive shift lever. See Checking and Adjustment following.

Second Type—Later type assemblies changed over first design as follows: Reversing switch is provided with a stop which limits forward motion of switch lever, providing proper travel of switch lever. A new connector link made of flat stamping with a spring loaded sliding section (preventing bending of lever) is used between switch lever and starter drive shift lever. No adjustment or checking necessary on this second type switch assembly. REPLACEMENT NOTE—Second type Reversing Switch Unit Part No. 1884827 can be installed on cars with first type switch. All parts must be replaced, switch and operating linkage. No parts interchangeable between first and second types.

1941 IGNITION NOTE:—Ignition system comprises a special Ignition Coil, special larger capacity Condenser, and a special insulated Distributor (used in conjunction with the new Reversing Switch. The distributor has a new type breaker cam with steeper angle to provide greater cam angle or dwell and more output with the new greater capacity ignition coil.
IMPORTANT—New condenser must not be used with previous type ignition coil or Distributor (capacity too great for this earlier type equipment).



REVERSING SWITCH:—Consists of a 4 terminal switch (1 terminal grounded by strap to starter frame through switch mounting bracket) connected between the ignition coil and the distributor (special two terminal, insulated type) and operated by a link connected to the starter pinion shift lever so that the direction of current flow across the breaker contacts is reversed each time the starter is operated to start the engine. This reversal of current causes a periodic reversal of the natural tendency of the contacts to pit (one contact) and build up a cone (opposite contact) so that smoother contact surface and longer contact life is assured. This switch is used in conjunction with a special insulated distributor of the following type:

Chevrolet Distributor (Delco-Remy 1110090)—The breaker plate is insulated from the distributor housing by insulated nuts located in the breaker plate lugs so that the stationary contact is not grounded through the distributor housing in the customary manner. A second terminal is provided on the distributor housing and this terminal is connected to the breaker plate (terminal stud is screwed in breaker plate lug). Both distributor terminals are connected to the Reversing Switch and these terminals are alternately connected to the ignition coil or to ground by the successive operations of the reversing switch. See illustration for switch wiring.

IMPORTANT BATTERY CABLE NOTE:—Positive battery cable at starting switch should lead straight up from terminal so that it will not interfere with starter shift lever when it is depressed to start engine.

CHECKING & ADJUSTMENT (FIRST TYPE):—To check, turn on ignition (ammeter will indicate ignition load), slowly press down on starter pedal while watching ammeter and observe sequence of switch operations as follows: Ammeter pointer will drop back to '0' as switch begins to operate and will then indicate ignition load as switch again completes ignition circuit, switch will then 'click' as ratchet locks in closed circuit position and further movement of the pedal will cause starter to operate. Reversing switch lever must not move more than ⅛" from point where 'click' is heard to point where starter begins to operate (measure movement in horizontal direction at reversing switch). If switch lever moves more than ⅛", adjust by bending switch connecting rod at the center so as to shorten the rod slightly. Recheck operation after adjustment completed to make certain that movement is not more than ⅛".

IMPORTANT NOTE—This adjustment is important as incorrect switch rod movement may cause switch to open ignition circuit so that engine can not be started.

1941 DELCO-REMY IGNITION SWITCHES

Pontiac 8, 41-27,28,29 RHD (1941)	1115129	1116312

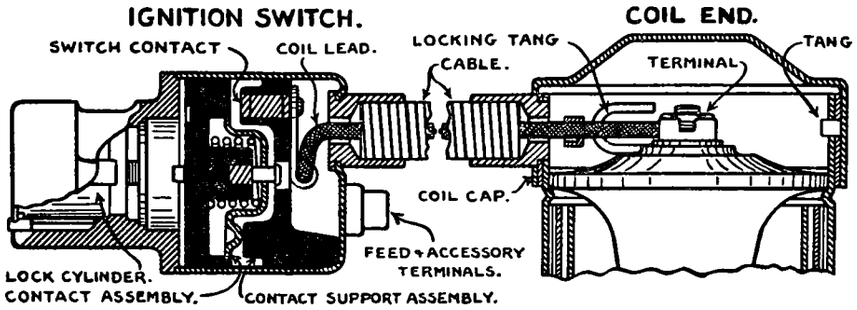
DESCRIPTION:—These switches are used with lock-extension type coils. The ignition coil lead from the switch is enclosed in an armored cable permitting coil to be mounted at a distance from the switch, usually on the engine block or engine side of the dash. An accessory terminal is provided on the switch for the gasoline gauge, radio, heater, defroster, etc., connection. The armored cable end cap on ignition coil can be disconnected as described below (see Servicing Coil).

TROUBLE SHOOTING:—Circuits through the switch can be tested with a test lamp and battery or other current source and test leads as follows: In each case test leads should be connected at points indicated and it should be noted whether test lamp lights or not.

1. Switch Off. Disconnect feed wire on switch. Test from feed terminal on switch to gasoline gauge or accessory terminal. Lamp should not light.
2. Switch On. Disconnect feed wire on switch. Test from feed terminal to gasoline gauge terminal. Lamp should light.
3. Switch On. Disconnect feed wire on switch. Test from feed terminal to breaker terminal on ignition coil. Lamp should light. If lamp does not light and previous test indicated that switch circuits were satisfactory, disconnect coil (as directed below) and test separately.
4. Switch On. Disconnect feed wire from switch and block open breaker contacts or disconnect breaker lead at coil. Test from feed terminal on switch to switch case. Lamp should not light. If lamp lights; switch, coil lead or ignition coil are grounded. Disconnect coil and test separately.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



SERVICING COIL:—The armored cable end cap on ignition coil is locked in place by tang on cap which engages lock recess on coil case. Two locating lugs on cap fit in 'L' slots in coil case. To remove end cap, use special tool J-726 (a thin blade of spring steel .015"x ½"), insert tool between coil cap and case at a point approximately 1" to left of seam on coil case. The tool will press the large tang out of the groove in the coil case. Then turn cap counter-clockwise until it can be withdrawn. Disconnect coil lead wire at terminal on bottom of coil case. When installing, align locating lugs on cap with 'L' slots in coil case so that lock tang will engage lock recess in case when cap rotated in place.

1—Coil Primary Shorted. Check current draw of coil. If current exceeds 6 amperes at 6 volts, coil is probably shorted.

2—Coil Primary Grounded. Disconnect low tension lead to distributor and remove all leads at ignition switch. With switch turned on, connect 110 volt test lamp between primary coil terminal to ground (unpainted surface of case). Lamp should not light (grounded if lamp lights).

3—Coil Primary Open-Circuited. Connect 6 volt test lamp in series with low tension terminal at lower end of coil and wire to distributor. If lamp does not light with ignition switch turned on, an open-circuit is indicated.

4—Coil Secondary Grounded. Test from secondary terminal of coil to ground on coil case. Use 110 volt test lamp. Lamp should not light with coil disconnected from switch.

1941 MITCHELLOCKS

Car Model	Type	Lock Assembly	Switch and Cable	Lock Cylinder
Chrysler, C28 (1941)	30-R	8793	8794	8414
Chrysler, C30, C33 (1941)	24-R	8052	8053	8414
DeSoto, S8 (1941)	30-R	8793	8794	8414

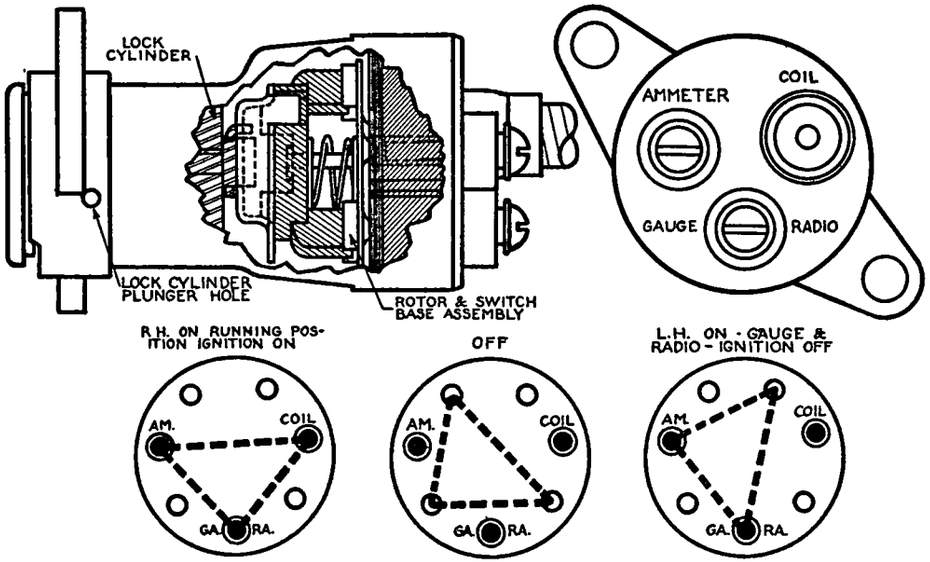
Hudson 8, 14,15,17 (1941)	24-B	8797	8798	6095
Packard, 1900 (1941)	24-B	8781	8782	6760
Packard, 1901, 1901A (1941)	24-B	8781	8782	6760
Packard, 1903 to 1908 (1941)	24-B	8779	8780	6760
Plymouth, P11, P12 (1941)	24-R	8197	8198	8414
Studebaker, Champ. 3G (1941)	24-R	8771	8772	8414
Studebaker, Comm. 11A (1941)	24-R	8775	8776	8414
Studebaker, Pres. 7C (1941)	24-R	8777	8778	8414

DESCRIPTION:—Similar in design to previous type Mitchellocks except that terminals located on lock case cover (see illustration). Furnished in three types as follows:

'B' Type (24-B)—Has extra terminal for gasoline gauge or other accessory connection. Accessory terminal live only with switch 'on'.



'R' Type (24-R)—Same as above but switch has two 'on' positions; one for regular running with ignition on, and a second position with accessory terminal live but ignition off. This position may be used for gasoline gauge reading with engine not running or for radio control with car parked.

'R' Type (30R)—Has additional terminal for Chrysler & DeSoto Underdrive type transmission control connection. See 1941 Chrysler Six C28 or DeSoto S8 'T&E' page for wiring connections at switch.

SERVICING:—Manufacturer recommends that no attempt should be made to service internal switch parts since duplication of original factory assembly in the field is extremely difficult. Switches which prove defective should be replaced. To remove assembly, remove lock head from instrument panel, disconnect switch wires from terminals, remove ignition coil base by bending up 4 lugs on coil case which extend over coil base and lift off cover, disconnect wire lead from coil and remove ignition switch assembly. Lock cylinders can be serviced as directed below.

Lock Cylinder:—To remove lock cylinder, remove lock head from instrument panel, disconnect ammeter lead, turn key to extreme right hand position, insert a pointed tool as far as possible into small hole in side of lock case to depress lock cylinder retainer fully, pull lightly on key to withdraw lock cylinder.

TROUBLE SHOOTING:—Test circuits through switch with lamp and test points. See description above for terminals which should be 'live' with switch key in each position. If switch circuits are completed correctly and ignition still unsatisfactory, remove ignition coil base (cable connection) by bending up 4 lugs on coil case which extend over coil base. This will expose coil terminal in base. Check circuit through switch and coil lead to this terminal. If circuit tests OK., disconnect coil, test coil and replace if necessary. If tests indicate switch defective, replace switch (see Servicing).

1940 PRODUCTION CHANGES & NEW REGULATOR TYPES:—On 1940 cars, Regulator specifications were changed, or new Regulators used in production as listed below. ***Mark these changes on 1940 Supplement 'T&E' Pages and Auto-Lite Regulator pages in Electrical Equipment Section of 1940 Supplement to insure latest specifications being used when servicing 1940 car models.***

VRP-4000 Series—On all units after Serial No. 5U-000001, Current Regulator Air Gap should be set at .048-.052" (same as Voltage Regulator—use same ST281-7 gauge to check air gaps on both units). On regulators before this serial number, air gap was set at .034-.038" (ST281-6 gauge).

VRP-4000 Series—Cutout Relay Air Gap should be .031-.034" and is checked with ST-281-9 Gauge. This supersedes .034-.038" air gap (ST-281-3 gauge) originally specified for these units.

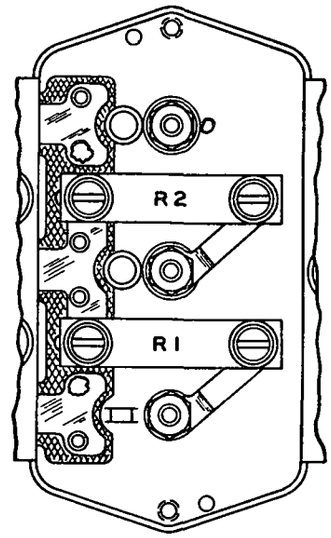
VRP-4000 Series (Except Models VRP-4008A, B, C)—Voltage setting changed and all units should be set to voltage figures shown in table below. These settings supersede original settings given in 1940 Supplement.

VRP-4001B,1F,4C,4E,5B,6E,6F,7A,7B,8A,8C,9C—On these models, Resistor "2" changed after Serial No. 6U-000001 to new 13.5-16.5 ohm resistor (marked '15'). Before this serial number, this #2 resistor was 10-12 ohm (marked '11').

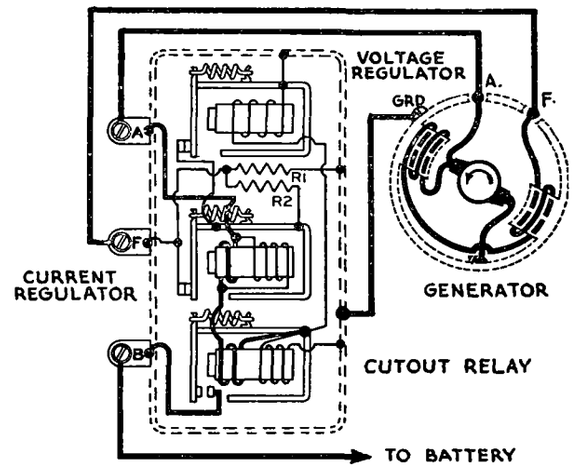
VRP-4100 & 4200 Series—New types—see data below. NOTE—These units used on Late 1940 cars as follows: **VRP-4201A-1**—Packard Six 1800 & Eight 1801, 1A ('40) with GEA-4801A Generator. **VRP-4202A-1**—Packard Super Eight 1803, 4, 5, 6, 7, 8 ('40) with GEA-4802A Generator.

GROUND TERMINAL NOTE:—Each type regulator designed for use with particular battery terminal grounded as noted in table above. When installing regulator, see that correct battery terminal grounded and repolarize generator (after all connections made) as follows:

Polarizing Generator—Connect jumper wire momentarily from starting switch battery connection to generator 'A' terminal (after all connections have been made). This momentary surge of current through generator windings will polarize generator for correct operation.



TYPE:—Vibrating type regulators similar in design to types used on 1940 car models (see 1940 Production Change Note above for changes in specifications). These regulators differ from earlier 'VRB' and 'VRD' regulators mainly in that they have the following new features:



Cutout Relay—New type armature with contact mounted on spring so that armature seals against yoke after contacts close. Designed to produce wiping action of contacts.

Armature Springs (all units)—Two different type springs used. Springs on Cutout Relay and Current Regulator units have 12¾ coils while spring on Voltage Regulator unit has 14½ coils. CAUTION—Springs must not be interchanged. Make certain that correct spring used on each unit.

VRP Current Regulator Windings—Two windings used (see illustration).

CHECKING & ADJUSTMENT:—Check each unit as directed below. See that correct armature spring installed (see note above), check resistors for correct value and location, and check and adjust all gaps before making adjustments to change regulator performance. After making adjustments, always make final 'flash' test (see instructions below) and polarize generator when generator and regulator replaced on car (see Ground Terminal Note above).

CUTOUT RELAY

Model	Voltage Winding Resistance	Contact Gap	Air Gap
All VRP-4000 Series	29.8-33.0 ohms	.015" Min.	.031-.034"
All VRP-4100 Series	29.8-33.0 ohms	.015" Min.	.034-.038"
All VRP-4200 Series	29.8-33.0 ohms	.015" Min.	.034-.038"
All VRR-4000 Series	29.8-33.0 ohms	.015" Min.	.034-.038"

Winding Resistance—Use ohmeter (ST-384) to measure resistance directly, measure from regulator 'A' terminal to ground with voltage regulator lead disconnected from cutout relay yoke.

Armature Spring Note—Springs on all models have 12¾ turns.

Air Gap—Use flat gauge ST-281-9 (VRP-4000 Series only), ST-281-3 (all others) to measure between magnet core and armature at point as close to armature hinge as possible **with contacts open.** Adjust by bending armature stop and make certain that armature stop does not rub against edge of armature. NOTE—Armature 'seals' against yoke after contacts close and air gap must be measured with contacts open.

Contact Gap—Check with feeler gauge. Gap must not be less than .015" but may exceed this figure in service. With correct adjustment, contacts will close and armature will then 'seal' against yoke. CAUTION—If contact gap too large, contacts will not close before armature seals against yoke (armature must have further travel to effect this sealing).

Model	Contacts Close	Contacts Open
All 'VRP' Types	6.4-6.6 volts	①4.8-5.6 volts
All 'VRR' Types	6.4-6.6 volts	②4.8-5.6 volts

①—Discharge current will be approximately 4-6 amperes (VRP-4000 Series), 7-8 amperes (VRP-4100, 4200 Series).

②—Discharge current will be approximately 4-6 amperes.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Closing Voltage—Connect ammeter in charging line at regulator 'B' terminal, connect voltmeter between 'A' terminal and ground. Operate generator and increase speed slowly until contacts just close **but without sealing against yoke,** note voltmeter reading at this point (NOTE—a 2000 ohm earphone connected between 'B' terminal and ground may be used to check closing, a click will be heard as the contacts close). To adjust, use tool ST-283 and adjust armature spring tension by bending lower spring hanger. Increase spring tension to increase closing voltage, lower spring tension to decrease voltage. CAUTION—Closing voltage must always be set .5 volts less than Voltage Regulator setting (contacts will not close if closing voltage higher than regulator setting).

Opening Voltage or Amperage—Connect meters as for Closing Voltage Check (above), decrease generator speed slowly and note voltmeter (or ammeter) reading as contacts open. Adjust by changing contact gap (see above).

VOLTAGE REGULATOR

Model	Winding Resistance	Contact Gap	Air Gap
All 'VRP' Types	10.8-12.0 ohms	.012" Min.	.048-.052"
All 'VRR' Types	10.8-12.0 ohms	.012" Min.	.048-.052"

Winding Resistance—Use Ohmeter (ST-284) to measure resistance directly. Measure between lead (disconnect lead from cutout relay yoke) and ground.

Armature Spring Note—Springs on all models have 14½ turns.

Air Gap—Use pin gauge ST-281-7 and measure at point next to stop pin on contact side with contacts just opening. Test air gap by connecting test lamp and battery between 'F' terminal and ground. Insert low limit pin gauge, depress armature by hand, lamp should dim or go out. Repeat test with high limit pin gauge. Lamp should remain lighted. To adjust air gap, loosen screw holding upper contact bracket, use tool ST-282 to raise bracket (to increase gap), tap top of bracket to lower contact (to decrease gap), tighten screw. See that contact spring is straight and parallel with armature.

Contact Gap—Check gap with feeler gauge while holding armature down against stop pin (CAUTION—do not press on contact spring, press down on armature evenly on both sides of spring). Gap may vary in service, if gap variation too great stop pin is wrong length and unit should be replaced.

Model	Voltage Setting	Model	Voltage Setting

Voltage Setting Tables

Table 1. Temp.	Volts	Table 2. Temp.	Volts	Table 3. Temp.	Volts	Table 4. Temp.	Volts
50°	7.51	50°	7.63	50°	7.41	50°	7.44
60°	7.48	60°	7.57	60°	7.38	60°	7.39
70°	7.45	70°	7.50	70°	7.35	70°	7.35
80°	7.42	80°	7.43	80°	7.32	80°	7.31
90°	7.39	90°	7.38	90°	7.29	90°	7.27
100°	7.37	100°	7.31	100°	7.27	100°	7.22
110°	7.34	110°	7.24	110°	7.24	110°	7.18
120°	7.31	120°	7.17	120°	7.21		

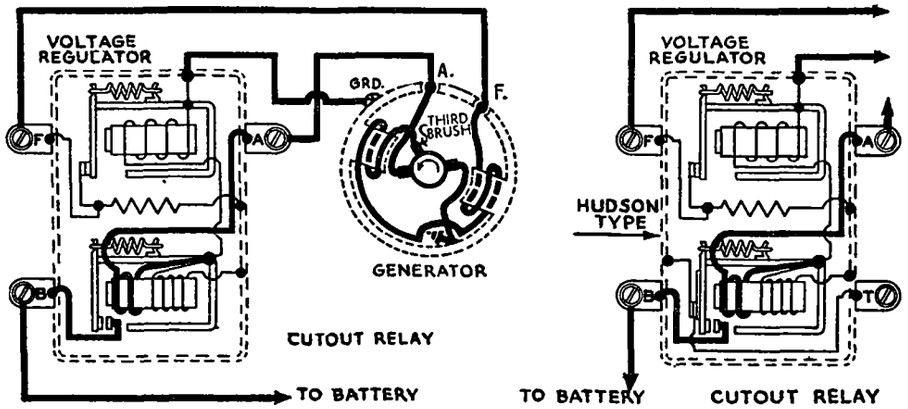
NOTE—Allowable variation in all voltage settings is plus or minus .15 volts

Voltage Setting Check—Connect ammeter in charging line at regulator 'B' terminal (ammeter must read to 1 ampere and internal resistance must not exceed .01 ohm, use short heavy leads for connections), connect voltmeter between regulator 'B' terminal and ground (meter must read to .1 volt). Make certain that car battery is fully charged with gravity reading of 1.275-1.280 (substitute fully charged battery if car battery run down). Run engine at speed equivalent to 30 MPH for at least 15 minutes with generator charging battery to bring regulator up to operating temperature. Then note voltmeter reading which should agree with table above. NOTE—Single earphone of 2000 ohm or greater resistance connected between 'F' terminal and ground is recommended in checking regulator operation.

Adjustment—Use tool ST-283 to vary armature spring tension by bending arm at lower end of spring. Increase spring tension to increase voltage, decrease tension to decrease voltage. Replace cover and recheck performance.

CURRENT REGULATOR

NOTE—Data below applies to 'VRP' types only with separate Current Regulator. Disregard this data for 'VRR' Regulators used with third brush generators.



Model	Current Setting	Contact Gap	Air Gap
All VRP-4000 Series	See Table	.012" Min.	①.048-.052"
All VRP-4100 Series	See Table	.012" Min.	.048-.052"
All VRP-4200 Series	See Table	.012" Min.	.034-.038"

①—After Serial No. 5U-000001. Before this No., Air Gap was .034-.038".

Armature Spring Note—All armature springs have 12¾ turns except VRP-4100 Series after Serial No. 12T-000001 which are 10¾ turns.

Air Gap—To check gap, use pin gauge ST-281-6 (VRP-4000 Series before No. 5U-000001 and all VRP-4200 Series), pin gauge ST-281-7 (VRP-4000 Series After No. 5U-000001 and all VRP-4100 Series). Check and adjust gap in same manner as on Voltage Regulators (see instructions above).

Contact Gap—Check in same manner as Voltage Regulator (above).

Current Setting

Model	Max. Amperes	Model	Max. Amperes
VRP-4001A	34-36	VRP-4006A, 6AP	29-31
VRP-4001B	31-33	VRP-4006B, 6G	24-26
VRP-4001C	27-29	VRP-4006C	27-29
VRP-4001D	29-31	VRP-4006D	19-21
VRP-4001E	24-26	VRP-4006E	31-33
VRP-4001F	39-41	VRP-4006F	39-41
VRP-4002A, 2C, 2D	34-36	VRP-4007A	31-33
VRP-4002B	27-29	VRP-4007B	39-41
VRP-4003A, 3B	34-36	VRP-4007C	34-36
VRP-4004A, 4F	34-36	VRP-4007D	29-31
VRP-4004B, 4H	29-31	VRP-4008A	39-41
VRP-4004C	31-33	VRP-4008B	34-36
VRP-4004D	27-29	VRP-4008C	31-33

VRP-4004G	24-26	VRP-4009B	27-29
VRP-4005A	34-36	VRP-4009C	39-41
VRP-4005B	31-33	VRP-4009D	19-21
VRP-4005C	24-26	VRP-4101A, 2A	21-23
VRP-4005D	27-29	VRP-4103A, 4A, 5A	19-21
VRP-4005E	39-41	VRP-4201A-1, 2A-1	34-36

Current Setting Check—Connect test meters and heat regulator as directed for Voltage Regulator Check (above). Then connect load in excess of rated capacity of regulator at point between regulator and battery (use bank of headlamp bulbs, or turn on all lights and accessories). Note ammeter reading with Current Regulator operating. Generator output must be within 5% of rated capacity stamped on regulator cover as shown in table above.

Adjustment—Same as Voltage Regulator (above). Use ST-283 tool.

FINAL 'FLASH' TEST:—After adjusting Cutout Relay, Voltage Regulator, or Current Regulator, final flash test should be made after regulator cover replaced, by operating generator and noting regulator performance immediately.

①—Accessory Equipment. ②—With Single Carburetor only.
③—Cars with Hydra-matic Drive Transmission.

IMPORTANT SERVICE NOTE:—For High Charging Rate and High Voltage complaints, always check generator for grounded field coils or grounded leads before changing regulator settings. To check, disconnect lead from regulator 'F' terminal with generator operating. If output drops off, trouble is in regulator. If output does not drop off, trouble is in generator and generator should be inspected for grounded field coils or leads.

Open Circuit Caution—Generator must never be operated on open circuit which will damage Generator or Regulator and cause burnt generator windings or regulator windings, burnt field resistance, or fused contacts. If these conditions found in service, check wiring circuits for open circuits or high resistance and correct before re-installing generator or regulator.

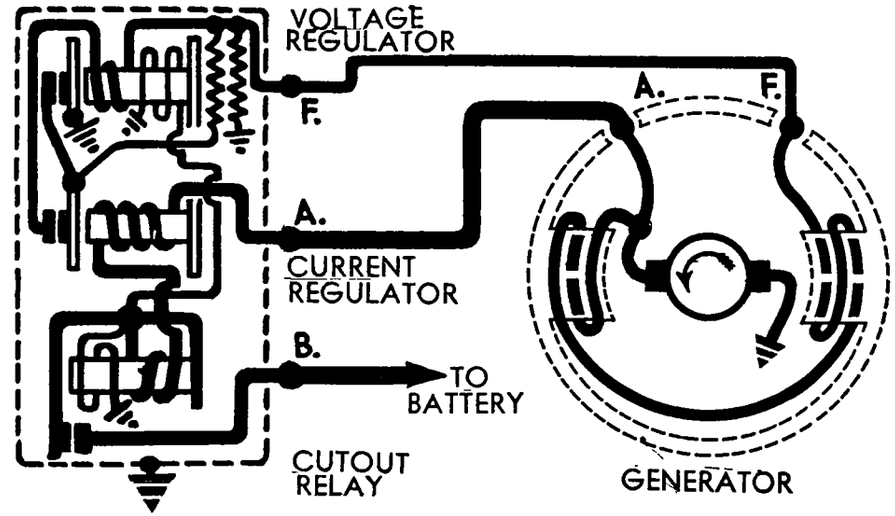
Regulator Seals—Regulator covers are sealed to indicate they are adjusted to original factory specifications. Warranty is void if unit is damaged by improper servicing (adjustments may be made by competent operators).

GROUND TERMINAL NOTE:—Each regulator designed to be used on cars with a particular battery terminal grounded as shown in table above. When installing regulator, make certain that correct battery terminal is grounded and always repolarize generator whenever generator or regulator has been disconnected.

Polarizing Generator—After generator and regulator connected, connect jumper lead between regulator 'BAT' and 'GEN' terminals momentarily. This will allow momentary flow of current through generator windings and cause generator to assume correct polarity for operation on car.

TYPE:—These Single Core Regulators are similar in design to types used on 1940 car models and have the following features:

Windings—All windings for each unit (Cutout Relay, Voltage Regulator, Current Regulator) are wound on a single core.



Cutout Relay—Has double contacts. Both sets of contacts must be set so as to open and close together.

Regulator Armature Springs—Two springs of equal weight used on both Voltage Regulator and Current Regulator units. Adjustments are made normally on one spring only. Special directions are required for adjustment of second spring (required only when new springs installed or when unit is badly out of adjustment).

Regulator Contacts—Lower movable contact mounted directly on upper surface of armature (spring type mounting not used).

CHECKING REGULATOR & GENERATOR PERFORMANCE:—To quickly locate trouble on the car, make the following tests before removing the generator or regulator for further testing and adjustment on the bench. Check battery condition with hydrometer, note whether battery low (discharged) or high (fully charged), operate engine and note charging rate as follows:

Fully Charged Battery & Low Charging Rate—This indicates that Voltage Regulator is operating normally. To check Current Regulator operation, connect test ammeter in charging line at regulator 'BAT' terminal, use starter motor to crank engine for about 15 seconds (disconnect high tension lead to prevent engine starting) to bring battery down, then run engine at medium speed, turn on all lights and accessories to start Current Regulator operating and not ammeter reading which should agree with current regulator setting (see table below). As soon as generator replaces current used in starting, charging rate should taper off to original low rate.

Fully Charged Battery & High Charging Rate—Check battery temperature (charging rate will be higher with hot battery). If charging rate excessive, operate generator at medium speed with ammeter in charging line at regulator 'BAT' terminal and note ammeter reading as follows: Disconnect lead from regulator 'F' terminal. This opens field circuit and generator output should drop off (indicating that trouble is in regulator). If output does not drop off, disconnect this lead at generator 'F' terminal. If this causes output to drop off, this lead is grounded in harness and should be replaced. If output does not drop off, check generator for grounded field leads or windings. If trouble is located in regulator, reconnect field lead at regulator 'F' terminal, remove regulator cover, depress voltage regulator armature so as to open regulator contacts manually. If output drops off, regulator has not been functioning correctly and should be adjusted. If output does not drop off, check field circuit within regulator for shorts or grounds, see that all insulators in place and that both voltage and current regulator contact support bushings and insulators are properly installed (see Servicing data below).

Discharged Battery & Low Charging Rate or No Output—Check entire charging circuit for loose connections, damaged or broken wires, and short-circuits. If entire charging circuit in good condition and no high resistance in circuit, ground regulator 'F' terminal and operate generator, increase speed slowly and note generator output (CAUTION—Do not operate generator at excessive speed —generator is operated with no regulation when 'F' terminal is grounded and output may cause generator to burn out if speed increased excessively). If output increases with speed, regulator is defective and should be checked for incorrect setting or dirty or burnt contacts. If output does not increase beyond a few amperes, check generator for grounded or open field coils, dirty or burnt commutator, defective armature or brushes. If no output is noted, quickly disconnect lead from regulator 'GEN' terminal and flash this lead to ground. If no spark is noted, generator is defective. If spark occurs, check Cutout Relay for contacts not closing (burnt contacts, open shunt winding, high voltage setting, or grounds).

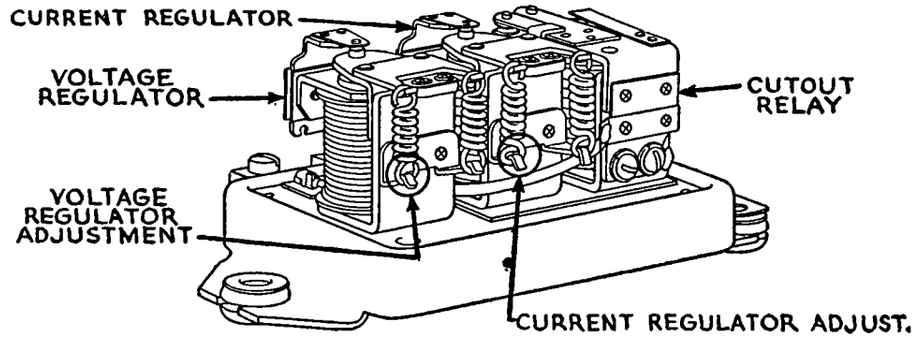
CAUTION—Do not operate generator more than momentarily with lead disconnected from regulator 'GEN' terminal. This is open-circuit operation and will damage generator or regulator if continued more than momentarily.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ADJUSTMENT:—Check all specifications for each unit first and adjust each unit as follows:

CUTOUT RELAY



Model	Cut-in Setting Volts (Hot)	Cut-out Setting Disch. Amperes	Contact Gap	Air Gap
1118201 to 8	6.2-6.7	0-4.0	.020"	.020"
1118209, 10	12.4-13.4	0-4.0	.020"	.020"
1118211, 12, 13	6.2-6.7	0-4.0	.020"	.020"
1118214	12.4-13.4	0-4.0	.020"	.020"
1118215, 16	6.2-6.7	0-4.0	.020"	.020"
1118217 to 20	12.4-13.4	0-4.0	.020"	.020"
1118221, 22, 23	6.2-6.7	0-4.0	.020"	.020"
1118224	6.3-6.9	0-4.0	.020"	.020"
1118225	12.4-13.4	0-4.0	.020"	.020"
1118226	6.2-6.7	0-4.0	.020"	.020"
1118227, 28	12.4-13.4	0-4.0	.020"	.020"
1118229 to 34	6.2-6.7	0-4.0	.020"	.020"
1118235, 39	12.4-13.4	0-4.0	.020"	.020"
1118236, 37, 38	6.2-6.7	0-4.0	.020"	.020"

Cut-in Setting Note—Check only with unit HOT (at operating temperature).
Contact Gap—Adjust by bending upper armature stop (see Air Gap adjustment). Both contacts must have same gap so as to open and close together.
Air Gap—Check with armature pressed down so contacts just close. If both sets of contacts do not close simultaneously, bend spring fingers until they do. To adjust air gap, loosen two screws on hinge bracket at back of relay, raise or lower armature and hinge assembly.
Cut-in Voltage & Cut-out Amperage—To check, connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'GEN' terminal and ground. Operate generator and gradually increase speed until relay contacts close, note voltmeter reading. Decrease speed slowly and note reverse current reading on ammeter when contacts open. To adjust closing voltage, bend spring post down (to decrease voltage), up (to increase voltage).

VOLTAGE REGULATOR

Model	Voltage Setting Volts (Hot)	Model	Volts (Hot)
1118201 to 6	7.2-7.4	1118221, 22, 23	7.0-7.2
1118207, 8	7.0-7.2	1118224	7.4-7.6
1118209, 10	14.0-14.2	1118225, 27, 28	14.0-14.2
1118211, 12	7.0-7.2	1118226, 29, 30	7.0-7.2
1118213	7.2-7.4	1118231	7.2-7.4
1118214	14.0-14.2	1118232, 33, 34	7.0-7.2
1118215, 16	7.0-7.2	1118235, 39	14.0-14.2
1118217 to 20	14.0-14.2	1118236, 37, 38	7.0-7.2

Important Note—Regulator over-compensated for temperature and must be checked only when hot and with cover in place (setting higher when cold).
Checking Voltage Setting—Connect ammeter and variable resistance of 'AVR' set in charging line at regular 'BAT' terminal, or disconnect charging line and ground the 'BAT' terminal through ¾ ohm fixed resistance (6 volt units), 1½ ohm fixed resistance (12 volt units). Resistance must be capable of carrying 10 amperes and must not change in value during temperature changes. Connect voltmeter between 'BAT' terminal and ground. Operate generator and increase speed to point where rated output normally produced (see car model 'T&E' page for generator data), adjust variable resistance of 'AVR' set so that charging current is 8-10 amperes (not required if fixed resistance method used). When regulator reaches operating temperature (150° or very hot to the touch) with regulator cover in place, cycle generator by decreasing speed to point where relay contacts open, then increase speed to original figure and note voltmeter reading. Adjust regulator if voltage not correct as shown in table above.
CAUTION—Do not change setting to correct High Voltage without first checking generator for grounded fields—see 'Important Service Note' above.
Adjustment—Bend spring hanger at lower end of **one spring only** down to increase spring tension and raise voltage setting, or up to decrease tension and lower voltage setting. If correct adjustment can not be secured on one spring, or if new springs are being installed, adjust second spring as follows:
Spring Adjustment—With one spring disconnected, connect voltmeter between regulator 'GEN' terminal and ground. Open regulator contacts by hand (press down on regulator armature), operate generator and slowly increase speed until voltmeter reading is 3 volts (6 volt units), 6 volts (12 volt units), release armature. Adjust spring tension by bending hanger at lower end of spring which is connected until voltage is 4 volts (6 volt units). Then connect second spring and adjust this spring as directed under 'Adjustment' above (do not touch first spring when making this final adjustment).
Contact Servicing—Contact points must be clean (dirty or oxidized points will cause reduced generator output and rundown batteries). To clean or surface contacts, remove upper contact support and service each contact separately. Use a thin, fine-cut contact file and file each point separately using great care not to file smaller rounded point excessively. If flat point has a cavity, use a 'spoon' or 'riffler' file to clean cavity out so that good contact secured between contact points (do not file contact excessively to remove cavities). When reinstalling upper contact support, make certain that all insulators correctly installed and adjust air gap. CAUTION—Do not use sandpaper or emery cloth
Air Gap—.070" measured at center of core with contacts just closing.
Air Gap Adjustment—To check, press armature down and allow it to come back until contacts just close, measure air gap at center of core with armature in this position. To adjust, loosen two screws on upper contact support bracket, move bracket up or down being careful to keep contacts lined up.

CURRENT REGULATOR

NOTE—Data below applies only to 3 unit Regulators (with separate Current Regulator Unit). Disregard this current regulator data when adjusting 2 unit Regulators (no Current Regulator) used with third-brush generators.

Model	Current Setting Amperes	Model	Amperes
1118201, 2	32-34	1118222, 23	34-36
1118207, 8	28-30	1118224	12.5-13.5
1118209, 10	16-18	1118225	14-16
1118211, 12	38-40	1118226, 29	34-36
1118214	24-26	1118230	26-28
1118215, 16	22-24	1118232	34-36
1118217	19-21	1118233, 34	24-26
1118218	7-9	1118235, 39	9-11
1118219	24-26	1118236	26-28
1118220	12-13	1118237, 38	38-40
1118221	26-28		

Important Note—On units with steel armature spring hinges, regulators are over-compensated for temperature and must be checked only when hot (have higher setting when cold). Units with bronze armature spring hinges operate at same value both cold and hot.
Checking Current Setting—Remove regulator cover and connect short jumper from voltage regulator frame to upper contact support bracket (this will short out voltage regulator while current regulator being checked). Connect ammeter in charging circuit at regulator 'BAT' terminal. Turn on lights, radio and other accessories (to provide load which will bring current regulator into operation), operate generator and increase speed until output remains stationary. With regulator at operating temperature (150° or very hot to the touch) and cover in place, ammeter reading should agree with setting given above.
CAUTION—Do not change setting to correct High Charging Rate without checking generator first for grounded fields—See "Important Service Note" above.
Adjustment—Bend spring hanger at lower end of **one spring only** down to increase tension and increase current setting, up to decrease tension and decrease current setting. If adjustment cannot be secured on one spring, or new springs are installed, proceed as follows:
Spring Adjustment—With one spring disconnected, operate generator at medium speed, adjust hanger at lower end of spring until output is regulated at approximately half rated output (17 amperes on 1118201,2). Then connect second spring and adjust this spring as directed above (do not touch first spring when making this final adjustment).
Contact Servicing—Same as for Voltage Regulator (above).
Air Gap—.080" measured at center of core with contacts just closing.
Air Gap Adjustment—Same as for Voltage Regulator (above).

Car	Generator	Regulator
Ford, All V8 Cars & Trucks	01A-10000-B	01A-10505-C
Ford, 4 Cylinder Truck	S08T-10000	01A-10505-C
Lincoln, All Models	01A-10000-B	01A-10505-C4
Mercury, Model 19A	01A-10000-B	01A-10505-C

PRODUCTION CHANGE NOTE:—Regulators with several minor differences will be found in service as follows:

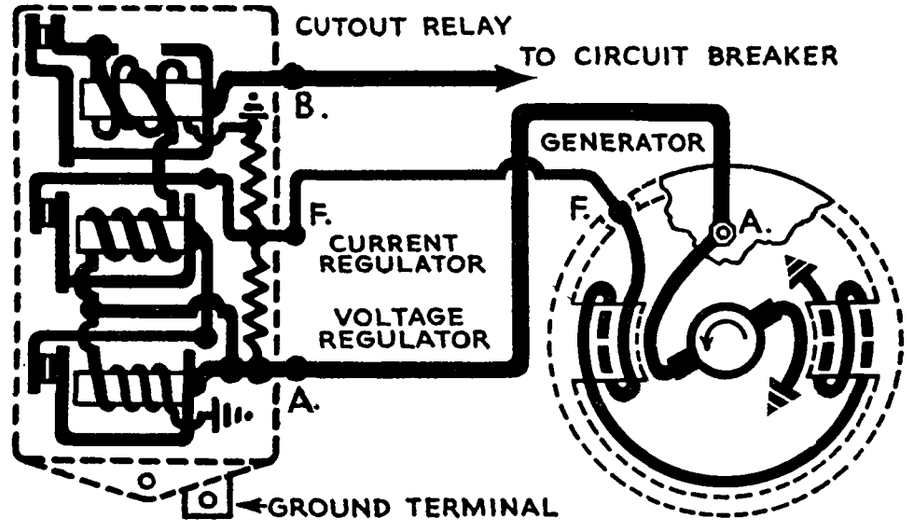
Regulator Ground Lead—On some regulators, ground lead consists of a braided pigtail connected to a lug on the regulator case by which the regulator is grounded directly to the engine dash. The regulator case ground lug is attached to the regulator case by the cover rivet and this ground connection is disturbed by removal of the regulator cover. On other regulators, the ground connection consists of a separate wire which is connected to the regulator case and grounded to a terminal screw on the generator frame. CAUTION—Ground lead must be in place when regulators are tested. If ground disturbed by removal of regulator cover, re-install ground lead before making regulator tests.

Regulator Wiring Color Code—On some regulators, wire colors are marked on regulator cover adjacent to terminals. See car model wiring diagrams in 'T&E' section for wire colors and regulator connections on all models.

1940 PRODUCTION NOTE:—These new 3-unit Regulators were used on late 1940 Ford, Lincoln, and Mercury (after July) and are also furnished as Service Replacement for the earlier 2-unit type regulator. All data given below applies to 1940 and earlier cars with this new 3-unit regulator.

TYPE:—New design 3-unit (Cutout Relay, Voltage Regulator, Current Regulator) regulator with separate voltage and current regulator units (these units were combined on previous 2-unit regulators). Regulators are vibrating type and charging rate is normally controlled by Voltage Regulator. Current Regulator operates when current reaches value in excess of rated capacity and limits current to this figure. Both regulators operate in the same manner by cutting the resistance in and out of the field circuit and control the generator output by regulating the field current. Cutout Relay is compensated for temperature by means of a bi-metal clip on the armature spring so that the cut-in voltage is held constant throughout the normal temperature range.
SERVICE CAUTION—Ford Generators and Regulators are not wired in same manner as units of other makes and cannot be operated in conjunction with units of other makes. Always operate Ford Generators & Regulators together.

CHECKING & ADJUSTMENT:—When checking regulator on the car, test Battery, Charging Circuit, and Regulator in order and exactly as described below. Regulator should be at normal operating temperature (car should be operated for approximately 5 minutes to bring generator and regulator up to operating temperature).



Battery:—Check battery with 'BRS' attachment and Ford Test Set. If battery tests less than 70%, recharge battery or install fully charged battery.

Charging Circuit:—Check entire circuit for high resistance as follows: Operate engine at 1250 RPM. with generator charging battery (use HI-TAC tachometer and Ford Test Set to set engine speed or see Service Note on Engine Speed below). Use 3-volt voltmeter test leads, connect one lead to positive post of battery, other lead to generator frame or positive (grounded) main brush. Voltmeter reading must not exceed .1 volt (Ford Test Set 'B' scale reading of 4). Then check resistance between generator and regulator by connecting one voltmeter lead to generator 'A' terminal, other lead to regulator 'A' terminal (armature terminal). Note voltmeter reading (or 'B' scale reading on Ford Test Set), then shift voltmeter lead from regulator 'A' terminal to regulator 'B' terminal (battery terminal) without disturbing lead at generator 'A' terminal. Voltmeter or Ford Test Set 'B' scale reading must not be more than 6 times previous reading (from generator to regulator 'A' terminals). Then shift voltmeter lead to negative post of battery (without disturbing lead on generator 'A' terminal), voltmeter or Ford Test Set 'B' scale reading must not be more than 6½ times first reading (from generator to regulator 'A' terminals). If voltmeter readings too high (indicating high resistance in charging circuit), correct this condition by cleaning and tightening terminals or replacing wiring before checking and adjusting regulator.

Regulator:—Regulator should be checked by 'fixed resistance' method which requires a special ¾ ohm fixed resistance capable of carrying 10 amperes and which does not change in value due to temperature changes. A special Heyer 'BABAE' ¾ ohm resistance unit is available for this purpose. To install resistor, disconnect charging line at regulator 'B' terminal (leave this lead disconnected while tests being made), connect ¾ ohm resistor to regulator 'B' terminal and ground opposite end of resistor. Then check and adjust regulator as directed below. NOTE—With this ¾ ohm resistor connected between regulator and ground, generator output is approximately 10 amperes.

CAUTION—Regulator is grounded through braided pigtail connected to regulator cover rivet or by separate ground wire from regulator case to generator frame. Ground connection must always be in place when generator and regulator are operated. If ground wire disturbed by removal of regulator cover, **make certain that regulator is grounded whenever generator and regulator are being operated.**

Relay Cut-in Voltage—Connect 15 volt voltmeter between generator 'A' terminal and ground. Start engine and slowly increase speed until cutout relay contacts close (pointer will drop back slightly as points close). Check by repeating test several times, note voltmeter reading. Cut-in voltage should be

5.8-6.3 volts at operating temperature. To adjust, remove regulator cover (see Service Note below for cover rivet removing tool), bend bi-metal at lower end of cutout relay armature spring in to increase tension and raise cut-in voltage, out to decrease tension and lower cut-in voltage.

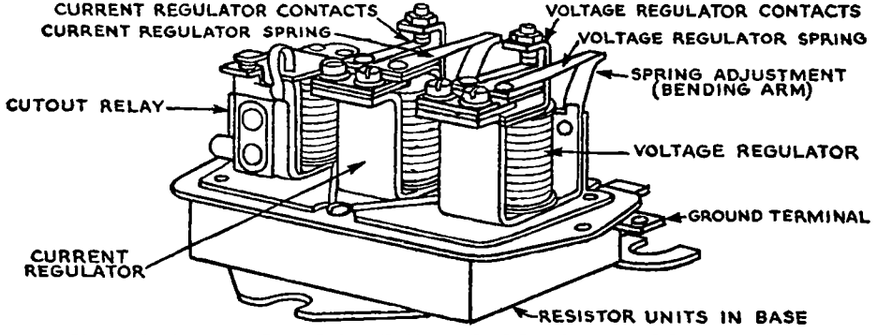
NOTE—If idling speed is higher than cut-in point, it will be necessary to back off throttle stopscrew and lower idling speed below cut-in point before the above test can be made. If idling speed changed in this manner, make certain that speed is reset at 500 Eng. RPM. (5-7 MPH.) after tests completed.

Voltage Regulator Setting—Re-install regulator cover and make certain that regulator case grounded (if ground pigtail disturbed by cutout relay adjustment above). Connect 15 volt voltmeter between regulator 'B' terminal and ground. Operate generator at 2300 RPM. using HI-TAC tachometer and Ford Test Set to set engine speed at correct figure in table below (or see Service Note on Engine Speed below). Note voltmeter reading which will be voltage regulation point. Voltage should be 6.9-7.2 volts (46-48 on Ford Test Set 'B' Scale) with regulator at 70-80° F. (temperature after 5 minutes operation). See Service Note Table below for voltages at other temperatures. If voltage is not within these limits, regulator should be replaced. See Service Note on adjustment below.

Engine Speed Table (for 2300 Generator RPM).

Generator Pulley Size	Engine-Generator RPM Ratio	Engine RPM.
3.0"	1.82	1250
3.44"	1.57	1468
3.5"	1.52	1510
3.53"	1.48	1550
3.85"	1.35	1700
4.2"	1.25	1840

Current Regulator Setting—With engine running at same speed as for Voltage Regulator test (above), connect '90' ammeter in charging line at regulator 'B' terminal (connect one ammeter lead to regulator 'B' terminal,



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

other lead to charging line previously disconnected from this terminal, make certain that ¾ ohm fixed resistance disconnected by removing resistor ground lead), turn on headlamps and close starter switch so that starter runs free (to supply load and cause current regulator to operate), note ammeter reading which will be current regulation point. Current should be 28 amperes at 7.0 volts with regulator hot (after engine has been run for 5 minutes. IMPORTANT NOTE—This 28 ampere setting at 7.0 volts is equivalent to 196-200 watts generator output which should not be exceeded for continuous operation.

Cutout Relay Reverse Current—After checking Current Regulator (above) and without disturbing test connections, slowly decrease engine speed until ammeter indicates discharge 'reverse' current through cutout relay (On Ford Test Set, meter plug should be reversed in socket when charging current reading drops to approximately 5 amperes or 5.5 on the 'B' scale so that discharge current can be read on dial). Note ammeter reading at instant contacts open (pointer will drop to zero with contacts open). Reverse current must not exceed 8 amperes.

SERVICE NOTES:—Regulator Cover Removing Tool—Regulator cover is fastened on by a rivet to the regulator frame flange at either end. On some models, one rivet also attaches the ground pigtail terminal. A special tool (combination punch and rivet set) is available with which the cover rivets can be easily removed (to remove cover for adjustments) and installed when cover is replaced. CAUTION—Always make certain that ground lead pigtail or wire is properly attached when cover is installed.

Voltage & Current Regulator Setting & Adjustment—Adjustments are not recommended on Voltage & Current Regulators. These units have adjustable spring post or 'bending arm' which controls regulating voltage and current. Bending this post or arm in so as to increase spring tension will increase voltage or current setting, bending arm out so as to decrease spring tension will decrease voltage or current setting. Air Gap for both Voltage & Current Regulators is approximately .047-.050".

Voltage Regulator Setting—Regulating voltage depends on temperature and if regulator is not at 70-80° when being tested (as directed above), voltage should agree with following table for temperature ranges as noted.

Voltage Setting

Temperature (°F.).	Volts
50°	7.0-7.3
60°	6.92-7.25
70°	6.85-7.2
80-90°	6.8-7.1
100°	6.75-7.05
110-130°	6.7-7.0
140-150°	6.65-6.95
160-180°	6.6-6.9

Setting Engine Speed—Manufacturer recommends that tachometer (HI-TAC tachometer and Ford Test Set) be used to determine engine speed when checking and adjusting regulator. However, if tachometer not available, approximate engine RPM. can be determined from the car speedometer by running the engine with transmission in high gear (rear wheels blocked up) at a car speed (speedometer reading) which will depend on the Tire Size and Rear Axle Ratio and can be calculated as follows: Multiply the 'Tire Revolutions per Mile' (see table below) by the 'Rear Axle Ratio' (see table below), divide this amount by 60 to determine 'Engine Revolutions per mile per hour' as indicated on car speedometer. Note desired Engine RPM in table under 'Voltage Regulator Setting' above (RPM depends on size of generator pulley), divide this RPM figure by the previously calculated 'Engine Revolutions per mile per hour' figure. The result will be the speedometer reading at which the engine should be run in high gear to secure the desired Engine RPM for regulator testing and adjusting.

Tire Revolutions per Mile

Tire Size	Rev. per Mile	Tire Size	Rev. per Mile
5:50x16 (4 ply)	772	6:50x20 (8 ply)	620
6:00x16 (4 ply)	740	7:00x16 (4 ply)	713
6:00x16 (6 ply)	734	7:00x16 (6 ply)	710
6:00x18 (4 ply)	696	7:00x20 (8 ply)	592
6:00x18 (6 ply)	688	7:00x20 (10 ply)	597
6:00x20 (6 ply)	636	7:50x20 (8 ply)	573
6:00x20 (8 ply)	636	7:50x20 (10 ply)	568
6:50x16 (4 ply)	722	7:50x18 (10 ply)	602
6:50x16 (6 ply)	730	8:25x20 (10 ply)	553
6:50x20 (6 ply)	616	9:00x18 (10 ply)	559

1941 Models	Rear Axle Ratios (Std. & Optl.)	Axle Ratio
Ford V8 Passenger Car & Commercial		4.11, 3.54, 3.78
Ford 4 Cylinder Commercial		4.55
Ford ¾ & 1 Ton Truck		4.11, 4.857
Ford 4 Cyl. ¾ & 1 Ton Truck		6.666
Ford 148½" WB. Bus		6.666, 5.83
Ford All Other V8 Trucks		6.666, 5.83, 5.14
Lincoln Zephyr, Continental, Custom		4.44
Mercury		3.54, 3.78, 4.11

NOTE—For earlier car models, see Rear Axle data on 'M' pages in manual.

1941 AUTO-LITE REGULATORS

CONTINUED FROM PAGE EE-452

REGULATOR RESISTORS:—One resistance unit used on 'VRR' regulators, two used on 'VRP' models (see VRP illustration for resistor locations). Resistors should be checked for correct resistance by testing with ohmeter (ST-284). CAUTION—Remove one resistor at a time to avoid interchanging units. Use extreme care to replace resistors in exact original location.

Voltage-Current Regulator Resistors

Model	Mark —R1— Ohms	Mark — R2 — Ohms

VRR-4001B, 2B, 3A, 4A, 5A	20	19-21

POSITIVE PINION SHIFT TYPES

Car Model	Starting Switch	Starter
De Soto, Model S8 (1941)	SW-2813	MAW-4019
Dodge, Model D19 (1941)	SW-2813	MZ-4089
Dodge, Canadian Models (1941)	SW-2813	MAW-4019
Plymouth, P11, P12 (1941)	SW-2813	MZ-4089
Plymouth, Canadian Models (1941)	SW-2813	MAW-4019

TYPE:—Consists of a manually operated pinion shift on starting switch (linked to starting pedal on toeboard). Starting switch is mounted on starter field frame and is operated by a knob on the shift lever after the pinion has been meshed with flywheel (adjustment provided to insure pinion being meshed before switch closes).

CHECKING & ADJUSTMENT:—Check starter armature endplay, pinion position and clearance (single adjustment) as follows:

Pinion Position when disengaged—With pinion at rest, distance from outer face of mounting flange on pinion housing to outer end of pinion should be 1 11/32" plus 1/64" or minus 5/32".

Pinion Clearance when engaged—With pinion fully meshed in flywheel (full travel of shift lever), clearance between outer end of pinion and face of thrust washer next to outer pinion housing bearing should be 5/64" plus or minus 1/64". To adjust, turn button on outer end of starting switch plunger in or out on plunger (press down on spring to free button which is locked in position by outer end of spring).

Armature Endplay—Armature endplay should be .005" minimum, .030" maximum. Adjust by inserting MU-54 thrust washer of correct thickness between the MAD-96 thrust washer and the commutator end plate. These thrust washers furnished as follows: MU-54—1/32", MU-54A—1/64", MU-54B—3/64".

Switch Travel—Plunger travel between at rest position and closed position should be approximately 5/32".

Checking Switch Action—Switch action can be checked by slipping special steel spacer (square stock 1" wide, 3/4" thick, with 5/8" slot in the 1" face) on armature shaft between pinion and thrust washer at pinion housing outer bearing. With spacer in place, switch should close when pressure applied to outer end of pinion shift lever.

SOLENOID PINION SHIFT TYPES

Car Model	Solenoid Switch	Starter
Chrysler 6, Model C28 (1941)	SS-4703	MAX-4045
Chrysler 8, C30, C33 (1941)	SS-4703	MAX-4045
Packard Super 8, 1903 to 8 (1941)	SS-4205	MAX-4041
Studebaker President, 7C (1941)	SS-4702	MAX-4044

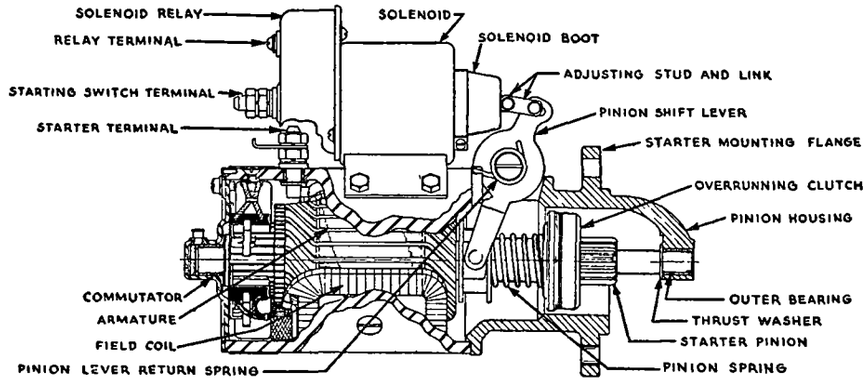
PACKARD NOTE:—Packard Super 8 starter is a reduction gear type unit with solenoid operated pinion on reduction gear shaft which is driven at 14/29 armature speed. Grease plug provided on drive end of starter through which gear compartment can be packed with heat-resisting grease. Solenoid Switch unit is similar to types use on other starters and is serviced in the same manner.

TYPE:—Solenoid type combined starting switch and pinion shift (with control relay mounted in solenoid case) mounted on the starter field frame. Types used on 1941 car models are similar in design to units used on corresponding 1940 cars (Chrysler type has new design shift lever and protective boot on outer end of solenoid plunger—no shift mechanism cover being used on this type).

CHECKING & ADJUSTMENT:—Check starter armature endplay, pinion position and clearance (single adjustment), solenoid performance and relay specifications as follows:

Solenoid Winding Tests—Shunt and series windings together should draw 34-38 amperes at 3.0 volts. Shunt coil only should draw 14-16 amperes at 6.0 volts

Solenoid Relay Specifications



Contacts Close—3.5-4.5 volts. **Contacts Open**—1.5-2.5 volts.
Contact Gap—.025-.035". **Coil Resistance**—7.5-8.3 ohms at 77° F.

Pinion Position when disengaged—With pinion at rest, distance between outer face of mounting flange on pinion housing to outer end of pinion should be 15/16" (MAX-4041), 19/32" (MAX-4044), 1 11/32" (MAX-4045) plus 1/64" or minus 5/32". Adjusted by changing solenoid plunger stud position (below).

Pinion Clearance when engaged—With switch closed and plunger fully bottomed in core (press in on plunger when making this test), clearance between end of pinion and thrust washer next to outer pinion housing bearing should be 5/64" plus or minus 1/64". To adjust, remove pin in plunger link and turn stud in or out of plunger.

Armature Endplay—Armature endplay must be .005" minimum, .030" maximum. Adjust by inserting MU-54 thrust washer of correct thickness between the MAD-96 thrust washer and the commutator end plate. These thrust washers furnished as follows: MU-54—1/32", MU-54A—1/64", MU-54B—3/64".

Checking Switch Action—Switch action can be checked by slipping special steel spacer (square stock 1" wide, 3/4" thick, with 5/8" slot in the 1" face) on armature shaft between pinion and thrust washer at pinion housing outer bearing. With spacer in place, switch plunger should bottom and switch contacts should close with normal voltages.

TROUBLE SHOOTING:—**Pinion fails to engage or disengage properly.** Check for interference between shift yoke and collar at open end of yoke where curved section passes over rim on collar. Binding of yoke on collar at this point should be corrected by filing yoke at point where interference occurs. Check for binding of yoke shoes on mounting pins which causes shoes to turn and bind in collar. Correct by cleaning all dirt from between shoes and yoke, lubricate shoe pins and make certain that yoke shoes installed with curved side toward pinion end of starter clutch. Check for binding of yoke assembly on yoke fulcrum pin due to paint or dirt on pin. Clean yoke pin and yoke sleeve thoroughly, examine return spring on pin. If this does not correct trouble, replace yoke assembly.

Flywheel ring gear teeth damaged by pinion. May be caused by too early closing of starting switch contacts which will result in starter operating before pinion has been meshed with flywheel. Check pinion position (see specifications above). Switch contacts should close approximately 3/16" plunger travel before plunger bottoms in solenoid core.

MAGNETIC SWITCH TYPES

Car Model	Switch Type	Starter
Hudson 6, 10, 11, 12, 13, 18 (1941)	SS-4001	MZ-4092
Hudson 8, 14, 15, 17 (1941)	SS-4001	MAB-4100
Packard Clipper, Model 1951 (1941)	SS-4017	MAW-4021,24
Packard 6, Model 1900 (1941)	SS-4017	MAW-4021,24
Packard 8, Model 1901, 1A (1941)	SS-4017	MAW-4021,24
Willys Comm'l., 441P Panel (1941)	SS-4001	MZ-4049, MZ-4100

NOTE:—**Packard Clipper**—This switch used with Carter Car Starter. See separate article for complete data on this Carter Car Starter.

TYPE:—Consists of a magnetic switch mounted on the starter field frame and controlled by a pushbutton switch on the instrument panel. The feed wire for the pushbutton and switch is normally connected to the 'gauge' side of the ignition switch so that the starter is operative only with the ignition turned on. These switches used only on starters with Bendix drives.

PERFORMANCE:—**Closing & Opening Voltages**—Initial contact of switch should occur with terminal voltage of not more than 4.0 volts and switch plunger should bottom with voltage of not more than 5.25 volts. Switch contacts open with voltage of .75 volt minimum, 2.0 volts maximum.

Coil Winding—Winding has resistance of 1.82-2.06 ohms at 70° F. and current draw is 2.9-3.3 amperes at 6.0 volts.

CHECKING & ADJUSTMENT:—Check switch performance (see performance specifications above). No adjustment of the switch is required.

NOTE—Switch can be operated by hand by removing small metal cap on end of switch case and pressing in on switch plunger.

MANUAL PINION SHIFT TYPES

Car Model	Starting Switch	Starter
Chevrolet, All Models (1941)	820052	1107033
Graham, 109, 113 (1941)	820052	738-T
Oldsmobile, All Sixes (1941)	820052	1107034
Oldsmobile, All Eights ('41)	820052	1107922
Pontiac, All Sixes (1941)	820052	1107032
Pontiac, All Eights (1941)	820052	1107921

DESCRIPTION:—These starters have a pinion assembly and shift lever similar to that used on Solenoid Pinion Shifts but the shift lever is connected through linkage to the starting pedal so that the pinion is positively engaged with the flywheel teeth when the starting pedal is depressed. The starting switch is mounted on the starter field frame and switch plunger is depressed by lug on shift lever to close switch contacts and operate starter after pinion has been meshed with the flywheel.

SERVICING:—No servicing required and no adjustments provided. Switch contacts should not close until after pinion has been meshed (except when pinion teeth butt against flywheel teeth in which case compression of spring between shift collar and overrunning clutch on pinion sleeve will allow switch contacts to close and revolve pinion to meshing position). Return spring on shift lever should have sufficient tension to disengage pinion promptly when starting pedal is released.

Pinion Assembly. Same as types used on Solenoid Pinion Shift Starters (see below). The compression spring and collar can be serviced but no attempt should be made to dismantle or service overrunning clutch.

SOLENOID PINION SHIFT TYPES

SOLENOID SWITCHES (WITH PUSHBUTTON CONTROL)

SOLENOID SWITCHES (WITH VACUUM SWITCH CONTROL)

Buick, 41-40, 50 (1941)	1542	1107005	1990127①
Buick, 41-40, 50 RHD. ('41)	1542	1107018	1990127①
Buick, 41-60, 70, 90 (1941)	1542	1107908	1990127①
Buick, 41-60, 70, 90 RHD. ('41)	1545	1107909	1990127①

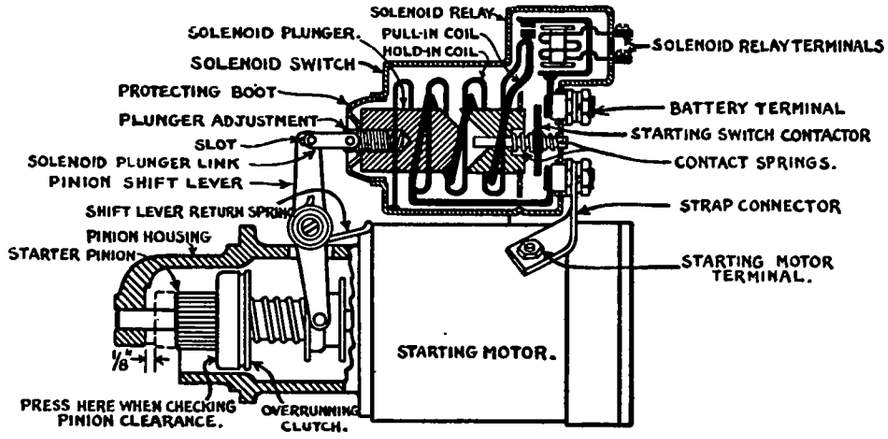
①—Used on cars with Stromberg Carburetors only. Cars with Carter Carburetors have Carter Car Starter No. 192-11U.

NOTE:—Chevrolet, Graham, Oldsmobile, Pontiac LHD. Models—These models have Manual Pinion Shift (starting pedal) type starter control. See separate article for data on this manual pinion shift type.

TYPE:—Solenoid type combined starting switch and pinion shift (with control relay in solenoid case) mounted on the starter field frame with the solenoid plunger linked to the pinion shift lever. Types used on 1941 car models are similar in design to types used on corresponding 1940 cars.

PERFORMANCE:—Solenoid Switch—Solenoid should close (bottom in core) against 70 lb. pull with ½" gap drawing 65-71 amperes at 5 volts. While closed, current should be 12-14 amperes (hold-in coil only).

Relay Specifications (1542, 1545, 1546)



Contacts Close—1.9 volts maximum. **Contacts Open**—1.0-1.2 volts.
Contact Gap—.035" (.025-.045"). **Air Gap**—.012" (contacts closed).

CHECKING & ADJUSTMENT:—Check Solenoid and Relay performance (see specifications above). Adjust solenoid plunger link for correct pinion clearance as follows:

Solenoid Setting—Clearance between end of pinion and inner face of starter pinion housing should be 3/16" (solenoid plunger bottomed in core). Adjustment will be simplified if lead disconnected at terminal on starter field frame (so starter will not spin) and relay contacts closed so that plunger is drawn into coil core. Press back on pinion to take up backlash in overrunning clutch, remove solenoid plunger link pin, adjust link (by turning link stud in plunger) until pin can just be inserted at forward end of shift lever slot.

Cadillac Note—On these starters, pinion travel (from disengaged or at rest position to fully engaged position with solenoid plunger bottomed in core should be 23/32" to 25/32".

SERVICING:—Pinion Assembly & Spring—Pinion assembly same type as used on previous models (may be identifed by groove in pinion teeth approximately ⅛" from clutch shell). Compression spring must have tension of at least 34 lbs. when compressed to 1". To remove spring, press shift collar down on pinion sleeve to compress spring until lock ring on end of sleeve is exposed, remove lock ring. Spring and collar can be serviced but no attempt should be made to dismantle overrunning clutch mechanism. Clutch is packed with high melting point grease and pinion assembly should not be cleaned by any method which may remove this lubricant.

Shift Lever Return Spring—Return spring on shift lever should have tension of 9-12 lbs. (start of travel), 28-35 lbs. (end of travel). Weak spring may cause sluggish disengagement particularly in cold weather or if shaft is gummy.

MAGNETIC SWITCH TYPES

Car Model	Switch Type	Starter
Packard '110' Six, 1900 (1941)	1452	1107037

TYPE:—Consists of a magnetic switch mounted on the starter field frame and controlled by a pushbutton switch on the instrument panel. The feed wire for the switch is connected to the 'gauge' terminal of the ignition switch so that the starter is operative only with the ignition turned on. Starter used with this type switch is equipped with a Bendix Drive.

PERFORMANCE:—Operating Voltage—Switch contacts should remain closed with voltage reduced to .7 volts (.54-.65 ampere current draw).
Current Draw—3.1-3.7 amperes at 4.0 volts.

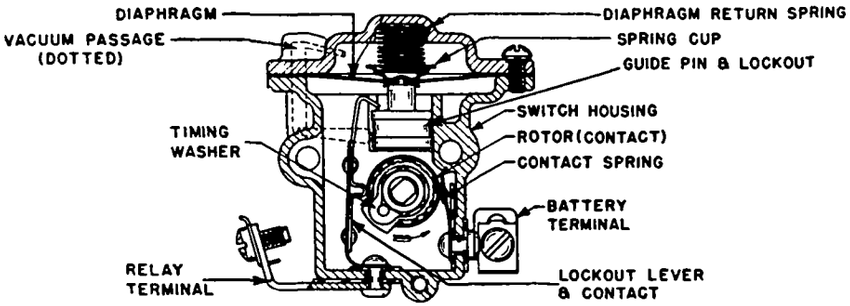
CHECKING & ADJUSTMENT:—Check switch performance (see specifications above). No adjustment of the switch is normally required.
NOTE—Switch can be operated by hand by pressing in on switch plunger after small metal cap on end of switch case is removed.

Model **Used On:**

1990127—BUICK, SERIES 41-40, 50, 60, 70, 90 ('41) WITH STROMBERG CARBURETORS.

TYPE:—Same design as used on 1940 Buick models with Stromberg carburetors. Switch is 'direct operated' type and is mounted directly on the carburetor (front carburetor of Compound Carburetion cars) with the switch rotor mounted directly on the carburetor throttle valve shaft.

DESCRIPTION:—This Vacuum Switch is of the 'direct operated type' with contact rotor mounted directly on end of throttle valve shaft within switch body (switch assembly mounted directly on carburetor casting at end of throttle shaft by two screws). Vacuum chamber is formed within top cover plate and is connected to the manifold below the throttle valve by a channel extending through the top cover, switch body, and carburetor casting. Diaphragm is clamped between switch body and top cover and consisted of a riveted assembly including spring cup (spring sits in cup and is positioned by recess in top cover) and combination guide pin and lockout plunger (which moves in guides formed in switch body). The internal circuit through the switch is completed from one contact spring through the contact rotor to the opposite contact spring (mounted on the lockout lever).



OPERATION:—With the engine not running (no vacuum) and the throttle valve closed, lockout will free lockout lever (diaphragm pressed down by return spring) but lockout lever and contact will be held away from contact plate on contact rotor by insulating knob on rotor. When the throttle is opened to start the engine, contact rotor turns with throttle valve shaft and as soon as insulating knob is turned away from the lockout lever, the contact spring on the lever contacts the rotor and completes the circuit through the switch. As soon as vacuum is developed in the manifold, diaphragm attempts to move upward but is prevented from doing so by hook on upper end of lockout lever which engages top of lockout plunger. When throttle is closed (to idle engine after it has started), insulating knob on contact rotor presses out on lockout lever and frees lockout plunger, diaphragm then moves up and lockout engages lockout lever so that the contact spring is held away from the contact rotor while the engine is running. When engine is stopped, the closing of the throttle valve lifts the lockout lever from the lockout (this Unlatch Action occurs 17-23° from closed throttle position) and diaphragm and lockout plunger drop down into position for a new start.

ADJUSTMENT:—No adjustment ordinarily required. Switch is "timed" for correct throttle position when contacts closed by timing washer assembled on face of contact rotor which positions rotor on throttle valve shaft. Timing can be checked, and new washers installed to change timing as follows:

Switch Timing Check:—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Take out screws and remove side cover plate on switch. Start engine, close throttle, then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine must be cold), stop engine without disturbing throttle position. Place mirror so that switch guide pin and lockout visible from left side of car, close throttle slowly by lightly tapping on hand throttle lever until guide pin and lockout releases, then measure clearance between stopscrew and fast idle cam with cam in fast idle position. Clearance should be 3/64" minimum, 3/32" maximum. If less than 3/64" timing washer should be replaced by one having a **higher number.** If more than 3/32", timing washer should be replaced by one having **lower number.** See directions below.

Switch Action Check (On Car):—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Start engine, close throttle then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine cold), stop engine. Tap throttle closed until clearance between stopscrew and cam is exactly 3/64" (use extreme care not to close throttle further, if clearance less than 3/64", repeat entire procedure). Start engine by opening throttle from this position. Repeat this test several times. Engine should start each time. If engine does not start more than once, timing washer should be replaced with one having a **higher number.** After making above test for minimum clearance between fast idle cam and stopscrew, check for maximum clearance as follows. Repeat test instructions given above except that clearance between fast idle cam and stopscrew should be set at not less than ⅛". Engine should not start from this position. If engine starts, timing washer should be replaced with one having **a lower number** and first test (for minimum clearance) should be repeated.

Timing Washers:—Washer has slot which engages flat on throttle shaft and lug which engages hole in contact rotor (rotor is free on shaft and is positioned by timing washer). Washer marked by number on side opposite rotor lug and furnished with lug in different positions for smaller or larger stopscrew-to-fast idle cam clearance (washer with higher number will increase clearance, lower number decrease clearance). Washer number indicates angular degrees of

throttle shaft rotation and washers are furnished in 3° steps. Select correct washer by means of tests given above and install washer as follows:

Timing Washer Installation. Take out screws in side cover on switch, remove cover and gasket. Remove nut on end of throttle valve shaft within switch, remove lockwasher and timing washer (if contact rotor removed, make certain that steel washer installed on shaft behind rotor). Install timing washer being careful to see that lug engages hole in contact rotor, install lockwasher and tighten nut, replace cover and gasket. Recheck switch timing.

CAUTION—Cover gasket is felt and is designed to provide necessary 'breathing' action required by diaphragm movement. This gasket must always be installed under side cover and no other type gasket should be used

SERVICING:—No servicing required. If top cover removed (for diaphragm replacement), make certain that return spring properly seated in cover recess and spring cup on diaphragm and that vacuum channel in top cover and switch body line up. When installing new parts, always check switch timing and install correct timing washer as directed above.

CAUTION:—Always connect wire with red cross tracers (hot lead) to terminal on front of switch to prevent lock-out lever being short-circuited if it should be bent back against housing during timing operation.

1940 DELCO-REMY STARTERS

NOTE:—When burnt commutators are found on starters used on early 1940 cars, starter should be inspected for improper armature coil connections at commutator bar risers and this condition corrected as follows:

CHECKING STARTER:—Carefully examine all armature leads at point where they are soldered to commutator bar risers (pay particular attention to inner or underneath leads) for evidence of improper soldering and poor bond between leads and commutator bars.

CORRECTING TROUBLE:—Remove armature, carefully resolder all leads to commutator bar risers. Turn down commutator. When reassembling starter, check brushes to make certain that they are free and not binding, see that pigtail leads are correctly attached and free so that they do not hold brush off commutator. Check brush spring tension (see car model 'T&E' page for specifications). CAUTION—Too little brush spring tension will cause arcing and burnt commutator, excessive tension will cause rapid wear.

Time Allowance—Time required for complete repair (resoldering armature and turning down commutator) is 1½ hours (including removal of starter from car), 1 hour (when starter off engine).

CARTER MODEL No. 192-11U

BUICK, SERIES 41-40,40A,50,60,70,90 (1941)—WITH CARTER CARBURETORS. PACKARD, CLIPPER MODEL 1951 (1941)

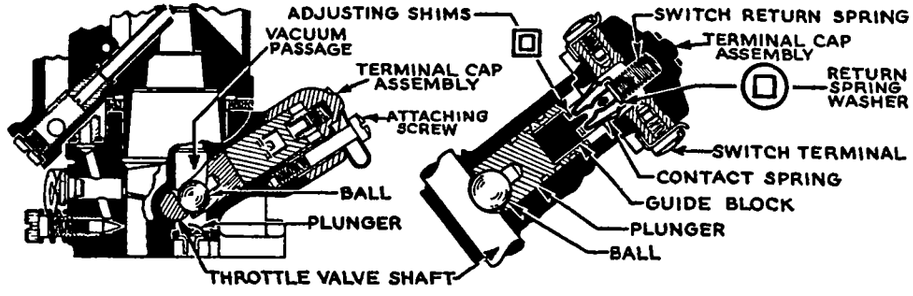
NOTE:—Buick—Carter Car Starter or Vacuum Switch is built in Model WCD Type carburetors (front carburetor only on Compound Carburetion Cars) which are used on these cars. Switch assembly must be removed before the carburetor throttle valve shaft can be taken out (when carburetor being disassembled).

Packard—Carter Car Starter is used in conjunction with a Magnetic Switch (Auto-Lite Model SS-4017) mounted on the starter. Starter is equipped with a Bendix drive. See Auto-Lite Starter Controls—'Magnetic Switches' for switch data.

DESCRIPTION & OPERATION:—Plunger type switch mounted on carburetor body casting and operated by steel ball which engages switch plunger and flat on carburetor throttle valve shaft when engine is not running. Depressing accelerator pedal to open throttle forces switch plunger up until 'W' shaped contact spring on upper end completes circuit between two brass contact blocks in the switch cap. When the engine begins to fire, switch ball is drawn up out of engagement by manifold vacuum (ball blocks vacuum passage as long as engine is running) so that switch is inoperative. When engine stops, throttle must be closed momentarily to allow switch ball to drop down between throttle shaft and switch plunger.

ADJUSTMENT:—Checking Vacuum Switch Timing. Use special Carter tool T109-155S (see Note) consisting of scale clamped on choke housing and indicator arm fastened on throttle lever. Connect test lamp in switch circuit to check switch closing. Rotate fast idle cam to hot or slow idle position, back off throttle lever stopscrew so that throttle valves are tightly closed. Loosen setscrew and set indicator arm opposite '0' on the 'WCD' scale of the gauge. Open throttle lever and note gauge reading when switch closes (test lamp will light). Gauge reading should be between 30° and 40°. Adjust by adding (if throttle opening more than 40°), removing (if throttle opening less than 30°) square brass adjusting shims located on bakelite guide block under 'W' shaped contact spring (these shims have square hole which engages tongue on guide block, do not confuse these shims with round spring seat washer which seats on middle leg of contact spring).

Carter Tool T109-155S Note—This tool similar to tool No. T109-121S used to check Carter Car Starter on Buick Series 40 (1939) Carter Carburetors and this earlier T109-121S gauge can be used to check 1941 cars if it is brought up to date by installation of following parts: T109-156 Swivel Block Screw, T109-159S Coil Housing Clamp Assembly. NOTE—If T109-121S gauge is used, refer to upper 'WDO' scale (new T109-151S gauge has upper scale marked 'WCD-WDO').



Checking Switch Without Gaug . If tool not available, rough check can be made on car by measuring clearance between machined surface of stop boss on carburetor throttle base and nearest edge of throttle stop arm. Distance should be 23/64" minimum, 27/64" maximum when switch closes.

SERVICING:—Removal & Disassembly. Disconnect and tape leads on switch terminals (wire with red tracer on terminal nearest engine is 'hot' with ignition turned on). Remove switch terminal cap attaching screw, hold-down clip, switch cap, withdraw return spring, guide block and contact spring assembly, switch plunger and ball. Be careful not to lose spring seat washer (on contact spring) or adjusting shims (on guide block under contact spring).

Servicing. Clean switch ball, plunger, cylinder, carburetor vacuum chamber and inlet screen, throttle valve shaft flat with gasoline. Check 'W' contact spring and switch return spring. Replace these parts if dimensions incorrect.

'W' Contact Spring—Distance across spring at widest part (across outer contact legs) should be 7/16" plus or minus 1/32" with spring seat washer seated on middle leg of spring.
Return Spring—Free length of spring should be 11/16-¾" and pressure of 32 ozs. should be required to compress spring to ⅜" length.

Reassembly. When installing switch plunger make certain that lip on inner end of plunger is down toward manifold (lip will prevent ball engaging on flat of shaft if installed incorrectly). See that adjusting shims are in place under contact spring, and spring seat washer seated on middle leg of contact spring. Make certain that return spring enters socket in switch cap and that boss on cap enters counterbore on casting. Do not oil any part of switch mechanism. Connect wire with red tracer (hot wire) to terminal nearest engine (away from throttle stopscrew).

1941 CARBURETOR CAR MODEL INDEX

NOTE: *Two Separate Indexes* are provided for CARBURETORS. The CARBURETOR INDEX directs you to Each Carburetor *Type*. The CARBURETOR CAR MODEL INDEX to the CARBURETOR *installed on each Car Model.*

IMPORTANT SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—The following production changes should be incorporated on earlier engines, and the specification changes listed below should be kept in mind when servicing or tuning up Compound Carburetion Engines as follows:

Compression Ratio Change:—New cylinder heads (combustion chamber milled out .032" for greater volume) for lower compression ratio used on all Compound Carburetion Engines with the following engine numbers: Series 40,50—No. 4208629 to 4210399 and all engines after No. 4215901, Series 60,70,90—All Engines after No. 4197602. See table below for gasket data and compression ratio of engines with each type head.

Series 40 (With Single Carburetor)—Same cylinder head as used on Compound Carburetion Engines (above) used on this model on all engines after Engine No. 4220016. New thinner cylinder head gasket used with this new head so that compression ratio approximately unchanged. See table below for compression ratio and gasket data.

	1st Type Head		2nd Type Head	
Car Model	**Ratio**	**Gasket No.**	**Ratio**	**Gasket No.**
40 (Single Carburetor)	6.5-1	1321396 (.070")	6.4-1	1323288 (.050")
40, 50 (Compd. Carb.)	7.0-1	1320433 (.015")	6.7-1	1320433 (.015")
60, 70, 90 (Compd. Carb.)	7.0-1	1320436 (.015")	6.7-1	1320436 (.015")

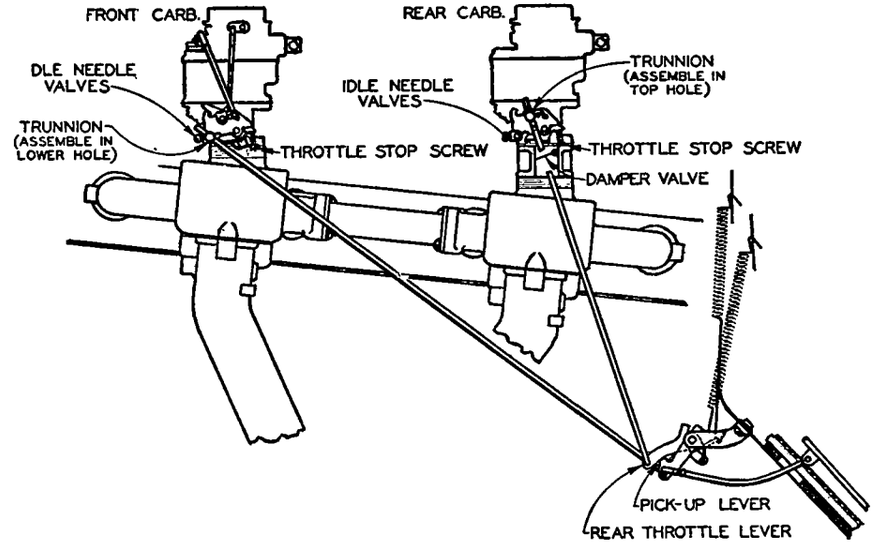
Lowering Compression Ratio of First Compound Carburetion Engines—To correct spark rap, compression ratio of first Compound Carburetion Engines with 7.0-1 compression ratio may be lowered by installation of special thicker head gaskets as follows: **Series 40,50**—Install No. 1323288 gasket (.050" thick—this is production gasket used on later Series 40 engines with Single Carburetor) which will lower compression ratio to 6.67-1. **Series 60, 70, 90**—Install No. 1297992 gasket (this is 1940 gasket and is .050" thick) which will lower compression ratio to 6.68-1. ***Refer to Mechanical Equipment Index for Buick Special Shop Notes for Gasket Installation directions.***

Spark Plug Change:—10 MM. spark plugs (as used on first engines) changed in production, and new 14 MM. spark plugs used on later engines as follows: **10 MM. Spark Plugs**—Original type spark plugs, No. 104 (without dash under 0) as used on engines before approximately Nov. 1, 1940, should be changed to any of the following types: No. 104 (with dash under 0), No. 106 (with dash under 0), or No. 106 (without dash) or new type 14 MM. spark plugs may be installed (to correct complaints of spark plugs fouling and causing uneven engine operation). ***Refer to Mechanical Equipment Index for Buick Special Shop Notes for 14 MM. Spark Plug Installation directions.***

14 MM. Spark Plugs—These new AC No. 46, 14 MM. type spark plugs used on all engines with following Engine Numbers: **Series 40 (Single Carburetor)**—No. 4306734 to 4309599 and all engines after No. 4316800. **Series 40, 50 (Compound Carburetion)**—No. 4306735 to 4309599 and all engines after No. 4312638, **Series 60, 70, 90 (Compound Carburetion)**—All Engines after No. 4287873.

Intake Manifold Gasket Change:—Vellumoid gaskets used on first engines and new steel gasket used on later engines as listed below. Use only new type steel gasket for service replacement.

Vellumoid Intake Manifold Gaskets—Used on all Engines before the following engine numbers (see Manifold Sealing below for production change and sealing of manifolds on first cars): **Series 40 (Single Carburetor)**—Before Engine No. 4240254, **Series 40, 50 (Compound Carburetion)**—Before No. 4246537, **Series 60, 70, 90 (Compound Carburetion)**—Before No. 4231957. Cars on which three thin gaskets, or one thick gasket, are used (marked with white stripe 1" wide on front leg of manifold) will operate satisfactorily but steel gasket only should be used for service replacement. First cars with single thin gasket should be sealed as follows:



Manifold Sealing—On all cars before following engine numbers: No. 4159081 (Series 40, 50 Compound Carburetion), No. 4120022 (Series 60, 70, 90 Compound Carburetion); on which single thin (1/64") vellumoid intake manifold gasket is used (engine will be marked with white stripe 1" wide on front leg of manifold if gasket correction has been made in service), manifold should be sealed by installation of new service steel gasket (as used on later engines) to correct leaks which may develop at operating temperatures and under driving conditions (leaks may not be apparent while tuning up engine). This change can also be made on Single Carburetor Engines if desired (trouble is less likely to be encountered on these engines). To install this new gasket, remove intake manifold, install gasket between cylinder head and each branch of manifold. Tighten both intake manifold and exhaust manifold securely to cylinder head, then tighten intake manifold to exhaust manifold. Check both carburetor mounting bolt nuts for tightness, retighten all manifold nuts after engine is warm.

Steel Intake Manifold Gasket—Used on all engines after following engine numbers: **Series 40 (Single Carburetor)**—No. 4240254, **Series 40, 50 (Compound Carburetion)**—No. 4246537, **Series 60, 70, 90 (Compound Carburetion)**—No. 4231957. This steel gasket should be used for all service replacements. See Manifold Sealing data (above) for gasket installation data.

Carter Carburetor Changes (Compound Carburetion Cars):—New carburetors used on all models with Compound Carburetion with following engine numbers: **Series 40, 50**—No. 4349790 to 4351799 and all engines after No. 4356175, **Series 60, 70, 90**—All Engines after No. 4329468. These new models should be used to replace all first type carburetors on engines before these numbers. ***Refer to Buick (Carter) Carburetor article for complete data.***

Carter Carburetor Float Level Change—New type float used after approximately November 1, 1940 (beginning with carburetors marked 'LO' in second square of brass inspection tag on carburetor). Float level should be 9/64" for first type float (with cross-rib reinforcement), 3/16" for second type float (with eleven vertical-rib reinforcement). See Carter 'WCD' dual carburetor article for complete float level checking instructions.

Stromberg Carburetor Changes (Compound Carburetion Cars):—Carburetors have been changed in production and new Code Numbers used to indicate these changes as listed in Carburetor Equipment List below. Changes can be incorporated in first type carburetors to correct off-idle leanness and to improve idling performance and hot starting as follows:

Code 7-42 & 7-39 (Front Carburetors)—Special service throttle valves, Part No. 382698, can be installed on these models and all changes outlined for later 7-42A and 7-39A carburetors (following) should also be made on these carburetors.

Code 7-42A, 7-39A (Front), 7-43, 7-41 (Rear) Carburetors—Front carburetors only (7-42A, 7-39A) have new type throttle valve, No. 382600. All carburetors should be changed by installing new Idle Tube and reworking Idle Air Bleed, Secondary Idle Discharge Hole, and Float Bowl Vent to same specifications as later carburetors listed below. ***Refer to Buick (Stromberg) Carburetor article (following) and see 'Special Service Notes & Production Changes' for directions.***

Code 7-42B, 7-39B (Front), 7-43A, 7-41A (Rear) Carburetors—These models have all changes incorporated as listed above for earlier models. No changes required for these carburetors.

Code 7-46, 7-44 (Front), 7-47, 7-45 (Rear) Carburetors—These carburetors used after approximately April 15, 1941. Same design as immediately preceding models (above) except for slight difference in Float Bowl Vent. No changes required for these models.

SERIES 40 NOTE:—This model regularly equipped with single dual carburetor (Carter 'WCD' or Stromberg AAV-16 as listed below). Compound Carburetion is Optl. and data below applies to this model when so equipped.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CARBURETOR EQUIPMENT:—All models equipped with either two Carter or two Stromberg Carburetors as follows:

SINGLE CARBURETOR

Car Model	Carter	Stromberg
41-40 Std.	WCD Model 487-S	AAV-16 Code 7-37

COMPOUND CARBURETION
Carter Carburetors (All Type WCD)

	Series 40,40A,50		Series 60,70,90	
	Front	Rear	Front	Rear
First	509-S	510-S	490-S	491-S
Later	528-S	529-S	533-S	534-S

Stromberg Carburetors (Model AAV-16 Front, AA-1 Rear)

First Type	Code 7-42	Code 7-43	Code 7-39	Code 7-41
Second Type	Code 7-42A	Code 7-43	Code 7-39A	Code 7-41
Third Type	Code 7-42B	Code 7-43A	Code 7-39B	Code 7-41A
Latest Type	Code 7-46	Code 7-47	Code 7-44	Code 7-45

NOTE—See Special Service Notes & Production Changes (above) for differences in these models and changes to be made in first carburetors.

Stromberg Code Number—Code number is stamped on bowl cover directly above fuel level inspection plug.

Rear Carburetor Note—These carburetors are similar to front or main carburetors except that they have Idle System and Main Nozzle System only (No Fast Idle, Accelerating Pump, Economizer, or Automatic Choke.

COMPOUND CARBURETION DESCRIPTION:—Consists of two dual carburetors installed on one dual manifold so that the inner barrel of both carburetors feeds the inner branch of the manifold (Cylinders 3, 4, 5, 6) and the outer barrel of both carburetors feeds the outer branch of the manifold (Cylinders 1, 2, 7, 8). Carburetor throttle valves are connected to the accelerator pedal by an overrunning type of linkage so that only the front carburetor throttle valves open (front carburetor operates alone) until a position is reached corresponding to 75 MPH. car speed. At this point, the rear carburetor throttle valves also open and both carburetors operate together and feed equally when wide open throttle position is reached. The rear carburetor has an automatic damper valve below the throttle valve and controlled by a counterweight. This valve is opened by the air flow through the carburetor and controls the manner in which the rear carburetor cuts in when car is operated with wide open throttle (see Full Throttle Operation below). Damper valve is a loose fit so that rear carburetor idles in the customary manner with this damper valve closed.

OPERATION:—The damper valve below the rear carburetor causes the carburetors to operate differently on Part and Full Throttle as follows:

Part Throttle Operation:—For closed throttle idling and car speeds up to 22 MPH, idling systems of both carburetors operate together (damper valve clearance allows rear carburetor to operate even though valve is closed). As accelerator pedal is depressed, throttle valve of front carburetor only opens and this carburetor operates alone until a car speed of 75 MPH. is reached. At this point, the accelerator linkage opens the rear carburetor throttle valve so that when wide open throttle position is reached both carburetors are feeding equally to provide maximum power (rear carburetor damper valve opened by air flow).

Full Throttle Operation:—If accelerator pedal is fully depressed for wide open throttle operation at low car speeds, damper valve controls manner in which rear carburetor cuts in as follows: At speeds below 15 MPH. main metering system of front carburetor operates normally but damper valve prevents main metering system of rear carburetor operating. At 15-20 MPH., damper valve begins to open and rear carburetor main metering system begins to operate. At 35-40 MPH., damper valve is wide open and both carburetors feed equally.

ADJUSTMENT:—When tuning up engine, all of the following points should be checked before the carburetors are adjusted. Then adjust carburetors as directed below.

Spark Plug Type & Gaps—Make certain that latest type 14 MM. spark plugs, AC No. 46, or correct type 10 MM. plugs (see Spark Plug change data under 'Special Service Notes & Production Changes' above) installed on engine. Set spark plug gaps at .028".

Compression Ratio—If spark rap being corrected, see that correct type cylinder head gasket installed. See Compression Ratio change data in 'Special Service Notes & Production Changes' above.

Intake Manifold Gasket and Sealing of Manifold (First Cars)—If manifold removed, make certain that latest type steel gasket used when manifold installed. On first cars with single thin (1/64") vellumoid gasket, this gasket should be replaced by new steel gasket to seal manifold. See Intake Manifold Gasket data in 'Special Service Notes & Production Changes' above for directions. NOTE—On first engines, where manifold has been sealed by installation of three thin gaskets or one thick gasket, a white stripe 1" wide will be found on front leg of intake manifold to indicate this change.

Valve Tappet Clearance or Lash—Tappet clearance for all valves should be set at .015" with engine warmed up and water and oil at normal operating temperature. IMPORTANT—In cold weather, if engine is warmed up in the shop, water and oil temperatures will not be uniform and tappet clearance should be set as follows: Warm up engine by idling for about 15 minutes. Then set tappet clearance at .017" for all valves. This will result in clearance of approximately .015" with engine at road operating temperature.

Ignition Timing—Check and adjust ignition timing as directed on Buick 'T&E' page. If Synchroscope used to time ignition, carburetor throttle stopscrews should be backed off so that engine idles at slowest possible speed. CAUTION—Engine speed must not be greater than 375 RPM (7 MPH, road speed) when using a Synchroscope for ignition timing (automatic advance will cause error in results if engine idled at faster speed). Ignition mark on 40 & 50 engines is a broad yellow mark and ignition must be timed at leading edge of this mark for correct 4° BTDC ignition timing (trailing edge of mark is used for 2° BTDC ignition timing for 40 Engine with Single Carburetor).

Manifold Heat Control Valve & Rear Carburetor Damper Valve—Make certain that these valves operate freely and do not stick or bind in any position.

Carburetor Throttle Linkage—Floor mat must be in place when linkage adjusted (mat serves as stop for pedal in wide open position). Carburetors should be cold (if carburetors warm, hold de-loader cam in position so that it contacts carburetor lever as throttle is opened while making adjustments). Adjust front carburetor throttle rod length by changing trunnion position on rod so that throttle valves and throttle lever are in wide open position with accelerator pedal depressed to floor mat (de-loader must be in operation so that normal load exerted on throttle rod), make certain that throttle rod trunnion installed in lower hole on lever. Adjust rear carburetor throttle rod length in same manner so that rear carburetor throttle valves are also wide open with accelerator pedal depressed to floor mat, make certain that throttle rod trunnion is installed in upper hole on lever. CAUTION—When making these adjustments, accelerator pedal should be depressed while sitting in driver's seat (reaching through car door will cause pedal to strike raised portion of floor and result in incorrect adjustment). Rear carburetor rod should be disconnected while adjusting front carburetor rod and should be prevented from striking engine pan which will interfere with adjustment (rod can be looped up by rubber band). De-loader can be placed in operation to apply normal load on linkage while making adjustment by holding choke valves in closed position. After rods adjusted, see that both rods operate freely, do not bind or interfere with return springs, and that rods operate freely and return to fully closed position (bend both legs of cotter pin in rear throttle trunnion toward front of car to prevent interference with throttle lever ear). If throttles do not return to closed position, check lower ends of throttle return springs to see if they are contacting lower side of levers attached to dash brackets, and if necessary, hook both return springs in upper hole on dash.

CARBURETOR ADJUSTMENT:—Float Level—Make certain that float level is even with bottom of inspection hole on side of float bowl (remove inspection plug). See Production Change Note above and refer to Carter 'WCD' Carburetor and Stromberg AAV-16 Carburetor articles for complete float level checking and adjustment instructions.

Idle Adjustment—Engine must be thoroughly warmed up so that automatic choke and fast idle inoperative when adjustment made. Hot or slow idle speed should be set at 450 RPM. (8-10 MPH. depending on axle ratio). To secure equal adjustment for both carburetors, proceed as follows: Back off both stopscrews so that throttle valves completely closed (if engine idles too fast with valves closed, valves are not centered—See Carter & Stromberg carburetor articles for throttle valve setting data), turn stopscrew on one carburetor in until engine just begins to increase speed, then turn stopscrew on second carburetor in until engine again begins to increase speed. Carburetors are then equalized and final adjustment for correct idle speed should be made by turning both stopscrews in exactly equal amount. To set idle adjusting screws (fuel mixture adjustment), first set all adjusting screws (two screws for each carburetor) exactly alike by turning each screw in until it is lightly seated then back screw out exactly 1⅛ turn (Carter Carburetors—first type), ¾ turn (Carter Carburetors—2nd type, All Stromberg Carburetors). Make final adjustment by turning all screws in evenly 1/16 turn and noting performance, then turn screws back to original position and 1/16" turn further out and again note performance. Finally set all screws alike at point within this range at which best performance is secured.

Accelerating Pump, Fast Idle, Automatic Choke & Other Adjustments—See Carter 'WCD' and Stromberg AAV-16 carburetor articles for complete data.

SINGLE CARBURETOR

Series 41-40 (1941) Std. ..... **AAV-16 Code 7-37**

COMPOUND CARBURETION

	Series 41-40, 40A, 50		Series 41-60, 70, 90	
	AAV-16 (Front)	AA-1 (Rear)	AAV-16 (Front)	AA-1 (Rear)
First Type	7-42	7-43	7-39	7-41
Second Type	7-42A	7-43	7-39A	7-41
Third Type	7-42B	7-43A	7-39B	7-41A
Latest Type	7-46	7-47	7-44	7-45

NOTE:—Code Number Identification Mark—Code Number is stamped on bowl cover directly above fuel level inspection plug and can be used to identify each model.

Compound Carburetion—Optl. on Series 41-40, Std. on all other models. Consists of two carburetors (AAV-16—front, AA-1—rear) on each engine. See separate article on 'Buick Compound Carburetion' for description and complete service data on engines with Compound Carburetion.

Carter Carburetors—Carter 'WCD' dual carburetors also used on these car models. See Carter 'WCD' Carburetor article for data on these types.

Delco-Remy Vacuum Switch—Switch for starter control is mounted on carburetor and operated by throttle valve shaft. *See Delco-Remy Vacuum Switch article in Electrical Equipment Section for adjustment and servicing data.*

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Code 7-42 & 7-39 (First type Front Carburetors)—If slight off-idle leanness develops on cars with these carburetors, this can be corrected by installing special service throttle valves, Part No. 382698, 7¾° type notched valves which provide same idle hole clearance of .010" as later 7-42A & 7-39A models with new No. 382600 throttle valve (this 382600 valve must not be installed on these 7-42 & 7-39 carburetors). Also make changes listed below for 7-42A and 7-39A carburetors to bring these 7-42 and 7-39 models up to later 7-42B and 7-39B specifications.

Code 7-42A & 7-39A (Front Carburetors), 7-43 & 7-41 (Rear Carburetors)—Front carburetors only (7-42A & 7-39A) have new type, Part No. 382600, 6° notched throttle valves and new Idle Hole clearance of .010". For better idling performance and improved hot starting, all of these carburetors (front & rear) should have the following new parts installed or jet and air bleed holes changed as follows: Idle Tube—#65 Part No. 382806 (was #70 Part No. P-19424), Idle Air Bleed in Main Body—#65 (7-42A & 7-43), #60 (7-39A & 7-41), (was #70 on all models), Secondary (upper) Idle Discharge Hole—#58 (was #60), and new External Float Bowl Vent (drilled hole in carburetor casting—not used on carburetors originally). Make these changes as follows:

Idle Tube—Dismantle carburetor and remove air horn and float bowl cover assembly (see Servicing directions below). Unscrew old idle tubes and install new type tubes as specified above.

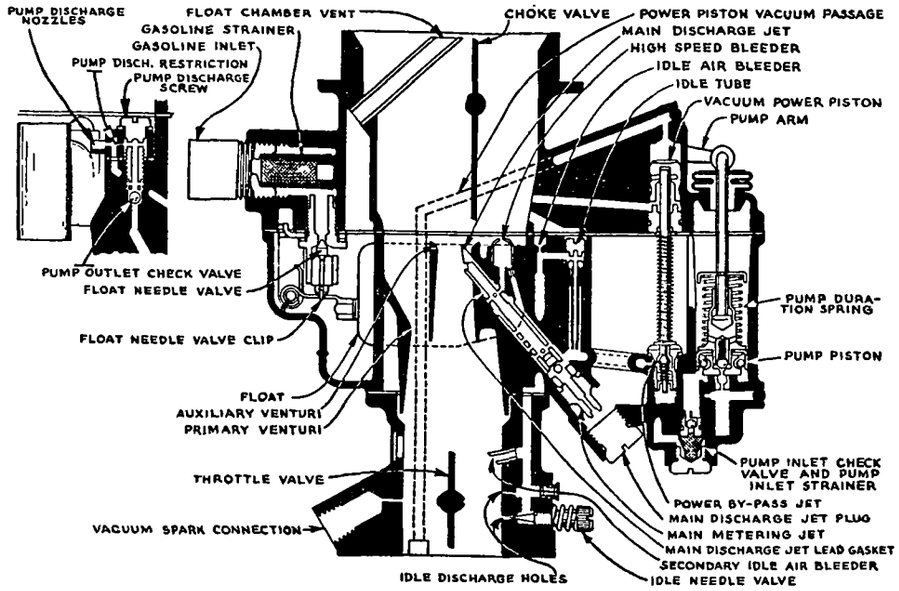
Idle Air Bleed—With carburetor dismantled for Idle Tube replacement (above), use wire drill in pin vise (#65 drill for Series 40,50 Code 7-42A & 7-43 Carburetors, #60 drill for Series 60,70,90 Code 7-39A & 7-41 Carburetors) and drill out idle air bleed hole (in boss in float bowl adjacent to idle tube) by hand. NOTE—Air bleed provided for each barrel, both holes must be enlarged.

Secondary Idle Discharge Hole—Remove welch plugs in holes on rear side of throttle body directly across from idle holes. Use #58 drill (all models) in pin vise, insert drill through hole from which welch plug removed and drill out the secondary or upper idle discharge hole in the carburetor wall. NOTE—Both welch plugs must be removed and idle hole in each barrel of each carburetor must be enlarged.

Float Bowl Vent—On all carburetors, prick punch center of boss to left (facing gasoline inlet connection) and above gasoline inlet connection on air horn and bowl cover casting, drill hole at this point with #46 drill (all models) so it connects with bowl vent channel in casting for additional external vent.

Code 7-43B & 7-39B (Front Carburetors), 7-43A & 7-41A (Rear Carburetors):—These models include all changes as listed above for Code 7-42A, 7-39A, 7-43, 7-41 models (New Idle Tube, new size Idle Air Bleed and Secondary Idle Discharge Hole, new External Bowl Vent). Equivalent to latest types (below).

Code 7-46 & 7-44 (Front Carburetors), 7-47 & 7-45 (Rear Carburetors):—These models are same as Code 7-43B, 7-39B, 7-43A, 7-41A models listed above except that External Float Bowl Vent is slightly different design and either of these latest designs should operate satisfactorily on Compound Carburetion engines.



Engine Changes:—For data on new type Spark Plugs, Compression Ratio change, Manifold Gasket change and Sealing of Manifolds on first cars, refer to preceding article on Buick Compound Carburetion.

TYPE:—Model AAV-16. Aircraft type, duplex, downdraft carburetor. Similar to design of AAV-16 and AAV-26 carburetors used on preceding Buick models. This carburetor has built-in Fast Idle and Automatic Choke. Refer to Carburetion Equipment Index for 'Stromberg AAV-16, AAV-26 Automatic Choke' for complete servicing and adjustment directions.

Model AA-1. These rear carburetors (used on Compound Carburetion cars only) are basically the same as the front carburetors (AAV-16) but do not have Vacuum Economizer (power by-pass jet), accelerating pump, choke valve and automatic choke, fast idle, or vacuum switch mounting provision. See separate article on Buick Compound Carburetion for description of manner in which these carburetors supplement front carburetors for Compound Carburetion.

IDLE ADJUSTMENT (ALL MODELS):—Compound Carburetion Models—Engines should be checked for correct spark plugs and sealing of manifold, and other tune up operations performed (valve tappet clearance adjustment, ignition timing, etc.) before carburetors are adjusted and carburetors must be adjusted exactly as specified to secure equalized operation. *See Buick Compound Carburetion article for complete Adjustment directions.*

Series 41-40 with Single Carburetor—See adjustment directions in Buick Compound Carburetion article for tune up operations which should be performed before carburetor is adjusted. Then adjust carburetor as follows: With engine warmed up so that choke valve wide open and engine idling at hot or slow idle speed (Automatic Choke & Fast Idle inoperative), set throttle stopscrew so that engine idles at 450 RPM (8-10 MPH, depending on gear ratio). Set both idle adjusting screws (one for each barrel, adjust exactly alike) so that engine idles smoothly (turn screws in for leaner mixture, out for richer mixture). Recheck idle speed.

METERING JETS:—Metering jets are non-adjustable type located under plug at lower end of main nozzles. See Stromberg Jet Specification Table for data.

ACCELERATING PUMP (AAV-16):—Same type as used on other AAV carburetor (operated by throttle lever through walking-beam connector, piston spring-loaded on plunger stem with duration spring to prolong pump discharge).

Pump Capacity—With pump rod connected in center hole on throttle lever (medium stroke), capacity should be 11-15 cc. per 10 strokes when operated fast (all models), 15-19 cc. per 10 strokes when operated slowly (Series 40 single carburetor), 16-20 cc. per 10 strokes when operated slowly (all other models). Use T-24972 Pump Capacity Burrette Gauge to check pump capacity.

Pump Seasonal Adjustment—Throttle lever has three holes for pump connector rod engagement. Medium stroke (with rod connected in center hole) is standard for use with regular fuel. If carburetor is lean on acceleration, connect rod in outer hole for maximum stroke, if carburetor charge is too rich or engine loads up on acceleration, connect rod in inner hole for minimum stroke.

VACUUM ECONOMIZER (AAV-16):—Consists of vacuum piston controlled power by-pass valve similar to design used on other AAV carburetor models. No adjustment required.

Setting—Vacuum piston opens valve with manifold vacuum of 5-6" of HG (mercury) corresponding to car speed of 65-70 MPH.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FAST IDLE & CHOKE RELEASE (AAV-16):—Consists of a start-aid loose lever and fast idle cam assembly (spring connected) mounted on the carburetor so that the cam serves as a stop for the throttle stopscrew. Cam is linked to choke valve by connector rod and is rotated to the fast idle position (stopscrew on highest step of cam) when the choke valve closes for cold starting. As the engine warms up and the choke valve opens, fast idle cam rotates (with stopscrew resting on successively lower steps of cam) so that the throttle valves close to the hot or slow idle position with the engine warmed up.

Adjustment—Close choke valve on #53 drill rod (.0595"), open and close throttle valve and note if ear on locking lever on throttle valve shaft clears lug on loose lever on fast idle cam stud. Adjust by bending connector rod near upper end so that locking lever ear and loose lever lug just clear.

Choke Release (Unloader) Adjustment—Hold throttle valve wide open, check choke valve opening by inserting 11/64" drill rod (Tool T-25057) between edge of valve and air horn wall. Adjust by bending ear of throttle lever which engages lug on fast idle cam so that choke valve opening is .156-.187".

FLOAT LEVEL (ALL MODELS):—**Fuel Level**—Should be 19/32" below top edge of float bowl (gasket removed) with engine idling (5 lbs. pressure) or even with lower edge of inspection hole on side of bowl (remove plug to check level)

Float Level—To check float level (with bowl cover and float assembly removed), invert cover, install float level checking gauge T-24971 on gasket. Tops of floats should be 3/64" above tops of vertical guides on gauge (Series 40 Single Carburetor), 1/32" below tops of gauge guides (All Compound Carburetion Carburetors) and sides of float should be tangent to gauge guides without any drag (this is important to prevent floats dragging on sides of float bowl). Adjust by bending float arm. Use care to secure equal setting for both floats.

Float Needle Valve & Seat—Part No. P-22499 (40 Single Carburetor), P-22498 (All Compound Carburetion Carburetors). Furnished as matched sets only. When installing, see that needle valve is clipped to float lever.

Float Bowl Vent—Bowl is vented to outside through opening in air horn wall directly below air cleaner collar (Series 40 Single Carburetor), through vent tube in air horn below air cleaner for 'balanced' operation (All Compound Carburetion Carburetors).

THROTTLE VALVE SETTING (ALL MODELS):—Throttle valves on Compound Carburetion Front Carburetors changed in production (See Special Service Note above) and throttle valve setting is different on each type. CAUTION—When special service throttle valves installed on first (Code 7-42 and 7-39) carburetors, throttle valve setting is same as later (Code 7-42A and 7-39A) carburetors with new type throttle valves. To check throttle valve location, insert #60 drill in idle port, measure from drill to edge of throttle valve with valves tightly closed (stopscrew backed off). Setting for each model as follows:

Carburetor	Code No.	Throttle Valve	Idle Port
AAV-16 (40 Single Carb.)	7-37	P-24684-5°	.022"
AAV-16 (Compd. Carb.)①	7-42, 7-39	382246-6°	.022"
AAV-16 (Compd. Carb.)②	7-42, 7-39	382698-7¾°	.010"
AAV-16 (Compd. Carb.)	7-42A,B; 7-39A,B	382600-6°	.010"
AAV-16 (Compd. Carb.)	7-46, 7-44	382600-6°	.010"
AA-1 (Compd. Carb.) Rear	7-43,A; 7-41,A	382246-5°	.022"
AA-1 (Compd. Carb.) Rear	7-47, 7-45	382246-5°	.022"

①—With original throttle valve. ②—With new service replacement valve. NOTE—All Idle Port figures are plus or minus .004".

Vacuum Spark Port (AAV-16 only)—To check vacuum spark control port location, insert #58 drill in port, measure from drill to edge of throttle valve with valves tightly closed (stopscrew backed off). Distance should be .041" (40 Single Carb.), .080" (All Compd. Carburetion Carbs.) plus or minus .004".

CHOKE (AAV-16):—Stromberg Automatic type. ***See article on Stromberg Automatic Choke, AAV-16, AAV-26 type in Carburetion Equipment Section for complete data.***

Choke Setting—Inverted 'V' mark on thermostat cover should be set 1 Notch Lean (clockwise) on Series 40 Single Carburetor, at reference mark on housing (centered) on all Compound Carburetion Carburetors. Setting may be varied not more than two notches to improve warming up performance under special operating conditions (as when highly volatile fuels used). To adjust, loosen three cover attaching screws, rotate cover. CAUTION—When assembling heat tube connection, use extreme care not to use excessive pressure which may cause cover to shift and change choke setting.

NOTE—Thermostat cover assembly marked '6' for identification.

SERVICING (ALL MODELS):—Serviced in same manner as Stromberg AAV-26 models (see Model AAV-26 article for complete instructions). Model AA-1 does not have choke system, accelerating pump, or vacuum economizer.

SERVICE PARTS:—Gasket Set—No. J-5656-G (40 Single Carburetor), No. 382398 (AAV-16 Compd. Carburetors), No. 382399 (AA-1 Compd. Carburetors).

CARTER DUAL TYPE WCD

SINGLE CARBURETOR

Series 41-40 (1941) Std. Equipment.....Model 487-S

COMPOUND CARBURETION

Car Model	Front Carburetor First Cars	Front Carburetor Later Cars①	Rear Carburetor First Cars	Rear Carburetor Later Cars①
Series 41-40,40A,50	509-S	528-S	510-S	529-S
Series 41-60,70,90	490-S	533-S	491-S	534-S

①—Used on all cars with following Engine Numbers: **Series 40,40A,50**—No. 4349790 to 4351799 and all engines after No. 4356175. **Series 60,70,90**—All Engines after No. 4329468. These models used to replace first carburetors.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Engine Changes (New type Spark Plugs, Compression Ratio change, Manifold Gasket change, and Sealing of Manifolds on first cars—Refer to preceding article on Buick Compound Carburetion for complete data and instructions.

Carburetor Production Change—Carburetor models used on later cars (see Equipment List above) are used to replace carburetors used on first cars.

Float Level Change (First Carburetors)—Two float types used with different float settings for each type. With first type float (which has cross-rib reinforcement) before approximately Nov. 1, 1940, float level should be set at 9/64". Carburetors after Nov. 1, 1940 (beginning with carburetors marked 'LO' in second square of brass inspection tag on carburetor) have new float with 11 vertical-rib reinforcements and float level should be set at 3/16". See Float Level section below for checking and adjustment directions.

Carter Car Starter—Switch for starter control built-in on Models 487-S, 490-S, 509-S, 528-S, 533-S. ***Refer to Electrical Equipment Index for 'Carter Car Starter' for complete adjustment and servicing data.***

COMPOUND CARBURETION NOTE:—Compound Carburetion (with two carburetors) is Optl. on Series 41-40, Std. on all other Buick models. See preceding article on 'Buick Compound Carburetion' for description and complete service data on engines with Compound Carburetion.

Stromberg Carburetors—These models also use Stromberg Model AAV-16 and AA-1 carburetors. See Stromberg AAV-16 Carburetor article for complete data

TYPE:—Models 487-S, 490-S, 509-S, 528-S, 533-S. Plain tube, dual, downdraft type. Differ from other Carter Vacumeter type dual carburetors mainly in that they have a new design concentric float bowl and double float, new permanently assembled main nozzles, high pressure type spring operated accelerating pump, and built-in Carter Car Starter (vacuum switch for starting motor control). Conventional plunger type anti-percolators are not used but carburetor is fitted with Fast Idle and Climatic Control (automatic choke). ***See Carter Climatic Control article in Carburetion Equipment Section for automatic choke servicing data.***

Models 491-S,510-S,529-S,534-S (Rear Carburetor of Compound Carburetion). These models are basically the same as the front carburetor models but do not have metering rods (metering jet only used), accelerating pump, choke valve, Fast Idle, Climatic Control, or Carter Car Starter. See article on Buick Compound Carburetion (preceding) for description of manner in which these carburetors supplement the front carburetors of Compound Carburetion engines.

IDLE ADJUSTMENT (ALL MODELS):—Compound Carburetion Models—Engines should be checked for correct spark plugs and sealing of manifold, other tune up operations (valve tappet clearance adjustment, ignition timing, etc.), performed before carburetors are adjusted, and carburetors must be adjusted exactly as specified to secure equalized operation. ***See Adjustment instructions in Buick Compound Carburetion article (preceding) for complete instructions.***

Series 41-40 with Single Carburetor (487-S)—See Adjustment Instructions in Buick Compound Carburetion article (preceding) for tune up operations which should be performed before carburetor is adjusted. Then adjust carburetor as follows: With engine thoroughly warmed up so that choke valve wide open and engine idling at hot or slow idle speed (Automatic Choke and Fast Idle inoperative), set throttle stopscrew for idling speed of 450 RPM. (8-10 MPH. depending on gear ratio). Set both idle adjusting screws (one for each barrel, adjust screws exactly alike) so that engine idles smoothly. Screws should be set ½-1½ turns open from inner seated position and should be turned in for leaner mixture. Recheck idle speed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

PERFORMANCE:—Should be satisfactory if idling adjustment correctly made. Special lean metering rods furnished for special operating conditions (see Carter Jet Specification table for complete data). IMPORTANT—Special metering rod for Altitude use only is furnished in conjunction with a special altitude metering jet which should be installed in rear carburetor at same time to insure balanced operation of both carburetors.

ACCELERATING PUMP (487-S, 490-S, 509-S, 528-S, 533-S):—High pressure type with spring operated lever. Seasonal adjustment provided only on 528-S, 533-S.

Seasonal Adjustment (528-S, 533-S)—Pump arm on bowl cover (under dust cover) has two holes for pump link engagement. Connect link in inner hole (short radius) for short stroke and minimum discharge, outer hole (long radius) for long stroke and maximum discharge.

Pump Stroke Adjustment—See table below for correct plunger travel (from closed throttle to wide open position). To check stroke, back off throttle stopscrew so that throttle valves tightly closed, take out screws and remove dust cover, place pump gauge T109-117S (see Note below) in inverted position on upper edge of dust cover boss on carburetor so that lip on lower end of indicator arm rests on top surface of connector link in upper end of pump plunger stem. Note gauge reading. Open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in 64th of an inch) and should agree with specifications in table below. To adjust stroke, bend connector rod slightly at lower angle near throttle lever. CAUTION—When checking stroke on Models 528-S, 533-S, make certain that pump link properly connected for correct stroke as indicated in table.

Car Model	Carburetor	Pump Stroke	Pump Link Connection
40 Std.	487-S	21/64"	Not Adjustable
All Compd. Carb. (First)	490-S, 509-S	21/64"	Not Adjustable
40,40A,50 Compd. (Later)	528-S	16/64" (¼")	Long Stroke
60,70,90 Compd. (Later)	533-S	14/64" (7/32")	Short Stroke

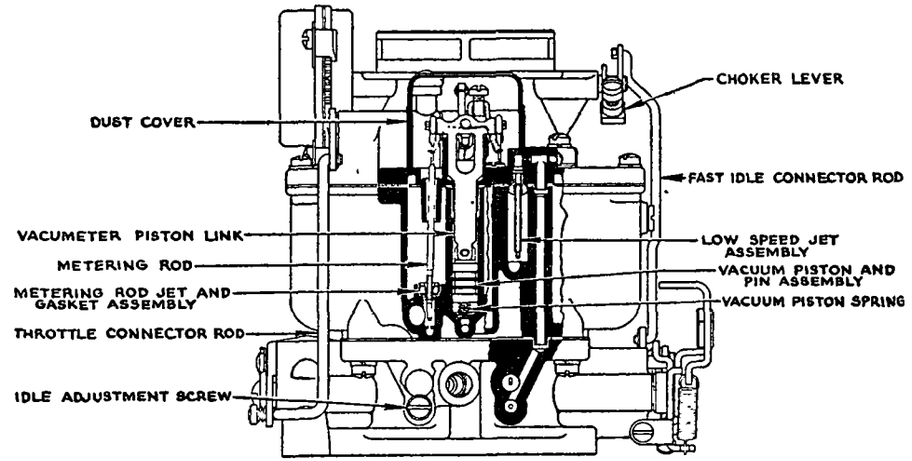
Pump Gauge Note—All pump gauges after Sept. 15, 1940 have new type indicator arm with gauging lips on both ends as required when checking these models. Earlier T109-117S gauges can be brought up to date by installing this new type indicator arm, Part No. T109-153.

METERING ROD ADJUSTMENT (487-S, 490-S, 509-S, 528-S, 533-S):—Metering rods are controlled by a single spring-loaded vacuum piston (rods held down in metering jets for maximum economy by manifold vacuum, and lifted out of jets by spring for acceleration and full power operation when vacuum decreases as throttle is opened). Lip on metering rod arm (on pump operating lever shaft which is linked to throttle lever) acts as stop for vacuum piston link and insures correct metering rod position for particular throttle opening. Metering rod setting should be checked whenever rods removed or changed and when carburetor is overhauled.

Metering Rod Setting—To check metering rods, take out retaining screws and remove dust cover, disconnect metering rod springs and remove both rods, install one metering rod gauge, T109-152 (2.440"), in place of rods. With throttle stopscrew backed off so that throttle valves tightly closed, press down lightly on vacuum piston link. Clearance between shoulder of notch on gauge and part of vacuum piston link on which metering rods hang should be less than .005" and lip of vacuum piston link should rest on lip of metering rod arm on pump operating lever shaft. To adjust, bend lip of metering rod arm until it contacts lip on vacuum piston link. Remove gauge, re-install metering rods, connect springs, install dust cover and reset throttle stopscrew.

FLOAT LEVEL (ALL MODELS):—Fuel Level—Should be even with lower edge of fuel level inspection hole on side of float bowl (remove inspection plug).

Float Level (487-S, 490-S, 491-S, 509-S, 510-S)—Two different settings used. On float with cross-rib reinforcement (before Nov. 1, 1940), distance from float seam (measured at top center—both sides equal) to lower edge of bowl cover should be 9/64" (Gauge T109-160) with needle valve seated. On carburetors after Nov. 1, 1940 (beginning with carburetors marked 'LO' on brass inspection tag) with float with 11 vertical-rib reinforcement, float level should be 3/16" (T109-162) measured as above. Floats must be checked both laterally and vertically to insure correct height and to prevent dragging on sides of bowl as follows: With bowl cover assembly removed, remove gasket, invert cover so that needle valve is seated, place correct gauge (T109-160 or T109-162) directly under floats with notched portions of gauge fitted over machined surface of casting. Floats should just touch vertical sides of gauge and just clear horizontal portion. Adjust by bending float arm (do not bend floats) and use extreme care to secure same setting on both floats.



Float Level (528-S, 529-S, 533-S, 534-S)—Float level should be 3/16". Use Gauge No. T109-162, check and adjust floats in same manner as on first models with second type float (above).

Needle Valve & Seat—Furnished only in matched sets, Part No. 25-80S (487-S, 490-S, 491-S, 509-S), No. 25-105S (528-S, 529-S, 533-S, 534-S). Intake hole size is #42 drill. NOTE—No. 25-105S needle valve is push-pull' type.

Bowl Vent (Model 487-S)—Bowl is vented to outside atmosphere by ¼" diameter hole in bowl cover and air horn casting.

Bowl Vent (Models 490-S, 509-S)—Bowl is vented to air horn for 'balanced' operation by 7/32" inside diameter balance vent tube which opens into air horn.

Bowl Vent (Models 528-S, 529-S, 533-S, 534-S)—Balance types with 7/32" inside diameter and secondary .125" diameter vent to air horn. Bowl is also vented to outside atmosphere by #35 drill hole (early production), two #47 drill holes (late production).

THROTTLE VALVE SETTING:—Install valves with trademark (small 'c' in circle) toward manifold and on idle port side of bore, use new screws and install screws loosely. With throttle stopscrew backed off, tap valves lightly with screwdriver to centralize them in bore, then tighten attaching screws.

Idle Port Opening—On all models, idle port opening should be .067-.073" above top edge of throttle valve with valve closed tightly.

Vacuum Spark Port Height—Bottom of vacuum spark port should be .046-.050" (487-S), .035-.039" (490-S, 509-S, 528-S, 533-S) above valve. NOTE—This vacuum spark port not used on Compound Carburetion rear carburetors (491-S, 510-S, 529-S, 534-S).

FAST IDLE (487-S, 490-S, 509-S, 528-S, 533-S):—Consists of a fast idle cam and trip lever assembly. The cam engages the fast idle screw on the throttle shaft dog and collar assembly. Cam trip lever is linked to the choke valve shaft by a connector rod so that the cam is rotated to the fast idle position when the choke valve closes for cold starting. As the choke valve opens, trip lever is revolved and spring returns fast idle cam to off position and throttle valves return to hot or slow idle speed position (controlled by stopscrew).

Adjustment—With choke valve tightly closed, adjust fast idle screw so that clearance between throttle valve and carburetor bore on side opposite port is .012" (487-S), .015" (490-S, 533-S), .012" (509-S, 528-S). When adjusting, back off throttle stopscrew, then back off fast idle adjusting screw until it just contacts high point of fast idle cam (choke valve closed and fast idle cam in fast idle position), finally turn fast idle screw in 2½ turns (all models) which will provide correct throttle opening. Reset throttle stopscrew for correct hot or slow idle speed.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

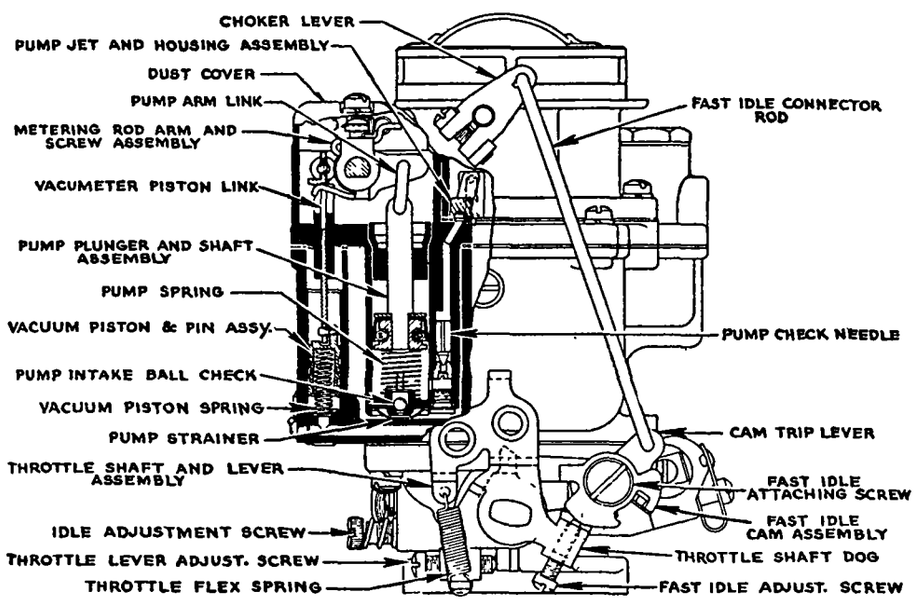
CHOKE (487-S, 490-S, 509-S, 528-S, 533-S):—Carter Climatic Control. Refer to Carburetion Equipment Index for 'Carter Climatic Control' for complete servicing and adjustment directions. NOTE—No choke valve or choke mechanism used on Compound Carburetion rear carburetors (491-S, 510-S, 529-S, 534-S).

Choke Setting—Reference mark on thermostat coil housing should be centered on scale on choke housing (all models).

Unloader:—Consists of an ear on the throttle lever which engages fast idle cam so as to open choke valve when throttle valve is opened wide.

Adjustment—Two separate adjustments required as follows: First, loosen screw on choke valve shaft lever, insert .010" feeler between lip on fast idle cam and boss on carburetor flange casting, hold choke valve tightly closed and tighten lever screw. Secondly, with throttle valves wide open, adjust unloader lip on throttle lever so that choke valve opening or clearance between upper edge of choke valve and air horn wall is 3/16" (use T109-28 gauge for all models).

SERVICING (487-S, 490-S, 509-S, 528-S, 533-S):—**Disassembly**—With Climatic Control tubing connection disconnected and carburetor off engine, remove choke shaft lever and fast idle connector rod. Take out attaching screws and remove air horn and Climatic Control as an assembly. Remove thermostat coil and housing assembly (do not remove coil from housing), gasket, baffle plate, choke valve, choke piston lever, link and shaft assembly, and vacuum piston (use care not to lose piston pin). Take out attaching screws and remove pump jet and housing assembly, lift off air horn gasket, remove dust cover, gasket, throttle connector rod, pump connector link, strainer nut and gasket, and strainer. Take out attaching screws and remove bowl cover assembly, lift out vacuum piston spring. CAUTION—Do not make any attempt to remove nozzles from body casting. Remove float pin, take out float assembly and needle valve and seat assembly. Turn vacuum piston ¼ turn to free it from piston link. Raise piston link and, at same time, turn pump arm and countershaft so that link is free, remove link. Remove low speed jets and bowl cover gasket. Remove pin spring on end of pump countershaft and loosen metering rod arm screw, slide countershaft and lever assembly out, dismantle pump and metering rod arm parts. Hold plunger guide down, remove plunger guide screw, plunger guide and pump plunger assembly, plunger spring and strainer (invert carburetor). Remove pump intake ball and retainer cap by inserting soft brass pin through hole in bottom of cylinder and tapping retainer out. Remove pump discharge passage plug, pump discharge check plug, and discharge needle, metering rod jets and gaskets. Invert carburetor, take out retaining screws and remove body flange and switch as an assembly. Hold switch firmly against casting, remove terminal cap clip and screw, disassemble switch and remove switch ball, use care not to lose small square adjusting washers, remove switch strainer and retainer ring. Remove throttle shaft arm, throttle valves and throttle centering screw, slide throttle valve shaft out, remove fast idle cam and trip lever assembly. Remove idle adjusting screws, springs, and idle port plugs.



Servicing—Wash all parts in gasoline except thermostatic coil and housing assembly and switch parts. Blow out all jets and passages in carburetor castings with air, scrape carbon from throttle body bore and flange. Replace all worn or damaged parts. Soak new Intake Needle Seat Gasket, Pump Relief Plug Gasket, and Metering Rod Jet Gasket in 90 proof denatured alcohol for 20 minutes, install on part and allow to dry before installing in carburetor.

Reassembly—Use all new gaskets (see Service Parts list below) and observe following cautions when assembling carburetor: Install throttle valves as directed under 'Throttle Valve Setting' above, make certain that throttle centering screw installed and check throttle valve position. Use new idle port rivet plugs. Check float level, metering rod setting, Accelerating Pump stroke, Fast Idle, Unloader, and Choke setting. Adjust carburetor when reinstalled on engine. NOTE—See article on 'Carter Car Starter' in Electrical Equipment Section for complete switch servicing data and see article on 'Carter Climatic Control' in Carburetion Equipment Section for servicing data on these units.

SERVICING (491-S, 510-S, 529-S, 534-S):—These rear carburetors serviced in same manner as front carburetors (above) except that disassembly is simplified by fact that no metering rods, choke system, or accelerating pump used.

Disassembly—Take out attaching screws and remove air horn, remove strainer nut and gasket, and strainer. Take out attaching screws and remove bowl cover assembly. Remove float pin, float and lever assembly, intake needle and seat assembly, and bowl cover gasket. Remove both low speed jet assemblies, body flange assembly and gasket. CAUTION—Do not attempt to remove main nozzles—these are permanently installed in carburetor casting. Take out attaching screws and remove body flange casting and gasket. Remove throttle valves, throttle centering screw, throttle shaft and lever assembly. Remove idle adjusting screws, springs, and idle port rivet plugs.

SERVICE PARTS:—Gasket Assortment—No. 154 (487-S, 490-S, 509-S, 528-S, 533-S), No. 155 (491-S, 510-S, 529-S, 534-S).

483-S—CHEVROLET, ALL PASS. CARS & TRUCKS (1941)—SEE NOTE

492-S—CHEVROLET, ALL MODELS WITH ECON. ENG. (1941)—SEE NOTE

NOTE:—Carburetors may be identified by casting number on face of flange as follows: 421 (483-S), 432 (492-S); and by carburetor body color which is Black (483-S), Brown (492-S).

Economy Model 492-S—This carburetor has special jet calibration (see Carter Jet Specification Table for complete data) and stop pin which limits throttle opening to approximately 60 MPH.

Cab-over-Engine Trucks & Dubl-Duti Panel—These models equipped with Carter BB Model 489-S Updraft type carburetor. See separate article for data on this updraft carburetor.

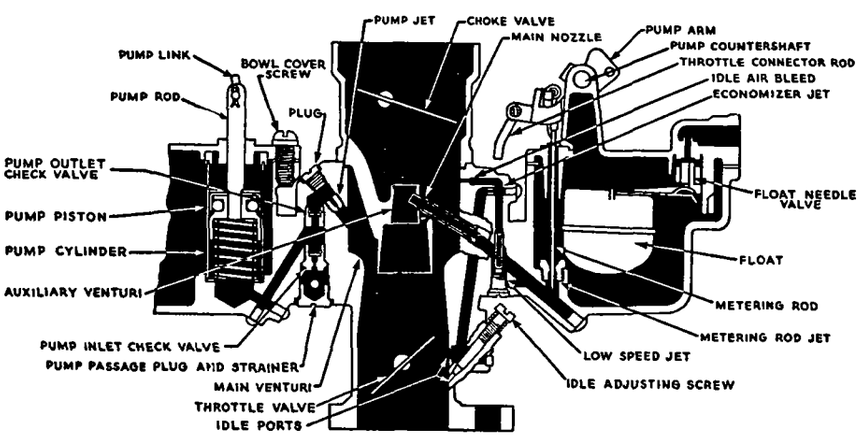
SPECIAL SERVICE NOTES:—Installing 1941 Bowl Cover Assembly on 1940 Carburetors to reduce pump arm and countershaft wear. This new bowl cover which has granodized pump shaft pressed in as part of cover may be installed on 1940 carburetors. Install all of following parts to make this change: Carburetor Bowl Cover #605312, Pump Arm #839522, Pump Connecting Link #839525, Plunger Assembly #839528, Throttle Connector Rod (select proper rod), Antirattle Spring #839539, Anti-rattle Spring Retainer #839540. IMPORTANT—Use regular bakelite metering rod hole cover and metering rod hole cover stop from 1940 carburetor when installing above bowl cover (see 1940 Chevrolet Carburetor data) and remove flat spring from inside of dust cover to permit assembly. Saturate felt wick in lever yoke with light engine oil and check metering rod setting when installation completed.

Chevrolet Running Backward (when key turned off)—To correct these complaints, check idle speed and set stopscrew for speed not to exceed 7 MPH. Check throttle valve and make certain that it is not sticking, check throttle valve spring tension. Check manifold heat control valve and thermostatic spring. Make certain that valve is not binding and that spring is wound up not more than enough to slip free end over manifold pin (approx. ½ turn).

TYPE:—Balanced bowl type similar to carburetor used on 1940 Chevrolet models except for following changes: Carburetor throat increased to 1½" with same size (1¼") main venturi as in 1940. Low speed jet well has been lowered and jet is fed through drilled passage opening through side of jet. One idle air bleed only is used (this air by-pass increased in size and second by-pass discontinued) and an additional idle discharge port is located above the throttle valve. Balance passages in air horn have been increased in size and opening above choke valve consists of brass tube pressed in casting. New type float bowl cover used with new granodized pump shaft pressed in place and lubricated by felt oil wick (not necessary to pack screw hole with graphite grease as on previous models). Accelerating pump has new rectangular plunger stem and is furnished as an assembly with shaft, guide and leather. Pump outlet check valve is a brass disc (was bakelite) and must not be interchanged with the former bakelite type. Throttle connector rod upper end is flattened for new type anti-rattle coil spring and lock (flat anti-rattle spring riveted inside dust cover not used). Choke valve has machined angle on each end so that valve seats solidly against air wall and back-fire spring protection device not used (spring type semi-automatic feature continued).

IDLE ADJUSTMENT:—Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate setting is 1-2 turns of screw out from inner seated position (both models). Idle speed controlled by throttle lever stopscrew and should be set for 400 RPM idle speed with engine warm. See car model 'T&E' page for complete tune up instructions.

PERFORMANCE:—Should be satisfactory if idling adjustment and accelerating pump adjustment correctly made. See Carter Jet Specification Table for standard jet calibration and recommended changes for special operating conditions (lean metering jets, etc.).



ACCELERATING PUMP:—Low pressure type positively actuated by throttle lever. Fuel is drawn into pump cylinder through intake check valve and strainer when throttle is closed and is discharged through outlet check valve and pump jet in wall of mixing chamber when throttle opened for acceleration.

IMPORTANT SERVICE NOTE—Pump outlet check valve is a brass disc type and must not be interchanged with bakelite type check valve used on former carburetors (use of bakelite check valve on 1941 carburetor, or brass check valve on 1940 carburetor, will upset carburetor calibration). Pump arm on countershaft lubricated by felt oil wick which should be saturated with light engine oil when carburetor overhauled.

Adjustment—Pump stroke is not adjustable.

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened to provide greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and special lean metering rods for each model. Check and adjust metering rods whenever rods removed and replaced

Metering Rod Adjustment (Chevrolet)—Take out dust cover screw, remove dust cover, remove pin spring, turn metering rod ¼ turn to disengage it from pump arm pin, lift rod out being careful not to lose the rod spring and disc. Back off throttle stopscrew so that throttle valve tightly closed, install metering rod gauge T109-25 (2.795") in place of rod being careful that gauge is vertical and tapered end seats in metering rod jet. If metering rod pin does not rest on bottom of notch on gauge with pump arm connector rod centered freely in pump arm hole, remove connector rod and bend until this setting secured. Remove gauge and re-install metering rod, make certain that disc in place on rod and that pin spring properly connected.

FLOAT LEVEL:—To check float level, remove bowl cover and float assembly, invert cover, remove gasket, measure from gasket seat on cover to top of float at free end. Distance should be ½" (plus or minus 1/64").

Float Travel—Float travel from open to closed position should be ½". To check travel, measure distance from cover to top of float at free end with float hanging freely from cover. Distance should be 1". Adjust by bending two float stops slightly with small pliers.

Needle Valve & Seat—Furnished only in matched sets, Part No. 25-33S—#48 intake hole (all models).

THROTTLE VALVE SETTING:—When installing valves, use new attaching screws and install screws loosely, tap valve lightly to centralize it in bore, then tighten attaching screws securely.

Setting—Check with stopscrew backed off so that throttle valve tightly closed. Top of lower idle port should be .044-.048" above top edge of throttle valve and bottom of Vacuum Spark Port should be .000-.004" above top of valve with throttle valve closed tightly. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve position.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CHOKE:—Choke valve is butterfly type with offset angled valve which seats solidly in air horn when closed to prevent damage due to back fire. Choke is semi-automatic type (choke valve shaft linked to lever by coil spring) so that valve automatically positions itself for correct choke action during warming up period.

SERVICING:—**Disassembly**—Take out attaching screw and remove dust cover, remove lock on upper end of connector rod by pushing lock in and turning it 90°, remove lock and anti-rattle spring. Disconnect metering rod spring, remove metering rod, using care not to lose metering rod disc. Remove accelerating pump link. Take out bowl cover screws, remove bowl cover assembly, disassemble float, remove float needle valve and seat. Remove pump plunger, plunger spring, and metering rod jet. Loosen three air horn screws, remove main nozzle passage plug and nozzle screw plug. Reach down through air horn with screwdriver and press on 'D' section of nozzle to force nozzle out of 'D' section of main venturi (CAUTION—do not press on end of main nozzle). Take out air horn screws and remove air horn. Remove low speed jet, accelerating pump passage plug and pump check valves, pump jet passage plug and pump jet, idle adjusting screw and idle passage plug. If necessary to remove throttle valve or choke valve, take out attaching screws.

Servicing—Wash all parts in clean gasoline, blow out all passages with compressed air, check idle ports and idle air bleed for carbon deposits. Inspect metering rod, metering rod jet, low speed jet, pump jet and check valves, and pump plunger for wear or damage. See that choke valve operates freely. Inspect main nozzle for burrs on end (CAUTION—Do not dismantle nozzle assembly which consists of inner nozzle pressed in outer nozzle). Replace all worn or damaged parts.

Reassembly—Use all new gaskets (see Parts List below), soak needle seat gasket and metering rod jet gasket in denatured alcohol for 15 minutes, install gaskets on parts and allow to dry before installing in carburetor. Install all parts in reverse order to disassembly directions above and note following special instructions and cautions:

Throttle & Choke Valves—Install choke valve with trademark 'C' upward, throttle valve with trademark toward idle port side, use new attaching screws and install screws loosely, tap valve lightly to centralize it in bore, then tighten attaching screws securely.

Nozzle Assembly—Install air horn screws loosely, make certain that copper gasket in place on nozzle, invert carburetor and drop nozzle into place with flat portion of 'D' section of nozzle in line with 'D' section of primary venturi, install nozzle screw plug securely, tighten air horn screws. Check nozzle position by measuring from inner diameter of primary venturi to end of nozzle. Distance should be .210-.230" and is adjusted by the copper gaskets on the nozzle. Use new copper gasket when installing nozzle passage plug.

Low Speed Jet—Jet must seat securely in casting. To check seating, install jet, then remove jet and inspect for complete bearing around top end of jet. If bearing not complete, install new jet.

Air Horn—Make certain that small fibre gasket in place at balance passage when installing air horn. This gasket is very important to insure correct 'balanced' performance of carburetor.

Adjustments—Check metering rod setting, float level and travel (see directions above), adjust carburetor when re-installed on engine.

SERVICE PARTS:—**Gasket Set**—No. 138A (all models). **Repair Package**—No. 1089 (483-S), 1091 (492-S).

TROUBLE SHOOTING:—**Engine stalls or idling performance unsatisfactory**—Check idle adjusting screw and throttle stopscrew setting. Remove low speed jet tube and clean with compressed air, check tube seat in carburetor (tube must be tight in casting at top and bottom). Remove idle adjusting screw, clean idle passage with air.

Acceleration Unsatisfactory—Disassemble and examine accelerating pump for damaged or worn plunger leather, cracked or corroded pump cylinder, bent pump arm, gummed or sticking check valves, loose or leaking check valves, clogged pump jet or passages (clogged jet or passages will be noticed by increased resistance on foot throttle).

Carburetor 'loads'—Check float level and adjust if incorrect.

TYPE WA1

***472-S—GRAHAM, HOLLYWOOD MODEL 113 (1941)**

***481-S—OLDSMOBILE 6, ABOVE MODELS WITH HYDRA-MATIC DRIVE TRANS.**
494-S—PONTIAC SIX, MODELS 41-24, 25, 26 (1941)
***496-S—STUDEBAKER CHAMPION, MODEL 3G (1941)**
***410-S—STUDEBAKER COMMANDER, MODEL 11A (1941)**

*—Vacumeter Type Carburetor.

NOTE:—**Graham Hollywood Supercharger Model 109**—This model has a Carter Dual 'WDO' carburetor. See following article for Carter 'WDO' data.

Hudson, Nash, Oldsmobile, Pontiac, Studebaker Eights—These models have Carter 'WDO' dual carburetors. See following article for 'WDO' data.

Studebaker Commander—This model also uses Stromberg BXOV-26 carburetor. See separate article for data on Stromberg BXOV-26 carburetors.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—**Nash Loading or Warming up slowly**—Check hot air tubing. See that tubing not kinked at bends or pinched at point where it enters coil housing. See that tube tight in coil housing and hot air stove connection.

Hudson Models—Carburetors are installed with **eight** gaskets between carburetor and mounting pad on manifold. When installing carburetor, place four gaskets between manifold and heat deflector, four additional gaskets between deflector and carburetor. NOTE—Governor plate is installed between two top gaskets on new cars during breaking in period—when governor plate removed, gasket between plate and carburetor must be replaced so that total of four gaskets used between heat deflector and carburetor.

Pontiac Throttle Sticking Correction (First Cars)—On first cars with accelerator pedal rod which does not have stop at bend, rod may be forced into hole in bracket and cause throttle to stick if cross-shaft bracket and pedal rod alignment not correct. Correct this by installing thin washer on end of rod against bend and soldering washer in place. Pedal rods on later cars have stop formed on rod at this point. Check accelerator pedal alignment and shim with washers under anchor stud so that pedal rod aligned with exact center of hole in toeboard.

Studebaker Champion—To correct complaints of insufficient heat at Climatic Control, which will cause choke valve to be slow in opening as engine warms up, make certain that Heat Tube is not bottoming in pocket in exhaust manifold. It is recommended that heat tube end be cut at an angle so that tube can not bottom in pocket and close off passage in tube.

TYPE:—Same design as previous WA1 models (Standard & Vacumeter Types) with Climatic Control (Automatic Choke), Fast Idle, Anti-Percolator, Unloader, and Choke Valve Lock. See Climatic Control article in Carburetion Equipment Section for complete servicing directions on Climatic Control.

Hudson Model 454-S—This model has special 'Trip Lever' mounted on fast idle link which must be checked after fast idle and other adjustments are made. See Trip Lever Adjustment below.

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed with choke valve wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings are shown in table below. Idle speed is controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up data on each car model.

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Graham 113	472-S	½-1½ turns open	7-8 MPH.
Hudson 6	454-S	¾-1½ turns open	600 RPM.①
Nash 6	435-S	¾-1½ turns open	7-8 MPH.
Oldsmobile 6	504-S, 481-S	½-1½ turns open	②
Pontiac 6	494-S	¾-1¾ turns open	7-8 MPH.③
Studebaker Champ.	496-S	½-1½ turns open	8 MPH.
Studebaker Comm.	410-S	½-1¼ turns open	8 MPH.

①—7½-8 MPH. (4 1/9-1 Axle), 6½-7 MPH. (4 5/9-1 Axle), 6-6½ MPH. (4⅞-1 Axle).
②—6 MPH. or 425 Eng. RPM. (504-S—Std. Trans.), 375 RPM. (481-S—Hydra-matic Drive).
③—450-475 Engine RPM.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

ACCELERATING PUMP:—All models except Pontiac 494-S, Studebaker 496-S. Pump is low pressure type and is positively operated by throttle lever through arm and countershaft assembly on bowl cover. Countershaft arm has three holes for pump link engagement to provide varied pump stroke for seasonal requirements.

Pontiac 494-S, Studebaker Champ. 496-S—Pumps are low pressure (Pontiac), high pressure (Studebaker) and are operated by a spring-loaded arm (pump arm and pump operating lever linked by coil spring). Pontiac type is adjustable (two holes provided in both pump arm and pump plunger stem). No adjustment provided on Studebaker 496-S carburetor.

Pump Seasonal Adjustment—Three holes provided in pump arm on countershaft for pump link connection (except Pontiac—2 holes in both arm and pump stem). Inner hole provides minimum stroke, lower hole medium stroke, outer hole maximum stroke. See tune up data on car model 'T&E' page for recommended setting and seasonal changes. This adjustment accessible after taking out screw and removing dust bowl cover.

Pump Stroke Adjustment:—To check pump plunger travel, back off throttle lever stopscrew so that throttle valve closes tightly, adjust pump connector link for correct pump stroke as shown in 'Pump Setting' column of table below (see Pump Adjustment above for this connector link adjustment). Install Universal Pump Stroke Gauge T109-117S on ridged portion of bowl cover so that projecting portion of gauge rests on top surface on connector link at pump shaft. Hold gauge vertical and note reading, then open throttle wide and again note reading. Difference between these two readings is pump stroke (in sixty-fourths of an inch) and should agree with 'Pump Stroke' figure in table below. To adjust, bend throttle connector rod at lower angle near throttle lever. CAUTION—Check metering rod adjustment (disturbed by this adjustment).

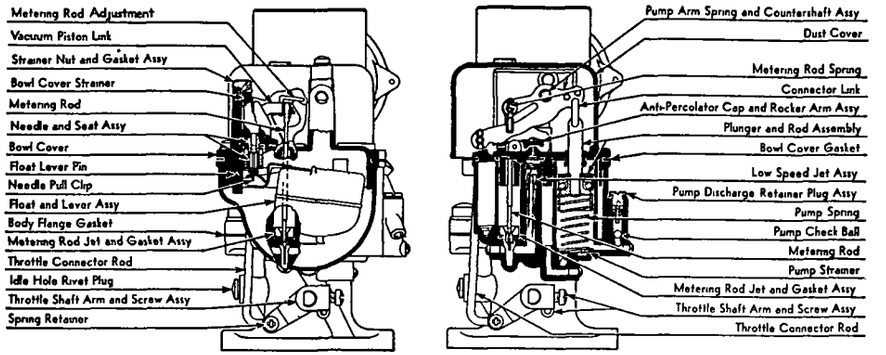
Pump Gauge Change Note—All T109-117S pump gauges after Sept. 15, 1940, have new indicator arm with gauging lips on both ends. This new indicator arm, Part No. T109-153, can be installed on previous gauges to bring them up to date.

Car Model	Carburetor	Pump Stroke	Pump Setting
Graham 113	472-S	19/64"	Medium Stroke
Hudson 6	454-S	12/64"	Short Stroke
Nash 6	435-S	27/64"	Long Stroke
Oldsmobile 6	504-S, 481-S	20/64"	Medium Stroke
Pontiac 6	494-S	18/64"	Short Stroke
Studebaker Champ.	496-S	11/64"	Non-Adj.
Studebaker Comm.	410-S	18/64"	Medium Stroke

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened and provides greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and leaner-than-standard metering rod calibrations. Check and adjust Metering Rod whenever rods removed and replaced or when pump stroke setting is changed.

Vacumeter Type Note—On these types, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (lug on pump arm serves as stop for lip on piston link to prevent vacuum piston pulling metering rod down in jet beyond correct point for the particular throttle opening). These models adjusted in special manner (see instructions below).

Metering Rod Adjustment (except Vacumeter Types)—Take out screw and remove dust cover on float bowl cover. Unhook metering rod spring, disengage metering rod from arm on pump shaft, lift out rod being careful not to lose metering rod disc. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle lever stopscrew so that throttle valve tightly closed. Clearance between pin in arm on pump shaft and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending arm (use extreme care not to bend lower portion of arm to which throttle connector link is attached—this will disturb pump stroke setting). Remove gauge, install metering rod and disk, connect metering rod spring.



Metering Rod Adjustment (Vacumeter Type)—Remove metering rod (hung on pin on upper end of vacuum piston link) being careful not to lose metering rod disk. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle stopscrew so that throttle valve tightly closed. Press down lightly on vacuum piston link at point directly over piston. Clearance between pin on piston link and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending lip on piston link so that it contacts lug on pump arm (use special tool T109-105). Remove gauge, install metering rod and disc, connect metering rod spring.

ANTI-PERCOLATOR:—Saxophone Key Type. Consists of a main nozzle vent in the bowl cover controlled by a leather-faced, felt-backed metal cap which opens the vent when the throttle is closed to prevent any percolating discharge from the nozzle. The cap must be seated to close the vent when the throttle is opened beyond idling position.

Adjustment—Crack throttle open by inserting special gauge No. T109-29 (use .030" end for Graham 472-S, Hudson 454-S, Pontiac 494-S, Studebaker 496-S and 410-S; .020" for Nash 435-S, Oldsmobile 504-S and 481-S) between edge of valve and carburetor wall on side opposite idle port. Bend anti-percolator rocker arm (use special tool T109-105) so that clearance between lip on rocker arm and pump arm is .005-.015" (use feeler gauge to check this clearance).

NOTE—T-109-29 Gauge used for both .020" and .030" settings.

Pontiac Note—Anti-percolator may also be adjusted after throttle stopscrew has been set for 7 MPH idle speed (turn screw in until it just contacts lowest step of fast idle cam, then turn screw in additional ½ turn) by rotating fast idle cam until stopscrew rests on highest step of arm and then bending the anti-percolator rocker arm until clearance between arm and pump arm is .005".

FLOAT LEVEL:—To check float level, remove float bowl cover, invert cover, measure from top edge of machined projection on cover at free end of float to top of soldered seam. See table below for float level on each model. Adjust by bending lip of float lever at valve needle.

Car Model	Carburetor	Float Level
Graham 113	472-S	3/8"
Hudson 6	454-S	3/8"
Nash 6	435-S	3/8"
Oldsmobile 6	504-S, 481-S	½"
Pontiac 6	494-S	½"①
Studebaker Champ.	496-S	5/16"
Studebaker Comm.	410-S	¼"

①—Supersedes 7/16" setting originally specified for this model.

Float Travel—Should be ½" (all models). To check, hold float bowl in normal position, note drop at free end of float. To adjust, bend two small float stop lips at hinge end of float.

Float Needle Valve & Seat—Furnished only in matched sets as follows:

Car Model	Carburetor	Part Number	Intake Hole
Graham 113	472-S	25-42S	#38
Hudson 6	454-S	25-33S	#48
Nash 6	435-S	25-34S	#46
Oldsmobile 6	504-S, 481-S	25-75S	#46
Pontiac 6	494-S	25-42S	#38
Studebaker Champ.	496-S	25-42S	#38
Studebaker Comm.	410-S	25-34S	#46

THROTTLE VALVE SETTING:—When installing valves, see that trademark is up and on idle port side, install screws loosely, tap valve lightly to centralize it in bore, tighten screws securely. See that throttle valve stopscrew is backed off so that valve closes tightly, check throttle valve setting as shown in table below

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

(idle ports are slotted type). Vacuum port height is distance from top of valve to bottom of port. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve position.

Car Model	Carburetor	Idle Port Opening	Vacuum Port Height
Graham 113	472-S	133-.137"	①.029-.034"
Hudson 6	454-S	120-.124"	.021-.029"
Nash 6	435-S	137-.141"	None
Oldsmobile 6	504-S, 481-S	136-.140"	.022-.027"
Pontiac 6	494-S	107-.111"	.022-.027"
Studebaker Champ.	496-S	②.010-.014"	③.055-.060"
Studebaker Comm.	410-S	②.010-.014"	①.054-.059"

①—Top of port above throttle valve.
②—Port opening below valve (above valve on all other models).
③—Top of port above valve for late production only. On early models, top of port is .045-.055" above valve.

FAST IDLE:—Consists of a fast idle cam pivoted directly above the throttle lever so as to serve as a stop for the throttle stopscrew and linked to the automatic choke mechanism. See Climatic Control article in Carburetion Equipment Section for complete servicing directions.

Adjustment—To check, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against first step of cam (screw must not be on step), check clearance between lower edge of choke valve and air horn wall (use tool T109-85—all models). Distance should be 5/8". To adjust, use tool T109-41 and bend offset portion of fast idle link.

TRIP LEVER:—Hudson Model 454-S—Should be adjusted after all other choke linkage adjustments have been made. This trip lever not used on other carburetor models.

Adjustment—Hold choke valve tightly closed with pin on fast idle cam resting at bottom of slot in fast idle link. Bend trip lever stop on fast idle link so that clearance between fast idle cam and lip on trip lever is .010".

CHOKE:—Plain type offset valve. See Climatic Control article in Carburetion Equipment Section for automatic choke servicing data.

Setting—Thermostatic coil housing should be set so that reference mark centered on scale on piston housing for all models except those listed in table below, and should be rotated counter-clockwise (Rich) or clockwise (Lean) for these special models as shown. To adjust, loosen two thermostatic coil housing attaching screws, rotate housing.

Car Model	Carburetor	Choke Setting
Nash 6	435-S	①1 Notch Rich
Pontiac 6	494-S	3 Notches Rich
Studebaker Comm.	410-S	1 Notch Rich
All Others		Centered

①—Supersedes setting of 2 Notches Rich originally specified for this model.

Unloader—Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

Car Model	Carburetor	Gauge No.	Choke Valve Clearance
Graham 113	472-S	T109-83	1/2"
Hudson 6	454-S	T109-81	7/16"
Nash 6	435-S	T109-82	31/64"
Oldsmobile 6	504-S	T109-81	7/16"
Oldsmobile 6	481-S	T109-80	3/8"
Pontiac 6	494-S	T109-106	7/32"
Studebaker Champ.	496-S	T109-31	1/4"
Studebaker Comm.	410-S	T109-31	1/4"

Choke Valve Lock—Prevents choke valve closing when throttle valve held wide open. To adjust, hold choke and throttle valves wide open, bend lip at lower end of fast idle link so that clearance between lip and lock on throttle lever is 1/32" (use tool T109-105).

TROUBLE SHOOTING:—Poor Idling Performance—If engine stalls while idling, low speed performance is unsatisfactory, or correct adjustment cannot be secured, remove idle tube (low speed jet) and clean with compressed air or install new tube. See that tube seats tightly at shoulder. Remove idle adjusting screw and clean low speed channels with air. If idle is rich, check metering rod linkage for binding and see that rod is not rubbing on dust cover. On Vacumeter types, see that vacuum piston is clean and operates freely.

Poor Acceleration—Check pump seasonal adjustment and pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger, corrosion or dirt in pump cylinder, ball check valves sticking or leaking. If plunger removed from cylinder, use loading tool when re-installing to avoid damaging plunger leather. On vacumeter types, make certain that vacuum piston is clean and operates freely in cylinder, examine spring under piston.

Carburetor Loads Up or Performance is Poor—Check and adjust float level. See that correct type metering rod installed (replace metering rod and jet as an assembly—check metering rod setting when installed). On vacumeter types, see that vacuum piston operates freely and vacuum channel open and clean.

SERVICING:—Disassembly—Take out attaching screw and lockwasher, remove dust cover. Remove fast idle cam screw and fast idle cam. Take out air horn attaching screws (two screws on top, one beneath Climatic Control housing), remove air horn and gasket. Take out retainer screws, remove thermostatic coil and housing assembly, piston housing strainer. Take out choke valve screws and remove choke valve. Loosen screw on choke lever and link assembly 4 full turns, pry lip on lever away from shaft with screwdriver. Revolve choke shaft counter-clockwise to free piston from cylinder and remove assembly (CAUTION Do not remove pin holding piston housing and air horn casting together—these parts line-reamed at factory and must be kept in alignment). Remove pin spring, spring retainer, and spring from throttle connector rod and remove rod. Remove pin spring and connector link from pump arm. Remove low speed passage plug and gasket assembly (located next to anti-percolator cap). Take out bowl cover screws and remove bowl cover assembly intact. On Vacumeter types, remove vacuum piston spring from cylinder in casting, disconnect piston from link by turning piston 1/4 turn, remove piston link and metering rod from bowl cover and disassemble rod and link, using care not to lose metering rod disc. On non-Vacumeter types, remove metering rod and disc, using care not to lose disc or damage spring, remove pump arm and collar assembly and pump operating lever and countershaft assembly by revolving 1/2 turn. On all models, remove float, needle and seat assembly, strainer nut and gasket, and strainer. Take out pin and remove anti-percolator cap and rocker arm assembly and spring. Remove pump plunger and rod assembly, take out strainer and check ball in lower end of pump cylinder. Remove low speed jet assembly, nozzle passage plug, nozzle retainer plug, and nozzle (use tool T109-55). CAUTION—Make certain that small nozzle gasket removed from nozzle passage. Remove metering rod jet and gasket assembly. Remove pump jet passage plug and pump jet. Remove pump discharge ball retainer and check ball. Remove body flange (lower casting) gaskets and insulator, idle adjusting screw and spring, and idle port rivet plug. Remove throttle shaft arm and shaft assembly, take out throttle valve screws, remove throttle valve and shaft and lever assembly.

Servicing—Wash all parts in clean gasoline (except thermostatic coil and housing assembly and cork parts), blow out all passages with compressed air, scrape carbon from casting bore, examine jets and metering rods and replace all worn parts.

Reassembly—Use all new gaskets (see Parts List below), group all low speed circuit, high speed circuit, float, pump, and choke circuit parts together to insure correct re-installation. Install parts in reverse order of disassembly directions given above and note following special instructions and cautions: When installing throttle valve, use new attaching screws, install valve with trademark up and on idle port side of bore, install screws loosely, tap valve lightly to centralize it in bore and then tighten attaching screws. Centralize choke valve in same manner and check operation by making certain that choke valve falls open freely of own weight. When installing nozzle, make certain that new gasket used, install nozzle with flat side up. See that low speed jet seats firmly in casting at shoulder. Check and adjust metering rod, anti-percolator setting, pump stroke, float level, fast idle and choke setting, throttle valve setting as directed above. Adjust carburetor when re-installed on engine.

SERVICE PARTS:—Gasket Set & Repair Packages—Furnished for each model as follows:

Carburetor	Gasket Set	Repair Package
Graham 113 472-S	No. 139A	
Hudson 6 454-S	No. 139 A	No. 1078
Nash 6 435-S	No. 139A	No. 1065
Oldsmobile 6 504-S, 481-S	No. 157	
Pontiac 6 494-S	No. 146	
Studebaker Champ. 496-S	No. 159	
Studebaker Comm. 410-S	No. 160	

507-S—WILLYS AMERICAR, MODEL 441 (1941)
WILLYS COMMERCIAL, PICKUP 441, PANEL DELIVERY 441P (1941)

TYPE:—Same design as Carter 'WO' model used on 1940 Willys models.

ADJUSTMENT:—Adjust only with engine warmed up and choke valve wide open (fast idle inoperative). Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings 1¼ turns (½-1½ turns) of screw from inner seated position. Idle speed controlled by throttle lever stopscrew and should be set for 8 MPH. speed in high gear. See car model 'T&E' page for complete tune up data.

PERFORMANCE:—Should be satisfactory if Idling Adjustment and pump stroke setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods for special operating conditions such as high altitudes. See Trouble Shooting.

ACCELERATING PUMP:—High pressure type (spring operated). Operated by throttle lever through spring connection between pump operating lever and pump arm (under dust cover on bowl cover). Fuel is drawn into pump cylinder through strainer and inlet ball check valve when throttle is closed and is discharged through outlet ball check valve and pump jet location in side of mixing chamber above main venturi when throttle is opened for acceleration. Pump is not adjustable for seasonal changes.

Pump Stroke Adjustment—To check pump plunger travel, remove dust cover on float bowl cover, install Universal Pump Stroke Gauge T109-117S on raised portion of bowl cover so that gauge is vertical and projecting ear rests on top surface of pump shaft. Back off throttle lever stopscrew so that throttle valve tightly closed, note gauge reading. Open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should be 14/64". To adjust, use special bending tool T109-41 to bend throttle connector link at lower angle near throttle lever.
CAUTION—Check metering rod setting (disturbed by this adjustment).

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters fuel for main nozzle and rod is operated by throttle lever in same manner as on other Carter models. Metering rod mounting on pump operating lever is new and consists of a pin locked in place in a slotted hole in the pump arm by a nut. Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and lean metering rod calibrations. Check and adjust metering rod whenever rods removed and replaced or when pump stroke setting is changed.

Metering Rod Adjustment—Disconnect choke linkage, take out air horn attaching screws, remove air horn and dust cover. Unhook metering rod spring, remove metering rod being careful not to lose disk on rod at bowl cover. Insert special gauge, T109-26 (2.718") in place of metering rod so that tapered end is seated in metering rod jet and gauge is vertical. Back off throttle lever stopscrew so that throttle valve closes tightly. Metering rod pin on pump operating rod should be even with shoulder of notch in gauge. To adjust, loosen pin nut, shift pin on arm, tighten nut securely (use special wrench T109-76). Remove gauge, install metering rod and disk, install pin spring, connect metering rod spring.

FLOAT LEVEL:—**Note**—Float needle valve stem is hollow and has a spring installed in this hole to take up clearance between valve and float level.

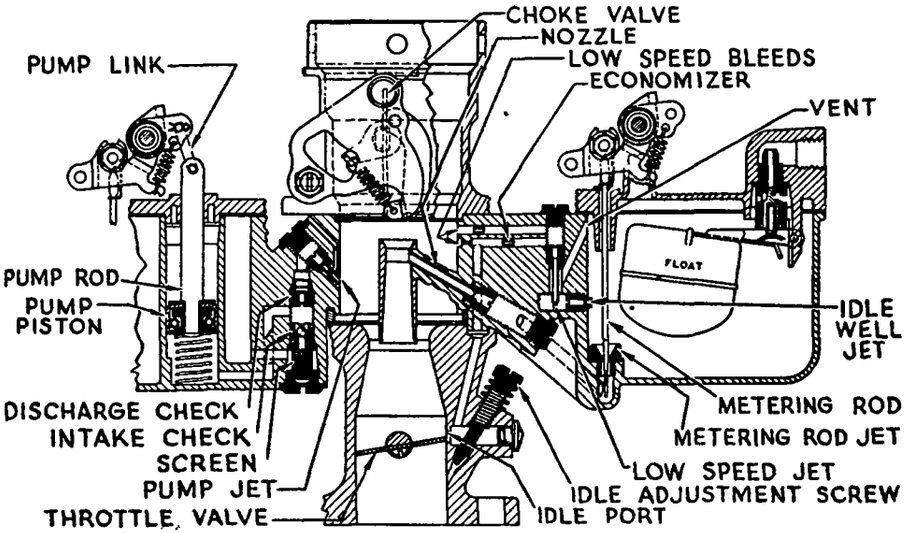
Float Level—To check, remove bowl cover and float assembly, invert cover, turn gasket so that machined surface of bowl cover is exposed, measure distance from this machined surface to top of float at free end (see Caution below). Distance should be ⅜". To adjust, bend lip of float lever at point where it contacts needle valve (do not bend float arm).
CAUTION—Use extreme care not to compress spring in needle valve stem when checking float level (will cause incorrect setting). Allow float to hang freely on inverted cover.

Float Travel—To check, hold bowl cover and float assembly in normal position. Free end of float should drop ½". Adjust by bending two small float stop lips at hinge end of float.

Needle Valve & Seat—No. 25-93S (matched Set). Intake Hole size #53.

CHOKE:—Offset type valve with poppet type relief valve. Check choke linkage to see that choke valve closed when control button on instrument panel pulled out and open with control button pushed in (engine not running—choke control is semi-automatic and spring-loaded).

Fast Idle:—Consists of an interconnecting linkage between the choke valve lever and throttle valve lever so that throttle valve is opened to fast idle position with choke valve closed. Should not require adjustment.



THROTTLE VALVE SETTING:—When installing valves, back off throttle lever stopscrew, see that trademark on valve is on idle port side, use new attaching screws and install screws loosely, tap valve lightly to centralize it in carburetor bore, tighten screws securely, check valve setting.

Setting—With throttle valve closed tightly (stopscrew backed off), idle port opening (below lower edge of valve) should be .010-.014" and top of Vacuum spark port .042-.048" above upper edge of valve when valve tightly closed

TROUBLE SHOOTING:—**Poor Idling Performance**—If motor stalls while idling, low speed performance is unsatisfactory, or if correct idling adjustment cannot be secured, remove idle well plug and gasket assembly and allow fuel to drain from bowl which will flush out idle well jet. Remove idle well jet and clean with compressed air, remove low speed jet and clean with air, see that jet seats gasoline tight at shoulder in casting when replaced. Check carburetor wall at throttle valve edge for carbon deposits. Remove idle adjusting screw and clean out idle passages with air.

Poor Acceleration—Check pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger or bent pump arm, sediment or corrosion in pump cylinder, sticking or leaking ball check valves. If pump plunger removed from cylinder, use loading tool to install plunger to avoid damage to plunger leather.

Carburetor Loads up or Performance is Poor—Check float level, see that correct type metering rod installed and check metering rod setting.

SERVICING:—**Disassembly**—Remove choke connector link and spring, take out attaching screws and remove air horn assembly. Remove idle well plug and gasket assembly, remove idle well jet. Remove throttle shaft arm and connector rod. Take out screws and remove bowl cover assembly, disassemble parts on bowl cover. Remove low speed jet plug and gasket, low speed jet, idle adjusting screw and spring, metering rod jet and gasket assembly, nozzle passage plug and gasket, nozzle retainer plug, nozzle (use tool T109-55). Take out body casting flange attaching screws, remove flange casting and throttle valve assembly. Remove pump strainer plug and gasket, strainer, inlet ball check valve assembly, outlet ball check valve assembly. Remove pump jet passage plug and gasket, and pump jet. Remove idle port rivet plug. Take out throttle valve attaching screws, remove valve, withdraw shaft and lever assembly. Remove choke control bracket assembly from air horn, take out choke valve attaching screws, remove valve, withdraw choke valve shaft and lever assembly.

Servicing:—Clean body castings and all parts in gasoline, blow out all passages in castings and all jets with compressed air, dry all parts with air before reassembling. Check all parts for wear, see that they agree with specifications (see Carter Jet Specification Table), replace all worn parts.

Reassembly:—Use all new gaskets (soak metering jet gasket and needle seat gasket in 90 proof alcohol for 15 minutes, install on part and allow to dry before using). Reassemble by reversing disassembly directions above and note:

Nozzle Installation—Use new gasket. Use special tool T109-55 to install nozzle and make certain that flat side of nozzle is upward.

Low Speed Jet—Make certain that hole at lower end is open, work jet into seat by moving it back and forth, make certain that jet seats tightly in casting and install jet plug and gasket.

Choke Valve—Centralize valve in air horn by tapping valve lightly before tightening attaching screws.

***506-S—CADILLAC V8, SERIES 41-60S, 61, 62, 63, 67, 75 (1941)**
488-S—GRAHAM, HOLLYWOOD SUPERCHARGER MODEL 109 (1941)

469-SM—PONTIAC EIGHT, MODELS 41-27, 28, 29 (1941)
409-S—STUDEBAKER PRESIDENT, MODEL 7C (1941)

*—Vacumeter type Carburetor.

1940 SPECIAL SERVICE NOTES:—Throttle Stop Dog Adjustment (Buick 474-S)—Should be adjusted before adjusting Unloader. Use Gauge T109-121S to check throttle opening (See Carter Car Starter in Electrical Equipment Section for gauge data). With choke valve open, close throttle valve, then close choke valve and adjust lip on throttle stop dog (on throttle shaft) to contact throttle stop with throttle opening of 44° Minimum, 55° Maximum, from tightly closed position.

Hudson Throttle Sticking Correction—To correct complaints of sticking throttle caused by binding between throttle connector rod and throttle lever or pump arm on 455-S, 461-S carburetors, remove and discard original throttle connector rod (No. 115-52), install new Throttle Connector Rod No. 115-65 and Throttle Connector Rod Washer No. 136-37. NOTE—This washer must be used with the new rod.

Pontiac Throttle Sticking Correction—Refer to Pontiac Shop Notes in 'M' Section for recommended accelerator linkage adjustment.

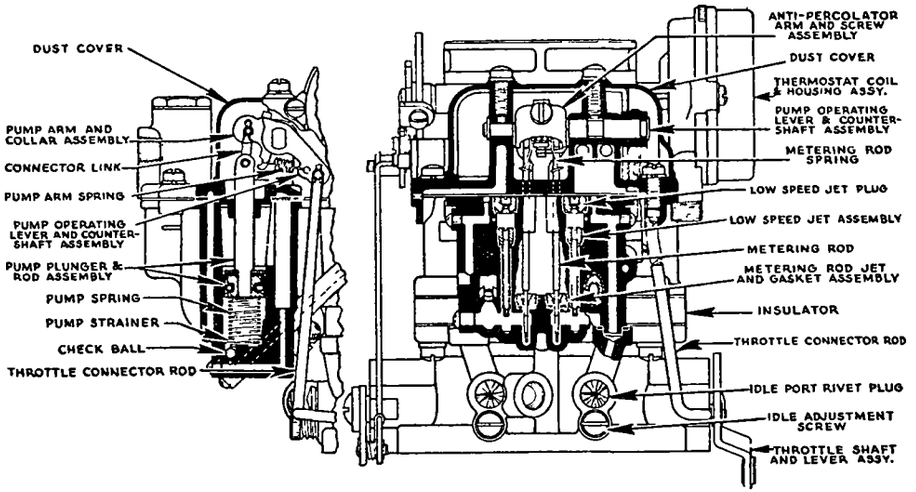
NOTE:—Cadillac, Studebaker Models—Stromberg carburetors also used on these models. Refer to Stromberg Model AAV-26 Carburetor article for data.
Hudson 6 & 8 (First Cars)—Carburetors used on first cars are same types as used on corresponding 1940 models (with dashpot or slow closing throttle device). New carburetor models used on later cars do not have this dashpot.
Packard Clipper (512-S)—This model has Carter Car Starter No. 192-11U built-in carburetor. Refer to Carter Car Starter in Electrical Equipment Section.

1941 SPECIAL SERVICE NOTES:—Pontiac Throttle Sticking Correction—Refer to Carter WA1 article for recommended correction (same as for Six).

Hudson (All Models)—Carburetors are installed with **eight** gaskets between carburetor and mounting pad on manifold. When installing carburetor, place four gaskets between manifold and heat deflector, four additional gaskets between deflector and carburetor. NOTE—Governor plate is installed between two top gaskets on new cars during breaking in period—when governor plate removed, gasket between plate and carburetor must be replaced so that total of four gaskets used between heat deflector and carburetor.

TYPE:—Same design as previous Carter WDO dual models (Standard and Vacumeter types) with Climatic Control (automatic choke), Fast Idle, Anti-Percolator, Unloader and Choke Valve Lock. See Climatic Control article in Carburetion Equipment Section for complete servicing directions on these units.

IDLING ADJUSTMENT:—Adjust carburetor only with engine warmed up and idling at hot or slow idling speed (choke valve wide open, fast idle inoperative). Idle adjusting screw provided for each carburetor barrel. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture and both screws just be adjusted exactly alike. See table below for approximate settings on each car model. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See car model 'T&E' page for complete carburetor tune up instructions on each car model.



Car Model	Carburetor	Idle Screw Setting	Idle Speed
Cadillac V8	506-S	½-1½ turns open	7-8 MPH④
Graham 109	488-S	½-1¼ turns open	7-8 MPH.
Hudson 6	461-S, 501-S	¼-1¼ turns open	600 RPM.①
Hudson 8	455-S, 502-S	½-1½ turns open	600 RPM.①
Nash	511-S	½-1½ turns open	7-8 MPH.
Oldsmobile 8	503-S, 480-S	½-2¼ turns open	②
Packard 8	478-S, 512-S	½-1½ turns open	6 MPH.
Pontiac 8	469-SM	¼-1¼ turns open	7-8 MPH.③
Studebaker 7C	409-S	¼-1¼ turns open	8 MPH.

①—7½-8 MPH. (4 1/9-1 Axle), 6½-7 MPH. (4 5/9-1 Axle), 6-6½ MPH. (4⅞-1 Axle).
②—6 MPH. or 425 Eng. RPM. (503-S—Std. Trans.), 375 RPM. (480-S—Hydra-matic Drive). ③—450-475 Eng. RPM.
④—For Std. Transmission. Set at 375 Eng. RPM on cars with Hydra-matic Drive.

PERFORMANCE:—Should be satisfactory if Idling Adjustment and Accelerating Pump Setting correct. See Carter Jet Specification Table for standard jet calibrations and special lean metering rods (for special operating conditions). Both metering rods must be same size and adjusted alike. See Trouble Shooting below.

METERING ROD (NON-VACUMETER TYPES):—Fuel metered by stepped metering rods (separate rod and jet used for each carburetor barrel) which are raised in metering rod jets as throttle is opened to permit greater fuel flow to nozzles. Metering rods used for both barrels must be same size and must be adjusted alike. Metering rods can be changed for special operating conditions such as high altitude (see Carter Jet Specification Table for standard and special lean metering rods). Setting should be checked whenever metering rods removed and replaced or when pump stroke setting is adjusted.

Metering Rod Removal—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and metering rods (on models with separate dustcover, take out two retaining screws and remove dust cover only). Remove pin spring from metering rod pin, slide pin out being careful not to lose metering rod springs, lift out metering rods and springs. Remove metering rod discs (on some models, discs held in place by retainer which must first be removed by taking out brass retainer screw). On models where retainer not used, use care not to lose discs.

Metering Rod Setting—Back off throttle lever stopscrew so that throttle valves tightly closed, loosen anti-percolator arm screw. Install metering rod gauge (see table below for each model) in place of each metering rod, making certain that gauges seat in metering rod jets and are vertical. Install metering rod pin and pin spring in metering rod arm. Press down lightly on pump arm. Pin should rest on shoulders of notches in both gauges (bend arm slightly to equalize if necessary) with clearance of less than .005" between pin and each gauge. Tighten anti-percolator arm screw. Remove gauges and metering rod pin, install metering rods and disks, springs, pin and pin spring, hook metering rod springs on rods.

CAUTION—Anti-percolator must be checked after this adjustment completed.

Car Model	Carburetor	Metering Rod Gauge No.	Length
Graham 109	488-S	T109-113	2.280"
Nash 4180	511-S	T109-113	2.280"
Pontiac 8	469-SM	T109-27	2.359"
Studebaker 7C	409-S	T109-27	2.359"

METERING ROD (VACUMETER TYPES):—Fuel for nozzles metered by metering rod and jet (independent rod and jet for each nozzle). Metering rods operated by single vacuum piston with throttle control (stop pin on pump arm limits piston travel so that metering rod lifted in accordance with throttle opening). No adjustment provided but metering rods can be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or high altitude conditions (both rods must be same size and should be changed as a unit). Check metering rod setting whenever rods removed and replaced or when pump stroke setting is adjusted.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

To Remove Metering Rods—Take out screws and remove dust cover or remove air horn and dust cover assembly (where these parts integral—see Service data for removal instructions). Remove pin spring from metering rod pin and slide pin from vacuum piston link being careful not to bend metering rod spring. Lift out metering rods, remove metering rod discs (on some models discs held in place by retainer which must first be removed by taking out brass retainer screw). On models where retainer not used, use care not to lose discs.

To Check Metering Rods—Back off throttle stopscrew so that throttle valves tightly closed. Install metering rod gauge (see table below) in place of one metering rod making certain that tapered end of gauge is seated in metering rod jet. Install metering rod pin in piston link, press piston and link down until metering rod pin contacts lip on anti-percolator arm. With piston down and throttle valve seated, clearance between metering rod pin and shoulder of notch in gauge should be less than .005". To adjust, bend lip on anti-percolator arm.

To Install Metering Rods—Make certain that discs are in place under disc retainer and that pin spring and metering rod springs are properly connected.

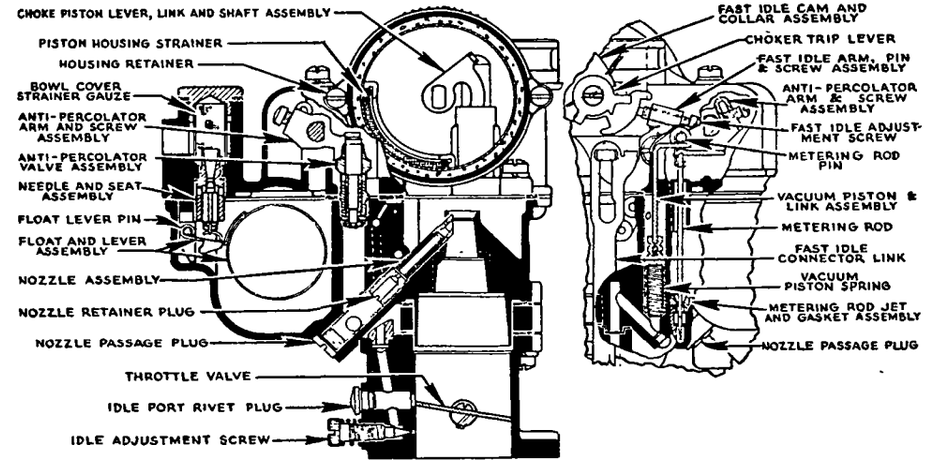
Car Model	Carburetor	Metering Rod Gauge No.	Length
Cadillac V8	506-S	T109-113	2.280"
Hudson 6	461-S, 501-S	T109-113	2.280"
Hudson 8	455-S, 502-S	T109-113	2.280"
Oldsmobile 8	503-S, 480-S	T109-113	2.280"
Packard 8	478-S, 512-S	T109-113	2.280"

ACCELERATING PUMP:—High pressure type with spring operation (pump operating lever and pump arm linked by small coil spring) except Studebaker Model 409-S which is Low Pressure type. Inlet ball check valve located in bottom of pump cylinder, outlet ball check valve under retainer plug in main body casting.

Pump Seasonal Adjustment—On some models, pump arm (under dust cover) has two or three holes for pump rod link connection to provide varied pump stroke for seasonal pump requirements. See car model 'T&E' page for recommended settings and seasonal changes.

Pump Stroke Adjustment—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and connector link (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed, check pump seasonal adjustment (connector link must be engaged in hole for correct stroke as shown in table below). Install Universal Pump Stroke Gauge T109-117S on rim of bowl cover at plunger shaft so that projection on gauge rests on top surface of connector link at pump shaft. Note gauge reading with throttle closed, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with figure shown in table below. Adjust by bending throttle connector rod at lower angle near throttle lever (use bending tool T109-75).

CAUTION—Check metering rod setting and anti-percolator adjustment after adjusting pump stroke.



Pump Gauge Change Note—All T109-117S pump gauges after Sept. 15, 1940 have new indicator arm with gauging lips on both ends. This new indicator arm, Part No. T109-153, can be installed on previous gauges to bring them up to date.

Car Model	Carburetor	Pump Stroke	Pump Setting
Cadillac V8	506-S	26/64"	Non-adj.
Graham 109	488-S	22/64"	Short Stroke
Hudson 6	461-S, 501-S	18/64"	Long Stroke
Hudson 8	455-S, 502-S	18/64"	Long Stroke
Nash 8	511-S	32/64"	Long Stroke
Oldsmobile 8	503-S, 480-S	19/64"	Non-adj.
Packard 8	478-S, 512-S	14/64"	Short Stroke
Pontiac 8	469-SM	19/64"	Non-adj.
Studebaker 7C	409-S	16/64"	Long Stroke

ANTI-PERCOLATOR:—Plunger Type (All Models). Consists of a vent above each main jet well controlled by spring-loaded plunger type valves. Valves are opened by anti-percolator arm connected to throttle when throttle valves are closed to vent nozzles and prevent any 'percolating' discharge when carburetor is hot. Valves must be closed when throttle is opened (incorrect adjustment will cause flat spots).

Adjustment—Make this adjustment after metering rod setting and pump stroke setting have been adjusted (use extreme care not to disturb these settings). On models with integral air horn and dust cover, remove this assembly to expose anti-percolators (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed. On models listed in table below, insert special gauge (or feeler gauge of thickness listed) between anti-percolator stems and lips on anti-percolator arms—**do not use any gauge on other models.** Bend lips so that center of indicator line on each anti-percolator stem is flush with top of anti-percolator plug. Use extreme care to secure same adjustment on both anti-percolator units.

Car Model	Carburetor	Checking Gauge	Thickness
Cadillac V8	506-S	T109-72	.015"
Packard 8	478-S, 512-S	T109-72	.015"
Studebaker 7C	409-S		.010"
All Others		None	None

FLOAT LEVEL:—To check float level (with bowl cover assembly removed), remove cover gasket, invert cover, measure from machined gasket seat on cover to top of float (check at both ends of float—settings must be alike). See table below for float level and special checking gauge for each model. To adjust, bend lip on float level at point where it contacts valve needle (do not bend float or arm).

Car Model	Carburetor	Float Level	Checking Gauge
Cadillac V8	506-S	1/8"	
Graham 109	488-S	3/16"	T109-28
Hudson 6 & 8	461-S, 455-S	3/32"	
Hudson 6 & 8	501-S, 502-S	1/8"	
Nash 8	511-S	3/16"	T109-28
Oldsmobile 8	503-S, 480-S	3/16"	T109-28
Packard 8	478-S, 512-S	5/32"	T109-154
Pontiac 8	469-SM	5/16"	T109-107
Studebaker 7C	409-S	3/16"	T109-28

Needle Valve & Seat—Furnished only in matched sets as shown in table below. When installing assembly on Oldsmobile and Pontiac carburetors, see that clip on needle valve engages float lever.

Car Model	Carburetor	Part Number	Intake Hole Size
Cadillac V8	506-S	25- 98S	#38
Graham 109	488-S	25- 59S	#38
Hudson 6	461-S, 501-S	25- 59S	#38
Hudson 8	455-S, 502-S	25- 59S	#38
Nash 8	511-S	25- 59S	#38
Oldsmobile 8	503-S, 480-S	25-100S	#38
Packard 8	478-S, 512-S	25- 98S	#38
Pontiac 8	469-SM	25- 74S	#38
Studebaker 7C	409-S	25- 59S	#38

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

THROTTLE VALVE SETTING:—Install valves with trademark 'C' toward idle port side, use new attaching screws, install screws loosely, tap valves lightly to centralize them in bore, then tighten screws securely. Check valve setting with throttle lever stopscrew backed out so that valves tightly closed. Idle port figure is distance from top edge of valve to top of idle port. Vacuum spark port figure is distance from top edge of valve to top (or bottom as noted) of vacuum spark port. Shims furnished .002" thick (2-93), .005" thick (2-94) for throttle valve setting adjustment.

Car Model	Carburetor	Idle Port Opening	Vacuum Spark Port
Cadillac V8	506-S	.135-.141"	②.033-.037"
Graham 109	488-S	.162-.168"	②.038-.042"
Hudson 6	461-S, 501-S	.108-.112"	②.029-.033"
Hudson 8	455-S, 502-S	.133-.137"	None
Nash 8	511-S	.140-.146"	None
Oldsmobile 8	503-S, 480-S	.144-.150"	②.029-.033"
Packard 8	478-S, 512-S	.135-.141"	①.009-.013"
Pontiac 8	469-SM	.140-.146"	②.052-.056"
Studebaker 7C	409-S	③ .009-.015"	②.029-.033"

①—Bottom of port above top of valve. ②—Top of port above top of valve.
③—Opening below lower edge of valve.

FAST IDLE:—Consists of a fast idle lever linked to the throttle valve lever and mounted directly below the fast idle cam on the choke valve shaft. To adjust, hold choke valve tightly closed, adjust fast idle arm screw so that clearance between throttle valve and carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge inserted between throttle valve and wall to check opening).

Car Model	Carburetor	Throttle Opening	Checking Gauge
Cadillac V8	506-S	.023"	T109-149
Graham 109	488-S	.026"	T109-114
Hudson 6 & 8	461-S, 455-S	.018" (See Note)	T109-44
Hudson 6	501-S	.045"	
Hudson 8	502-S	.053"	
Nash 8	511-S	.015"	T109-44
Oldsmobile 8	503-S, 480-S	.015"	T109-44
Packard 8	478-S, 512-S	.030"	T109-29
Pontiac 8	469-SM	.010"	See Note
Studebaker 7C	409-S	.018"	T109-44

Note—Gauge No. T109-44 used for both .015" and .018" settings.

Hudson Note—On Carburetor Models 461-S, 455-S, fast idle can be adjusted as follows: With throttle stopscrew set for correct slow idle speed of 600 RPM., open throttle so that clearance between stopscrew and stop on carburetor casting is .030", hold in this position, close choke valve, turn fast idle adjusting screw in until it just contacts fast idle cam.

Oldsmobile Note—With correct fast idle setting, clearance between throttle valve stopscrew and stop on carburetor casting should be .030" (503-S), .025" (480-S) with choke valve closed and fast idle screw on high lobe of fast idle cam.

Pontiac Note—Fast idle can also be adjusted as follows: Back off throttle stopscrew so that throttle valves tightly closed, hold choke valve closed, back off fast idle adjusting screw so that it clears high lobe of fast idle cam, then turn screw in until it barely drags on cam, and finally turn screw in ⅝ additional turn to provide correct .010" throttle opening. With this fast idle setting, clearance between throttle lever stopscrew and stop on carburetor casting will be .032" with stopscrew set for correct hot or slow idle speed of 7-8 MPH.

CHOKE:—Carter Climatic Control (automatic choke) is standard. See article in Carburetion Equipment Section for complete servicing and adjusting directions.

Setting—Thermostatic coil housing reference mark should be centered on mark on piston housing (for all models except those shown in table below) or should be rotated counter-clockwise (Rich), clockwise (Lean), the correct number of notches from the center mark as follows:

Car Model	Carburetor	Choke Setting
Hudson 6 & 8	501-S, 502-S	①1 Notch Lean
Nash 8	511-S	②Centered
Oldsmobile 8	480-S only	2 Notches Rich
Packard 8	478-S only	1 Notch Rich
Pontiac 8	469-SM	2 Notches Rich
Studebaker 7C	409-S	1 Notch Rich
All Others		Centered

①—Supersedes Centered setting originally specified for these models.
②—Supersedes 1 Notch Rich setting originally specified for this model.

Unloader:—Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall is correct as shown in table below (use specified gauge to check this opening).

Car Model	Carburetor	Unloader Gauge No.	Clearance
Cadillac V8	506-S	T109-39	13/64"
Graham 109	488-S	T109-31	¼"
Hudson 6	461-S, 501-S	T109-31	¼"
Hudson 8	455-S, 502-S	T109-31	¼"
Oldsmobile 8	503-S	T109-31	¼"
Oldsmobile 8	480-S	T109-28	3/16"
Packard 8	478-S, 512-S	T109-28	3/16"
Pontiac 8	469-SM	T109-28	3/16"
Studebaker 7C	409-S	T109-28	3/16"

Choke Valve Lock:—With unloader properly adjusted, choke valve will be locked in wide open position with throttle valves wide open. Choke valve will be released when throttle valves closed.

TROUBLE SHOOTING:—Same as for other Carter models (see preceding article).

SERVICING (ALL TYPES):—Disassembly—Take out screws and remove dust cover (on models where dust cover is separate part), remove fast idle arm and screw assembly using care not to damage fast idle arm spring, remove air horn assembly (one screw located within air horn beneath choke valve—use care not to lose discharge ball check located in this screw hole). Disconnect throttle connector rod at both ends, remove bowl cover and metering rod assembly (on Vacumeter Types, vacuum piston and link is part of this assembly and will come out with bowl cover), remove pump plunger spring and vacuum piston spring (Vacumeter Types). Remove metering rod pin, remove metering rods and spring using care not to lose discs on metering rods (on some models discs located under retainer which must be removed before discs can be taken out). Remove anti-percolator units (use tool T109-66). Remove strainer from pump cylinder (strainer will drop out when carburetor is inverted), remove pump intake check ball retainer (use tool T109-56) and check ball. Remove pump jet plugs and pump jets (on some models, jets are pressed in place and should not be removed—merely clean jets while in place). Take out retainer plug and remove pump discharge check ball (in air horn attaching screw hole). Remove low speed jet bleeder plugs and low speed jets (use tool T109-60 to remove jets), remove metering rod jet assemblies (use special screwdriver tool T109-58). Remove body flange assembly (lower casting) and rubber gaskets under float bowl. Remove nozzle passage plugs and nozzle retainer plugs (use tool T109-58), remove nozzles (use tool T109-55 with T109-90 handle). Remove idle adjusting screws. Remove throttle shaft arm attaching screw, remove washer and throttle shaft arm with fast idle link and spring. Remove throttle valve screws, throttle valves, throttle centering screw, and throttle shaft and lever assembly. Remove float pin, take out float assembly, remove needle valve and seat assembly (use tool T109-61). Remove connector link from pump arm, loosen anti-percolator arm screw and pin spring, slide pump arm and shaft assembly out. Remove bowl cover strainer nut, gasket and strainer. Remove thermostatic coil and housing assembly, lift out screen, remove choke trip lever screw from shaft, lift off trip lever washer and fast idle cam. Remove choke valve screws, take out choke valve. Turn choke lever to free piston from cylinder, remove lever and piston assembly using care not to lose piston pin.

Servicing—Wash all parts in clean gasoline (except cork gaskets and thermostatic coil and housing assembly), blow out all passages with compressed air, scrape carbon from casting bores, examine jets and metering rods, replace all worn or damaged parts.

Reassembly—Use all new gaskets (see Parts List below), group all low speed circuit, high speed circuit, pump, choke, and float circuit parts to insure correct re-installation. Install parts in reverse order to disassembly directions given above and note following special instructions and cautions: When installing throttle valves, use new attaching screws, install valves with trademark 'C'

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

toward manifold and on idle port side of carburetor bore, install screws loosely, tap valves lightly to centralize them in the carburetor bore and then tighten attaching screws. To install nozzles, make certain that old gaskets have been removed from casting, install nozzles with flat side up and use new gaskets and retainer plugs. Center choke valve before tightening attaching screws and make certain that valve does not bind at any point (valve should fall open of own weight when correctly installed). Check and adjust metering rods, anti-percolator setting, pump stroke, float level, fast idle and choke setting, throttle valve setting as directed above. Adjust carburetor when re-installed on engine.

SERVICE PARTS:—Gasket Set & Repair Packages—Furnished for each model as follows:

Carburetor	Gasket Set	Repair Package
Cadillac V8 ..... 506-S	No. 144B	
Graham 109 ..... 488-S	No. 149	
Hudson 6 ..... 461-S	No. 142A	No. 1080
Hudson 6 ..... 501-S	No. 149	
Hudson 8 ..... 455-S	No. 142A	No. 1079

⑫—Closed Tip. Top hole #70 (45° angle), Lower hole #52 (60° angle).
⑬—Was 48-98S.
⑭—Altitude only. When installed, special Altitude Metering Jet must be installed in Rear Carburetor. These jets furnished in package with Altitude Metering Rod (for Front Carburetor) as follows: 75-516U (509-S & 510-S carburetors), 75-515U (490-S & 491-S carburetors).
⑮—Inner Nozzle .120", Outer Nozzle .125".
⑯—Closed Tip. Top hole #75 (45° angle), Lower hole #49 (70° angle).
⑰—Three Sizes Lean—Part No. 75-514.
⑱—Used on cars with Hydra-Matic Drive only.
⑲—For 12,000 foot altitude only—73-54. Part No. 75-495.
⑳—Supersedes No. 75-506 (71-44). ㉑—Supersedes No. 75-507 (72-48).
㉒—Closed Tip. Top hole #75 (45° angle), Lower hole #48 (70° angle).
㉓—Three Sizes Lean—78-50. Part No. 75-412.
㉔—Idle Well Jet #61 drill. Part No. 43-67.
㉕—No. 75-498 for Altitude only.
㉖—Supersedes No. 48-108S.
㉗—Three Sizes Lean—66-55. Part No. 75-416.
㉘—Three Sizes Lean—655-49. Part No. 75-420.
㉙—Nozzle retainer plug size #52 drill.
㉚—Supersedes No. 48-112S.
㉛—Closed Tip. Top hole #65 (45° angle), Lower hole #46 (60° angle).
㉜—Front Carburetor (Compound Carburetion).
㉝—Rear Carburetor (Compound Carburetion).
㊱—Closed Tip. Top hole .021" (45° angle), Lower hole .0945" (70° angle).

489-S—CHEVROLET TRUCKS, CAB-OVER-ENGINE MODELS YU, YV, YW ('41) CHEVROLET DUBL-DUTI, MODEL AJ (1941)

TYPE:—Plain tube, updraft type with throttle operated accelerating pump and vacuum operated 'step-up' or economizer. Similar to type used on previous Cab-over-Engine and Dubl-Duti truck models.

IDLE ADJUSTMENT:—Idle adjusting screw controls fuel discharge from upper (closed throttle) idle discharge port and should be turned in for leaner mixture, out for richer mixture. Approximate setting is ½-1½ turns of the screw out from inner seated position and should be adjusted only with engine warmed up and idling at hot or slow idle speed with choke valve wide open. Idle speed controlled by throttle lever stopscrew and should be set for 300-375 RPM idle speed. See car model 'T&E' page for complete tune up instructions.

PERFORMANCE:—Should be satisfactory if idling adjustment and accelerating pump setting correct. Main metering jet is fixed type and special Lean or Rich jets are furnished for special operating conditions. See Carter BB Jet Specification Table (below) for complete jet specifications.

ACCELERATING PUMP:—Low pressure, delayed action type. Operated by throttle lever. Pump piston is positioned on pump plunger stem by a spring which is compressed when throttle is closed and pump piston is drawn upward in cylinder, the cylinder then being filled by fuel from the bowl flowing through the pump intake check valve. When throttle is opened for acceleration, spring forces piston down on stem and fuel is discharged through outlet check valve into main nozzle fuel passage.

Adjustment—Two holes provided in throttle lever and pump link to provide seasonal adjustment. Inner hole (Summer setting) provides minimum stroke of 9/16", outer hole (Winter setting) maximum stroke of 1". See car model 'T&E' page for recommended seasonal adjustment.

VACUUM STEP-UP (ECONOMIZER):—Consists of a step-up valve assembly controlled by a vacuum piston. Vacuum piston is normally held at top of stroke by manifold vacuum so that valve is closed. At high speed or when engine operated with wide open throttle with reduced manifold vacuum, spring above piston forces piston and push rod down so that step-up valve is opened and additional fuel is allowed through the valve directly to the main nozzle. This fuel is metered by the power orifice or step-up jet screwed in the lower end of the step-up valve assembly and does not pass through the main metering jet.

Vacuum Step-up Spring—Part No. 61-60.

FLOAT LEVEL:—Top of float (not soldered seam) should be 1/32-1/16" below top edge of float bowl with needle valve seated. To check float level, remove bowl cover and gasket, measure with straightedge across top of bowl. To adjust float level, bend float lever lip slightly (do not bend float arm).

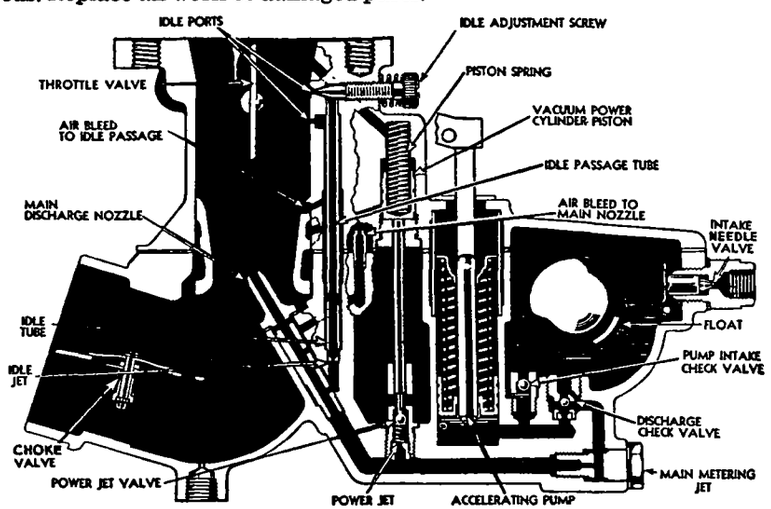
Needle Valve & Seat—Part No. 25-44S. Triangular type. Furnished as matched set only. Intake hole size #38.

CHOKE:—Choke valve is butterfly type with poppet type relief valve. Check choke linkage and see that choke valve is closed with choke button on instrument panel pulled out and fully open when button pushed in.

THROTTLE VALVE SETTING:—With stopscrew backed off so that valve tightly closed, top of lower idle discharge port should be .005-.009" below lower edge of valve and top of Vacuum Spark Port should be .000-.004" below valve.

NOTE—Throttle valve is notched at idle port opening.

TROUBLE SHOOTING:—**Engine stalls or Idle unsatisfactory**—Check idle adjusting screw and idle speed setting (above). If engine stalls, remove idle passage tube and idle tube and clean with compressed air. Remove idle adjusting screw and blow out idle ports and passage with air.



Acceleration Unsatisfactory—Check pump setting. Remove main metering jet, pump jet, and check valve assemblies and clean with compressed air. See that check valves are tight in carburetor casting. Examine pump spring.

Carburetor Loads up—Check float level and adjust as directed above.

Excessive Fuel Consumption or Poor Gasoline Mileage—See that vacuum piston operates freely and does not stick in cylinder. Examine vacuum piston spring (replace spring if weak or damaged). Make certain that correct flange gasket used at manifold, that vacuum port opens into gasket slot and that vacuum passage is clean. See that step-up valve is tight in carburetor casting and seats properly (disassemble and clean valve and power jet assembly). Check vacuum piston pushrod for free operation. Check jet calibration (see Jet Specification Table).

SERVICING:—**Disassembly**—Take out bowl cover screws and remove bowl cover and accelerating pump assembly. Compress pump spring, take out connector pin, disassemble and remove pump spring, retaining spring, and piston from pump rod and plate assembly. Take out vacuum piston plug, remove vacuum piston and spring. Remove idle adjusting screw and idle passage tube, pump sleeve, power jet pushrod, float lever pivot pin, float, and needle valve. Remove pump intake check valve, pump discharge check valve, and power jet from bowl. Remove main nozzle air bleed jet, idle jet, main nozzle, and main metering jet (on side of carburetor).

Servicing—Wash all parts in clean gasoline, blow out all passages in carburetor and all jets with compressed air. See that idle ports, air bleed passages, vacuum spark port, and throttle bore are free from carbon. See that vacuum piston cylinder is clean and that piston moves freely, clean vacuum passages thoroughly. (CAUTION:—Sticking of piston may cause power jet to be open at low speeds which will cause excessive fuel consumption and poor economy). Disassemble power jet valve and clean valve and power jet thoroughly. Clean and inspect pump check valves, idle jet, main nozzle, metering jet and air bleeds. Replace all worn or damaged parts.

Reassembly—Use all new gaskets (see Parts List below). Soak needle seat gasket in denatured alcohol for 15 minutes, install on needle seat and allow to dry in place before needle and seat assembly is installed. Assemble carburetor in reverse order to disassembly directions above and note following special instructions and cautions: If throttle valve removed, make certain that notch on edge of valve is placed on vacuum port side and set throttle valve as directed above. Install accelerating pump sleeve with holes in end of sleeve downward. When installing carburetor upper body, see that accelerating pump enters pump cylinder properly and that vacuum piston pushrod is in place. Check float level and adjust carburetor when re-installed on engine.

CAUTION—When installing carburetor, make certain that correct flange gasket is used and that slot in gasket uncovers vacuum spark port on carburetor flange. If this port covered, vacuum economizer will not operate correctly and gasoline consumption will be excessive.

SERVICE PARTS:—**Gasket Set**—No. 153. **Repair Package**—No. 1090.

D6C2—MODELS P11, P12—WITH AUTOMATIC CHOKE

B6P1—MODELS P11, P12—ECONOMY MODELS

PRODUCTION CHANGE NOTE:—Chrysler, De Soto (Wth Std. Transmission)—Carburetors listed above have different specifications and jet calibrations. See tune up data below and Carter (B&B) Jet Specification Table (following).

Chrysler, De Soto (Fluid Drive & Vacamatic or Simplimatic Transmission)—These models have Kick-down Switch for Transmission control (same on all models) and special Dashpot or Slow-closing Throttle (two types used). Dashpot design changed in production and different designs used as follows:

Models E6T1, E6U1, E6V1, EA1, EB1—Dashpot on these models is adjustable with an adjustment screw on the carburetor directly above the dashpot plunger

Models E6T2, E6U2—Dashpot is not adjustable (no adjustment screw) and has solenoid control so that it operates when throttle is closed at car speeds below 8 MPH. (First & Second Gear), 15 MPH. (Third & Fourth Gear) only.

SPECIAL SERVICE NOTES:—Whenever the body gasket (between the main body casting and air horn and bowl cover casting) is removed for carburetor servicing, use new gasket when reassembling. This is important to prevent air leaks at this point which will affect carburetor economy (carburetors are 'balanced' type with bowl vented through air horn. NOTE—This body gasket is Part No. 121-69 (E6N3, E6S2, E6S3, E6W1, D6A2, D6C2, B6P1, 513-S), No. 121-88 (E6T1, E6U1, E6V1), No. 121-90 (E6T2, E6U2, EA1, EB1).

Vacuum Step-up Spring for High Altitudes (1940 & Previous Models)—For operation at altitudes greater than 5000 feet, vacuum step-up spring should be changed to Part No. 61-134 at same time leaner metering jets are installed. This spring used as standard equipment on 1941 models and no change is required

TYPE:—Same design as previous Carter (B&B) models except for addition of Kick-down Switch and Slow-closing Throttle Dashpot (models used on cars with Fluid Drive and Vacamatic or Simplimatic Transmission only). ***Refer to 1941 Carburetion Equipment Index (for article on Chrysler Slow-closing Throttle) and 1941 Mechanical Equipment Index (for article on Chrysler Vacamatic & Simplimatic Underdrive Transmission for data on Kick-down Switch).***

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge through lower idle port and should be turned in for leaner mixture, out for richer mixture. Approximate idle screw settings given in table below. Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew. See car model 'T&E' page for complete carburetor tune up instructions.

Car Model	Carburetor	Idle Setting	Idle Speed
Chrysler C28①	E6S2, S3, W1; EA1	½-1½ turns open	6 MPH.
Chrysler C28②	E6T1, T2, U1, U2	½-1½ turns open	4 MPH.③
De Soto S8①	E6N3, S2, S3; EB1	½-1½ turns open	6 MPH.
De Soto S8②	E6V1, U1, U2	½-1½ turns open	4 MPH.③
Nash 4140	513-S	½-1¼ turns open	6 MPH.
Plymouth P11, P12	D6A2, C2	½-1¼ turns open	6 MPH.
Plymouth Economy	B6P1	½-1½ turns open	6 MPH.

①—Cars with Standard Transmission. ③—Or 450 RPM. maximum.
②—Cars with Fluid Drive & Vacamatic or Simplimatic Transmission.

ACCELERATING PUMP:—Delayed action type (spring operated pump plunger). Same design as used on previous Carter (B&B) models.

Seasonal Adjustment—Three holes provided in throttle lever for connector link engagement. Inner hole provides minimum stroke, center hole medium stroke, outer hole maximum stroke. See car 'T&E' page for recommended settings.

Pump Stroke Adjustment—To check, remove air horn and float bowl cover assembly, back off throttle stopscrew so that throttle valve closes tightly, connect pump connector link in correct hole of throttle lever (see table below), install Universal Pump Stroke Gauge T109-117S on bowl so that indicator lip on gauge rests on top of pump plunger shaft. Note gauge reading, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below. To adjust, bend horizontal portion of pump connector link.

Pump Gauge Change Note—All T109-117S pump gauges after Sept. 15, 1940 have new indicator arm with gauging lips on both ends. This new indicator arm, Part No. T109-153, can be installed on previous gauges to bring them up to date.

Car Model	Carburetor	Pump Stroke	Pump Setting
Chrysler C28	E6S2, S3, W1	26/64"	Medium Stroke
Chrysler C28	EA1	26/64"	Medium Stroke
Chrysler C28	E6T1, T2, U1, U2	26/64"	Medium Stroke
De Soto S8	E6N3, S2, S3	26/64"	Medium Stroke
De Soto S8	E6U1, U2, V1	26/64"	Medium Stroke
De Soto S8	EB1	26/64"	Medium Stroke
Nash 4140	513-S	30/64"	Maximum Stroke
Plymouth P11, P12	D6A2, C2	24/64"	Medium Stroke
Plymouth Economy	B6P1	19/64"	Medium Stroke

VACUUM STEP-UP (ECONOMIZER):—No adjustment required but setting should be checked when carburetor reassembled after servicing to insure step-up valve closing. To check, push vacuum piston down in cylinder to end of stroke, check clearance between piston plate and head of step-up valve needle stem. Clearance should be 1/64-1/32". To adjust, bend piston plate slightly.

Vacuum Step-Up Spring—When servicing carburetor, make certain that correct Step-up Spring installed as follows: No. 61-135 (E6N3, E6S2, E6S3, E6W1, D6A2, D6C2, 513-S), No. 61-134 (E6T1, T2; E6U1, U2; E6V1, B6P1, EA1, EB1).

FLOAT LEVEL:—To check float level, remove air horn (integral with float bowl cover), use special gauge No. 1522-B, placing gauge on top edge of bowl with lugs extending down toward float on either side of soldered seam. Press lip of float lever against needle valve, float should contact both lugs on gauge. Adjust by bending float lever lip slightly at point where it contacts valve needle (do not bend float arm). If gauge not used, top of float (not soldered seam) should be 5/64" (all models except EA1, EB1), 1/16" (EA1, EB1) plus or minus 1/64".

Float Needle Valve & Seat—Triangular type. Furnished only in matched sets as follows: No. 25-82S—#44 Intake Hole (E6N3, E6S2, E6S3, E6U1, E6U2, E6V1, EB1, D6A2, D6C2, 513-S), No. 25-102S—#44 Intake Hole (E6T1, E6T2, E6W1, EA1), No. 25-77S—#48 Intake Hole (B6P1 only).

THROTTLE VALVE SETTING:—When installing valves, insert attaching screws loosely, back throttle stopscrew off, tap valves lightly to centralize in bore, then fasten screws securely.

Setting—With throttle stopscrew backed off so that valve tightly closed, distance from top edge of valve to top of upper idle port should agree with 'Idle Port' figure in table below, and distance from top of valve to top of vacuum spark port should agree with 'Vacuum Spark Port' figure (except as noted).

Car Model	Carburetor	Idle Port Height	Vacuum Spark Port
Chrysler C28	E6S2, S3, W1	.088-.092"	.035-.041"
Chrysler C28	EA1	.088-.092"	.035-.041"
Chrysler C28	E6T1, T2, U1, U2	.088-.092"	.035-.041"
De Soto S8	E6N3, S2, S3	.088-.092"	.035-.041"
De Soto S8	EB1	.088-.092"	.035-.041"
De Soto S8	E6U1, U2, V1	.088-.092"	.035-.041"
Nash 4140	513-S	.118-.122"	.022-.028"①
Plymouth P11, P12	D6A2, C2	.118-.122"	.003-.009"①
Plymouth Economy	B6P1	.130-.134"	.035-.041"

①—Bottom of port above top edge of valve (top of port on other models).

CHOKE:—Offset type with poppet relief valve. Choke control on Plymouth models (without Automatic Choke) is semi-automatic (spring-loaded). Sisson Automatic choke Std. on Chrysler & De Soto, optional on Plymouth.

Fast Idle—Consists of a throttle shaft dog (throttle lever stop) pivoted below throttle shaft and linked to choke valve lever so that throttle opened to fast idle position when choke valve closed for starting. No adjustments required. NOTE—This Fast Idle not used on Plymouth B6P1 Economy Carburetor.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SERVICING:—Kick-down Switch & Slow-closing Throttle Note—On carburetors fitted with these units (E6T1, E6T2, E6U1, E6U2, E6V1, EA1, EB1), kick-down switch and slow-closing throttle are disassembled as part of regular carburetor disassembly as directed below. Disregard data pertaining to these units on all other models on which they are not used. CAUTION—If kick-down switch spring (located within piston) is replaced, make certain that any washers located within piston are not disturbed. If piston and spring are replaced, washers should be discarded (do not use washers with new piston and spring). ***Refer to 1941 Carburetion Equipment Index for article on Chrysler Slow-closing Throttle for complete data.***

Disassembly:—Take out throttle lever screw, remove throttle lever. Disconnect fast idle connector rod, take out attaching screws and remove air horn and float bowl cover assembly, remove float and lever assembly, float pin and retainer, remove body gasket. Remove idle orifice tube and plug assembly, step-up piston plate and rod assembly, step-up piston spring and gasket at bottom of cylinder, remove dashpot plunger and link and dashpot solenoid (on models so equipped). Remove pump connector link, remove pump plunger and rod assembly, pump spring, and pump link. Remove step-up jet and gasket assembly. Remove pump check plug and discharge check ball. Remove main metering jet and gasket assembly. Remove pump retainer ring and intake check ball. Take out attaching screws and remove body flange assembly and insulator. Remove pump jet rivet plug and pump jet. Remove main vent tube rivet plug, remove main vent tube (use tool T109-70). Remove float intake needle seat and gasket. Remove idle adjusting screw and spring, and idle port rivet plug. Remove throttle valve, throttle shaft and arm assembly, choke tube bracket assembly, choke valve, choke valve shaft and lever assembly. On models with kick-down switch, take out screws in endplate, withdraw plunger and springs and terminal block, remove switch contact piston and spring (CAUTION—Use care not to lose washers within piston and make certain that these washers replaced when switch reassembled unless new piston and spring installed when washers should be discarded).

Servicing:—Wash all parts except cork gaskets in clean gasoline. Blow out all jets and channels with compressed air (do not use wire drills to clean jets—dissolve gum deposits with denatured alcohol). Examine all parts for damage and wear, replace worn parts, use all new gaskets when reassembling carburetor.

Assembly:—Install all parts in reverse order from disassembly directions given above. Group all parts of intake system (float, intake valve, etc.), low speed system, high speed system, accelerating pump, kick-down switch, slow-closing throttle, choke system, to facilitate assembly and insure all parts being replaced in correct order. Adjust idle setting, float level, accelerating pump stroke and seasonal adjustment, slow-closing throttle adjustment (first type only), as directed above and note following special instructions for reassembly:

Balance Tube—When servicing carburetor make certain that balance tube in air horn is open and clean. Always use new gasket between body casting and air horn to insure air tight joint at bowl cover. Any air leak at bowl cover will upset 'balance' feature and affect fuel economy.

Vacuum Step-up Passage—Passage opens on carburetor mounting flange and special gasket (with slots which register with this vacuum passage hole) must be used when installing carburetor on manifold. Shutting off of this vacuum passage hole will cause excessive fuel consumption.

Clogged Main Vent Tube—Will cause excessive richness at speeds above 50 MPH. To replace tube, use tool T109-42 to remove rivet plug beneath float bowl, then remove old vent tube with Tool 109-70, use this tool to install new vent tube on all models except B6P1 (use tool T109-151 to install longer tube used on this B6P1 model only), make certain that tube seats tightly and install new rivet plug. CAUTION—Always use new Main Vent Tube and rivet plug when these parts are removed.

Throttle Valve—Valves should be installed with trademark 'C' facing down and toward idle port. Install valve screws loosely, close valve completely and tap lightly to centralize valve in bore, then tighten screws securely. Check throttle valve position as directed above.

Choke Valve—Centralize choke valve in same manner as throttle valve (above) before tightening attaching screws.

Kick-down Switch—Make certain that any washers found in switch piston are re-installed in piston unless new piston and spring being installed, in which case, washers should be discarded.

Slow-closing Throttle (First Type)—Adjusted as directed in special Chrysler Slow-closing Throttle article in Carburetion Equipment Section (refer to Carburetion Equipment Index for this data).

Slow-closing Throttle (Second Type)—Connect one solenoid terminal to kick-down switch terminal, connect other solenoid terminal to 'SF' terminal on transmission control relay. See special article on Chrysler Slow-closing Throttle in Carburetion Equipment Section and article on Chrysler Vacamatic & Simplimatic Underdrive Transmission in Mechanical Equipment Section for complete data on slow-closing throttle and kick-down switch.

TROUBLE SHOOTING:—Engine stalls while idling—Check idle setting (above). Check slow-closing throttle adjustment (first type only) as directed in article on Chrysler Slow-closing Throttle in Carburetion Equipment Section. Remove Idle Orifice Tube and Plug Assembly and clean tube and passages with compressed air. Remove idle adjusting screw and blow out idle ports with air.

Carburetor Loads Up—Check and adjust float level (see specifications above).

Acceleration Unsatisfactory—Remove pump jet and clean with compressed air, or replace pump jet. Examine pump for worn or damaged plunger leather, clogged or leaking intake or discharge check balls, sediment in pump cylinder. CAUTION—Use care not to damage plunger leather when installing plunger in cylinder.

Poor Gasoline Mileage (Economy complaints)—Check float level. See that main metering jet is correct type and not worn (special lean metering jets available for special service such as high altitudes or high test fuel). See that step-up jet tight on seat and not leaking, make certain that step-up valve rod and piston clean and not binding or sticking, check step-up piston spring (replace spring if weak or damaged). Check for clogged main vent tube (will cause excessive richness and poor gasoline mileage at speeds above 50 MPH.). See Main Vent Tube servicing data above.

AA1-Ford No. 91A-9510-A
FORD, ALL '85' PASSENGER CAR MODELS (1941)
FORD, ALL '85' AND '95' TRUCK MODELS (1941)
MERCURY, MODEL 19A (1941)

AA1-Ford No. 06H-9510
LINCOLN, ZEPHYR & CONTINENTAL MODEL 16H (1941)
LINCOLN, CUSTOM MODEL 168H (1941)

TYPE:—Dual or double barrel, plain tube, downdraft type. Carburetors are same design as used on corresponding 1940 car models.

IDLE ADJUSTMENT:—Idle adjusting screw for each carburetor barrel controls fuel discharge through lower (closed throttle idling) port. Screws should be turned in for leaner mixture, out for richer mixture. Setting should be approximately ⅝-⅞ turns open from inner seated position. Manufacturer recommends that vacuum gauge be used for this adjustment and each idle screw adjusted in turn to secure highest steady reading of gauge. Idle speed controlled by throttle lever stopscrew and should be set for 5-7 MPH speed. See car model 'T&E' page for complete adjustment directions on car.

METERING JETS:—Main metering jets are non-adjustable type located in float bowl and acessible by removing plug on side of float bowl opposite each jet. Jets should be changed only to compensate for special operating conditions such as high altitudes. See Chandler-Groves Jet Specification table.

ECONOMIZER:—Consists of a spring-loaded, vacuum diaphragm controlled, by-pass valve assembly screwed in lower face of main body casting so that valve extends into float bowl (diaphragm assembly fits in recess in throttle valve body casting and vacuum passage in casting connects diaphragm chamber with carburetor barrel below throttle valve). Vacuum economizer set at factory to open when vacuum decreases to 8½-9" of HG. (corresponding to engine speed of 3800 RPM). No adjustment provided.

ACCELERATING PUMP:—Pump cylinder and piston located in float bowl, operated by inverted 'L' shaped pump rod linked to throttle lever. Fuel is drawn into pump cylinder through inlet ball check valve at lower end when throttle is closed and is discharged through outlet check valve and pump discharge nozzle when throttle opened for acceleration (nozzle is located at upper edge of venturis and has two discharge holes so that fuel is discharged equally into each carburetor barrel). Pump piston connection to pump rod is through a driving spring on the piston stem which prevents loading up engine when throttle opened suddenly and also prolongs pump discharge (spring compressed at beginning of piston travel, expands at end of travel).

Capacity—As shown in table below in cc. per 10 strokes. Throttle lever stopscrew must be backed off to allow throttle to close completely and pump link must be connected in center hole.

Car Model	Carburetor	Pump Capacity
Ford '85', Mercury	91A-9510-A	9-13 cc.
Lincoln	06H-9510	14-18 cc.

Adjustment—Three holes provided in throttle lever for pump link connection (these holes numbered 1-2-3 from throttle valve shaft outward). Inner (#1) hole provides minimum stroke, Center (#2) hole medium stroke, Outer (#3) hole maximum stroke. Recommended setting is #1 hole (Summer), #2 hole (Winter), #3 hole (Extreme Cold Weather). See car model 'T&E' page.

NOTE—Pump link is locked in lower end of pump rod by a spring-loaded snap lock. To disengage lock, pull link shaft out of pump rod.

FLOAT LEVEL:—Fuel Level—Fuel level in bowl should be 11/16" ± 1/32" (Ford and Mercury), 19/32" ± 1/32" (Lincoln Models) below the top edge of the bowl (gasket seat) with 3 lbs. pressure (engine idling). NOTE—If glass tube or other sight level indicator used to check level, use extreme care to eliminate errors caused by capillary action of fuel in sight tube.

Float Level—With bowl cover and float assembly removed, remove gasket, invert cover so that float weight holds needle valve closed, check float with 9550-A 'Go' and 'No Go' gauge. On Ford and Mercury models, place gauge on bowl cover with gauging arm over float (check both ends of each float). On Ford and Mercury models, the 'Go' (1.353") end of gauge should clear the float. The 'No Go' (1.322") end of the gauge should rest on the float while the base of the gauge at the 'no go' end should clear the air horn. Lincoln models are checked in the same manner except that 1/16" feeler must be used between float and gauging arm on gauge.

Adjustment—Use 9550-C bending tool to bend float arm. Use extreme care to keep float level (check both ends of float). Make certain that float has sufficient travel to allow it to drop to bottom of float chamber (travel controlled by stop on float arm).

Float Needle Valve & Seat—Furnished in matched sets only as follows: Ford Part No. 78-9564 (All Models).

CHOKE:—Offset type with poppet type relief valve to prevent over-choking.

THROTTLE-KICKER (STARTING):—Consists of a spring loaded lever pivoted on side of carburetor casting so as to contact cam on choke lever at upper end and throttle lever at lower end (through throttle stopscrew which is mounted on this starting lever). Lever is rotated by choke lever cam when choke valve closed for starting and opens throttle to starting position. No adjustment

SERVICING:—Disassembly—Take out choke lever screw, remove choke lever, pawl, and spring. Take out throttle kicker screw, remove throttle kicker and spring. Take out five air horn screws, remove air horn assembly, use care not to bend float. Remove accelerator pump link (pry upper end of link out), remove pump plunger and rod assembly. Remove drain plugs and gaskets, remove main metering jets (use tool 9510-A, remove front nozzle bar screws and clamp, remove idle tubes and brass air bleeds from nozzle bar, then remove rear nozzle bar screws and clamp, remove nozzle bars, pump discharge nozzle and gasket, and nozzle bar gasket. Remove check valve retainer from bottom of pump cylinder (use small rod with hooked end), invert main body casting and catch pump discharge brass needle and check ball which will drop out. Remove throttle body attaching screws and lockwashers, lift throttle body off. Use wrench 9904-A to remove economizer valve assembly and gasket. Remove throttle valve loose lever collar, loose lever and spring, idle adjusting screws and springs. Take out float hinge pin and remove float assembly from air horn, remove fuel inlet needle valve and seat assembly and gasket (use wrench 9510-A).

Servicing—Clean all carburetor parts and make certain that all corrosion removed from float bowl. Examine all parts for wear as directed below and replace all worn or damaged parts (renew all following parts when carburetor overhauled: Accelerator pump rod felt and brass rod retainer, pump check valve retainer, accelerator pump piston, economizer (power) valve assembly), and all gaskets.

Float Inlet Valve & Seat—Keep needle valve and seat together as a set, rinse in cleaning solution and wipe off with clean cloth; if re-installed in carburetor, polish float lever end of needle valve with #320 'wet or dry' paper.

Choke Valve—Check valve tightness by holding air horn assembly against light and noting light around edge of valve. Check poppet relief valve and replace choke valve assembly if relief valve spring weak or broken. Check choke lever boss on air horn for wear using new choke lever, replace air horn if boss worn. Check choke lever for wear at ball end and in 'V' opening which engages choke shaft lever. Clean out choke lever pawl hole (use reamer 9537-A).

Float Assembly—See that float lever firmly soldered to float, examine float for leaks (immerse float in water heated just below boiling point, bubbles indicate that float leaks). Polish needle valve contact point on float arm with #320 'wet or dry' paper. Check float level and travel (use 9550-A gauge) as directed under Float Level (above) when float re-installed.

Throttle Valve Assembly—Check valves for tightness in same manner as choke valve (above). Replace complete assembly if valves worn, shaft worn or loose, throttle valve lever loose on shaft, or if pump link hole in throttle lever worn. If throttle valves replaced, stake attaching screws securely (use 9518-C anvil and 9518-D punch). Check throttle valve position using gauge 9518-A (which gauges distance from valve to idle ports with valve closed), replace throttle body and valve assembly if distances not within gauging limits.

Accelerating Pump—Remove brass retainer and pump rod felt from main body before cleaning casting in cleaning solution (solution will damage felt). If main body has shoulder around accelerating pump rod hole, remove this shoulder with a file (shoulder limits pump stroke) and if no vent provided between float bowl and pump head clearance chamber (larger section at top of pump cylinder), provide a vent by cutting a slot with a hacksaw or small file. Use driver 9513-C to install felt and brass retainer in pump rod hole. Seat check ball in bottom of pump cylinder by tapping lightly with a brass drift rod, then use ⅝" wood or fibre dowel to press retainer down in place. When installing brass pump discharge needle, tap needle lightly with brass drift to insure that it seats properly. When installing pump plunger and rod assembly, make certain that correct link is used (Ford and Mercury link marked 'C', Lincoln link marked '6'—do not use unmarked link). Check pump action when completely assembled, a good stream should be apparent at each pump jet when throttle opened several times (fill bowl with fuel to make this test).

Economizer Power Jet Assembly—When installing valve assembly, use new gasket and tighten securely to 15 lb. ft. torque.

Carburetor Body Castings—Clean castings thoroughly in cleaning solution, clean ports and channels with correct drill in hand chuck 9518-E as follows: Lower Idle Port (nearest throttle valve)—9518-H (.037") drill, Upper Idle Port—9518-E (.0395") drill, Idle Adjustment Screw Holes—9518-F (.046") drill, Idle Adjustment Screw Threads—9541-A Tap (use care not to remove any metal or enlarge holes), Idle Adjusting Needle Seat—9541-C refacer and 9541-D guide bushing, Accelerating Pump Rod Hole—9513-B reamer, also clean out felt retainer groove.

Marvel-Schebler Model TSX—Ford No. 9N-9510-A.
FORD TRUCK, ALL MODELS WITH 4 CYLINDER ENGINE (1941)

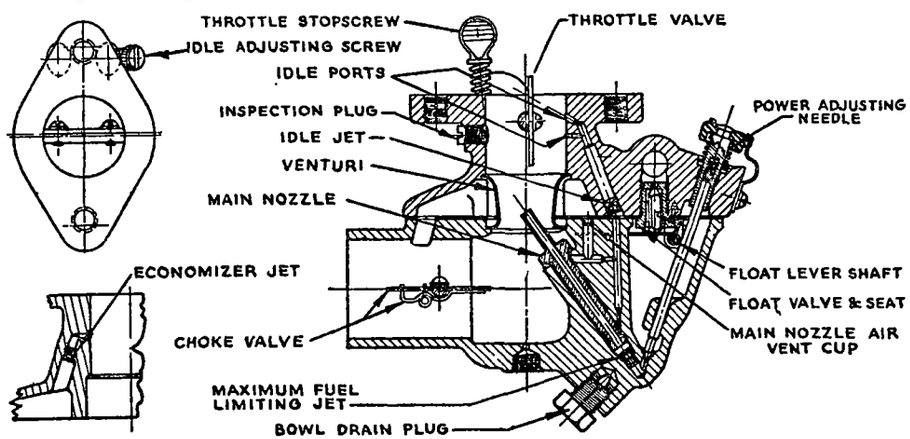
TYPE:—Plain tube updraft type with low speed (idle) and high speed (power) adjustments. Float bowl is concentric type with double 'saddle' type float and is vented through air horn. Fuel for idling is taken from main nozzle well up through passage in carburetor body and air horn castings to idle discharge ports at the throttle edge and is metered by Idle jet installed in lower end of passage in air horn and bowl cover casting. Idle adjusting screw controls air bleed in idle passage. Fuel for main nozzle is metered by power adjusting needle which controls fuel flow from bowl to main nozzle well and a Maximum Fuel Limiting Jet is located at the bottom of the main nozzle well for additional control. There is also an Economizer Jet located in a channel in the carburetor casting. Main nozzle is air bled through passage opening into top of float bowl chamber in bowl cover casting behind venturi. This passage has an Air Vent Cup pressed in the upper end at the bowl cover casting gasket opening.
CAUTION—If Air Vent Cup removed, new cup must be installed and reamed after assembly to specified size of .035" as directed in Servicing section below.

ADJUSTMENT:—Adjust carburetor only after engine warmed up and with choke valve wide open. Then adjust low speed (idling) and high speed (power) adjustments as follows:

Low Speed Idling Adjustment—Set throttle stopscrew for correct 5-7 MPH. idle speed. Turn idle adjusting screw in until engine begins to roll (mixture too rich), then turn screw out slowly until engine idles smoothly. Recheck idle speed. NOTE—This method of adjustment will give a setting which is slightly on the rich side which is preferable to a too lean setting.

High Speed Power Adjustment—Open throttle approximately ⅓. Turn power adjusting needle (on bowl cover beside fuel inlet connection) in or clockwise slowly until engine begins to lose power and speed drops off, then turn needle out or counter-clockwise until speed picks up and engine runs smoothly. Check performance and if engine tends to backfire or falter in picking up load, turn power adjusting needle out or counter-clockwise one notch at a time until acceleration is satisfactory. NOTE—This setting will give most economical performance and Economizer Jet will provide proper fuel mixture for full throttle operation. Power adjusting needle should be approximately 1 turn out from inner seated position.

FLOAT LEVEL:—Float is double type and both floats should be set exactly alike. To check float level, remove bowl cover and float assembly, invert cover, measure from gasket surface on cover to nearest edge of floats. Distance should be 9/32". To adjust float level, use bending tool M-8 and bend float lever at narrow section midway between valve and floats. Adjust both floats exactly alike.



Needle Valve & Seat—Furnished as matched sets only. Ford No. 9N-9564.

CHOKE:—Choke valve is butterfly type with spring-loaded flapper type relief valve. Check choke linkage and adjust so that choke valve fully closed when choke control button pulled out, and wide open when control button pushed in.

SERVICING:—Disassembly—Back out and remove power adjusting needle, spring, and gasket (CAUTION—Power adjusting needle must be removed before any attempt made to remove bowl cover and air horn casting). Remove four bowl cover attaching screws, remove bowl cover and air horn assembly. Take out float lever shaft, remove float and lever assembly, float valve, float valve seat and gasket, bowl cover gasket, venturi, Economizer Jet (use long, slender screwdriver), Idle Jet, idle adjusting screw and spring, fuel intake elbow and strainer screen, throttle valve screws and lockwashers, and throttle valve. Examine throttle valve shaft for wear (use new shaft when reassembling if wear evident), remove throttle shaft and lever, and packing at lever end of shaft. Remove idle port inspection plug. Remove main nozzle and nozzle gasket (use tool M-78), remove Maximum Fuel Limiting Jet from bottom of nozzle well. If necessary to remove Air Vent Cup from top of main nozzle air bleed passage, insert sharp pointed tool in cup and pry cup out (CAUTION—New cup must be installed when carburetor reassembled and then reamed to specified size—see Reassembly data below). Remove float bowl drain plug, remove dust strainer at bottom of carburetor (if strainer cannot be cleaned without removal). Remove choke valve screws, choke valve, shaft and lever assembly, and shaft packing.

Servicing—Clean out all passages and channels in carburetor castings, blow out jets with air, examine all parts for wear. NOTE—When overhauling carburetor after normal service, following parts only should require replacement: Throttle shaft and lever assembly, Float valve and seat (furnished as matched set), float lever shaft, power adjusting needle, felt packing on throttle valve and choke shafts.

Reassembly—Use new gaskets, install all parts in reverse order to disassembly directions above. Note following special directions and cautions: When installing choke valve and throttle valve, hold valves in closed position (throttle valve stopscrew must be backed off to allow valve to close completely) while tightening attaching screws, then check valves to make certain that they operate freely

without binding. When installing idle adjusting screw and power adjusting needle use care not to tighten these screws excessively which will groove needle point and prevent satisfactory adjustment (turn screws in until lightly seated, then back idle adjusting screw off 2 turns, power adjusting needle 1 turn which is approximate setting and will allow engine to be warmed up so that accurate adjustment can be made). Adjust float level.

Air Vent Cap Servicing Note—If cap removed, press new cap in place in main body casting, then ream hole in cap to finished size of .035".

Number **MODEL AAV-2**

380041—CHRYSLER 8, MODEL C30 SARATOGA & NEW YORKER (1941)
CHRYSLER 8, MODEL C33 CROWN IMPERIAL (1941)

NOTE:—Code No. Identification Marking—Carburetors may be identified by Code Number 4-103 stamped on bowl cover above fuel level inspection plug.

Throttle Guard on Cars with Fluid Drive—Used on cars with Fluid Drive to prevent engine stalling. See Chrysler Throttle Guard article in Carburetion Equipment Section for complete adjustment instructions.

TYPE:—Aircraft type, duplex, downdraft carburetor. Similar to AAV-2 type used on preceding Chrysler Eight models.

IDLING ADJUSTMENT:—Idle adjusting screw for each barrel controls fuel discharge from lower idling port. Screws should be turned in for leaner mixture and out for richer mixture and must be set alike. Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH idling speed with engine warmed up (choke valve wide open and fast idle inoperative). See tune up instructions on car model 'T&E' page for complete adjustment data.

METERING JETS:—Main metering jets are non-adjustable fixed type. Jets should be changed only for special operating conditions such as high altitude. See Jet Specification Table for standard jet calibrations for all models.
NOTE—Whenever main discharge jet located directly above main metering jet is removed, new lead gasket must be used in carburetor body to insure a good seal when jet is replaced. Use tool T-19099 to remove plug, tool T-24924 to remove and install main metering jet, tool T-24967 to remove and install main discharge jet.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.
NOTE—Use special tool T-24733 to remove vacuum power piston No. P-22803.

Setting—Vacuum piston opens valve with manifold vacuum of 5-7" of HG. corresponding to car speed of 70-75 MPH.

ACCELERATING PUMP:—Capacity—With pump set for maximum stroke, capacity per 10 strokes is 21-25 cc. (Fast), 27-31 cc. (Slow). Use T-24972 Pump Capacity Burrette Gauge to check pump capacity.

Adjustment—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) maximum stroke. See car model 'T&E' page for recommended settings.

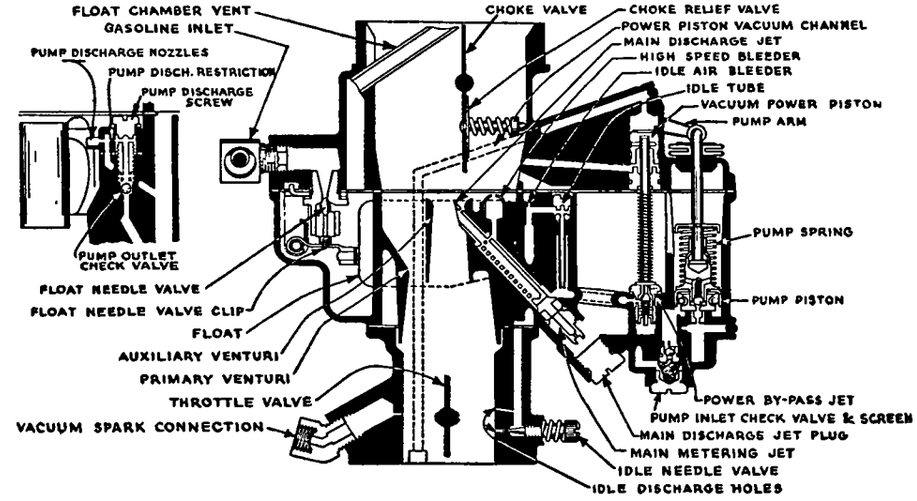
FAST IDLE:—Consists of a stepped rotary cam linked to the choke valve lever and serving as a stop for the throttle lever stopscrew. Cam is rotated to fast idle position when choke valve closed for cold starting so that throttle valve held open slightly.

Adjustment—To check setting, hold stopscrew against first step of fast idle cam and check choke valve opening with ⅛" drill rod inserted between edge of choke valve and air horn wall. If opening not correct, adjust rod length (turn ball joint end on rod). Open throttle wide and again check choke valve opening with 7/32" rod. If opening not correct, bend extended arm of fast idle cam slightly.

FLOAT LEVEL:—Fuel Level—Should be ⅝" below top surface of float bowl with 4 lbs. pressure (engine idling) or approximately even with the bottom of the inspection hole on side of float bowl (take out plug to check level).

Float Height—Use special service tool, T-24971 when setting floats. Remove air horn and float cover assembly, invert, mount tool on cover gasket. Tool guides will also check float travel (floats must be free and not rub on bowl). Adjust floats by bending float lever. Use extreme care to adjust both floats alike.

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets.



Float Bowl Vent—Bowl is vented to air horn by vent tube pressed in side of air horn above choke valve.

THROTTLE VALVE SETTING:—When installing throttle valves, they must be set so that distance from upper lip of valve to lower edge of upper idle port is .040" (plus or minus .004") and distance from upper lip of valve to lower edge of vacuum spark port (use #56 drill inserted in port) is .015" (plus or minus .004") with throttle valve tightly closed.

Throttle Valves—Part No. P-22752, 5° type.

CHOKE VALVE:—Offset type. Sisson Automatic Choke is standard equipment. See Sisson Automatic Choke article in Carburetion Equipment Section.

SERVICING:—Disassembly—Disconnect pump connector and fast idle connector rods, take out retaining screws and lift off bowl cover and air horn assembly. Take out float hinge pin, remove float and needle valve assembly, remove fuel inlet elbow. Remove idle tubes from main body casting, take out pump discharge nozzle attaching screw, remove nozzles, remove pump discharge ball check valve from screw hole (ball will drop out when carburetor inverted, use extreme care not to lose this ball and make certain that it is re-installed when carburetor reassembled). Remove main discharge jet plugs (use special screwdriver T-19099), take out metering jets (use special tool T-24924). If main discharge jets are removed, use special tool T-24967 and see that all traces of old

lead gasket removed from jets and seat in carburetor (use new gasket when jets re-installed). Take out four retaining screws and remove throttle body. Remove pump inlet valve plug, strainer screen and inlet valve. Remove economizer by-pass valve. Remove vacuum piston assembly (use special wrench T-24733).

Servicing—Examine economizer vacuum piston and remove any carbon or gum with crocus cloth (do not use emery or clean piston with gasoline or other cleaning fluid). Check by-pass valve and pump check valves for tightness by using special T-24970 tester (screw valve in proper opening of tester, immerse valve in gasoline and blow through tester—any leakage of valve will be indicated by bubbles). Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (CAUTION—do not attempt to clean jets with wire or drill rod). Blow out all channels and passages in carburetor with air, remove any carbon deposits in ports and throttle body. Replace worn and damaged parts.

Reassembly—Use all new gaskets (See Service Parts list below). Reassemble carburetor by reversing disassembly directions given above. Use new lead gasket when installing main discharge jets and make certain that all traces of old gasket removed from jets and seat in carburetor casting. Check and adjust float level, accelerating pump setting, throttle valve setting, fast idle, and idle setting when carburetor reassembled.

SERVICE PARTS:—Gasket Set—Part No. 382395.

Number **MODEL AAV-26**

380015—CADILLAC V8, SERIES 41-60S, 61, 62, 63, 67, 75 (1941)
380037—PACKARD SUPER EIGHT, MODELS 1903,3A,4,5,6,7,8 (1941)
380038—STUDEBAKER PRESIDENT, MODEL 7C (1941)

NOTE:—Code No. Identification Marking—Carburetors may be identified by Code Number stamped on bowl cover above fuel level inspection plug as follows: 205-8—Cadillac AAV-26; 10-44, 10-44A or 10-44B—Packard AAV-26 (see Service Notes below); 6-97 or 6-97A—Studebaker AAV-26 (see Service Notes).

Cadillac & Studebaker Models—Carter 'WDO' dual carburetors also used on these cars. See article on Carter 'WDO' Dual Carburetor for complete data.

Packard Throttle Guard—Used on cars with Econo-drive (Overdrive) to prevent engine stalling when free-wheeling. ***See article in Carburetion Equipment Section for complete adjustment instructions.***

SPECIAL SERVICE NOTES & PRODUCTION CHANGES:—Packard Idle Air Bleed Change—Idle air bleed in carburetor main body (see illustration) was #70 drill size on first 10-44 and 10-44A carburetors and has been changed to #60 drill size on later Code 10-44B carburetors. To correct complaints of poor idling performance on Packard cars, check carburetor and on first types with #70 idle air bleed, increase this hole size by drilling idle air bleed out with #60 drill.

Studebaker Change to correct flat spot on acceleration—Later Code 6-97A carburetors (used on cars after Serial No. 7139912), have idle passage inserts installed in idle passages and counterbore in main metering jet orifice. To correct complaints of flat spot at approximately 20 MPH on acceleration on cars with first type 6-97 carburetor (before above Serial No.), install following parts: Two No. 382269 Idle Passage Inserts, Two new type No. P-24773 Main Metering Jets. To make this installation, remove carburetor and remove throttle body which will expose drilled idle passages in main body casting. Install insert in each idle passage, driving insert down flush with bottom of counterbore in carburetor body with big end of insert toward opening in passage. Remove and discard both old metering jets, install new type metering jets.

TYPE:—Aircraft type, duplex, downdraft carburetor. Similar to type used on preceding Cadillac and Packard models.

IDLE ADJUSTMENT:—Adjust only when engine warmed up so that Automatic Choke and Fast Idle inoperative (choke valve wide open, stopscrew on lowest step of fast idle cam). Set throttle stopscrew for correct 7-8 MPH (Cadillac) 8 MPH (Studebaker), 6 MPH (Packard) idle speed. Turn idle screws (one screw for each barrel, both screws must be adjusted alike) in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in slowly until engine fires smoothly. These screws control fuel mixture discharge from lower (closed throttle) idle port. Recheck idle speed and readjust throttle stopscrew if necessary. See car model 'T&E' page for complete adjustment instructions. Check Fast Idle setting (see below).

METERING JETS:—Main metering jets are non-adjustable type located under plug at lower end of each nozzle. Jets should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification Table for complete jet data. IMPORTANT—See Special Service Notes (above).

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston forced down by spring.

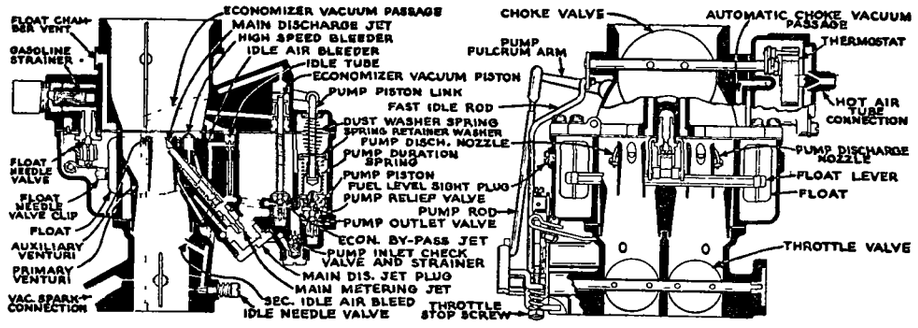
Setting—Vacuum piston opens valve with manifold vacuum of 4-6" of HG. (Packard), 5-6" (Cadillac & Studebaker) equal to car speed of 65-70 MPH.

ACCELERATING PUMP:—Similar to design used on other 'AAV' carburetors with spring-loaded relief valve in piston head and duration spring on rod above piston (light spring above duration spring in dust washer retainer) except that strainer has been added below intake check valve (see Note below).

Capacity—Pump capacity per 10 strokes fast (F), slow (S) is shown in table below. Pump must be set for correct stroke (see Adjustment) as shown in table.

Car Model	Carburetor	Pump Capacity	Pump Setting
Cadillac	AAV-26	13-17 cc.(F), 18-22 cc.(S)	Minimum
Packard	AAV-26	14-18 cc.(F), 27-31 cc.(S)	Maximum
Studebaker	AAV-26	12-16 cc.(F), 16-20 cc.(S)	Minimum

Pump Seasonal Adjustment—Two holes provided in throttle lever for pump rod connection (all models). Inner hole (short radius) provides minimum stroke and pump discharge, outer hole (long radius) maximum stroke. See car model 'T&E' page for recommended settings and seasonal changes on each model.



Pump Servicing Note—Strainer screen located in plug below pump intake check valve should be cleaned frequently to insure satisfactory pump operation.

FAST IDLE & CHOKE RELEASE:—Check and adjust as directed below. See Stromberg Automatic Choke (with integral Fast Idle) article in Carburetion Equipment Section for description and complete servicing instructions.

Cadillac—Open throttle and rotate fast idle cam so that stopscrew rests on high lobe of cam. Move choke valve toward closed position as far as possible, check choke valve opening by inserting drill rod between edge of valve and air horn wall. Choke valve opening should be .116" (#32 drill). To adjust, bend connecting rod between choke valve lever and fast idle cam loose lever at point near upper end. Use care not to cause bind in fast idle mechanism.

Packard & Studebaker—Check and adjust in same manner as Cadillac (above) except that choke valve opening should be equivalent to 7/64" drill.

Choke Release (All Models):—When throttle valve is opened wide, ear on throttle lever makes contact with fast idle cam loose lever and rotates the lever so as to open the choke valve to correct flooding. To check operation, open throttle wide, check choke valve opening by inserting 11/64" (.156-.187") drill rod between upper edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending ear on throttle lever slightly (use bending tool T-25056). Use care not to bind fast idle rod or distort fast idle cam spring.

FLOAT LEVEL:—Fuel Level—Should be 5/8" (all models) below top edge of bowl with engine idling or fuel pressure of 5 lbs. (Cadillac, Packard), 3 lbs. (Studebaker). To check fuel level, remove plug in sight hole on side of bowl. Fuel should be even with bottom of hole.

Float Height—Use special service tool T-24971 to check floats. Remove air horn and bowl cover assembly, invert cover and place tool on gasket. Top of floats should be 5/64" above tops of vertical guides (Cadillac, Packard), even with tops of guides (Studebaker) and sides of floats tangent to tool guides without any drag (to provide clearance between floats and bowl). Use extreme care to adjust both floats alike.

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets. When installing, make certain that needle valve is clipped to float lever.

Float Bowl Vent—Bowl vented through opening on side of air horn directly below air cleaner collar (and through balance tube in air horn on Cadillac).

THROTTLE VALVE SETTING:—To check throttle valve setting, back throttle stopscrew off so that valves are tightly closed, insert drill rods in idle port and vacuum port as follows: Idle Port—#56 (Cadillac), #58 (Packard), #60 (Studebaker); Vacuum Spark Port—#58 (Cadillac, Packard), #56 (Studebaker). Measure distance from throttle valve to nearest side of drill. Distances should be correct as shown in table below (all figures plus or minus .004").

Car Model	Throttle Valve	Idle Port	Vacuum Spark Port
Cadillac	P-24172—5°	.040"	.012"
Packard	P-24740	.022"	.012"
Studebaker	P-24740	.020"	Flush

CHOKE:—Stromberg automatic integral type. See article in Carburetion Equipment Section for complete servicing directions.

Choke Setting—Inverted 'V' mark on thermostat cover scale should coincide with reference mark on top of choke housing. To adjust, loosen three cover screws, rotate thermostat cover assembly.

Studebaker—Thermostat cover marked for three settings as follows: 'H', 'M', 'R'. Standard setting is with 'R' mark coinciding with reference mark on housing flange (correct for regular fuel and operating conditions). If engine loads up or over-chokes with this 'R' setting, change to 'M' setting. 'H' setting should only be used for continuous use of highly volatile fuel.

CAUTION—When connecting heat tube to thermostat cover connection, do not use excessive pressure which may rotate cover and change choke setting.

SERVICING:—Carburetors disassembled and serviced in same manner as AAV-2 types (see preceding AAV-2 article for complete data) except for Automatic Choke and Fast Idle mechanism. ***See Stromberg Type AAV-26 Automatic Choke article in Carburetion Equipment Section for complete servicing data.***

SERVICE PARTS:—Gasket Set 382393 (Cadillac, Packard), 382394 (Studebaker).

Number **MODEL BXOV-26**

380039—PACKARD '110' SIX, MODEL 1900 (1941)
380036—STUDEBAKER COMMANDER, MODEL 11A (1941)

NOTE:—Code No. Identification Marking—Carburetors may be identified by Code Number stamped on float bowl cover as follows: 10-45 (Packard), 6-98 (Studebaker).

Studebaker Models—Carter 'WA1' Model 410-S carburetor also used on these cars. See Carter WA1 Carburetor article for complete data on this type.

Packard Throttle Guard—Used on all cars with Econo-drive (Overdrive) to prevent engine stalling when free-wheeling. See Packard Throttle Guard article in Carburetion Equipment Section for complete adjustment instructions.

THROTTLE GUARD NOTE:—Vacuum diaphragm type throttle guard used on all cars with Overdrive to prevent engine stalling at speeds below 20 MPH. See Packard Throttle Guard article in Carburetion Equipment Section for adjustment instructions.

TYPE:—Plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer. Similar to type used on previous Packard Six model (not used previously on Studebaker).

Note—This model fitted with integral Fast Idle & Automatic Choke (thermostatic coil mounted on air horn and linked directly to choke valve shaft). See article in Carburetion Equipment Section for complete Fast Idle and Automatic Choke Servicing data.

IDLING ADJUSTMENT:—Adjust only when engine warm so that Automatic Choke and Fast Idle inoperative (choke valve wide open, throttle stopscrew on lowest step of fast idle cam) and engine idling at hot or slow idle speed. Idle adjusting screw controls fuel mixture discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture (standard setting approximately 1¼ turns open from inner seated position). Idle speed controlled by throttle lever stopscrew and should be set for idle speed of 6 MPH. (Packard), 7-8 MPH. (Studebaker). See car model 'T&E' page for complete tune up instructions. Check Fast Idle Setting.

METERING JETS:—Main metering jet is non-adjustable type located under plug at lower end of discharge jet. Jets should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification table for complete jet data.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.

NOTE—Use special tool T-24733 to remove vacuum power piston No. P-24043.

Setting—Vacuum piston opens valve with manifold vacuum of 4-6" of HG. corresponding to car speed of 65-70 MPH.

ACCELERATING PUMP:—Operated by throttle lever through vertical pump rod under float bowl cover. Fuel is drawn into pump chamber through strainer screen and inlet ball check valve and is discharged through outlet valve and pump discharge nozzle located in side of mixing chamber above main venturi when throttle opened for acceleration. Pump piston has duration spring on piston rod (spring compressed on sudden throttle openings, subsequent spring expansion prolongs pump discharge).

Capacity—Pump capacity in cc. per 10 strokes with pump set for medium stroke (link in center hole of throttle lever) is shown in table below. Use T-24972 Pump Capacity Burrette Gauge to check pump capacity.

Car Model	Carburetor	Pump Capacity	Pump Setting
Packard	BXOV-26	11-14 cc. (S)	Medium Stroke
Studebaker	BXOV-26	6-10 cc. (F), 16-20 cc. (S)	Medium Stroke

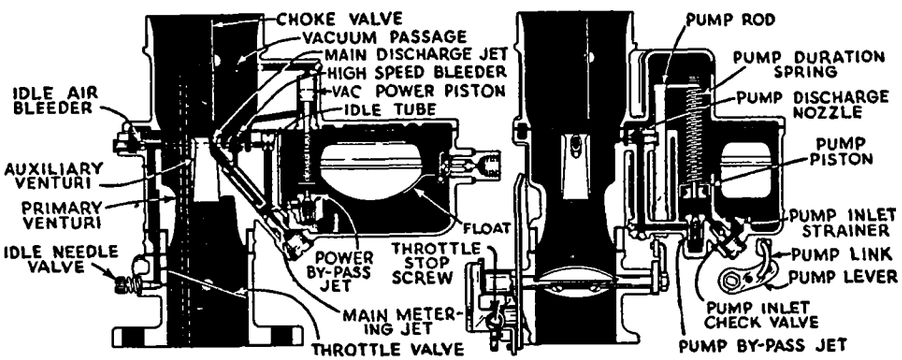
(F)—Fast stroke. (S)—Slow stroke.

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model tune up page for recommended seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE & CHOKE RELEASE:—Fast idle mechanism consists of a fast idle lever and cam mounted below the throttle valve shaft so that the cam serves as a stop for the throttle stopscrew. Fast idle lever is linked to choke valve lever by connecting rod so that cam is rotated to the fast idle position when the choke valve closes for cold starting. Choke release mechanism consists of an ear on the throttle lever which engages a lug on the fast idle cam so that the cam is rotated and choke valve opened when the throttle valve is opened wide. Fast idle and choke release setting are both adjusted by bending connector rod as follows:

Adjustment—Hold throttle stopscrew on lowest step of fast idle cam and against edge of second step, move choke valve toward closed position as far as possible (do not force valve beyond point where fast idle cam and lever are stopped against throttle stopscrew). Check choke valve opening by inserting 11/32" drill rod between upper edge of valve and air horn wall. If choke opening not correct, adjust by bending connector rod at bend near choke valve lever.



FLOAT LEVEL:—Fuel Level—Set at ⅝" below top edge (gasket seat) of bowl with 3 lbs. pressure (engine idling). Adjust by bending float arm at point where it is attached to float (use tool T-24733).

NOTE—Float fulcrum pin is retained by spring clip seated in float seat recess. When installing fulcrum pin, see that spring clip is seated and that it engages notches at ends of pin.

Float Needle Valve & Seat—Part No. P-21918—.093" intake hole (Packard), No. P-24063—.086" intake hole (Studebaker). Furnished as matched sets only.

Float Bowl Vent—Bowl is vented to outside atmosphere through slot in upper end of pump rod housing on bowl cover.

THROTTLE VALVE SETTING:—Valve is No. P-24059—20° type. To check valve setting, insert #56 drill in idle port, #56 drill (Packard), #60 drill (Studebaker) in vacuum spark control port above throttle valve, measure from edge of throttle valve to nearest side of drill. Idle port should be .010" (plus or minus .004") from valve and Vacuum Spark Control Port should be Flush with valve.

CHOKE:—Valve is offset plain type. Operated by automatic choke thermostatic spring coil which is linked directly to shaft. See article in Carburetion Equipment Section for Automatic Choke data.

SERVICING:—Disassembly—Disconnect choke connector link, take out six retaining screws, remove bowl cover and air horn assembly. Remove float pin lock wire (this will spring out when released), remove float hinge pin, remove float, needle valve, and needle valve seat. Remove idle tube from carburetor body casting, disconnect pump link and withdraw pump rod and piston assembly. Remove pump outlet check valve (in bottom of pump cylinder), remove inlet check valve plug and valve assembly. Remove main jet plug (use tool T-19099), main metering jet (use tool T-24924), and main discharge jet (use tool T-24967). Remove vacuum economizer by-pass valve assembly. To remove vacuum piston, use tool T-24733 inserting tool prongs in slots in piston retaining plug. To dismantle choke assembly, take out retaining screws and remove thermostat cover and coil assembly (do not remove thermostat coil from cover), remove small nut and lockwasher on end of choke valve shaft, turn lever to withdraw vacuum piston from cylinder and remove piston and link assembly.

Servicing—Examine vacuum economizer piston and automatic choke vacuum piston for carbon and gum deposits, clean with crocus cloth (do not use emery or wash pistons with gasoline). Check economizer by-pass valve and pump check valves for tightness by using special T-24970 tester (screw valve in proper opening of tester, immerse valve in gasoline and blow through tester—any valve leakage will be indicated by bubbles). Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (CAUTION—do not attempt to clean jets with wire or drill rods). Blow out all channels and passages in carburetor with air, remove all carbon deposits in ports and throttle body. Replace all worn or damaged parts.

Reassembly—Use all new gaskets (see Service Parts list below), reassemble carburetor by reversing disassembly directions given below. Check and adjust float level, accelerating pump setting, throttle valve setting, fast idle and choke setting, and idle setting when carburetor reassembled.

SERVICE PARTS:—Gasket Set—Part No. J-5652-G (all models).

Number **MODEL BXV-3**

A-18123—DODGE, MODEL D19 (1941)—WITHOUT FLUID DRIVE.

MODEL BXVD-3

380044—DODGE, MODEL 19 (1941)—WITH FLUID DRIVE.

380045—DODGE, EXPORT D19 (1941)—WITH FLUID DRIVE.

NOTE:—Model BXVD-3—This model has special dash pot or slow closing throttle device and is used on cars with Fluid Drive only. See Slow Closing Throttle data below for adjustment.

SPECIAL SERVICE NOTES & PRODUCTION CHANGES (BXVD-3 CARBURETOR):—On later cars with Fluid Drive equipped with BXVD-3 Carburetors Code 3-59B (Domestic), 3-60B (Export); these carburetors have differences in specifications from first Code 3-59 and 3-60 carburetors as follows: Main Metering Jet—.057" Part No. P-19442 (was .058"), Power By-pass Jet—#58 Part No. 382675 (was #54 Part No. P-21197), Vacuum Piston Assembly—Part No. P-24201 (was No. P-24043).

Economy Complaints on First Cars—On first Fluid Drive cars equipped with first BXVD-3 carburetors Code 3-59 (Domestic), 3-60 (Export); new Main Metering Jet, Power By-pass Jet, and Vacuum Piston Assembly (same as listed above for later 3-59B and 3-60B carburetors) may be installed for increased economy. Refer to Servicing data below for jet removal and installation directions. This change does not apply to BXV-3 carburetor used on cars without Fluid Drive.

TYPE:—Plain tube, downdraft type. Similar to type used on previous Dodge models. Model BXVD-3 (new type) similar to BXV-3 except that is it equipped with special dash pot or slow closing throttle device (see data below).

IDLING ADJUSTMENT:—Idle adjusting screw controls fuel discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture. Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH. hot or slow idle speed (with choke valve wide open). See car model 'T&E' page for complete tune up instructions.

METERING JET:—Main metering jet is non-adjustable type and should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification table for complete jet data.

NOTE—Use tool T-19099 to remove main jet plug, tool T-24924 to remove and install main metering jet, tool T-24967 to remove and install main discharge jet.

ECONOMIZER:—Vacuum piston type. Consists of a vacuum piston in a cylinder in the air horn casting which controls the by-pass valve and jet assembly in the main body casting. No adjustment required. Economizer is set to open valve with vacuum of 4-6" of HG. corresponding to car speed of 65-70 MPH.

ACCELERATING PUMP:—Capacity—With pump set for medium stroke (center hole in throttle lever), capacity in cc. per 10 strokes when pump operated slowly is 11-14 cc. Use T-24972 Pump Capacity Burrette Gauge to check capacity.

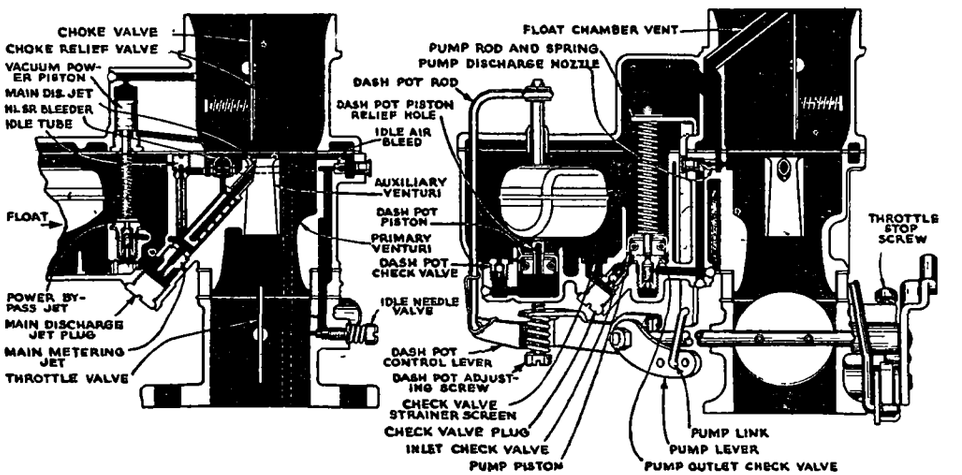
Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model tune up page for recommended seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE:—Consists of a cam pivoted directly below the throttle lever shaft and linked to the choke valve. Cam serves as stop for throttle lever stopscrew and opens throttle to fast idle position when choke valve is closed for starting. No adjustment required but stopscrew should be at high point of cam with choke valve fully closed.

SLOW CLOSING THROTTLE (BXVD-3):—Consists of a dashpot and piston assembly in the float bowl with the piston linked by a rod to a control lever which engages the throttle valve lever. When the throttle is opened, dashpot cylinder is filled with fuel which flows freely in through dashpot check valve. When the accelerator pedal is released (to close throttle), this fuel is trapped in the cylinder and is allowed to escape slowly through this relief hole in the dashpot piston stem above the piston. This action retards the movement of the piston and linkage toward the closed throttle position and the linkage prevents the throttle valve closing too rapidly.

Setting—Full travel of dashpot piston should be 5/16-11/32" with all slack removed from linkage. To check, place rule on float bowl cover at dashpot piston stem, measure distance from bowl cover to edge of retainer on stem, open throttle and recheck distance. Difference in readings should be 5/16-11/32".



Adjustment—Turn adjusting screw on dashpot control lever under float bowl to lengthen stroke, out to shorten stroke.

FLOAT LEVEL:—Fuel Level—Should be 5/8" below top edge of float bowl with engine idling (3 lbs. pressure). Adjust by bending float lever arm at point where it is attached to float.

Needle Valve & Seat Assembly—Part No. P-24063. Furnished only as matched set. When installing float or needle valve make certain that spring clip is properly engaged in notches on float fulcrum pin.

CHOKE:—Valve is offset type with poppet type relief valve.

Automatic Choke—Sisson. See article in Carburetion Equipment Section for adjustment and servicing instructions.

THROTTLE VALVE SETTING:—Part No. P-24059 (20° type). To check throttle valve, insert #58 drill in idle port, two #60 drills in vacuum spark ports. With stopscrew backed off and throttle valve tightly closed, throttle valve edge should be flush with edge of drills (.006" maximum clearance between valve and idle port drill allowable). NOTE—An additional #60 vacuum spark port is drilled at random below throttle valve.

SERVICING:—Disassembly—Disconnect fast idle connector rod. On Model BXVD-3 only, disconnect dashpot piston connector rod. Take out retaining screws, remove bowl cover and air horn assembly. Free clip on float hinge pin (clip will spring out when released), take out hinge pin, remove float and needle. Disconnect accelerating pump link, withdraw pump rod and piston assembly, remove pump outlet check valve (in bottom of pump cylinder). Remove economizer valve assembly. Remove main discharge jet plug (use T-19099 screwdriver). If main metering jet and main discharge jet to be removed (can be cleaned with air without being removed) use special tool T-24924 (to remove metering jet), T-24967 (to remove discharge jet). To remove vacuum economizer piston, use tool T-24733 and engage tool prongs in slot in piston retainer.

Servicing—Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (do not attempt to clean jets with wire or drill rods). Blow out all jets and passages in carburetor with air.

Reassembly—Use all new gaskets (see Service Parts list below), assemble carburetor by reversing disassembly directions. Check and adjust float level, accelerating pump setting, throttle valve setting, dashpot or slow closing throttle setting (BXVD-3), and idle setting as directed above.

SERVICE PARTS:—Gasket Set—No. J-5968-G (BXV-3 and BXVD-3).

DY-1A—CROSLEY, MODEL CB-41 (1941)

TYPE:—Single barrel, plain tube, downdraft type with high speed (Main) and low speed (Idle) adjustments.

ADJUSTMENT:—Make adjustments in order as listed below. Preliminary adjustment will allow engine to be started and warmed up (other adjustments should not be made until engine thoroughly warm).

Preliminary Adjustment:—Close Main Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly two complete turns. Close Idle Adjustment Screw by turning to right (clockwise) until it is lightly seated, then back screw out exactly one complete turn. Start engine and run until thoroughly warmed up.

Main (High Speed) Adjustment:—With engine warm and running, open throttle so that engine speed is 30-35 M.P.H. Turn Main Adjustment Screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then back screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting will be approximately 1½ turns open (first 1000 cars), 1¾-2 turns open (later cars) of screw from inner seated position.

Idle (Low Speed) Adjustment:—Set throttle lever stopscrew so that engine runs at faster than normal idling speed. Close throttle. Turn Idle Adjustment Screw in or clockwise to lean mixture until engine begins to miss, then back screw out slowly until engine fires smoothly. Clear manifold by opening throttle momentarily, then recheck idle setting. Correct setting will be approximately ¾-1¼ turns of the screw from the inner seated position. Set throttle lever stopscrew for idling speed of 7 M.P.H. when pulling car in high gear.

PERFORMANCE:—Should be satisfactory for operation at altitudes less than 5000 feet if adjustments correctly made as directed above. If performance not satisfactory, check adjustments and tune up engine (see car model T&E page for tune up data). See Trouble Shooting Section below.

FLOAT LEVEL:—Fuel Level—Should be 23/32" below top edge of float bowl or just below lower edge of inspection hole on side of float bowl (remove inspection hole plug to check level).

Float Level—To check, invert upper body assembly (air horn and float bowl cover with complete float mechanism), measure from face of body gasket to top of raised seam on each float. Distance should be 1 27/64". To adjust, bend each float lever arm **using extreme care to secure equal setting for both floats.** DISASSEMBLY CAUTION—Before taking off Upper Body Assembly (to check or adjust float level), remove Idle Adjustment Screw, Spring and Idle Tube to avoid damage to tube and main nozzle when upper body assembly lifted off.

Inlet Needle Valve & Seat—Part No. 06287 (matched set).

CHOKE:—Plain butterfly type. Adjust choke linkage so that choke valve is wide open when dash control button is pushed all the way in.

TROUBLE SHOOTING:—Engine Stalls—Check idle speed setting, tighten throttle stop retaining screw, check idling or low speed adjustment, see that idle adjustment screw not ringed, clean idle tube and idle fuel channels with air, check float level (see Fuel Level Note below).

Flatness on Acceleration—Check Idle (Low Speed) and Main (High Speed) Adjustments, check float level (if engine loads up, see Fuel Level Note below), clean idle tube and idle fuel channels with air.

Performance Unsatisfactory—Tune up engine (see car model T&E page for tune up data), check all carburetor adjustments.

Fuel Level Note—If fuel level in float bowl rises above setting, dismantle needle valve, clean needle valve and seat with a soft clean cloth, reseat needle valve by tapping with finger several times while turning needle around. Reset float level. If level not maintained, install new needle valve and seat.

SERVICING:—Before removing Upper Body Assembly (air horn and float bowl cover), remove Idle Adjustment Screw and spring, unscrew and remove Idle Tube through adjusting screw hole—this is important to avoid damage to tube and nozzle when upper assembly lifted off. Idle tube positioning pin in main body casting is not removable. Main nozzle outlet and gasket are staked in main body casting and cannot be removed (nozzle base can be removed through main adjustment screw plug hole after adjustment screw assembly removed). Blow out all jets and channels with compressed air—do not use wires or drills to clean passages. See that float bowl vent to air horn is open and clean.

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts. Use all new gaskets and replace parts in same order as removed. See that nozzles and plugs are tight. Set float level and adjust carburetor.

[35]—Supersedes #70 Part No. P-19424.

MODEL 61A5—Outline 9321
BANTAM, SUPER FOUR SERIES 65 (1941)

TYPE:—Plain tube, updraft, 'balanced' type with float bowl vented through drilled hole in carburetor casting which opens into air horn. Fuel jets consist of a Low Speed or Idling System and a High Speed or Main Jet System in conjunction with a Compensating System which operate as follows:

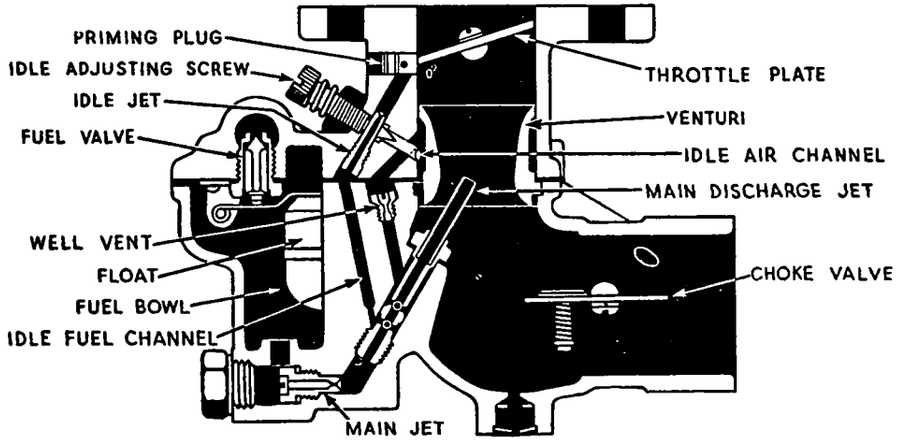
Idling System—Fuel for closed throttle idling and low speed operation is taken from the main discharge jet well through a cross-drilled passage in the lower end of the main discharge jet and up through the idle fuel channel to the Idle Jet which meters this fuel. As the fuel leaves the idle jet it is mixed with air admitted through the Idle Air Channel and controlled by the Idle Adjusting Screw. The fuel mixture is then discharged through the Priming Plug port into the air stream at the throttle edge.

Main Jet System—At higher engine speeds, fuel is discharged directly from the main discharge jet into the throat of the venturi and the idling system drops out. This fuel is metered by the Main Jet located in the fuel channel below the main discharge jet and the discharge jet is air bled by admitting air from the idle air channel through the Well Vent and drilled cross-channels in the lower end of the main discharge jet. This well vent and air bleed channel form the Compensating System. The main jet and compensating system are not adjustable but the main discharge jet delivery can be made richer or leaner by changing the main discharge jet or the well jet (see Performance data below).

IDLE ADJUSTMENT:—Idle adjusting screw controls air for the idle fuel mixture. Adjust only when engine thoroughly warmed up and choke valve wide open. Set throttle stopscrew so that engine idles at 6 MPH., turn idle adjusting screw in or clockwise for richer mixture, out or counter-clockwise for leaner mixture until engine fires smoothly. Final position of adjusting screw should be 1-1½ turns out from inner seated position. Check idle speed and readjust throttle stopscrew.

CAUTION—If idle adjusting screw must be turned in less than ¾ turn from inner seated position for good idling performance, check carburetor for clogged idle channels and jet or for air leaks at gasket between main body and throttle body gaskets (see Servicing below).

PERFORMANCE:—Performance should be satisfactory if Idle Adjustment correctly made as directed above. If necessary to change main discharge jet fuel delivery calibration for special operating conditions, this fuel mixture can be made richer by either increasing the size of the Main Discharge Jet or decreasing the size of the Well Vent. The fuel mixture can be made leaner by either decreasing the size of the Main Discharge Jet or increasing the size of the Well Vent. See Jet Calibration Table below.



FLOAT LEVEL:—Fuel Level—Fuel level in bowl should be 13/32-15/32" below top edge (gasket seat) of float bowl.

Float Level—Bottom of float at free end should be 1 5/32" (plus or minus 3/64") from the gasket seat of the throttle body (bowl cover) with the needle valve closed. Check by inverting throttle body.

Adjustment—Manufacturer recommends that no attempt be made to correct float level by bending float arm. Install new parts to correct level.

CHOKE:—Butterfly type with poppet type relief valve. When checking choke linkage, see that choke valve is wide open when choke control button on instrument panel is pushed in, and that valve is fully closed when button is pulled out.

SERVICING NOTES:—Always use new Body Gasket #C142-16 between main body casting and throttle body casting whenever carburetor is dismantled for cleaning. Carburetor is 'balanced' type and air leaks at this point will upset carburetor performance.

ZENITH JET SPECIFICATIONS
Bantam—Model 61A5—Outline 9321

Part	Size	Part Number
Venturi	#16	C38-35
Main Jet	#18	C52-6-1
Idling Jet	#15	C55-6
Main Discharge Jet	#60-1	C66-26-1
Well Vent	#20	C77-18
Fuel Valve & Seat	#25	C81-17

NOTE—Fuel valve and Fuel Valve Seat (Float Valve) are furnished in matched sets. Always replace both parts as a unit.

①—Cars with Overdrive. ②—Optional Equipment.

FUEL PUMP TESTING

NOTE:—Manufacturer recommends that Fuel Pump Analyzer No. 1521551 be used in making these tests. All tests should be made with the fuel pump in place on the engine and the engine running to drive the pump. Engine speed should be 30-35 MPH (for capacity test), lowest possible idling speed (pressure test).

TESTING:—Test equipment should be connected at pump outlet. Disconnect fuel line from pump to carburetor at pump, use special fitting and connect "T" connection, use rubber tubing to join gasoline line to end of "T", connect test equipment (bleeder line, pressure gauge and shut-off valve to open and close bleeder line) to side opening of "T" connection. Operate engine and make tests in following order.

CAPACITY TEST

Bleeder tube end must be at carburetor level or slightly higher. Shut-off valve should be open permitting fuel delivery through bleeder tube. Operate engine at 30-35 M.P.H. note quantity of fuel pumped in 45 seconds or 1 minute(see table below). Pressure gauge not used in making this test. If pump capacity in excess of 1 pint, check pump pressure (see test below), and if pressure not excessive pump need not be checked further. Delivery capacity of 1 pint is ample for all engine operation.

PRESSURE TEST

Idle engine at lowest possible speed to secure static pressure reading. Close shut-off valve. Note pressure gauge reading. Pressure should not exceed figure in table below. If pressure does not exceed this figure and capacity is satisfactory, fuel pump operation is OK. Excessive pressure may cause rich fuel mixture and in extreme cases flooding of carburetor (if carburetor floods and pressure is not excessive, check carburetor float level setting and see that float needle valve shuts off tightly).

Fuel Pump No.	Minimum Capacity	Maximum Pressure
429	1 Pint in 1 Minute	3¾ lbs.
496	1 Pint in 45 Seconds	4¾ lbs.
499	1 Pint in 45 Seconds	4½ lbs.
505	1 Pint in 1 Minute	4 lbs.
509	1 Pint in 1 Minute	3½ lbs.
514	1 Pint in 45 Seconds	4 lbs.
521, 522	1 Pint in 45 Seconds	4¾ lbs.
524	1 Pint in 1 Minute	4 lbs.
525	1 Pint in 45 Seconds	4¾lbs.
527, 528	1 Pint in 1 Minute	3½ lbs.
529	1 Pint in 45 Seconds	4¾ lbs.
530	1 Pint in 45 Seconds	5 lbs.
532, 533, 534	1 Pint in 1 Minute	3½ lbs.
535, 536	1 Pint in 45 Seconds	5 lbs.
537	1 Pint in 45 Seconds	4¾ lbs.
538	1 Pint in 1 Minute	2½ lbs.
539	1 Pint in 45 Seconds	4¾ lbs.
540	1 Pint in 1 Minute	3½ lbs.
541	1 Pint in 1 Minute	2¾ lbs.

FUEL PUMP TROUBLE SHOOTING

FUEL PUMP UNIT

TROUBLE SHOOTING:—If the pump action is not satisfactory, check in accordance with the following table:

No Fuel or Insufficient Fuel at Carburetor:

(1) Gasoline tank empty.
(2) Bent, kinked, leaky tubing or connections. Tighten all connections. Check condition of tubing. Replace if necessary.
(3) Dirty filter screen or loose sediment bowl. Take off glass sediment bowl, clean filter screen. Examine cork gasket and replace if necessary. Tighten bowl thumbnut securely.
(4) Loose valve plugs or caps. Examine gasket under head of plug, replace if necessary. Tighten plugs securely.
(5) Dirty or warped valves. Loose valve seat. Remove valve plugs and take out valves. Wash valves in gasoline. If warped or gummed, replace. Examine valve seat for smooth surface and see that seat is tight in pump body. Replace valves and assemble valve springs and plugs.
(6) Worn linkage, weak driving spring. Check for excessive play in linkage or worn rocker arm pin which will shorten pump stroke. Check driving spring (under diaphragm).
(7) Insufficient pump capacity. Check capacity (above).

Fuel Leakage through Vent in Pump Body:

(1) Worn or punctured diaphragm. Replace diaphragm.
(2) Loose diaphragm nut or defective gasket. See that nut on upper end of pull rod is tight and that gasket under nut is in good condition.

Fuel Leakage at edge of Diaphragm:

(1) Loose cover screws. Tighten cover screws securely (alternately around pump body).

Carburetor Flooding:

(1) Carburetor needle valve not seating. Check for worn valve or seat, sediment or other obstruction preventing seating of valve. Check float level.
(2) Excessive pump pressure. Check pressure (above).

VACUUM PUMP UNIT

TROUBLE SHOOTING:—If vacuum pump performance is not satisfactory as evidenced by faulty windshield wiper action, check as directed in following table:

Windshield Wiper operations slow at high speeds or when accelerating. Indicates that vacuum pump is not operating. Check windshield wiper lines and fittings. If no leaks are found, disassemble vacuum pump and check valves and diaphragm.

Oil Smoke in Engine Exhaust. Indicates punctured diaphragm. To check before disassembling pump, disconnect line between pump and manifold, operate pump, hold a piece of paper over pump outlet. Oil spray in exhaust from pump indicates a punctured diaphragm (if no oil spray noted at this point, oil smoke may indicate defective piston rings, etc.

FUEL PUMPS

TYPE:—Mechanically operated, diaphragm type, with oil seal on pull rod and riveted diaphragm and pull rod assembly. Types used on various car models differ slightly in design of linkage and sediment bowl (some types have separate glass sediment bowl) but service operations are essentially the same on all types.

OPERATION:—On all AC fuel pumps, suction stroke is positively actuated by the pump linkage (when rocker arm pushed in toward pump, pump link pulls down on diaphragm pullrod) and the delivery stroke is actuated by the driving spring under the diaphragm. Fuel delivery is controlled by the back pressure in the delivery line so that whenever the carburetor float valve is closed, diaphragm remains at top of stroke with driving spring compressed and the motion of the rocker arm is absorbed by the pump linkage. When pressure is relieved by the opening of the carburetor float valve, pumping is resumed.

PERFORMANCE:—See separate article on Fuel Pump Testing (preceding page) for Capacity & Pressure specifications for each pump model. Use Fuel Pump Analyzer to check performance.

TROUBLE SHOOTING:—See article on Fuel Pump Trouble Shooting (preceding page).

SERVICING:—Manufacturer recommends that, whenever pump requires overhauling, a Replacement Exchange Pump should be installed (see Equipment List on preceding page for Replacement Pump Nos.).

Disassembly:—On types with separate glass or metal sediment bowl, remove retaining nut or screw, remove bowl, gasket, and filter element or strainer screen. On types with built-in sediment bowl, remove cover screw, cover, gasket, and strainer screen. Mark cover and body castings to insure correct replacement, take out screws in flange holding the two castings together, remove cover casting using care not to tear diaphragm assembly. Take out screw in valve retainer, remove retainer and lift out valve assemblies. To remove pullrod and diaphragm assembly on types with oil seal assembled on pullrod (where seal and retainer assembly seated on boss in pump body), use thin bladed tool to lift lower edge of retainer up on edge of pump body boss, disengage pullrod from rocker arm link by pressing down and away from rocker arm on pullrod (wedge link up toward diaphragm with screwdriver inserted through rocker arm slot), lift pullrod and diaphragm assembly out. On types with oil seal installed in recess in pump body, remove rocker arm pin (where pin staked in body, remove stakings; where small counterbored end of pin swedged out to hold pin in place, drill out this counterbored end of pin), disengage link from pullrod, lift pullrod and diaphragm assembly straight out to avoid damage to oil seal.

Oil Seals:—Oil seals installed in recess in pump body are staked in place and should be removed only if seal being replaced. Oil seals assembled on pullrod stem consist of several oil seal washers assembled between upper and lower retainers with small oil seat spring between upper retainer and diaphragm lower retainer. Note position of oil seal parts on pull rod stem before removing seal and re-install in same relative positions (retainers locked on pullrod by being rotated 1/4 turn.

Diaphragm Assembly:—On types where pullrod end riveted over upper diaphragm protector, pull rod and diaphragm should be replaced as an assembly. New diaphragms can be installed on types where a nut is used. When installing diaphragms, see that upper and lower protectors properly installed (with cupped edges away from diaphragm), line up holes in diaphragm layers with locating ring or several cover screws and make certain that holes in correct relation to flat or link slot on pullrod, use special wrench to hold alignment washer from turning while tightening pullrod nut and use extreme care not to twist diaphragm layers out of alignment.

Valve Assembly:—On types with valve cages installed in recesses in pump casting and retained by retainer and screw, make certain that inlet and outlet valves installed in correct position, see that retainer fits snugly on each valve cage and that retainer screws are tightened securely (see that retainer does not shift while screws being tightened). On types with separate valve discs and springs installed under valve plugs, see that valve seat is clean and smooth, place fibre valve on seat, install spring on valve, install valve plug making certain that boss on plug enters spring and that valve is not cocked on seat, tighten plug securely.

Pump Reassembly:—Install pullrod and diaphragm assembly and oil seal assembly by reversing disassembly procedure. Engage pullrod and rocker arm link (if rocker arm pin removed, use special tapered assembly tool to line up rocker arm and link parts, push tool out with rocker arm pin as pin is installed). When installing cover assembly, push in on rocker arm so diaphragm is flat and holes line up with hole in pump body and cover, install all cover screws and turn screws down evenly until pump flanges are 1/8" apart, then release rocker arm or use special tool to press up on link and pullrod so that diaphragm flexed in upper position, tighten all cover screws evenly and securely. CAUTION—This flexing of the diaphragm when cover screws are being tightened is necessary to insure full stroke of pump in operation.

FUEL & VACUUM PUMPS

TYPE:—Combination fuel-and-vacuum pumps consist of a conventional diaphragm type fuel pump with an additional diaphragm type vacuum pump unit mounted on the pump body and operated by the same rocker arm (separate rocker arm links used so that each pump section can operate individually).

FUEL PUMP SECTION

OPERATION & SERVICING:—Same as for separate fuel pumps. See Fuel Pump servicing data above.

VACUUM PUMP SECTION

OPERATION:—Exhaust stroke positively actuated by pump link and rocker arm, suction stroke actuated by large driving spring above diaphragm. Whenever windshield wiper not in use (inlet or suction line shut off), manifold vacuum holds diaphragm at upper end of stroke with driving spring compressed and rocker arm motion is absorbed by linkage.

SERVICING:—Disassembly. With pump clamped in vise, take out two opposite flange screws and install special guide pins as pilots when cover removed (guides may be made up of 3/16" cold-rolled stock, 2" long, with 1/4" of 10-32 thread on one end). Mark cover and body flanges to insure correct reassembly, take out remaining flange screws, lift off cover assembly. Press down on rocker arm, unhook diaphragm assembly from inner pump link, lift diaphragm assembly out.

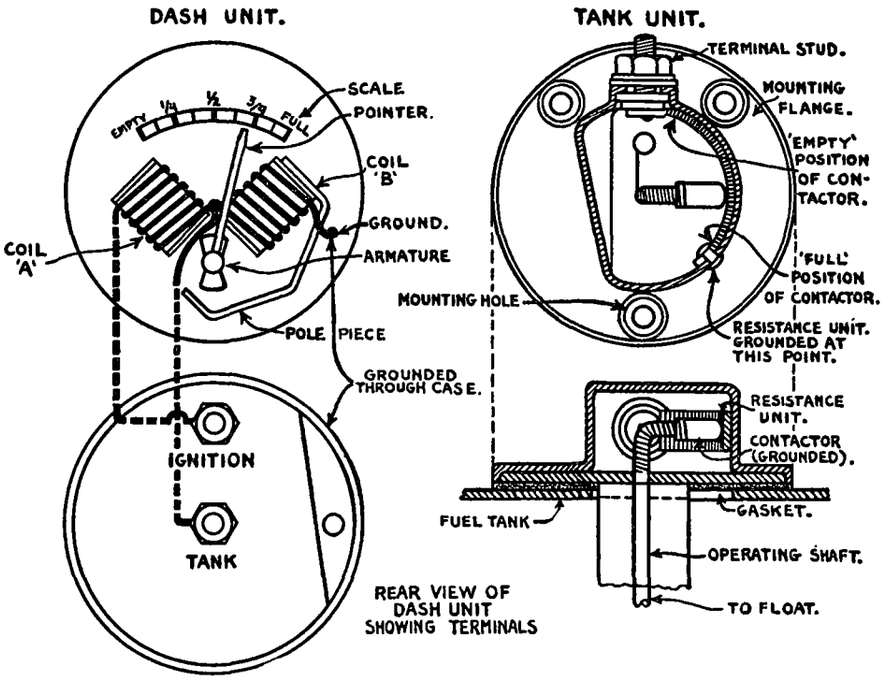
Vacuum Pump Body Assembly. Place fibre inlet valve on brass valve seat (body furnished with valve seat installed), and position inlet valve spring on valve. Install spider-shaped valve stop plate on valve spring making certain that top coil of spring is seated in recess in stop plate. Install outlet valve spring and see that spring is centered in recess in body. Press down on inlet valve stop plate, install fibre outlet valve on valve spring, see that legs on stop plate fit into recess in body. Without releasing stop plate, slide retainer gasket into position, place retainer on top of gasket (countersunk holes must face up), insert flat-headed retainer screws and tighten securely (tighten center screws first, end screw last). Turn pump body over and install screen making certain that screen is flat and fits snugly around screw holes in body, install gasket on screen, place bottom cover on gasket and install four cover screws. See that gasket fits properly and cover screws tightened evenly to prevent leaks at this point.

Diaphragm & Pullrod Assembly—On types where pullrod riveted over diaphragm protector, replace diaphragm and pullrod as an assembly. New diaphragms can be installed on types where a nut is used on this point. When installing diaphragm, see that upper and lower protectors properly installed (cupped edges away from diaphragm, line up hole in diaphragm layers and see that these holes in correct relation to flat or link slot on pullrod, use special wrench to hold alignment washer from turning while tightening pullrod nut and use extreme care not to twist diaphragm layers out of alignment. Place oil seal parts (retainers, washer, and spring) in position in pump body and see that assembly fits snugly in recess around the pullrod hole. Install diaphragm on top of retainer spring, threading pullrod through oil seal and engaging hooked end of longer pump link in pullrod slot.

Vacuum Pump Assembly. Clamp pump body (with fuel pump installed) in vise with vacuum diaphragm up. Press down on rocker arm until diaphragm is flat on flange, install small metal wedge between body and shoulder on arm to hold it in this position while completing assembly. Place heavy driving spring on diaphragm, place vacuum pump body assembly in position on spring making certain flange marks line up and that spring is centered on diaphragm and around boss in pump body. Press down on vacuum pump body, insert flange screws (lockwasher on each screw), turn screws down loosely. Remove rocker arm wedge, tighten screws evenly. Check vacuum pump operation after pump re-installed on engine.

DESCRIPTION:—The A.C. Electric Gasoline Gauge is of the balanced coil type and consists of two units, a dash unit or recording gauge and a tank unit or measuring device mounted on top of the gasoline tank. The dash unit mounted on the instrument panel consists of two coils mounted at an angle of 90 degrees. The gauge pointer is attached to an armature which is pivoted at the intersection of the coil axes. The dash unit is connected to the coil side of the ignition switch and to the tank unit through insulated wires. The dash unit is grounded through the mounting screws to the instrument board and car frame.

Tank Unit:—Gearless type with integral float arm and contactor arm (rheostat ground brush). Float arm is pivoted in lower end of tank unit case so that movement of the arm (with the rise and fall of the float in the tank) causes the upper end of the arm to sweep across the tank unit resistance coil. Except for this float arm construction and separately mounted fuel outlet pipe (some models), gasoline gauge is similar to type used on previous car models.



OPERATION:—The upper terminal of the dash unit marked 'Ignition' is connected to the coil side of the ignition switch (or to the 'auxiliary' terminal of lock switch coils) so that the gauge is operative whenever the ignition switch is turned on. Current flows through coil 'A' of the dash unit to the center terminal marked 'Tank'. The second coil 'B' is connected to this terminal. The other end of this coil winding is grounded to the gauge case. The 'Tank' terminal of the gauge is connected to the terminal on the tank unit and circuit is completed to ground through the tank unit resistance winding. This resistance winding in the tank unit is grounded through the movable contactor so that the resistance is cut in or out of the dash unit coil circuits as the float rises and falls with the gasoline level in the tank.

INSTALLATION:—Both the tank unit and dash unit are grounded and care must be taken whenever the units are installed or replaced that a ground is provided. On the tank unit it will be sufficient to remove paint and carefully clean the tank under the tank unit flange.

TROUBLE SHOOTING:—Defective units should be replaced and servicing operations will be confined to locating trouble in dash unit or tank unit. Check gauge operation from following table:

1. **Pointer does not move when ignition is turned 'on'.**
   The line from the ignition switch to the dash unit is open. Check connections and supply new lead from switch to 'IGN' terminal on gauge.
2. **Gauge indicates 'Full' at all times.**
   The line between dash unit and tank unit is open. Check connections and replace line with insulated wire.
   Tank unit burned out. Replace tank unit.
   Tank unit not grounded. Check by supplying new ground from tank unit to car frame.
3. **Gauge indicates 'Empty' at all times.**
   Wires reversed on dash unit. See that connections are made as indicated above on diagram.
   Dash unit is not grounded. See that dash unit is properly grounded. Check by supplying special test ground to car frame. If dash unit does not register correctly, it must be replaced.

SERVICING:—No service operations required other than to see that wires are properly connected and terminals are tight. Defective units (as determined by tests given below) should be replaced.

AC GASOLINE GAUGE TESTING

NOTE:—Manufacturer recommends that AC Gas Gauge Tester, Part No. 1516000, or HMO-204 be used to make tests. Tester similar to gas gauge Tank Unit equipped with test leads and an operating handle by which the resistance can be cut in and out of the gauge circuit in a similar manner to the operation of the tank unit on the car.

TESTING:—Make the following tests in the order given which will completely check all gas gauge units and wiring.

DASH UNIT

With ignition switch 'off', disconnect tank wire at terminal on back of dash unit, connect RED tester lead to this terminal, ground BLACK tester lead to frame. Turn ignition switch 'on', move Tester arm up and down. Gas gauge dash unit should register 'Full' and 'Empty'. If operation is O.K., disconnect tester and reconnect tank wire. If dash unit pointer does not register correctly, check feed wire by connecting 6 volt test lamp between dash unit Ignition Terminal (second terminal on back of dash unit) and ground. If test lamp does not light, circuit from ignition switch is defective and ignition switch and connecting wire should be checked or replaced. If lamp lights (gauge circuit O.K.) and dash unit does not operate, replace dash unit and reconnect wires.

GAUGE WIRING

Disconnect tank unit wire at nearest point to tank unit (bayonet type snap connector or junction block). Attach Red tester lead to wire running back to dash unit, ground BLACK tester lead to the car frame. Turn ignition 'on'. Move tester arm up and down and watch dash unit pointer which should move from 'Empty' to 'Full'. If dash unit reads 'Empty' at all times, or if reading is lower than when dash unit tested alone (dash unit test above), check wire for shorts or leaks (broken insulation, short junction block terminals, un-insulated connectors touching body or frame, etc.). If dash unit reads above 'Full' at all times, or if reading is higher than when dash unit tested alone, check wire for open-circuits (break in wire, loose connections, corroded terminals, etc.). If dash unit and wire tests O.K., check tank unit.

TANK UNIT

Remove tank unit, clean tank unit terminal and mounting flange thoroughly, connect tank unit to wire running to dash unit, ground tank unit by connecting jumper wire from tank unit mounting flange to car frame. Turn ignition 'on'. Move tank unit float arm up and down. Dash unit pointer should move from 'Empty' to 'Full'. If dash unit reading indicates tank unit defective, replace tank unit. Always check tank units before installing in tank and make certain that float arm is free (check for freedom of movement by noting that float arm falls back to empty position when released in various positions). See that gasoline tank and tank unit mounting flange are clean (tank unit grounded to frame through tank) and that a good ground contact exists between tank and frame.

Studebaker Pres. 7C (1941)	NG-9594D	NG-9659T

DESCRIPTION:—Gauge consists of a bimetal or thermostatic arm type dash unit and a rheostat type tank unit connected together by two wires.

Dash Unit—Pointer actuated by the two bimetal arms on which heating coils are wound (these arms hinged at upper end with lugs to engage pointer at lower end). The two outer bimetal arms (without heating coils) compensate the dash unit for temperature changes (left hand arm controls dash unit contacts, right hand arm has insulated stop at each side to limit motion in each direction) and the contacts compensate for battery voltage variations (remain closed at 5 volts or less, open and close at voltages above 5 volts to maintain constant gauge input). The circuit through the dash unit is from the 'IGN.SW' terminal through the contacts and then through each heating coil to terminals '1' and '2'.

Tank Unit—Consists of a resistance coil wound on a flat form and connected between the two tank unit terminals. Contact arm is grounded and circuit from each terminal is through the resistance to ground at the contact arm. Contact arm is mounted on the float lever and moves across the resistance as the float rises and falls so that resistance is cut out of one dash unit heating coil circuit and in on the other heating coil circuit with this movement.

OPERATION:—When the ignition switch is turned on, current flow through heating coil on each bimetal arm in the dash unit depends on contact arm position in tank unit (contact arm controls amount of resistance in each heater coil circuit) and the unequal current flow through each coil causes an unequal deflection of the bimetal arms so that the pointer is moved on the scale. Any change in the position of the tank unit contact arm (caused by float movement) causes a like change in the bimetal arm deflection and pointer reading of the dash unit. When voltage at gauge exceeds 5 volts, or if bimetal arms become overheated, contacts open and close to maintain constant input so that readings are accurate regardless of voltage fluctuations (pointer position entirely dependent on division of current between heating coils on bimetal arms as controlled by tank unit. Contact opening and closing is sufficiently rapid so that pointer does not change). External temperature changes (affecting outer unwound bimetal arms) cause a slight rotation of the hinge so that position of inner bimetal arms and pointer remains unchanged. Gauge design results in a lag or damping action so that pointer fluctuations due to fuel tank surges are minimized. When ignition switch is turned off, bimetal arms flex away from pointer which is then returned to the empty position by the counterweight at the lower end.

TESTING:—Use spare tank unit, which is known to be in good order, to test gauge units. Disconnect wires on terminals '1' and '2' of dash unit, connect these terminals to same numbered terminals of test tank unit, ground test unit to car. Turn ignition switch on and operate test unit by hand, moving float from empty to full position, and noting dash unit pointer reading. NOTE—Allow one minute for dash unit to indicate true reading. If dash unit reads correctly when operated with test tank unit, trouble is in wiring or tank unit (see Trouble Shooting Table and test directions below). If dash unit does not read correctly, replace unit (see Calibration Adjustment below).

Checking Wiring—Connect 6 volt test lamp in series with wire to tank unit at connector accessible through hole in trunk floor. With ignition turned on, lamp should go on and off at regular intervals. If lamp does not light, wire is grounded or open-circuited (See Trouble Shooting Table). Test both No. 1 and No. 2 wires in this manner. NOTE—Open-circuits are usually found at wire connectors in rear compartment. Clean contact surfaces thoroughly to remove all grease, dirt, insulating varnish. Grounds may occur at left windshield post where wires enter post or at left rear quarter window (make certain that moulding screws do not pinch or pierce wiring insulation).

TROUBLE SHOOTING:—If wires open-circuited, grounded or reversed, gauge will read inaccurately as follows:

	Gauge Reading With:		
Wire (See Note)	Tank Empty	Tank ½ Full	Tank Full
#1 Wire Grounded	Empty	¼ Full	½ Full
#1 Wire Open	½ Full	¾ Full	Full
#2 Wire Grounded	½ Full	¾ Full	Full
#2 Wire Open	Empty	Empty	Empty
#1 & #2 Wires Reversed	Full	½ Full	Empty

NOTE—Dash unit and tank unit terminals are marked as indicated above (tank unit terminals may be painted over). See Car wiring diagram (on car model 'T&E' page) for wire colors.

Gauge Reading Inaccurate—See table above. May also be caused by excessive tightening which has loosened terminal studs requiring replacement of dash unit (see Service Note and Calibration Adjustment).

Pointer Sticks or Binds—See that pointer does not bind on panel at lower end (if necessary, shim gauge out from panel by installing gasket cut to size of dash unit mounting face. Check pointer bearing alignment and endplay (adjust by bending bearing supports).

Fluctuating Pointer—Examine contact points and clean by drawing piece of bond paper between them.

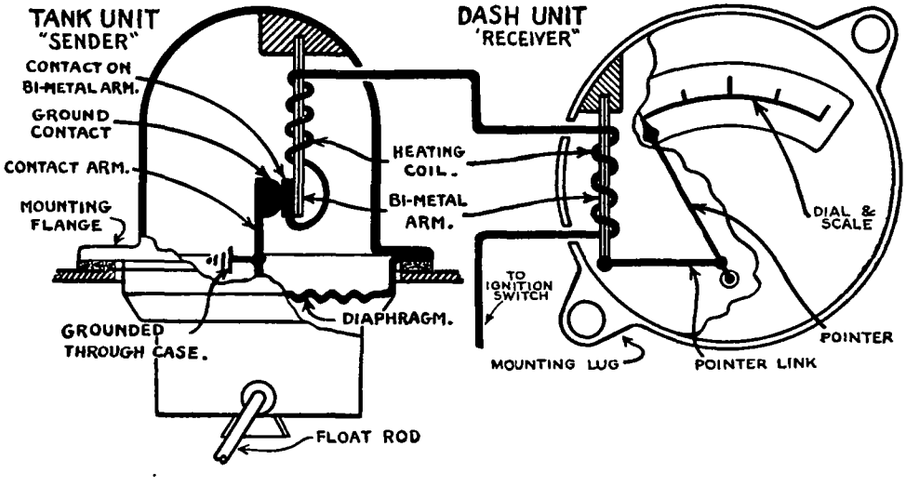
CALIBRATION ADJUSTMENT:—If pointer position not correct at Empty or Full, or if gauge reads inaccurately, dash unit should be calibrated as follows: Remove dash unit from car, connect to tank unit known to be in good condition and to a battery (see illustration for connections). Loosen both nuts on 'IGN.SW' terminal (inner nut is staked on later type units) to release calibrating arms. Set tank unit float in Empty position, move left hand calibrating arm (on which stationary contact is mounted) to right to raise pointer reading, or to left to lower pointer reading. Move tank unit float arm to Full position, move right hand calibrating arm to right to raise pointer reading, or to left to lower pointer reading. Recheck gauge at Empty position (setting may be changed by the Full adjustment). Tighten nuts on 'IGN.SW' terminal to lock calibrating arms in position using extreme care not to shift arms while tightening inner nut.
NOTE—When making this adjustment, or when testing dash unit on the bench, unit must be shielded from air currents which might cause unequal cooling of the bimetal arms and affect the gauge reading. Allow 1 minute for bimetal arm heating coils to heat up, after moving tank unit float, before checking dash unit pointer position.

1941 KING-SEELEY GASOLINE GAUGE

DESCRIPTION:—This is an electric type gauge using bi-metal arms on which heating coils are wound in both the tank or engine unit 'Sender' and the dash unit 'Receiver'. The two heating coils are connected in series and the gauge circuit is completed to ground through a set of contacts in the Sender unit (one of which is mounted on the bi-metal arm). The ground contact in the Sender is mounted on a movable arm (arm mounted through diaphragm forming lower cover of Sender unit and flexes diaphragm as it is moved). The lower end of the ground contact arm is actuated by the upper end of the float rod. When the float moves up to follow the gasoline level, the rod moves the arm so that contact pressure and length of time contacts remain closed is increased.

OPERATION:—When the Sender contacts are closed a current flows through the heating coils of both the Sender and Receiver units. This causes the bi-metal arm in the Receiver to bend, moving the pointer, and indicating a reading on the gauge dial. At the same time the heating coil in the Sender unit causes its bi-metal arm to bend, opening the contacts and interrupting the current flow. When this occurs the heating action stops and the cooling of the bi-metal arm causes it to flex in the opposite direction and again close the contacts. In operation, this cycle takes place very rapidly (approximately once each second for gauge when tank empty) so that steady reading secured on Receiver dial.

TROUBLE SHOOTING:—Manufacturer recommends use of extra or test Sender and Receiver to check operation of units which do not perform satisfactorily.



Testing Sender:—Disconnect lead of Sender unit on car, connect this lead to test Sender and ground this Sender to the car frame. Turn on ignition, move Sender float up to 'full' position and note reading on Receiver. Receiver should read full or 'F' after 10-15 seconds time. If Receiver reading is correct, check following points before replacing Sender unit.

1. **Ground.** Sender is grounded through case. See that all paint and grease are removed under flange and both surfaces make good contact.
2. **Radio By-pass Condenser Shorted.** If by-pass condenser is connected at Sender on cars with radio, test for short-circuit by disconnecting condenser and noting gauge operation. If gauge is satisfactory, replace condenser.

If reading secured with test Sender is same as that with Sender on car, check wire connecting Sender and Receiver. Replace if open-circuited or grounded.

Testing Receiver—Disconnect wires on Receiver on car and connect to same terminals on test Receiver. Turn on ignition switch and note reading on gauge. If test Receiver reading is correct, replace Receiver on car. If test Receiver reading is same as car Receiver, repeat tests on Sender and wiring.

SERVICING:—No service operations are required other than to see that wires are properly connected and terminals are tight. No repair operations are possible and defective Senders and Receivers should be replaced.

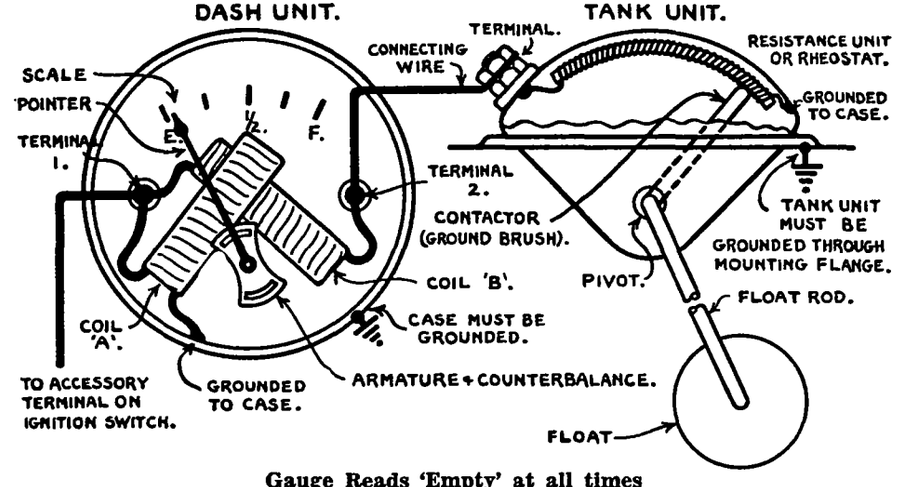
1941 STEWART GASOLINE GAUGE

DESCRIPTION:—This is an electric gauge of the 'balanced' coil type and consists of a dash unit or recording device and a tank unit or measuring device. The two units are connected by an insulated wire and each unit is grounded. The feed wire on the dash unit is connected to the accessory terminal of the ignition switch (or coil side of switch) so that the gauge is operative only with the ignition turned 'on'.

OPERATION:—The two coils in the dash unit are connected in parallel to the switch terminal (1) on the gauge case. Coil (A) is grounded to the gauge case so that the current flow through this coil is constant. The other end of coil (B) is connected to the tank terminal on the gauge case so that the coil is in series with the resistance unit in the tank unit. The resistance unit is grounded through the contactor on the upper end of the gasoline tank float rod so that the resistance is cut in or out of the coil (B) circuit as the float rises and falls.

MOUNTING:—Both the dash unit and tank unit are grounded through the case and a good ground must be provided when they are mounted on the car. Remove all paint and grease from under the mounting flange.

TANK UNIT NOTE:—Tank units are furnished in both Gear Type (for tanks greater than 12" in depth or where baffles prevent installation of lever type) and Lever Type (for tanks of 12" depth or less). Tank units furnished with floats not attached to arm and should be installed as follows:



Gear Type—Travel limited to 52½° above and below horizontal position of arm. When installing, cut off float arm to correct length required for depth of tank and solder float on arm in horizontal position.

Lever Type—Furnished with float arm 12" long. Cut off float arm to correct length and solder float on arm at right angles to arm and with long diameter of float horizontal.

TROUBLE SHOOTING:—If gauge operation not satisfactory check as follows:

Gauge Reads 'Full' at all times

1. Lead between dash unit and tank unit is grounded. Check by disconnecting lead at each end and substituting a test jumper wire. If gauge operates correctly, replace lead.
2. Connections on dash unit reversed. Reverse wires and note performance.
3. Coil (A) in dash unit open-circuited. To check, disconnect tank unit lead on dash unit momentarily. Pointer should move to 'Empty' end of scale. This coil should draw .13 ampere at 6.0 volts (between switch terminal on dash unit and ground on case with tank unit lead disconnected).
4. Resistance unit in tank unit short-circuited. Check with voltmeter and battery between tank unit terminal and ground on case with dash unit lead disconnected. Resistance of unit should be 110 ohms.

Gauge Reads 'Empty' at all times

1. Dash unit not grounded. Examine ground contact or run extra ground lead from case to car frame.
2. Open-circuit between dash unit and tank unit. Check by connecting jumper wire between terminals on units and noting gauge performance.

Gauge Reading Inaccurate

Mechanical defect in dash unit or tank such as tight pivot bearings, armature counterbalance binding or incorrectly positioned, bent dial pointer, or bent float rod.

SERVICING:—Replace all defective dash units and tank units.

SINGLE BARREL CARBURETOR TYPE

Car Model	Carburetor
Graham Hollywood, 113 (1941)	WA-1 472-S
Hudson Six, 10, 18 (1941)	WA-1 454-S
Nash Ambass. Six, 4160 (1941)	WA-1 435-S
Oldsmobile Six, 66, 76, 96 (1941)	WA-1 481-S, 504-S
Pontiac Six, 41-24, 25, 26 (1941)	WA-1 494-S
Studebaker Champion, 3G (1941)	WA-1 496-S
Studebaker Commander, 11A (1941)	WA-1 410-S

DUAL CARBURETOR TYPE

Buick, 41-40 (1941) Single Carburetor	WCD 487-S
Buick, 41-40, 50 (1941) Compound Carburetion	WCD 509-S
Buick, 41-60, 70, 90 (1941) Compound Carburetion	WCD 490-S
Cadillac, 41-60S,61,62,63,67,75 (1941)	WDO 506-S
Graham Hollywood, Schgr. 109 (1941)	WDO 488-S
Hudson Six, 11, 12 (1941)	WDO 461-S, 501-S
Hudson Eight, 14, 15, 17 (1941)	WDO 455-S, 502-S
Nash Ambass. Eight, 4180 (1941)	WDO 511-S

Packard Eight, '120' 1901, 1A (1941)	WDO 478-S
Pontiac Eight, 41-27, 28, 29 (1941)	WDO 469-SM
Studebaker President, Model 7C (1941)	WDO 409-S

NOTE:—Buick Compound Carburetion Cars—Front carburetor only is fitted with automatic choke (Climatic Control) and fast idle. Rear carburetor does not have choke valve or fast idle mechanism.

Buick, Cadillac, Studebaker Commander & President Models—These cars also use Stromberg Carburetors (AAV-16—Buick, AAV-26—Cadillac & Studebaker President, BXOV-26—Studebaker Commander). See separate articles on Stromberg Automatic Choke & Fast Idle for data on cars with Stromberg carburetors.

SPECIAL SERVICE NOTES:—Studebaker Champion—To correct complaints of insufficient heat at Climatic Control, which will cause choke valve to be slow in opening as engine warms up, make certain that heat tube is not bottoming in pocket in exhaust manifold. It is recommended that end of heat tube be cut off at an angle so that tube cannot bottom and close off passage in tube.

DESCRIPTION:—The Carter Climatic Control is an automatic choke designed to choke the carburetor for cold starting and to control the choking action during the warming up period. It employs a combination of engine temperature (hot air from hot air stove on manifold is delivered to control unit case by a flexible connecting tube) and manifold vacuum (vacuum passage in carburetor casting connects port below throttle valve and port in control case) to actuate a thermostatic spring linked to the choke valve shaft lever and a vacuum piston assembly built around the shaft lever (piston is mounted directly on end of lever). The control is adjusted to close the choke valve completely at 70°F. and the choke valve is opened progressively by the thermostatic spring as the engine warms up. The piston assembly, actuated by manifold vacuum, tends to open the choke when the engine begins to fire and prevents over-choking. A 'fast-idle' control is linked on the choke valve shaft (see below).

THERMOSTATIC COIL SETTING:—On all models except those noted in table below, center index mark or notch on thermostatic coil housing should be lined up with mark on piston plate housing. On other models, thermostatic coil housing should be rotated clockwise (Rich), counter-clockwise (Lean), number of notches shown in the table below.

Car Model	Carburetor	Thermostat Coil Setting
Hudson 6 & 8	501-S, 502-S	③1 Notch Lean
Nash Six 4160	435-S	①1 Notch Rich
Nash Eight 4180	511-S	②Centered
Oldsmobile Eight	480-S Only	2 Notches Rich
Packard Eight	478-S Only	1 Notch Rich
Pontiac Six	494-S	3 Notches Rich
Pontiac Eight	469-SM	2 Notches Rich
Studebaker Comm. 11A	410-S	1 Notch Rich
Studebaker Pres. 7C	409-S	1 Notch Rich
All Others		Centered

①—Supersedes 2 Notches Rich originally specified for this model.
②—Supersedes 1 Notch Rich originally specified for this model.
③—Supersedes Centered Setting originally specified for these models.

Adjustment—Loosen two mounting screws on rim of thermostatic coil housing, rotate coil and housing assembly, tighten mounting screws. NOTE—See Servicing data below for proper installation of thermostatic coil and housing assembly if taken off carburetor.

NOTE—If performance not satisfactory with standard settings as given above, thermostatic coil can be rotated 1 notch clockwise to lean setting (if engine runs rich or has a tendency to load up), 1 Notch counter-clockwise to enrich setting (if engine runs lean during warming up period). Adjustments should always be made with engine Cold (allow 4 hours for engine to cool off after being run), setting should be changed only 1 notch at a time, and performance should be checked while engine is warming up.

SERVICING (SINGLE BARREL CARBURETOR TYPE):—Disassembly—Take out attaching screws, remove retainers on rim of piston housing plate, turn thermostatic coil housing clockwise to disengage coil hook from prong, remove thermostatic coil and housing assembly. Remove strainer screen. Take out choke valve retaining screws, remove valve. Loosen clampscrew on fast idle link and lever assembly, bend lip under screw with screwdriver so that it clears portion of choke valve shaft which is not flat, revolve choke valve shaft so that piston clears cylinder, withdraw choke shaft, piston, piston lever and link as an assembly. Do not remove the rivet mounting piston plate housing on the air horn (these parts line-reamed at factory). If piston plate housing has been removed, line up the three holes so that the choke valve shaft and piston work freely.

Servicing—Wash all parts except thermostatic coil and housing assembly and cork gaskets in clean gasoline. Clean thermostatic coil assembly and blow out all passages with air. Replace all worn or damaged parts, use new gaskets when reassembling. CAUTION—Make certain that end of thermostatic coil does not drag on housing. Replace assembly if coil drags or is distorted.

Reassembly—Install choke shaft, piston lever, link, and piston in air horn and at the same time install choke lever, link, and screw assembly on shaft behind piston plate housing. Install choke valve using new screws and turning screws down loosely, close choke valve and tap valve lightly to centralize valve in air horn, then tighten valve screws securely. See that choke valve operates freely without binding in air horn. Tighten choke lever screw. Install strainer in piston plate housing (replace if dirty or clogged). Install thermostatic coil housing with reference mark or label at bottom, turn counter-clockwise until mark is at top and in line with mark on piston plate housing, tighten retaining screws. Check thermostatic coil setting (above), check and adjust Fast Idle, and Unloader (see Fast Idle section below).

SERVICING (DUAL CARBURETOR TYPE):—Disassembly—Take out attaching screws, remove retainers on rim of piston plate housing, turn thermostatic coil housing clockwise to disengage coil hook from prong, remove thermostatic coil assembly. Remove screw holding choke trip lever (fast idle end of choke valve shaft), remove washer, trip lever, fast idle cam and collar assembly from shaft. Take out choke valve attaching screws, remove valve. Turn shaft counter-clockwise until piston clears cylinder, remove piston (flat type) pull shaft and lever assembly out of air horn (round type piston removed as part of shaft assembly—use care not to lose piston pin).

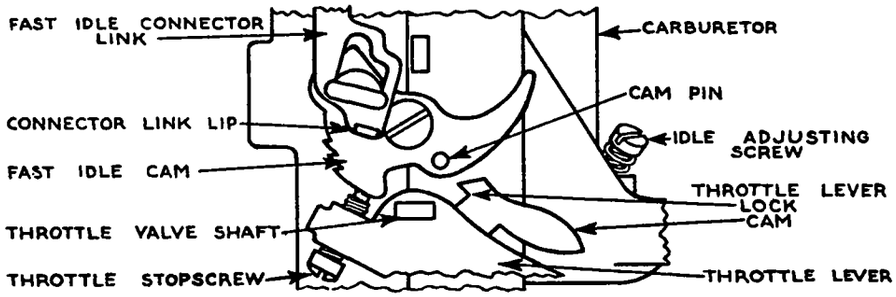
Servicing—Same as Single Barrel type (above).

Reassembly—Install choke shaft, lever, and piston assembly in air horn. Install choke valve using new screws and tapping valve lightly before screws tightened to centralize it in air horn bore. Check to see that valve operates freely and does not bind (valve should fall open of own weight). Install fast idle cam and collar assembly, washer, and trip lever on shaft, tighten mounting screw. Install piston housing strainer. Install thermostatic coil and housing assembly with reference notch at bottom, turn assembly counter-clockwise until notch is at top in line with reference mark on piston plate housing, tighten retaining screws. Check Thermostatic Coil setting (above), adjust Fast Idle, Unloader, and Choke Valve Lock (see Fast Idle section below).

INSTALLATION CAUTION:—Make certain that hot air flexible tubing connections are tight. Air leak at housing will interfere with correct Climatic Control operation. See that choke valve operates freely without binding at any point.

CONTINUED ON NEXT PAGE

FAST IDLE & UNLOADER



SINGLE BARREL CARBURETOR TYPE

FAST IDLE:—Consists of a fast idle cam pivoted directly above the throttle lever (serves as throttle lever stop) and linked to automatic choke mechanism.

Adjustment—To check, see that fast idle cam is in normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against (not on) first step of cam. Hold cam in this position and check choke valve opening by using tool T109-85 (all models) to check clearance between edge of valve and air horn wall. Clearance should be 5/8". If clearance not correct, adjust by bending offset portion of fast idle link using tool T109-41.

UNLOADER:—Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

Car Model	Carburetor	Gauge Number	Choke Valve Clearance
Graham 113	472-S	T109-83	1/2"
Hudson 10, 18	454-S	T109-81	7/16"
Nash 4160	435-S	T109-82	31/64"
Oldsmobile 6	504-S	T109-81	7/16"
Oldsmobile 6	481-S	T109-80	3/8"
Pontiac 6	494-S	T109-106	7/32"
Studebaker Champ.	496-S	T109-31	1/4"
Studebaker Comm.	410-S	T109-31	1/4"

TRIP LEVER:—Hudson Model 454-S—Should be adjusted after all other choke linkage adjustments have been made. This trip lever not used on other carburetor models.

Adjustment—Hold choke valve tightly closed with pin on fast idle came resting at bottom of slot in fast idle link. Bend trip lever stop on fast idle link so that clearance between fast idle cam and lip on trip lever is .010".

'WCD' DUAL CARBURETOR TYPE

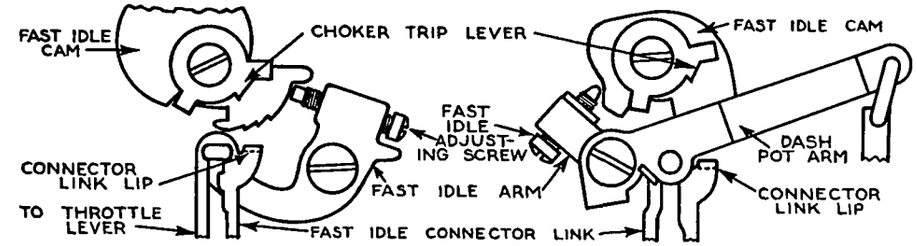
FAST IDLE:—Consists of a fast idle cam and cam trip lever assembly mounted on the carburetor so that the cam engages the fast idle screw on the throttle shaft dog and collar assembly. Cam trip lever is linked to the choke valve shaft by a connector rod so that the cam is rotated to the fast idle position when the choke valve is closed for cold starting. As the choke valve opens, trip lever is revolved and spring returns fast idle cam to off position and throttle valves return to hot or slow idle speed position (controlled by throttle stopscrew).

Adjustment—With choke valve tightly closed, adjust fast idle screw so that clearance between throttle valve and carburetor bore on side opposite idle port is .012" (487-S), .015" (490-S), .012" (509-S). To make this adjustment, back off throttle stopscrew, back off fast idle adjusting screw until it just contacts high point of fast idle cam (choke valve closed and fast idle cam in fast idle position), then turn fast idle screw in 2½ turns (all models) which will provide correct throttle opening. Reset throttle stopscrew for correct hot or slow idle speed.

UNLOADER:—Consists of an ear on the throttle lever which engages fast idle cam so as to open the choke valve when the throttle valve is opened wide.

Adjustment—Two separate adjustments required as follows: **First**—Loosen screw on choke valve shaft lever, insert .010" feeler between lip on fast idle cam and boss on carburetor flange casting, hold choke valve tightly closed and tighten lever screw. **Second**—With throttle valves wide open, adjust unloader lip on throttle lever so that choke valve opening or clearance between upper edge of choke valve and air horn wall is 3/16" (use T109-28 gauge to check opening on all models).

'WDO' DUAL CARBURETOR TYPE



FAST IDLE:—Consists of a fast idle lever and screw mounted directly below the fast idle cam on the choke valve shaft so that the fast idle screw contacts the fast idle cam and positions the lever in accordance with the choke valve position. Fast idle lever is linked to throttle valve lever so that the throttle valve is held open in fast idle position when the choke valve is closed.

Adjustment—Hold choke valve tightly closed, adjust fast idle screw so that clearance between throttle valve and carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge inserted between edge of valve and wall to check opening).

Car Model	Carburetor	Throttle Opening	Checking Gauge
Cadillac	506-S	.023"	T109-149
Graham 109	488-S	.026"	T109-114
Hudson 6 & 8	461-S, 455-S	.018" (See Note)	T109-44
Hudson 6	501-S	.045"	
Hudson 8	502-S	.053"	
Nash 8	511-S	.015"	T109-44
Oldsmobile 8	503-S, 480-S	.015"	T109-44
Packard 8	478-S, 512-S	.030"	T109-29
Pontiac 8	469-SM	.010"	See Note
Studebaker 7C	409-S	.018"	T109-44

Note—Gauge No. T109-44 used for both .015" and .018" settings.

Hudson Note—On Carburetor Models 461-S, 455-S, fast idle can be adjusted as follows: With throttle stopscrew set for correct slow idle speed of 600 RPM., open throttle so that clearance between stopscrew and stop on carburetor casting is .030", hold in this position, close choke valve, turn fast idle adjusting screw in until it just contacts fast idle cam.

Oldsmobile Note—With correct fast idle setting, clearance between throttle valve stopscrew and stop on carburetor casting should be .030" (503-S), .025" (480-S) with choke valve closed and fast idle screw on high lobe of fast idle cam.

Pontiac Note—Fast idle can also be adjusted as follows: Back off throttle stopscrew so that throttle valves tightly closed, hold choke valve closed, back off fast idle screw so that it clears high lobe of fast idle cam, turn screw in until it barely drags on cam, then turn screw in additional 5/8 turn to provide correct .010" throttle opening. With this fast idle setting, clearance between throttle lever stopscrew and stop on carburetor casting will be .032" with stopscrew set for correct hot or slow idle speed of 7-8 MPH.

UNLOADER:—Consists of a lip on the throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall is correct as shown in table below (use specified gauge to check this opening).

Car Model	Carburetor	Unloader Gauge No.	Clearance
Cadillac	506-S	T109-39	13/64"
Graham 109	488-S	T109-31	1/4"
Hudson 6	461-S, 501-S	T109-31	1/4"
Hudson 8	455-S, 502-S	T109-31	1/4"
Oldsmobile 8	503-S	T109-31	1/4"
Oldsmobile 8	480-S	T109-28	3/16"
Packard 8	478-S, 512-S	T109-28	3/16"
Pontiac 8	469-SM	T109-28	3/16"
Studebaker 7C	409-S	T109-28	3/16"

Choke Valve Lock:—With unloader properly adjusted, choke valve will be locked in wide open position with throttle valves wide open. Choke valve will be released when throttle valves closed.

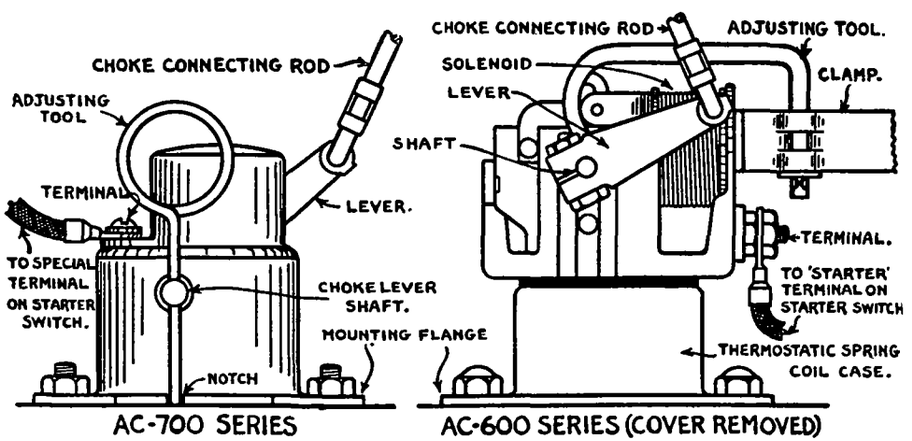
Car Model	Sisson Choke Model
Chrysler Six, Model C28 (1941)	AC-758B
Chrysler Eight, Models C30, C33 (1941)	AC-600
DeSoto, Model S8 (1941)	AC-758B
Dodge, Model D19 (1941)	AC-758B
Plymouth P11, P12 ('41)—Accessory Equipment	AC-758B

DESCRIPTION:—The Sisson Automatic Choke is a separate unit mounted on the exhaust manifold and connected to the carburetor choke valve lever by a connector rod. A solenoid within the choke case is connected to the starter side of the starting switch so that the solenoid is energized while the starter is operating. A thermostat is also mounted within the choke case and the solenoid and thermostat operate together to close the choke valve for cold starting and to control the choke valve during the warming up period. The AC-700 Series (AC-758B) and AC-600 Series, while of different design, operate in the same manner.

OPERATION:—When the starter is operated to crank the engine, the automatic choke solenoid is energized, attracting the armature, and rotating the choke lever, which is attached to the choke valve lever through a control rod so that the choke valve is closed if the engine is cold. When the engine is warm this armature movement does not take place and no choking action results. When the engine begins to fire and the starting switch is opened, the solenoid circuit is broken. The choke lever is then controlled entirely by the thermostatic spring within the choke case and this tends to rotate the lever and open the choke valve as the engine warms up. With the engine at normal operating temperatures, the choke valve will be entirely open.

ADJUSTMENT:—Model AC758B—Remove air cleaner, open throttle approximately ¼. Move choke lever until hole in automatic choke shaft (opposite end from lever) lines up with slot in bearings, insert special tool, Sisson No. C-723, through hole in shaft and push tool down so that lower end engages slot in choke base mounting flange. Loosen clampscrew on choke lever, press up on lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool.

Model AC-600—Remove air cleaner, open throttle approximately ¼, take off automatic choke cover. Clamp special adjusting tool, Sisson No. AC-620, in place on choke so that end of tool enters and lines up hole in armature and hole in magnet core, move flat bar on tool so that armature is locked tightly against magnet core. Loosen clampscrew on choke lever, move lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool and replace automatic choke cover.



CAUTION—When replacing air cleaner, make certain that clamp not tightened excessively which may cause choke valve to bind. See that choke valve does not bind or stick and that entire choke mechanism and fast idle linkage operate freely. Always check choke adjustment with throttle partly open. See car model 'T&E' page for Throttle-Cracker adjustment.

SERVICING:—If Trouble Shooting directions below do not correct faulty operation, remove Automatic Choke Unit and test operation on test fixture such as Sisson Model AC-753. Replace units which are defective. Do not oil any part of choke mechanism. When installing choke, make certain that heat insulating gasket is in place between exhaust manifold and choke case. Do not use a terminal screw on AC-758B models which is longer than original screw (Caution—a longer terminal screw will interefere with correct operation).

TROUBLE SHOOTING:—If engine does not start or warm up properly, and for all hard starting complants due to faulty choke operation, check following points first before replacing Automatic Choke.

Hard Starting with Cold Engine:

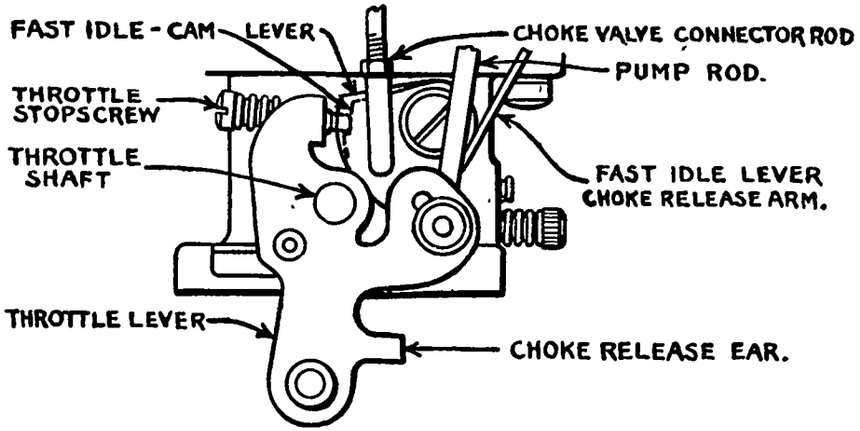
1. Check fast idle mechanism to see that it is free and not binding at any point (fast idle connecting rods usually connected to choke valve lever and binding will interfere with choke action).
2. See that choke rod connecting Automatic Choke lever and choke valve lever does not bind in levers.
3. Examine carburetor choke lever, Automatic Choke lever, and fast idle mechanism and remove all paint, grease, or dirt which might cause binding.
4. Check carburetor choke valve, see that edges are smooth and that valve does not rub against air horn walls or bind in any position. See that air cleaner does not interfere with choke valve and that mounting screw is not tightened excessively which will distort air horn and bind choke valve (check choke valve operation with air cleaner in place).
5. Check electrical connections at Automatic Choke and starter switch. Examine wire for short-circuits and breaks.
6. Check Automatic Choke ground (unit grounded through case). See that mounting screws are tight and that manifold under mounting flange is clean.
7. Check throttle cracking linkage (see Tune up instructions on car model page). This is important to insure correct throttle opening for starting and to place automatic choke in operation (on some cars with fast idles, fast idle will prevent choke valve closing until throttle valve has been opened to free fast idle cam).
8. Check Automatic Choke adjustment (see instructions above). If Automatic Choke does not function correctly after checking these points, the unit should be replaced.

Hard Starting with Hot Engine:

1. Check for rich mixture or flooding caused by percolating discharge of carburetor when engine stopped. To check, remove air cleaner immediately after stopping engine, note whether gasoline dripping into manifold from carburetor nozzle (this overflow should show up within 3-5 minutes after engine is stopped). Correct by installing special size Float Valve Needle and Seat Assembly and checking float level. See carburetor article in Carburetor Section for float level specifications.
2. Check carburetor for High Float Level. See Carburetor article in Carburetor Section for Float Level specifications and adjusting directions.

Engine Stalls while Cold:

1. Check Manifold Heat Control Valve. See Manifold Heat Control data on car model 'T&E' page for directions.
2. Check carburetor Fast Idle setting. See Carburetor article in Carburetor Section for directions.



CHRYSLER EIGHT FAST IDLE

Car Model	Carburetor	Automatic Choke
Chrysler Eight, C30, C33 (1941)	Stromberg AAV-2	Sisson AC-600

NOTE:—This Carburetor and Fast Idle is used in conjunction with a separately mounted automatic choke, Sisson Model AC-600. See Sisson Automatic Choke article for data on this unit.

DESCRIPTION & OPERATION:—**Fast Idle**—Consists of a stepped fast idle cam and a fast idle lever pivoted directly above the throttle valve shaft and linked to the choke valve lever. Fast idle cam serves as the stop for the throttle stopscrew. When the choke valve is closed for cold starting, fast idle cam is rotated so that the stopscrew rests on the highest step of the cam and the throttle valve is opened to the fast idle position. As the engine warms up and the choke valve opens, fast idle cam is allowed to drop down and throttle valve to close progressively until, when the choke valve is wide open, the throttle is closed to the hot or slow idle position with the stopscrew resting on the lowest step of the cam.

Unloader or Choke Release—Consists of an ear on the throttle lever which strikes an extended arm on the fast idle lever when the throttle is opened wide so that the choke valve is opened somewhat to correct flooding caused by over-choking.

SETTING & ADJUSTMENT:—**Fast Idle**—To check setting, close throttle valve so that stopscrew is against first step of fast idle cam. Move choke valve toward closed position as far as possible (do not force valve beyond point where stopscrew strikes edge of next step on fast idle cam). Choke valve opening in this position should be ⅛" (check by inserting ⅛" drill rod between edge of valve and air horn wall). Adjust by loosening locknut and changing position of ball joint on lower end of connector rod.

Choke Release—To check setting, open throttle valve wide, note choke valve opening by inserting drill rod between edge of valve and air horn wall. Opening should be 7/32". Adjust by bending arm on fast idle cam lever slightly.

CHRYSLER SLOW-CLOSING THROTTLE VACAMATIC OVERDRIVE TYPE

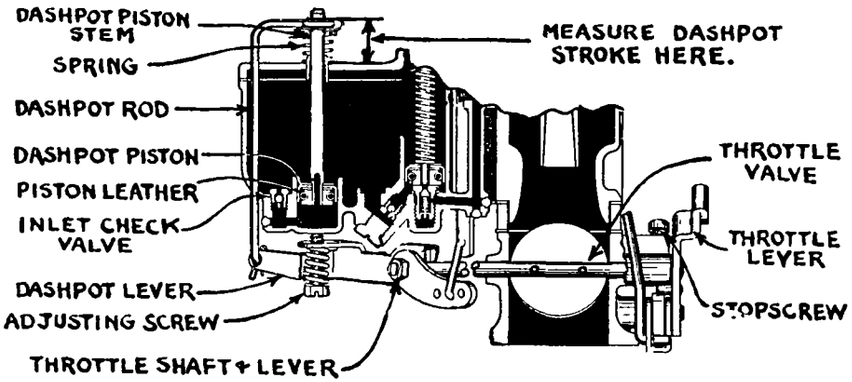
Used on following Models with Fluid Drive:

Chrysler Eight, Saratoga & New Yorker Models C30K, C30N (1941)

Chrysler Eight, Crown Imperial Model C33 (1941)

DESCRIPTION & OPERATION:—Throttle Guard is designed to prevent engine stalling when the accelerator pedal is released quickly. It consists of a plunger operating on a swivel block which is part of the accelerator linkage. Plunger is actuated by a spring-loaded vacuum diaphragm unit (similar to those used for vacuum spark control) connected to the engine manifold and having a relief valve at the point where it is connected to the Throttle Guard body. In normal operation, the throttle guard plunger follows the swivel in the linkage as the accelerator pedal is depressed (due to the vacuum unit spring pressure). When the accelerator pedal is released quickly, the increase in manifold vacuum acting with the throttle return spring pull offsets the vacuum unit spring pressure and the accelerator pedal return is retarded, the speed of the pedal return being controlled by the metered relief valve in the vacuum line.

SETTING:—With engine running at idle speed of 5 MPH. (5-7 MPH) in high gear on level road, throttle control plunger should just touch swivel block on throttle rod. Setting can be adjusted by loosening capscrews holding vacuum unit on throttle cross-shaft and rotating unit to proper position. Tighten capscrews after completing adjustment.



SERVICING:—**Assembly & Adjustment**—When installing throttle guard, see that carburetor adjusted for correct idle mixture and speed (smooth firing and idle speed of 5 MPH). With push pin removed, attach throttle guard and bracket so that bracket is horizontal and 1⅛" from end of tube. Hold choke valve open, close throttle so that stopscrew is against low step on fast idle cam (hot or slow idle speed position), insert stub pin setting tool, adjust nut on rear end of bell crank-to-carburetor rod so that slight drag secured on .010" feeler placed between swivel block and stub pin setting tool. Tighten locknut using extreme care not to disturb position of adjusting nut. Remove stub pin setting tool and install throttle guard push pin.

DODGE SLOW-CLOSING THROTTLE

Used on following Models with Fluid Drive:

Car Model	Carburetor
Dodge, Custom & Deluxe Model D19 (1941)	BXVD-3

NOTE:—This carburetor with Slow-closing throttle used on cars with Fluid Drive only.

DESCRIPTION & OPERATION:—The Slow-closing Throttle device consists of a dashpot and piston assembly in the float bowl with the piston linked by a rod to a control lever which engages the throttle valve lever. When the throttle is opened, dashpot cylinder is filled with fuel which flows freely in through dashpot check valve. When the accelerator pedal is released (to close throttle), this fuel is trapped in the cylinder and is allowed to escape slowly through the relief hole in the dashpot piston stem above the piston. This action retards the movement of the piston and linkage toward the closed throttle position and the linkage prevents the throttle valve closing too rapidly.

ADJUSTMENT:—Adjusting screw on dashpot control lever under float bowl should be adjusted for proper stroke (turn screw in to lengthen stroke, out to shorten stroke). Full travel of dashpot piston should be 5/16-11/32" with all slack removed from linkage. To check, place rule on float bowl cover at dashpot piston stem, measure distance from bowl cover to edge of retainer on stem, open throttle and recheck distance. Difference in readings should be 5/16-11/32".

SERVICING:—No special servicing operations required. See Carburetor article in Carburetor Section for complete carburetor servicing data including Slow-closing throttle mechanism.

CHRYSLER & DE SOTO SLOW CLOSING THROTTLE

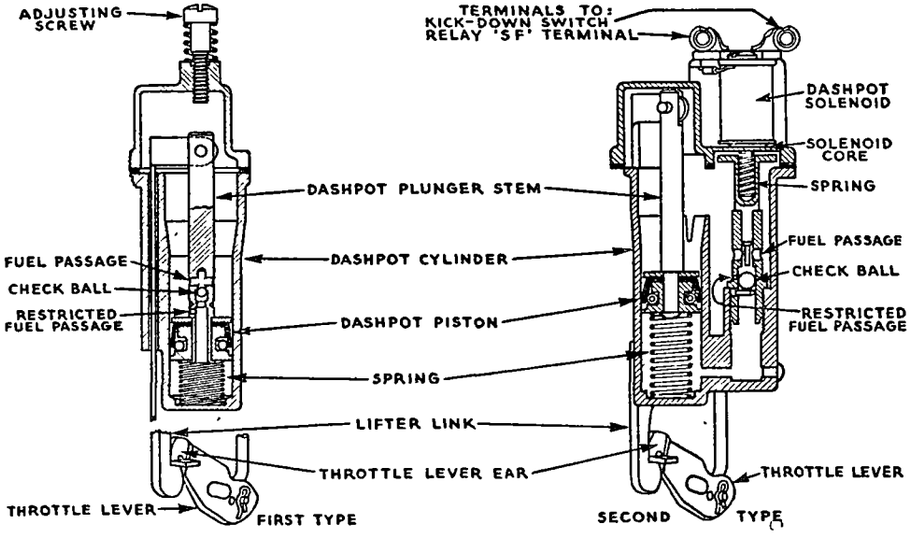
Used on following Models with Fluid Drive:

Chrysler Six, C28 (1941)—With Vacamatic Underdrive Transmission.
Chrysler Six, C28 (1941)—With Std. Transmission (EA1 Carburetor).
DeSoto, Model S8 (1941)—With Simplimatic Underdrive Transmission.
DeSoto, Model S8 (1941)—With Std. Transmission (EB1 Carburetor).

PRODUCTION CHANGE NOTE:—Two different types of Slow-closing Throttle have been used on 1941 cars. First type (no solenoid) has adjustment screw and should be adjusted as directed below. Second type (with solenoid control) is not adjustable and does not require attention.

DESCRIPTION & OPERATION:—The Slow-closing Throttle device consists of a dashpot built in the carburetor float bowl with the dashpot piston linked to the throttle lever. When the throttle valve is opened, dashpot piston is lifted up in cylinder and cylinder fills with fuel which flows in through the fuel passage and past the check ball. When the accelerator pedal is released to close the throttle, the check ball moves up to close the large fuel passage and the fuel trapped in the cylinder prevents the dashpot piston moving down so that the throttle is prevented from closing. The fuel in the cylinder is allowed to escape through the restricted fuel passage and this allows the piston to descend slowly and the throttle valve to close slowly. The first type slow-closing throttle has an adjustment screw located in the carburetor casting directly above the upper end of the dashpot piston stem. This screw should be adjusted as directed below. Second type slow-closing throttle does not have this adjustment screw

Dashpot Solenoid (Second Type Slow-closing Throttle on Carburetor Models E6T2 & E6U2)—On this model, dashpot fuel control valve is a separate unit (valve built in dashpot plunger stem on first type) with a spring-loaded solenoid operated valve plunger directly above the fuel passage check ball. At car speeds below 8 MPH (First or Second Gear), 15 MPH. (Third or Fourth Gear), solenoid is energized and the valve plunger is drawn up so that the check ball is free to seat and shut off the large fuel passage so that fuel forced out of cylinder is required to flow through restricted fuel passage which retards closing of throttle valve and provides correct slow-closing throttle action. At car speeds above 8 MPH. (First or Second Gear), 15 MPH. (Third or Fourth Gear), solenoid is not energized and spring forces valve plunger down which prevents check ball seating. Fuel is then free to escape from cylinder through upper large fuel passage and throttle closes promptly without slow-closing throttle action.



Solenoid Wiring—Solenoid has two terminals. Either terminal should be connected to the terminal on the 'Kick-down Switch' on the carburetor and the other terminal should be connected to the 'SF" terminal on the Transmission Control Relay (see car model wiring diagram on 'T&E' page for complete transmission wiring diagram). With these connections, solenoid is energized with the Governor Switch contacts closed, and inoperative with the Governor Switch contacts open (at speeds above 8 or 15 MPH. as detailed above).

ADJUSTMENT:—First Type Slow Closing Throttle (On Carburetor Models E6T1, E6U1, E6V1, EA1, EB1)—Adjustment screw should be turned out approximately 5 full turns. To adjust, turn screw in as far as possible, then back screw out exactly 5 full turns to provide correct stroke of 7/32" and check operation. If engine tends to stall when throttle is closed, retarding action is insufficient and screw should be turned out slightly. If automatic upshift is retarded, screw should be turned in slightly (too much retarding of throttle closing will delay synchronizing of gears and delay shifting).

Second Type Slow-closing Throttle (Carburetor Models E6T2, E6U2)—No adjustment required.

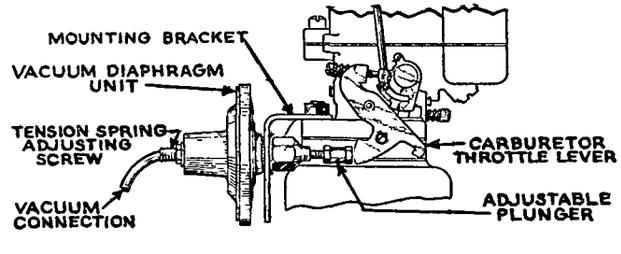
SERVICING:—No special servicing operations required. See Carburetor article in Carburetor Section for complete carburetor servicing data including Slow-closing Throttle mechanism.

NOTE—Leather seal on dashpot piston must be in good condition for proper operation. Worn, cracked, dry, or damaged piston seal will permit fuel escape past piston and interfere with slow-closing throttle action.

1941 PACKARD THROTTLE GUARD

Used on following Models with Econo-Drive:

Packard Clipper, Model 1951 (1941)
Packard Six, '110' Model 1900 (1941)
Packard Eight, '120' Models 1901, 1A (1941)
Packard Super Eight, '160' Models 1903, 4, 5 (1941)
Packard Custom Super Eight, '180' 1906, 7, 8 (1941)



DESCRIPTION:—Throttle Guard is designed to prevent engine stalling in the range from 0 to 20 M.P.H. It consists of a vacuum diaphragm unit, similar to those used on distributors for vacuum spark control, mounted on the carburetor so that the diaphragm plunger actuates the throttle valve fast idle lever.

OPERATION:—Throttle Guard cuts in at 4 MPH. when manifold vacuum decreases sufficiently so that spring within unit forces plunger out against throttle lever opening throttle and accelerating engine to prevent stalling. Throttle Guard kicks out at 9 MPH. when manifold vacuum increases sufficiently to retract plunger and allow throttle to close to regular 6 MPH hot or slow idle speed position.

ADJUSTMENT & TESTING:—*Note*—Make certain that carburetor correctly adjusted and set for 6 MPH. hot or slow idling speed before adjusting Throttle Guard.

Adjustment—Check clearance between outer end of throttle guard plunger and lug on throttle lever. This should be .060" (Six), .020" (Eight, Super Eight). Loosen locknut and turn tension spring and adjusting screw on outer face of throttle guard until distance from top of locknut to end of screw is 3/16" (Six, Eight), 7/32" (Super 8), tighten locknut. Check setting by road-testing car.

Road Testing—See that Overdrive Control knob pushed in (Overdrive operative), allow car to coast in high gear (accelerator pedal released) and decrease car speed slowly by applying brakes. Throttle guard should cut in at 4 MPH. (slight movement of accelerator pedal will be noted) and bring car speed up to 9 MPH. (with brakes released) at which speed it should kick out. If cut in speed is above 4 MPH., decrease spring tension by turning adjusting screw out slightly; if cut in speed below 4 MPH., increase spring tension by turning screw in. If kick out speed is higher than 9 MPH., increase gap between diaphragm plunger and throttle lever (loosen locknut and turn plunger on rod); if kick out speed below 9 MPH., decrease gap.

Used On:

Car Model	Carburetor
Buick, 41-40,50,60,70,90 (1941)	AAV-16
Cadillac V8, 41-60S,61,62,63,67,75 (1941)	AAV-26
Packard Super 8, '160' 1903,4,5; '180' 1906,7,8 ('41)	AAV-26
Studebaker President, Model 7C (1941)	AAV-26

NOTE:—Buick Compound Carburetion Cars—Front carburetor only (AAV-16) is fitted with Automatic Choke and Fast Idle. Rear Carburetor (AA-1) does not have choke valve or fast idle mechanism.

Buick, Cadillac, Studebaker Models—These cars also use Carter WCD (Buick), WDO (Cadillac, Studebaker) carburetors. See Carter Climatic Control article for data on automatic choke and fast idle on cars with Carter Carburetors.

DESCRIPTION & OPERATION:—Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam, but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed by thermostatic coil for cold starting, cam is revolved so that the throttle stopscrew rests on highest step of the cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.

ADJUSTMENT:—Thermostatic Coil Setting—Inverted 'V' mark or '0' mark on thermostatic coil housing should line up with reference mark on choke housing (all models except Buick AAV-16 Single Carburetor on Series 41-40), 1 Notch Lean (Buick 40 with Single Carburetor) or clockwise from mark on housing. This standard setting may be varied not more than 2 graduations (AAV-26) for use of high test fuel or with exceptional operating conditions. If warming up performance is not satisfactory with this setting, check choke valve and linkage for binding or replace thermostatic coil assembly. When installing thermostatic coil, place coil housing in position with coil hook down, then rotate housing in 'Rich' direction until correct setting secured (this will insure coil hook engaging prong properly).

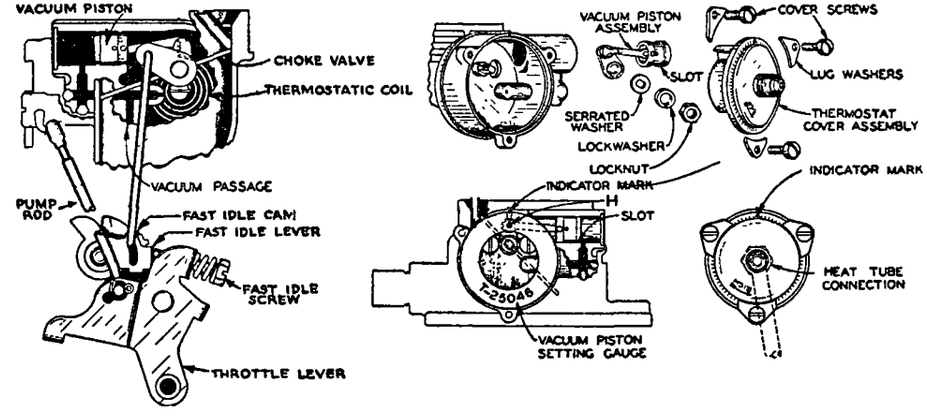
NOTE—For identification, thermostat coil cover has the figure '6' (All Buick models), '14' (Packard) stamped on the face of the cover near the direction arrow which is marked 'Rich.'

Studebaker Models—Choke housing on these models marked by three letters 'H', 'M', 'R'. To adjust, loosen mounting screws, rotate housing until 'R' mark lines up with reference projection on housing flange. This is standard setting. If engine tends to load up or over-choke, change setting to 'M' position. Use 'H' setting only when highly volatile fuels used.

CAUTION—When connecting heat tube, use extreme care not to use excessive pressure in tightening connection which may rotate thermosatic coil housing and change setting.

Fast Idle Setting—After setting both slow idle speed (throttle stopscrew adjustment), and fast idle speed (fast idle adjusting screw adjustment), see that choke valve is open, close throttle valve so that stopscrew is on high lobe of cam (all models except Buick for which see note below). Move the choke valve toward closed position as far as possible (do not force valve beyond point where stopscrew strikes against next step of fast idle cam). Measure remaining choke valve opening by inserting drill rod or special gauge (see table below) between edge of valve and air horn wall. If choke valve opening not correct, adjust by bending connector rod slightly at point below choke valve lever.

Buick Models—To check fast idle setting on these models, close choke valve against #53 drill (between valve and wall), open and close throttle and note clearance between locking lever on throttle valve lever and lug on loose lever mounted on fast idle cam shaft. Lever should just clear lug. Adjust by bending fast idle connector rod slightly.



Car Model	Carburetor	Choke Valve Opening
Buick	AAV-16	See Special Data.
Cadillac	AAV-26	#32 Drill (.116")
Packard	AAV-26	7/64"
Studebaker	AAV-26	7/64"

Choke Release (Wide Open Throttle Adjustment)—Open throttle to wide open position so that choke valve is opened by ear on fast idle lever contacting lug on fast idle cam. Check choke valve opening with special gauge T-25057 (Buick), T-25056 (All Others), or by inserting drill rod between edge of choke valve and air horn wall. Opening should be .156-.187" (11/64" drill). Adjust by bending ear on throttle lever slightly.

SERVICING (EXCEPT STUDEBAKER AAV-26):—Disassembly—Disconnect heat tube, remove carburetor from manifold, remove thermostatic coil housing attaching screws and lug washers, remove coil assembly by rotating cover clockwise to disengage coil hook from lever prong and lifting cover off. Remove locknut on end of choke valve shaft (use wrench T-25047), remove nut, lockwasher, serrated washer from shaft. Take out vacuum piston assembly.

Servicing—Clean cylinder with cloth saturated with Acetone or alcohol, blow out all channels with air, clean screen on inside of cover by blowing through heat tube connection (use care not to distort screen. Do not attempt to remove thermostat coil (coil and cover serviced as an assembly).

Assembly & Adjustment—When installing vacuum piston, make certain that slot is down toward vacuum port (do not lubricate cylinder). Assemble the serrated washer, lockwasher, and locknut in order on the end of the choke shaft and tighten nut only loosely (do not tighten fully until vacuum piston adjusted). Install gauge ring, tool T-25046, with small hole in tool fitting over pin on choke lever and indicator line on rim of tool in line with reference mark on choke housing. Hold choke valve closed against drill or gauge (see table),

tighten locknut lightly with wrench T-25047, remove gauge ring T-25046 and tighten the locknut securely. Recheck the choke valve to make certain that setting not changed by tightening of locknut. See that choke valve operates freely. This adjustment is extremely important to properly position vacuum piston and thermostatic coil prong. When assembly fast idle connector rod, install bushing (washer—Buick) on lower end of rod only after rod has been assembled to lever. See that fast idle cam torsional spring is assembled with end of spring hook against ear of lever. See that cam operates freely and make certain that rod does not bind in slot in cam. This is very important.

Car Model	Carburetor	Drill — Valve Opening — Gauge
Buick 40 Single Carb.	AAV-16	15/64" — T-25086
Buick All Comp'd. Carb.	AAV-16	#5
Cadillac	AAV-26	#3 (.213")
Packard	AAV-26	#4 — T-25085

SERVICING (STUDEBAKER AAV-26):—Serviced in same manner as BXOV-26 models (vacuum piston lever slotted for choke valve shaft engagement and no adjustment required). *See Stromberg BXOV-26 Automatic Choke article for servicing data on this model.*

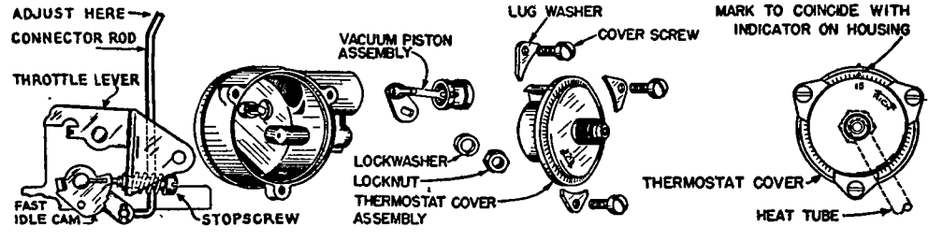
Used On:

Car Model	Carburetor
Packard Six, '110' Model 1900 (1941)	BXOV-26
Studebaker Commander, Model 11A (1941)	BXOV-26

NOTE:—Studebaker Model—Carter WA1 Carburetor also used on this model. See Carter Climatic Control article for data on Automatic Choke and Fast Idle on cars with Carter Carburetor.

DESCRIPTION & OPERATION:—Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam, but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed for cold starting, cam is revolved so that throttle stopscrew rests on highest step of cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.



ADJUSTMENT:—Thermostatic Coil Setting—Inverted 'V' mark or '0' mark on thermostatic coil housing should line up with reference mark on choke housing. This standard setting may be varied not more than 2 graduations for use of high test fuel or with exceptional operating conditions. If warming up performance is not satisfactory with this setting, check choke valve and linkage for binding or replace thermostatic coil assembly. When installing thermostatic coil, place coil housing in position with coil hook down, then rotate housing in 'Rich' direction until correct setting secured (this will insure coil hook engaging prong properly).

Studebaker Models—Choke housing on these models marked by three letters 'H', 'M', 'R'. To adjust, loosen mounting screws, rotate housing until 'R' mark lines up with reference projection on housing flange. This is standard setting. If engine tends to load up or over-choke, change setting to 'M' position. Use 'H' setting only when highly volatile fuels used.

CAUTION—When connecting heat tube, use extreme care not to use excessive pressure in tightening connection which may rotate thermostatic coil housing and change setting.

Fast Idle Setting—With choke valve open, close throttle so that stop-screw is on low lobe of fast idle cam and against step on cam. Move choke valve toward closed position as far as possible (do not force valve beyond point where all clearance is taken up). Check remaining choke valve opening by inserting 11/32" drill rod between edge of choke valve and air horn wall. If opening not correct, adjust by bending connector rod slightly at bend near upper end. CAUTION—Make certain that fast idle mechanism does not bind.

SERVICING:—Disassembly—Disconnect heat tube from thermostat coil cover, remove carburetor from manifold. Remove thermostat coil cover attaching screws and lug washers, remove thermostat coil and cover assembly (rotate cover clockwise to disengage coil hook from lever prong). Remove cork insulator and baffle plate. Remove locknut on end of choke valve shaft (use wrench T-25047), remove lockwasher. Loosen housing attaching screws slightly (do not take screws out), take out vacuum piston assembly.

Servicing—Clean vacuum piston cylinder with clean cloth saturated with Acetone or alcohol. Clean vacuum piston (do not use abrasives). Blow out all channels with compressed air. Do not attempt to remove thermostatic coil from housing (service as an assembly).

Assembly—Do not lubricate piston or cylinder when installing vacuum piston assembly. Install piston and engage slot in lever on flatted end of choke valve shaft (can only be installed in correct position), tighten housing attaching screws securely. Install lockwasher and and locknut, use wrench T-25047 to tighten locknut securely. Install baffle plate and cork insulator (CAUTION—if cork insulator buckled or does not fit properly, it will cause vacuum piston lever to bind and new insulator should be used). Install thermostat coil and cover assembly and adjust as directed above.

BANTAM NOTE—All Bantam Model 65 (1941) Specifications and Service Data same as for 1940 model. Refer to 1940 Supplement for Bantam Model 65 (1940).

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Hood hinged at each side. Hood fastener handle (part of louvre moulding stamped with car model name, Special, etc.) located at each side. To raise hood, pull out fastener handle, push in on safety catch rod with red rubber covering (under fastener handle) and hold until hood raised. Hood can be held open with support arm on upper edge of engine dash.

HOOD REMOVAL:—Unlatch both hood fasteners (at each side), release safety catches and lift hood off. No tools required.

HOOD ADJUSTMENT:—Hood Fastener. Fasteners must pass over and inside of ribs in fastener plates under edge of hood at each side. Outer edges of fasteners must be parallel to hood flanges when locked. Adjust by removing cotter pin holding operating link in rear fastener. Change operating link rod length by turning rod in or out of trunnion on handle until outer edge of fasteners are parallel to fender flange with fastener closed.

Hood Pilot—Adjust pilots in fender (to rear of each fastener) for proper hood fit to fender and cowl.

Grille to Hood Nose—Hood clearance between hood nose and top center grille strip should be ⅛". Adjust bolted bracket at top rear of grille on radiator stamped cover.

Rear Brackets—U shaped hood hinge located at upper rear corner of each front fender at cowl. These hinges or brackets prevent hood from contacting door if door opened as hood is raised. With hood raised, rear corner of hood must contact shroud. To adjust, bend outer edge of bracket until hood corner contacts shroud.

FRONT FENDER REMOVAL:—Fender forms hood side panel, headlamp shell, and part of radiator shell. Fender can be removed as follows: Disconnect headlamp wires at rear of junction blocks. Remove stamped cover over radiator (fastened to upper flange of front fenders) and insert pin in hole to secure fender to radiator mounting strap. Remove radiator side grille (work from above after stamped cover removed). Remove fender bolts from top flange of skirt, radiator lower panel, and skirt at gravel deflector. Remove cowl trim board and nuts (inside car). Remove fender-to-rocker panel bolts at lower rear corner of fender. Remove fender-to-cowl bolt at hinge pillar and lift off fender.

COMPRESSION RATIO CHANGE (FIRST CARS WITH COMPOUND CARBURETION):—On engines with first type Cylinder Head (see Production Change Note below) and compression ratio of 7.0-1, compression ratio can be lowered to correct spark rap by installing thicker head gaskets as listed below. *See Cylinder Head Gasket Installation data below.*

Model	Replacement Gasket	Compr. Ratio
40,50	No. 1323288①	6.67-1
60,70,90	No. 1297992②	6.68-1

①—This is production gasket used on later Series 41-40 cars with Single Carburetor.

②—This is 1940 type gasket which is .050" thick.

CYLINDER HEAD & COMPRESSION RATIO PRODUCTION CHANGE (ALL MODELS):—For lower compression ratio on all Compound Carburetion engines, new cylinder heads with combustion chamber depth increased by .032" were used in production on all cars after following Engine Numbers: 4220016 (40 with Single Carburetor), 4208629 to 4210399 and all engines after 4215901 (40,50 with Compound Carburetion), 4197602 (60, 70, 90). See special head gasket data below. IMPORTANT NOTE—Since these new heads also used on 40 with Single Carburetor, new .050" gasket used (original gasket .070" thick) for approximately same compression ratio (6.5-1 first, 6.4-1 later). See complete Head Gasket data following.

Cylinder Head Marking:—All cylinder heads machined for new compression ratio (above) marked 'L' at front end of spark plug cover face.

Cylinder Head Gaskets:—Gaskets unchanged on all Compound Carburetion Engines (.015" thick crimped type), change in compression ratio being effected by machining out head. On Series 41-40 with Single Carburetor, new thinner gasket (.050" thick—first type .070" thick) used to secure approximately same compression ratio with new head (same machined out head as used on other engines). NOTE—This new Series 41-40 gasket, Part No. 1323288, may be used on 1940 Series 40 & 50 cars (1940 gasket, No. 1303962, may be used on 1941 Series 40 but 1941 type is preferred as ferrules between cylinder bores provide greater strength). *See Cylinder Head Gasket Installation data below.*

Compression Ratio & Head Gaskets

Car Model	Ratio	Gasket	Ratio	Gasket
40 Single Carb	6.5-1	1321396	6.4-1	1323288
40,50 Compd.	7.0-1	1320433	6.7-1	1320433
60,70,90 Compd	7.0-1	1320436	6.7-1	1320436

CYLINDER HEAD GASKET INSTALLATION:—Gaskets now coated with lacquer. Whenever cylinder head removed, head and block should be thoroughly cleaned to remove any trace of lacquer from old gasket. **Do not use any type of coating (gasket oil, or sealer) when installing this new lacquer-coated cylinder head gasket. Always use new gasket whenever cylinder head installed.** These gaskets are crimped type. See Cylinder Head Gasket Installation (Series 50 & 70) for special instructions on these models.

Series 41-40 Gasket Note—Two types of head gaskets used: (1) Engines with single carburetors use Steelbestos type (.070" or .050" thick—see Production Change Note above). (2) Engines with Compound Carburetion use crimped gasket .015" thick.

CYLINDER HEAD GASKET INSTALLATION (SERIES 50 & 70):—Engine dash protrudes over rear of engine and cylinder head must be pushed forward when it is removed in order to clear body. #16 push rod must be removed and installed with cylinder head in order to avoid damage to push rod. To install cylinder head and gasket with least possibility of damage to gasket, car manufacturer recommends following procedure be used: Loosen exhaust pipe and pull away from engine to allow clearance for gasket (carburetor and manifold assemblies may be left in position on exhaust pipe). Set cylinder head in position on top of engine before installing head gasket. Tilt head up on right side with edge of head resting on top of push rod cover. Tilt head up on left side just enough to insert cylinder head gasket from left side. Set head flat on block and gasket, align gasket with hole in head and block. To minimize possibility oil leak between edges of cylinder head gasket and push rod cover, head gasket should be pushed toward push rod cover as far as possible.

INSTALLING 14 MM. SPARK PLUGS ON FIRST CARS:—These new 14 MM. spark plugs used on all engines after following Engine Numbers: 4306734 to 4309599 inclusive and 4316800 Up (40 with Single Carburetor), 4306735 to 4309599 inclusive and 4312638 Up (40, 50 Compound Carburetion), 4287873 (60,70,90). On cars before above Engine Numbers which were equipped with 10 MM. spark plugs, the new 14 MM. spark plugs may be installed to correct complaints of spark plugs fouling and causing uneven engine operation. To install these 14 MM. plugs, follow instructions given below.

IMPORTANT NOTE—The 10 MM. spark plugs were changed in production from No. 104 to No. 106 and all No. 104 plugs should be replaced by one of following types: No. 104 with dash under 0, No. 106 with dash under 0, No. 106 without dash. Before changing to 14 MM. spark plugs, make certain that complaints not caused by use of these original No. 104 plugs.

Cylinder Head Fixture:—Wooden holding fixture should be made up so that head can be mounted on bench with spark plug holes vertical. To make this fixture, mount two 1¾" thick, 4⅜" high, blocks on base so that total length (to outside edge of blocks) is 30¼" (this dimension important so that fixture can be used on all heads). Cut 90° 'V' notch in each block so that one side of 'V' raised 25° from the horizontal. This will support head at angle with spark plug holes vertical.

Drilling Cylinder Head:—With cylinder head mounted on fixture on bench, thoroughly clean spark plug recess and mount drill guide bushing, No. J-1747-1, on spark plug seat using extreme care to see that bushing seats squarely on seat. Use ½" twist drill in portable electric drill to drill out spark plug hole. CAUTION—Bushing must be used to guide drill and bushing must be installed squarely on seat to insure holes being drilled properly in cylinder head.

Tapping Cylinder Head:—Use special tap guide bushing, No. J-1747-2, and regular 14 mm.-1.25 tap to thread each spark plug hole. Use extreme care to secure good threads.

Installing Spark Plugs & Cylinder Head:—When head is reworked as directed above, spark plug gasket seat will be tapered (not flat). Install spark plugs with one gasket. Check cylinder head gasket and install correct gasket for desired compression ratio as directed above (On first cars with compression ratio of 7.0-1, thicker gasket may be installed to lower compression ratio if complaints of spark rap being corrected). *See Compression Ratio Change data above.*

ENGINE MOUNTINGS:—Identification. Part numbers moulded in rubber section of mounting. When two part numbers used, part number determined by color name (black or red) following number. If rubber black use part number preceding the word black, if rubber red or mounting paint marked red, use part number preceding word red.

Front Mounting—On Series 40, 50, 60, 70 same mounting used (also same on both right and left sides). Series 40, 50 mounting installed with bolt flange to rear, Series 60, 70 to front. Series 90 use similar type but bolt holes are different and right and left mountings are not the same.

Center Mounting—Single mounting used on bottom front end of transmission. Mounting same for all series except that softer rubber used on Series 40, 50. Mounting secured to front face of transmission by two special head bolts, to top of frame crossmember by two bolts (bolt holes in support slotted for fore and aft positioning), and to forward side of cross member by one bolt and shims (to take up space for fore and aft positioning). Mounting not adjustable for up and down position.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Transmission Support Mounting:—Saddle type mounting under universal joint (torque ball) housing mounted on cross-member bolted to each leg of 'X' member. Brace rod connected between cross-member and under side of 'X' member. Shims provided at each end of cross-member. Softer rubber used in Series 40, 50 mounting. Install mounting with thin portion of rubber section to front. This mounting is a positioning member only (does not support weight of engine).

Engine Mounting Adjustment:—Loosen all mountings on frame, loosen transmission support rod at mounting, loosen transmission support cross-member at frame ends (with mounting tight at torque ball), and center torque tube and ball joint in frame X-member. For proper engine mounting adjustment proceed as follows: Tighten right and left front engine mountings to engine and frame. Tighten center engine mounting to transmission and frame cross-member (use shims to take up space between forward web of frame cross-member and lower mounting flange at lower bolt). Tighten transmission support mounting to transmission and transmission support (cross-member). Shim transmission support at frame ends without disturbing its normal position. Tighten rod at transmission support without placing any 'push' or 'pull' tension on rod.

CYLINDER BORE SIZES:—Original production (new engine) bore size indicated on all engines by number and color of paint marks on lower crankcase flange, under gasket, in line with each cylinder (not uniform for all cylinders of one block). See table below for sizes and markings.

.010" Oversize Production Engines:—Factory engines equipped with .010" (low limit) pistons marked by dash (—) following engine number.

Color Markings:—Cylinder bore paint marks on lower crankcase flange on right side extend from underneath oil pan gasket. Piston paint marks on underside of one or both piston bosses visible from below with oil pan removed (pistons need not be removed).

PISTONS (ORIGINAL PRODUCTION):—Pistons graded for size in .0003" steps and marked by one or two color marks below pin bosses within skirt. Pistons fitted in .010" Oversize Production Engines are low limit .010" oversize pistons. All replacement pistons fitted with piston pins. See table below for original piston size for all original cylinder bore sizes.

Series 40, 50—Original Production

Piston Diameter 3 3/32"

Piston & Engine Mark	Piston Diameter	Cylinder Diameter
XX—Yellow	3.0886-3.0889"	3.0907-3.0910"

PISTONS (REPLACEMENT SERVICE):—Pistons furnished in following sizes for service (not graded and marked as for earlier car models).

Series 40, 50—Replacement Pistons

Nominal Size	Piston Diameter	Part Number
Standard①	3.0910-3.0922"	1393028
.005" Oversize	3.0966-3.0972"	1393029
.010" Oversize	3.1016-3.1022"	1393030
.015" Oversize	3.1066-3.1072"	1393031
.020" Oversize	3.1116-3.1122"	1393032
.030" Oversize	3.1216-3.1222"	1393033

Series 60, 70, 90—Replacement Pistons

Nominal Size	Piston Diameter	Part Number
Standard①	3.4358-3.4370"	1393034
.005" Oversize	3.4414-3.4420"	1393035
.010" Oversize	3.4464-3.4470"	1393036
.015" Oversize	3.4514-3.4520"	1393037
.020" Oversize	3.4564-3.4570"	1393038
.030" Oversize	3.4664-3.4670"	1393039

①—Standard size pistons supplied for service are all high limit pistons (or same as .001" oversize pistons). Therefore no .001" oversize furnished.

Piston Diameter—Measure at top of skirt at right angles to wrist pin bosses (greatest diameter) with pistons at 70° F. minimum.

Piston Fitting—Clearance .0018-.0024" (40, 50), .0020-.0026" (60, 70, 90). See 1941 Buick 'M' pages for fitting piston with feeler gauges.

REPLACEMENT PISTON RINGS:—Car manufacturer supplies oversize rings in sizes listed below and recommends that they be fitted to pistons as follows:

Ring Oversize	Piston Oversize
.010"	.005" to .010"
.020"	.011" to .020"
.030"	.021" to .030"

Replacement Ring Sets—Cylinder bores up to .005" maximum taper can usually be serviced by installing Perfect Circle X-90 piston ring set. To correct oil consumption in slightly worn engines, use new regular compression rings and two oil control rings of #3 type (which has narrower cylinder wall contact than #4 ring and gives more control during break-in) in both #3 and #4 piston ring grooves.

Excessive Oil Consumption Note—When installing rings to correct this condition use a fine hone very lightly on all bores (just enough to dull glaze surface and not changing bore size). This will allow quicker break-in of new rings. See Replacement Ring Sets (above) for optional ring sets and oil consumption correction in slightly worn engines.

Piston Ring Tool—Use service tool KMO-297-E (40, 50), KMO-297-D (60, 70, 90) for removing and installing rings.

REPLACEMENT MAIN BEARINGS:—Bearings are furnished (singly) or finished (sets only) as follows:

Unfinished—Have .012-.014" diameter extra babbitt stock and must be line-reamed to size.

Finished—Furnished in sets of 5 only which are finish-reamed as a set and require no reaming when installed (must not be used singly).

REAR MAIN BEARING OIL SEAL:—Cork gaskets used between vertical joint of bearing cap and crankcase, special packing gasket assembled in crankcase and bearing cap to rear of oil collecting groove on crankshaft. Bearing grooved ahead of oil collecting groove on crankshaft with drain hole into crankcase.

Installation—Use new cork gaskets and packing gasket. Packing gasket must be cut 3/64" above face of bearing for tight fit when assembled. Operate engine slowly when first starting after installing new oil seals.

#16 PUSH ROD INSTALLATION & REMOVAL (SERIES 50 & 70):—See Cylinder Head Gasket Installation (above) for removal and installation procedure.

ROCKER ARMS:—Same as 1940. Rocker arms are mounted on tubular shaft and held against side of shaft brackets by spring installed on shaft between adjacent rocker arms. Shaft retained in brackets by pilot setscrew installed in top of #2 bracket. When installing rocker arms, make certain that lug on side of arm at adjusting screw end is toward bracket (all rocker arms Series 40, 50, intake rocker arms Series 60, 70, 90). Exhaust rocker arms for Series 60, 70, 90 are straight (not offset) and do not have reference lug.

Rocker Arm Clearance—.002-.004".

Rocker Arm Lubrication Connection:—Metering restriction for oil feed to hollow rocker arm shaft located in cylinder head and oil pipe fitted directly into top of #1 bracket. #1 and #2 brackets are same part and shaft pilot screw is self-tapping type.

OIL PUMP:—Slot in pump shaft engages tongue on end of distributor shaft. Distributor shaft only pinned to drive gear.

Drive Clearances—Drive shaft bearing .001-.0025". Drive gear backlash .003-.005".

Pump Gear Clearances—Idler gear bearing .001-.0025". Backlash .003-.006". End Clearance .0005-.004".

Relief Valve Clearance—.003-.006".

CLUTCH PEDAL RETURN SPRING:—All models equipped with over-center type pedal return spring mounted between clutch pedal and frame. Tighten bracket mounting eyebolt nut up to limit of threads so as to stretch spring as much as possible. When removing clutch or brake pedal bracket, back off nut on eyebolt first to relieve spring tension.

TRANSMISSION STEADY REST:—See Engine Mountings (Transmission Support Mounting) above for complete data.

HOOD REMOVAL & ADJUSTMENT DATA, FRONT FENDER REMOVAL:—*See Buick Shop Notes.*

SERIAL NUMBER:—First number 1-3880108 (Flint), 2-3892008 (California), 3-3897008 (Linden). Stamped on tag attached to front of dash on right side.

ENGINE NUMBER:—First number (40) 4 — , (50) 5—4074859 (same number for both series). On boss on right side of crankcase behind oil filter.

.010" Oversize Engines—Engines factory-equipped with .010" OS. pistons marked (—) after Engine No.

ENGINE SPECIFICATIONS:—**Own 40, 50.** 8 cylinder, 'I' head type. **Bore**—3 3/32". **Stroke**—4⅛".

Displacement—248 cu. ins. **Rated HP**—30.63.

Developed Horsepower—115 at 3500 RPM (40 Single Carb.), 125 at 3800 RPM (40 Comp. Carb., 50).

Compression Ratio—6.5-1 (First 40—Single Carb.), 6.4-1 (Later 40—Single Carb.), 7.0-1 (First 40,50—Compound Carb.), 6.7-1 (Later 40,50—Compound Carb.).

See Buick Shop Notes for Compression Ratio change, New Cylinder Heads, and special Head Gasket Data.

Compression Pressure—142 lbs. (6.5-1 hd.), 148 lbs. (7.0-1 hd.) at 1000 RPM (uniform within 6 lbs.).

Vacuum Reading—Steady 18-20" idling at 7-8 MPH.

See Buick Shop Notes for Engine Mounting Adj. data.

PISTONS:—Fireball, turbulator top, aluminum alloy, transverse slot, full skirt, cam ground type with anodized finish. No 'T-slot' used. *See Buick Shop Notes for size identification (color marks) and Replacement Piston data.* **Length**—4 5/16".

Weight—13.78 ozs. (stripped), 19.84 (rings and pin).

Removal—Pistons and rods removed from above.

Clearance—.0021" (.0018-.0024") at top of skirt.

Fitting New Pistons—If micrometer used, check at point 90° from pin hole just below transverse slot. Clearance above correct with piston at 70°F. If feeler gauge used, insert ½" x 12" feeler between piston and cylinder wall at right angle to pin bosses (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler, hold on .00225".

Installing Pistons:—Hollowed side to camshaft.

PISTON RINGS:—Two compression (#1 notched, #2 taper faced), two slotted oil rings (#3 heavy duty, #4 regular) per piston, all above pin (heat-dam groove above top ring groove.

NOTE—Install top compression ring with relief up, #2 compression with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compr. ①	3/32"	.010-.020"	.0015-.0035"
Oil Control	3/16"	.010-.020"	.0015-.003"

①—Wall thickness Top .155", #2 .140".

Replacement Rings:—*See Buick Shop Notes for data.*

PISTON PIN:—**Diameter**—.8127". **Length**—2 11/16". Pin clamped in rod. Pins not furnished separately. All replacement pistons have fitted pins installed.

Pin Fit in Piston—.0003-.0004" @ 70° (easy finger push). NOTE—Pin clamp bolt tension 25-30 ft. lbs.

CONNECTING ROD:—**Length**—7⅝". **Weight**—28.46 ozs.

Crankpin Journal Diameter—2".

Lower Bearing—Spun babbitt-lined type.

Clearance—.0008-.0018". **Sideplay**—.005-.010".

Bearing Adjustment:—Shims. Do not file rods or caps.

Installing Rods:—Marks on rod and cap toward rear of engine, oil hole to camshaft. Align rod and cap.

NOTE—Use special ground bolts & palnuts on caps.

CRANKSHAFT:—5 bearing, 8 integral counterweights.

Journal Diameters—#1, 2 5/16"; #2, 2⅜"; #3, 2 7/16"; #4, 2½"; #5, 2 9/16".

Bearings—Steel-backed, durex-lined, slip-in type. *See Buick Shop Notes for Replacement Bearing data and Rear Main Oil Seal Installation.*

Clearance—.0007-.0022".

Bearing Adjustment:—Shims. Do not file caps.

End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive.

Journal Diameters—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32; #4, 2 1/16"; #5, 1¾".

Bearing Type—Steel-backed, babbitt bushings.

Clearance—.0005-.0035".

End Thrust:—Thrust plate between front bearing and camshaft sprocket. **Endplay**—.004-.008".

Timing Chain:—Link-Belt. Width 1". Pitch .500". Lgth. 24½" or 49 links. Initial slack ¼-⅜". 1" worn.

Camshaft Setting:—Mesh copper-plated washers on chain (10 links apart) with sprocket marks upward.

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 17/32"	.3720"	5 7/64"
Exhaust	1 11/32"	.3715"	5 7/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.348"	.0015-.0035"
Exhaust	45°	.348"	.0021-.0039"

Series 50 Note—#16 push rod must be removed and installed with cylinder head. *See Buick Shop Notes*

Tappet Clearance:—.015" all valves—engine hot.

Valve Guides:—Press fit in head, installed with stepped end up. Finish ream for correct clearance.

Valve Springs:—Double springs on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast iron. Lifter guide holes reamed in block. **Clearance**—.0005-.0025".

Rocker Arms:—*See Buick Shop Notes for installation*

Valve Timing:—See Camshaft Setting above.

Timing Points (Valve .004" Open)

Intake Valves—Open 13° BTDC. Close 68° ALDC.

Exhaust Valves—Open 55° BLDC. Close 22° ATDC.

Opening and Closing Points

Intake Valves—Open 26° BTDC. Close 81½° ALDC.

Exhaust Valves—Open 68° BLDC. Close 35° ATDC.

Valve Timing Check—With .015" tappet clearance, #2 or 7 exhaust valve should be .145" open (actual valve opening—use dial indicator) with #1 & 8 pistons at TDC and flywheel mark 'U.D.C/1&8' at indicator (inspection hole, right front face of housing).

LUBRICATION:—Pressure type (gear type oil pump in crankcase). *See Buick Shop Notes for Oil Pump data.*

Normal Oil Pressure:—45 lbs. at 35 MPH.

Oil Pressure Regulator:—On pump. Opens at 45 lbs.

Crankcase Capacity:—8 qts. (dry), 6 qts. (refill).

COOLING SYSTEM:—**Cap.** 13 qts. (14¼ with heater).

Pressure Valve—In filler cap. Opens at 7 lbs.

Water Pump:—Ball-bearing, packless type.

For complete data, refer to 1941 Mech. Equip. Index.

Thermostat:—Harrison. In cylinder head outlet.

Setting—Opens at 148-155°F. Fully open 173°F.

Temperature Gauge:—AC #1511070 Thermo gauge.

For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Own Make with Borg & Beck 'Borglite' or Long 10CF-TS driven member.** Single plate, 'crown spring' type. *For data, refer to Mech. Equip. Index.*

Facings—Molded-woven (B & B), woven (Long) types. 2 required. Inside Diameter 6½" (B & B), 6¾" (Long). Outside Diameter 10". Thickness ⅛".

NOTE—Install driven member oil baffle to rear.

Pedal Adjustment:—Free movement ¾-1" (adjusting screw and locknut on link at clutch fork). Toeboard clearance set by rubber bumper under toeboard.

See Buick Shop Notes for Pedal Return Spring data.

Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, disconnect linkage at yoke, remove clutch release bearing support by taking out spring washer in housing, pull out yoke (with release bearing) from fulcrum, mark clutch and flywheel, remove cover mounting screws.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with remote shift.

For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Buick 'Handi-shift' type.

For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Remove Rear Axle (see below), remove rear transmission support (wire shims to ends of support for correct replacement) and steady rest rod, place engine jacks (J-1580) on frame cross member with pilot end in hole in housing at each side of engine mounting, tighten jacks to take load off mounting, remove selector and shift levers, transmission mounting bolts (install guide pins J-851), remove 2 nuts freeing rear engine mounting (bolt heads seat in notches), adjust jacks to take strain off mounting bolts, remove transmission.

See Buick Shop Notes for Transmission Steady Rest

UNIVERSAL JOINT:—**Saginaw or Spicer 202-5.** 1 used.

For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque tube drive.

For complete data, refer to 1941 Mech. Equip. Index.

Ratio—**4.4-1** (white) Std. 40 Single Carb.; **4.1-1** (no paint) Std. 40 Comb. Carb., 50; **3.9-1** (red) Optl. 40 Single Carb. & 50. Paint marks on outer ends of axle shaft flanges, figures under axle housing.

Backlash—.006-.010". Screw adjustment.

Removal:—Hoist rear end of car. Disconnect parking brake at equalizer, hydraulic brake line at fitting anchored to left channel iron-strut, lower end of shock absorber links, rear radius rod at axle end, lower end of chassis springs (tie springs to bumper for clearance). Disconnect torque tube at universal joint ball, remove axle assembly from beneath car. IMPORTANT—2 piece torque tube assembly used (flanged at rear end and bolted to carrier). **Torque tube should never be dismantled at rear end except for gasket replacement.** Furnished as an assembly.

Axle Shaft Removal:—*See Mechanical Equipment Section.* NOTE—Right shaft ¾" longer than left.

Wheel Bearing Adjustment—None.

Rear Suspension:—Coil springs, conventional axle.

For complete data, refer to 1941 Mech. Equip. Index.

SHOCK ABSORBERS:—**Delco. Front**—Model 1948-A. Double acting, hydraulic type. **Rear**—Model 2105-C,D. Double acting, hydraulic, parallel cylinder.

For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear.** Saginaw Ball Bearing Worm-and-Nut. *For data, refer to Mech. Equip. Index.*

Front Suspension:—Independent, linked parallelogram type with coil springs.

For complete data, refer to 1941 Mech. Equip. Index.

Kingpin Inclination—3½° at 1⅛° Camber.

Camber—Regular Springs—Neg. ⅛° to Pos. 1⅛°. High Springs—Pos. ⅛° to 1⅜°. Not adjustable.

Caster—Positive ⅜° ± ⅜°. Adjustable.

Toe In—0-1/16". Adjust both tie rods equally.

Steering Geometry Inner wh'l 22° ± ¾°. Outer 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.

For complete data, refer to 1941 Mech. Equip. Index.

Drums—Centrifuse cast-iron type. Diameter 12".

Lining—Woven—Ferodo BZ-10-2C (primary). Moulded Manhattan Raybestos 2320 K (secondary). Width 1¾". Thickness 9/16". Length 9 15/16" (primary), 12¾" (secondary).

Clearance—.015" at each end of secondary shoe with primary shoe forced out against drum.

Hand Brake:—See Service Brakes above.

HOOD REMOVAL & ADJUSTMENT DATA, FRONT FENDER REMOVAL:—*See Buick Shop Notes.*

SERIAL NUMBER:—First number 1-3880108 (Flint), 2-3892008 (California), 3-3897008 (Linden). Stamped on tag attached to front of dash on right side.

ENGINE NUMBER:—First number (60) 6-, (70) 7-, (90) 9-4074859. On boss on right side of crankcase **.010" Oversize Engines**—Engines factory-equipped with .010" OS pistons marked (—) after Engine No.

ENGINE SPECIFICATIONS:—**Own 60, 70, 90.** 8 cylinder, 'I' head type. **Bore**—3 7/16". **Stroke**—4 5/16". **Displacement**—320.2 cu.ins. **Rated HP**—37.81. **Developed Horsepower**—165 at 3800 RPM. **Compression Ratio**—7.0-1 (First cars), 6.7-1 (Later cars). *See Buick Shop Notes for Compression Ratio change, new Cylinder Heads, and special service Cylinder Head Gasket data.* **Compression Pressure**—151 lbs. at 1000 RPM (all cylinders uniform within 6 lbs.). **Vacuum Reading**—Steady 18-20" idling at 7-8 MPH. *See Buick Shop Notes for Engine Mounting Adj. data.*

PISTONS:—Fireball, turbulator top, aluminum alloy, transverse slot, full skirt, cam ground type with anodized finish. No 'T-slot' used. *See Buick Shop Notes for size identification (color marks) and Replacement Piston data.* **Length** 4 9/16". **Weight**—17.94 ozs. (stripped), approx. 1.56 lbs. (with rings and pin). **Removal**—Pistons and rods removed from above. **Clearance**—.0023" (.0020-.0026") at top of skirt.

Fitting New Pistons:—If micrometer used, check at point 90° from pin hole just below transverse slot. Clearance above correct with piston at 70°F. If feeler gauge used, insert ½" x 12" feeler between piston and cylinder wall at right angles to pin bosses (piston inverted, pin parallel to crankshaft). Piston should pass on .0015" feeler, hold on .00225".

Installing Pistons:—Hollowed side to camshaft.

PISTON RINGS:—Two compression (#1 notched, #2 taper faced), two slotted oil rings (#3 heavy duty, #4 regular) per piston, all above pin (heat-dam groove above top ring). NOTE—Install top comp. ring with relief up, #2 with mark TOP up.

Ring	Width	End Gap	Side Clearance
Compr. ①	3/32"	.010-.020"	.0015-.0035"
Oil Control	3/16"	.010-.020"	.0015-.003"

①—Wall thickness Top .172", #2 .150".

Replacement Rings:—*See Buick Shop Notes for data.*

PISTON PIN:—**Diameter**—.8747". **Length**—3 1/16". Pin clamped in rod. Pins not furnished separately. All replacement pistons have fitted pins installed. **Pin Fit in Piston**—.0003-.0004" @ 70° (easy finger push). NOTE—Pin clamp bolt tension 25-30 ft. lbs.

CONNECTING ROD:—**Length**—8¼". **Weight**—35.58 ozs. **Crankpin Journal Diameter**—2¼". **Lower Bearing**—Spun babbitt-lined type. **Clearance**—.0008-.0018". **Sideplay**—.005-.010".

Bearing Adjustment:—Shims. Do not file rods or caps.

Installing Rods:—Marks on rod and cap toward rear of engine, oil hole to camshaft. Align rod and cap. NOTE—Use special ground bolts & palnuts on caps.

CRANKSHAFT:—5 bearing, 8 integral counterweights. **Journal Diameters**—#1, 2 9/16".; #2, 2⅝"; #3 2 11/16"; #4, 2¾"; #5, 2 13/16". **Bearings**—Steel-backed, durex-lined, slip-in type. *See Buick Shop Notes for Replacement Bearing data and Rear Main Bearing Oil Seal Installation.* **Clearance**—.0007-.0022".

Bearing Adjustment:—Shims. Do not file caps.

End Thrust:—Center (#3) bearing. **Endplay** .004-.008".

CAMSHAFT:—5 bearing. Non-adjustable chain drive. **Journal Diameters**—#1, 2 5/32"; #2, 2⅛"; #3, 2 3/32"; #4, 2 1/16"; #5, 1¾". **Bearing Type**—Steel-backed, babbitt bushings. **Clearance**—.0005-.0035".

End Thrust:—Thrust plate between front bearing and camshaft sprocket. **Endplay**—.004-.008".

Timing Chain:—Link-Belt. Width 1". Pitch .500". Length 25" or 50 links. Initial slack ¼-⅜". 1" worn.

Camshaft Setting:—Mesh copper-plated washers on chain (10 links apart) with sprocket marks upward.

VALVES:—

	Head Diam.	Stem Diam.	Overall Length
Intake	1 25/32"	.3720"	5¼"
Exhaust	1 7/16"	.3715"	5¼"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.347"	.0015-.0035"
Exhaust	45°	.342"	.0021-.0039"

Series 70 Note—#16 push rod must be removed and installed with cylinder head. *See Buick Shop Notes*

Tappet Clearance:—.015" all valves—engine hot.

Valve Guides:—Press fit in head, installed with stepped end up. Finish ream for correct clearance.

Valve Springs:—Double springs used on all valves. Spring free length 1⅞" (inner), 2 5/16" (outer).

	Inner Spring Pressure	Inner Spring Length	Outer Spring Pressure	Outer Spring Length
Closed	15½-20½ lbs.	1 21/32"	26½-31½ lbs.	1 15/16"
Open	45-51 lbs.	1 5/16"	67-73 lbs.	1 19/32"

Valve Lifters:—Barrel type, cast-iron. Lifter guide holes reamed in block. **Clearance**—.0005-.0025".

Rocker Arms:—*See Buick Shop Notes for installation data.*

Valve Timing:—See Camshaft Setting above.

Timing Points (Valve .004" Open)

Intake Valves—Open 14° BTDC. Close 71° ALDC.
Exhaust Valves—Open 56° BLDC. Close 25° ATDC.

Opening & Closing Points

Intake Valves—Open 27° BTDC. Close 84½° ALDC.
Exhaust Valves—Open 69° BLDC. Close 38½° ATDC.

Valve Timing Check—With .015" tappet clearance, #2 and 7 exhaust valve should be .155" open (actual valve opening—use dial indicator) with #1 & 8 pistons on TDC and flywheel mark 'U.D.C/1&8' at indicator (inspection hole, right front face of housing).

LUBRICATION:—Pressure type (gear type oil pump in crankcase). *See Buick Shop Notes for oil pump data.* **Normal Oil Pressure**—45 lbs. at 35 MPH. **Oil Pressure Regulator**—On pump. Opens at 45 lbs. **Crankcase Capacity:**—10 qts. (dry), 8 qts. (refill).

COOLING SYSTEM:—**Cap.** 16¾ qts. (18 with heater). **Pressure Valve**—In filler cap. Opens at 7 lbs.

Water Pump:—Ball-bearing, packless type.
For complete data, refer to 1941 Mech. Equip. Index.

Thermostat:—Harrison. In cylinder head outlet. **Setting**—Opens at 148-155°F. Fully open 173°F.

Temperature Gauge:—AC #1511070 Thermo gauge.
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Own Make with Borg & Beck 'Borglite' or Long 10½CF-TI driven member.** Single plate, dry disc type. *For data, refer to Mech. Equip. Index.* **Facings**—Molded-woven (B & B), woven (Long) types, 2 used. I.D. 6½". O.D. 10½". Thick. ⅛". NOTE—Install driven member oil baffle to rear.

Pedal Adjustment:—Free movement ¾-1" (adjusting screw and locknut on link at clutch fork). Toeboard clearance set by rubber bumper under toeboard. *See Buick Shop Notes for Pedal Return Spring data.*

Removal:—Remove Rear Axle & Transmission (see below), take off clutch underpan, disconnect linkage at yoke, remove clutch release bearing support by taking out spring washer in housing, pull out yoke (with release bearing) from fulcrum, mark clutch and flywheel (reassemble to marks), remove mounting screws in cover. NOTE—Metal spacers may be used between release levers and cover to relieve spring tension.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with remote shift.
For complete data, refer to 1941 Mech. Equip. Index.

Transmission Control:—Buick 'Handi-shift' type.
For complete data, refer to 1941 Mech. Equip. Index.

Removal:—Remove Rear Axle (see below), remove rear transmission support (wire shims to ends of support for correct replacement) and steady rest rod, place engine jacks (J-1580) on frame cross member with pilot end in hole in housing at each side of engine mounting, tighten jacks to take load off mounting, disconnect shift linkage, remove transmission mounting bolts (install guide pins J-851) and 2 nuts freeing rear engine mounting (bolt heads seat in notches), adjust jacks to take strain off mounting bolts, remove transmission.
See Buick Shop Notes for Transmission Steady Rest data.

UNIVERSAL JOINT:—**Saginaw.** One used.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Semi-floating, hypoid gear type with torque tube drive.
For complete data, refer to 1941 Mech. Equip. Index.

Ratio—3.9-1 (red) Std. 60, 70. **4.2-1** (no paint) Std. 90. **3.6-1** (blue) Optl. 60, 70. Paint marks on outer end of shaft, figures on underside of housing.

Backlash—.006-.010". Screw adjustment.

Removal:—Hoist rear end of car. Disconnect parking brake at equalizer, hydraulic brake line at fitting anchored to left channel iron-strut, lower end of shock absorber links, rear radius rod at axle end, lower end of chassis springs (tie springs to bumper for clearance). Disconnect torque tube at universal joint ball, remove axle assembly from beneath car. **Series 60, 70 Note**—2 piece torque tube assembly used (flanged at rear end and bolted to carrier). **Torque tube should never be dismantled at rear except to replace gasket** Furnished as an assembly.

Axle Shaft Removal:—*See Mechanical Equipment Section.* NOTE—Right shaft ¾" (60, 70), 15/16" (90) longer than left. **Wheel Bearing Adjustment**—None.

Rear Suspension:—Coil springs, conventional axle.
For complete data, refer to 1941 Mech. Equip. Index.

SHOCK ABSORBERS:—**Delco. Front**—Model 1948-A (all). **Rear**—2105-C,D (60,70), 1757-A,B (90). Double acting hydraulic (2105 parallel cylinder type).
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Saginaw Ball Bearing Worm-and-Nut type.
For complete data, refer to 1941 Mech. Equip. Index.

Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.

Kingpin Inclination—3½° at 1⅛° Camber (60, 70). 4¾° at ⅞° Camber (90).

Camber—Regular Springs—Neg. ⅛° to Pos 1⅛° (60, 70), Neg. ⅜° to Pos. ⅞° (90). **High Springs**—Pos. ⅛° to 1⅜° (60, 70). Not adjustable.

Caster—Positive ⅜° ± ⅜°. Adjustable.

Toe In—0-1/16". Adjust both tie rods equally.

Steering Geometry Inner wh'l 22°±¾°. Outer 20°.

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.

Drums—12" centrifuse (60, 70). 14" cast-iron (90).

Lining—Woven—Ferodo BZ-10-2C (primary), Moulded Manhatten Raybestos 2320K (secondary). Width 2¼" (60, 70), 2" (90). Thickness 3/16" (60, 70), ¼" (90). Length—Primary 10" (60, 70), 12 1/16" (90); Secondary 12 15/16" (60, 70), 14¾" (90).

Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.

Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connecting Rod Bolts, etc.*

HOOD LOCK:—Radiator ornament controls manual and automatic safety catch. To raise hood, tilt ornament back, lift up on forward edge of hood. CAUTION—Do not hold radiator ornament down when closing hood (this will cause damage to manual catch).

HOOD REMOVAL:—Hood and side panels are integral. To remove hood, raise hood and prop front end up. Remove counter-balancing springs by removing clevis pin on cowl at top of springs (41-60S only), use tool J-1638 to remove springs at bottom (all other models). Remove two shoulder capscrews from hood links-to-cowl bracket, lift hood off. CAUTION—Do not loosen or remove cowl brackets which control hood alignment.

Hood Alignment—If hood alignment necessary when hood re-installed, see Front Sheet Metal Assembly Alignment below for directions.

Hood Spring Note—Right and left hood springs not interchangeable. Install springs with top hook offset toward rear of car.

FRONT GRILLE REMOVAL:—Raise hood, disconnect parking light wires. Remove six Phillip's head screws from radiator grille-to-fender at front, six countersunk screws from radiator grille-to-shroud top flange. Lift radiator grilles out and remove parking lights from back of grilles. To remove vertical fins, remove attaching clips holding fins in place and disassemble fins.

Grille Alignment—If grille alignment required when grilles re-installed, see Sheet Metal Assembly Alignment below for directions.

FRONT SHEET METAL ASSEMBLY ALIGNMENT:—Assembly consists of Hood, Fenders, Radiator Core, Grilles and casings, baffles, and cradle assembly. Individual parts may be removed and installed separately without affecting alignment but if most parts removed, or if alignment required, entire assembly should be aligned as follows:

Alignment—With fenders off, assemble radiator core, grille casings, baffles, and cradle assembly loosely on front cross-member. Install hood loosely on cowl hinge brackets and see that brackets are loose on cowl. With hood down, push cowl hinge brackets up until links strike on brackets (41-60S) or on hinge bracket flange (all other models), install lower front cowl hinge bracket-to-cowl bolts and tighten securely. Force back end of each bracket down (loop wire over notch in ear at back end of bracket and pull down on wire with pry bar hooked under frame) so that hood wrapped tightly to cowl, tighten lower rear bolt on each cowl hinge bracket securely, raise hood and tighten upper bolt in each bracket securely. Assemble front fenders loosely to radiator casing and baffle assemblies, remove kick pad in front compartment, install rear fender bolt nuts loosely from inside car. Align fenders to hood, door panel, and radiator casing assembly and tighten all mounting screws and nuts securely. Tighten radiator assembly on front cross-member (shim cradle, if necessary, to maintain front fender alignment).

Front Fender Tail Alignment (41-60S)—Loosen screw in front face of door under weather strip and two screws in bottom face of door and align fender tail to front fender. Tighten screws.

Sheet Metal Clearances—3/32" at hood-to-fender catwalk and hood-to-radiator casing, ⅛" at hood-to-cowl (at top) and hood-to-door (at top), 5/32" hood-to-door (at bottom).

RADIATOR CORE REMOVAL:—Drain radiator and disconnect upper and lower hoses, disconnect thermostat-to-shutter rod at thermostat in radiator top tank. Remove carburetor air cleaner and fan. Remove capscrews mounting radiator on cradle assembly at each side of radiator, lift radiator core assembly out.

CYLINDER HEAD:—Same cylinder head used on all engines. Cylinder head gaskets interchangeable on right and left sides of engine.

Installation—Two cap screws used at water outlet connection on each head have oversize head and are ½" longer than other head screws. **Use two long cylinder head cap screws at water outlet connection only** to avoid damage to engine water jacket. Car manufacturer recommends use of Perfect Seal Gasket Paste when cylinder head gaskets installed.

LOWERING COMPRESSION RATIO—Special shims available for installation between cylinder head and block to reduce compression ratio for use of low octane fuel or special operating conditions.

ORIGINAL PRODUCTION ENGINE BORE & PISTON SIZES:—Cylinder bores and pistons graded in 30 sizes and marked by letter (10 letters used, singly, or with '+' or '—' sign for total of 30 sizes) as indicated in table below (+ and — sizes not shown). Marks are located as follows:

Cylinder Bore Marking—Letter stenciled on top of cylinder block at outer edge of cylinder bore and in line with center of bore (if not + or —), to left of bore center (—), to right of bore center (+). Plus or Minus sizes are indicated by these different letter positions and actual + or — signs are not used.

Piston Marking—Letter is marked on piston head.

Letter①	Piston Size	Cylinder Size
A	3.4979-3.4981"	3.5000-3.5002"
B	3.4981-3.4983"	3.5002-3.5004"
C	3.4983-3.4985"	3.5004-3.5006"
D	3.4985-3.4987"	3.5006-3.5008"
E	3.4987-3.4989"	3.5008-3.5010"
H	3.4989-3.4991"	3.5010-3.5012"
J	3.4991-3.4993"	3.5012-3.5014"
K	3.4993-3.4995"	3.5014-3.5016"
L	3.4995-3.4997"	3.5016-3.5018"
M	3.4997-3.4999"	3.5018-3.5020"

①—Cylinder bore letter in line with center of bore (letter to left of center indicates —, to right of center indicates +).

CAUTION—Cylinder bores should always be measured with micrometer to make certain that bore has not been enlarged in field without being marked 'oversize'.

REPLACEMENT PISTONS:—Finished pistons furnished for service in sizes listed below.

Nominal Size	Piston Diameter
Standard	3.4979-3.4999"
.003" Oversize	3.5014-3.5029"
.005" Oversize	3.5034-3.5049"
.010" Oversize	3.5084-3.5099"
.015" Oversize	3.5135-3.5149"
.030" Oversize	3.5284-3.5299"

CAUTION—Cylinder bores should always be measured with micrometer (1¼" below top of block and at right angles to crankshaft) to make certain that bore has not been enlarged by refinishing in the field without being marked 'oversize.'

FITTING NEW PISTONS:—Pistons should be fitted with skirt clearance (measured adjacent to 'T' slot and just below horizontal slot) of .0020-.0022" at 70° F. minus .0001" for each 5.5° above 70°, or plus .0001" for each 5.5° below 70°, if measured at other temperatures. Clearance can be determined by using micrometers, or pistons can be fitted by using feeler gauges as follows:

Micrometer Gauge Method:—Measure cylinder bore with micrometer gauge at point 1¼" below top edge and at right angles to crankshaft. Set inside micrometer at cylinder bore size, **then measure this gauge length with same outside micrometer used to measure piston.** This method will eliminate any error introduced by using different gauges to measure cylinder and piston. Use outside micrometer to measure piston diameter at upper corner of 'T' slot (adjacent to 'T' slot and just below horizontal slot—piston must be measured at this point because skirt tapered with .001-.002" larger diameter at lower end). Select piston of correct size so that clearance when installed will be .0020-.0022" at 70°F. If block and piston not at 70° when measured, subtract .0001" for each 5.5° above 70°, add .0001" for each 5.5° below 70°.

Feeler Gauge Method:—Use ½" feeler stock .002", .0025", or .003" thick (see Feeler Gauge Note and table below) on side of piston directly over 'T' slot (center feeler on slot) with lower rounded end of feeler extending ½" down on piston skirt past horizontal slot (feeler must not extend further down on piston skirt because skirt is tapered with greater diameter at bottom). Install piston and feeler in cylinder with piston right side up and feeler toward side, measure pull required to withdraw feeler. Pull will vary in accordance with thickness of feeler gauge used and with piston temperature. See table for correct pull for each feeler gauge thickness to give correct piston clearance of .0020-.0022" at 70° F. and subtract .0001" clearance or 2/5 lb. pull for each 5.5° increase in piston temperature over 70°, add .0001" clearance or 2/5 lb. pull for each 5.5° decrease in piston temperature below 70°.

Feeler Pull	Piston Clearance (70°F.)		
(In lbs.)	.002" Feeler	.0025" Feeler	.003" Feeler
1	.00225"	.00275"	.00326"
2	.002"	.00252"	.00304"
3	.00175"	.00228"	.0028"
4	.0015"	.00205"	.00258"
5	.00125"	.00182"	.00235"
6	.001"	.00157"	.00213"
7	.00075"	.00133"	.0019"
8	.0005"	.0011"	.00167"

Feeler Gauge Note—Feeler gauges used for piston clearance measurement should be clean and smooth with lower end rounded. Rusted or wrinkled feelers should be discarded and rough edges should be honed to prevent scratching cylinder wall.

PISTON PIN FITTING:—Piston pin holes in piston have bearingized finish and, if oversize pins are installed, holes should be honed to proper size as follows: Use Piston Pin Hone, Part No. KMO-336, mount hone in vise and revolve piston on hone slowly by hand—**do not use electric drill to drive hone.** Use very fine abrasive (Grit No. 240A), washing abrasive out frequently with gasoline or kerosene. CAUTION—Always wash piston thoroughly before inserting pin to gauge for size. Pins should

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

be a free hand press fit in each piston boss with no perceptible play at 70°F. (.0001-.0003" clearance).

CONNECTING RODS:—Bearing Removal & Installation—Bearing halves not interchangeable (upper half has oil hole for piston pin bushing lubrication). When installing bearings, make certain that tangs on bearings engage grooves in cap and rod and see that oil hole in upper half lines up with oil lead in rod to piston pin bushing.

MAIN BEARING SERVICING:—Bearing Removal—Bearing upper halves can be 'rotated' out without removing crankshaft. Install flattened cotter pin in oil hole in crankshaft so that pin engages bearing, turn crankshaft in reverse direction to push bearing out.

Bearing Installation—Clean all oil lines and crankcase before installing new bearings (see Lubrication System Servicing below). Install new upper bearing halves in same manner as old bearings removed ('rotate' bearings in place with cotter pin installed in oil hole, make certain that locating lug is in correct position).

Rear Main Bearing Oil Seals—With crankshaft out of engine, remove rear main bearing shells (to avoid damage), clean all old packing out of groove in crankcase and bearing cap, use tool J-1177 to install new packing as follows: Install length of new packing in groove in crankcase, drive packing up into place with tool J-1177 by pounding on tool handle with hammer, hold tool in position and cut off each end of packing flush with bearing edge. Install packing in bearing cap in same manner. When installing rear main bearing cap in engine, install new cork plugs in grooves on each side of bearing cap to prevent oil leaks at this point. Plugs should be well greased to facilitate installation.

CAMSHAFT:—Removal—To remove camshaft, first remove generator, carbruetor, fuel and vacuum pump, manifolds, and valve lifter assemblies. Remove radiator grille (see Front Grille Removal above), and radiator (see Radiator Core Removal above). Take out screws and remove timing chain cover, remove chain, remove retaining screws in camshaft thrust plate, withdraw camshaft.

Camshaft Bushing Servicing—Remove old bushings by pressing them out of bearing supports using tool J-829 (transmission and flywheel housing must be removed to take out rear bushing). To install new bushings, coat bushings with white lead, install front bushing first, then rear bushing, finally center bushing. Use tool J-829 to press bushings in place and pilot tool in two other bushings while pressing third bushing in place. CAUTION—Make certain that oil holes in each bushing lined up with oil leads in support.

VALVE SERVICING:—Valve Removal & Installation—Valve lifter assemblies must be removed before valves can be taken out. Use valve lifter J-257-X to compress springs for removal and installation of valve spring retainers and locks. Check valves for correct length (before installing lifters) with tool J-1055 measuring distance from end of valve stem to heel of cam (cam lobe turned 180° away from valve). If valve stem too long, grind off end of stem so that gauge will slide into place with valve seated. If tool not available, check clearance between end of valve stem and valve lifter plunger with plunger pressed down in lifter cylinder (lifter must be drained of oil for this check). Clearance should be .030-.070".

Valve Lifter Servicing—When installing lifter assemblies on engine, valve lifter bodies should be filled with oil and tool J-827 used to install lifter brackets in engine. Apply engine oil to tops of lifter assemblies after they have been installed. Connect oil feed pipes at supply end only and crank engine until all air is expelled from pipes, then connect pipes to lifter bracket connection. Check clearance between lifter and valve stem with plunger spring fully compressed and plunger seated in cylinder (all oil forced out). This clearance should be .030-.070". *See Wilcox-Rich 'Zero-Lash' Hydraulic Valve Lifter article in Mechanical Equipment Section for complete lifter servicing data.*

LUBRICATION SYSTEM SERVICING:—Before installing new main and connecting rod bearings, or when installing lifters in engine in which sludge noted in valve compartment, clean entire engine lubricating system thoroughly as follows: Remove oil pump and baffle, remove plug at front end of crankcase oil header, blow out oil lines by applying kerosene and air (use kerosene gun) at upper end of valve silencer feed line and at oil header opening. Wash down valve chambers and crankcase with compressed air and kerosene. Check and clean small hole at lower end of each connecting rod, clean any clogged oil lines with wire brush. Clean oil pump, baffle, float screen, regulator valve, and oil pan with compressed air and kerosene.

Oil Pump Specifications—Pump body and drive shaft clearance—.0010-.0025" (new), .005" (worn limit). Pump body and pump gear clearance—.002-.004" (new), .006" (worn limit). Pump gear endplay —.001-.004" (new), .006" (worn limit). Pump drive gear backlash—.008-.012" maximum.

Oil Pressure Regulator Specifications—Clearance between valve plunger and housing—.0020-.0035". (new), .005" (worn limit). Regulator spring pressure—5¾-6¼ lbs. at 1 13/32". Spring free length 2 25/64".

RADIATOR SHUTTER THERMOSTAT:—Shutter Control Rod Adjustment—With cooling system cold (below thermostat opening temperature of 150°), disconnect thermostat lever from shutter control rod, loosen locknut and turn clevis on thermostat end of rod to lengthen rod until clevis eye is 1/16" past hole in thermostat lever (rod 1/16" too long), tighten locknut and connect rod (align clevis and lever by forcing rod to right). This setting provides initial pressure on shutters which tends to keep them closed when cold.

Thermostat Checking—To check thermostat for correct operation on car, disconnect shutter control rod and note force required to open thermostat when cold (below opening temperature of 150°). Pull of 45-50 lbs. on spring scale hooked to thermostat stem should be required to open thermostat. If pull is less than 45 lbs., remove thermostat and check as follows: Place thermostat on brick in pan of water (thermostat must not come in contact with surface of pan), insert thermometer in water to check temperature, heat water and note thermostat operation. At 175°F, thermostat stem should raise 9/16" to open position and at 190°, stem should support weight of 20 lbs. without closing (Std. Thermostat). High-Reading thermostat should open 9/16" at 190°F. and support 20 lb. weight at 205°F. Before replacing thermostat check shutters for sticking or binding.

Radiator Shutter Checking—To check shutters for free operation, disconnect and remove control rod, hook spring scale in place of rod. Pull required to open shutters should not exceed 4 lbs. If pull exceeds 4 lbs., lubricate shutters and remove any cause of binding or sticking.

CLUTCH BALANCING:—Make certain that balance marks lined up when clutch installed on flywheel, then check balance by running engine at speed of 24-30 MPH. with rear wheels jacked up and note if any excessive vibration apparent. If vibration noted, re-balance clutch as follows: Install one or two ⅛" thick washers with 5/16" hole on clutch cover mounting capscrew (start at point where clutch drilled for balancing), repeat test and note if vibration increased or decreased. Add or remove washers at each mounting capscrew until satisfactory balance secured.

Locking Pin Removal:—Replacement clutches furnished by car manufacturer equipped with a locking pin (or block) under each release lever. These 3 pins must be removed when clutch installed on car (pins released when cover tightened) to avoid damage when car operated (pins will drop into clutch housing).

TRANSMISSION EXTENSION HOUSING:—Production Change—Two types of extension housing used in production (changed after first 3500 cars) as noted below. First type housing must be changed to second type on these first cars, if rear axle with optional gear ratio installed, to permit installation of different speedometer pinion for new axle ratio. Second type housing only furnished for service.

Extension Housing (First Type)—Permits mounting of speedometer pinion for standard rear axle ratio only. Must be changed to second type if rear axle ratio changed.

Extension Housing (Second Type)—May be identified by letter 'R' stamped on transmission case under speedometer cable opening. This housing permits mounting of speedometer pinion for standard and all optional rear axle ratios.

HOOD REMOVAL & INSTALLATION DATA, GRILLE REMOVAL, FRONT SHEET METAL ASSEMBLY ALIGNMENT:—*See Cadillac Shop Notes.*

SERIAL & ENGINE NUMBER:—1st number 5340001 (61), 8340001 (62), 7340001 (63), 6340001 (60S), 9340001 (67), 3340001 (75). On crankcase behind left cylinder block and on left frame side rail at steering gear.

ENGINE SPECIFICATIONS:—**Own.** 8 cylinder, 90° Vee, L head type. Upper crankcase and cylinder blocks cast Enbloc. **Bore**—3½". **Stroke**—4½".
Displacement—346 cu. ins. **Rated HP**—39.20.
Developed Horsepower—150 at 3400 RPM.
Compression Ratio—7.25-1 Std. cast-iron head.
See Cadillac Shop Notes for Cylinder Head Installation and Shims for Lowering Compression Ratio.
Compression Pressure—182 lbs. at 1000 RPM.
Vacuum Reading—Steady 20-21" idling at 7-8 MPH.

PISTONS:—Lynite or Bohn Lo-Ex aluminum alloy, 'T' slot, cam ground, anodized finish. **Length**—4⅛".
Weight—18.30 ozs. (stripped), 25.10 ozs. (complete).
Removal—Pistons and rods removed from above.
Clearance—.0020-.0022" at 70° F. for top of skirt
Original Bore & Piston Sizes, Replacement Pistons:—*See Cadillac Shop Notes for sizes and markings.*
Fitting New Pistons:—*See Cadillac Shop Notes for micrometer and feeler gauge data.*
Installing Pistons:—T-slot to left, for all pistons.

PISTON RINGS:—4 rings, all above pin (heat-dam groove above top ring). #1 Compression (PC Type 200—upper inner edge notched), #2 Comp. (70—lower outer edge notched), #3 Oil (X-90) & #4 Oil (85) slotted types. Drain holes in oil ring grooves.

Ring	Width	End Gap	Side Clearance
Compr. (Top)	3/32"	.007-.012"	.0023-.0041"
Compr. (#2)	⅛ "	.007-.012"	.0013-.0026"
Oil Control	5/32"	.007-.015"	.0013-.0026"

Replacem't Rings:—.003" .005" .010" .015" .030" oversize.

PISTON PIN:—**Diameter**—⅞". **Length**—3 1/16". Floating type. *See Cadillac Shop Notes for oversize pin data.*
Pin Fit in Piston—.0001-.0003" (new), .0006" (worn) or free hand-press fit at 70° F. in each boss.
Pin Fit in Rod Bushing—.0002-.0008" clearance (new), .0018" (worn limit).

CONNECTING ROD:—**Weight** 37.472 ozs. **Length** 8¾".
Crankpin Journal Diameter—2.4590-2.4595".
Lower Bearing—Steel-backed, babbitt-lined type.
Clearance—.0015-.0025" (new), .0045" Max. (worn).
Sideplay—.008-.014".
Bearing Adjustment:—None (no shims). Replace bearings. Do not file rods or caps. *See Cadillac Shop Notes for connecting rod bearing removal & installation.*
Installing Rods:—Numbers on rods and bearing caps on same side and toward bottom of engine.

CRANKSHAFT:—3 bearing with 6 counterweights.
See Cadillac Shop Notes for main bearing servicing and rear main bearing oil seal renewal.
Journal Diameters—2½" all bearings.
Bearings—Removable steel-backed, babbitt-lined.
Clearance—.0015-.0025" (new), .005" Max. (worn).
Bearing Adjustment:—None (no shims). Replace bearings. Do not file bearing caps.
End Thrust:—Taken by center (#2) bearing.
Endplay—.001-.005" (new), .010" Max. (worn).

CAMSHAFT:—3 bearing, non-adjustable chain drive.
See Cadillac Shop Notes for camshaft bushing data.
Journal Diameters—#1 and #2, 2.4071-2.4078"; #3, 2.0009-2.0016".
Bearing Type—Steel-backed, babbitt bushings.
Clearance—.0015-.0033" (new), .0045" Max. (worn).
End Thrust:—Taken by thrust plate behind camshaft sprocket. No endplay should be permitted.
Timing Chain:—Link-Belt Type 3766TWC-19. Width 1 11/32". Pitch ⅜". Length 23¼" or 62 links.
NOTE—Install chain 'endless' as an assembly with sprockets. Use Pilot Tool J-836 on end of camshaft.
Camshaft Setting:—Sprockets marked. Mesh chain with sprockets turned so that '0' marks are adjacent and in line with a straightedge across shaft centers.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1.876-1.886"	.3415-.3425"	5 33/64"
Exhaust	1.626-1.636"	.3405-.3415"	5 33/64"

	Seat Angle	Lift	Stem Clearance
Intake	45°	.335"	.0012-.0032"
Exhaust	45°	.345"	.0022-.0042"

NOTE—Stem clearance worn limit .005" (all valves).
See Cadillac Shop Notes for valve servicing.
Tappet Clearance:—None (automatic take-up used).
Valve Guides:—Press in block (long step end down).
Valve Lifters:—Wilcox-Rich 'Zero-lash' type hydraulic lifters (Mushroom type) in removable brackets.
For complete data, refer to 1941 Mech. Equip. Index.
Clearance—.0010-.0024" (new), .0035" (worn).
Valve Springs:—Free length 2.210".

	Spring Pressure	Spring Length
Valve Closed	63½ lbs.	1.926"
Valve Open	145 lbs.	1.581"

Valve Timing:—See Camshaft Setting above.
Intake Valves—Open at TDC. Close 42° ALDC.
Exhaust Valves—Open 52° BLDC. Close 10° ATDC.
Valve Timing Check—#1 cylinder (front-left bank) intake valve should open with piston at TDC and mark 'C.1/6' on crankshaft pulley aligned with chain case cover pointer (on right side).

LUBRICATION:—Pressure type (gear type oil pump in crankcase). *See Cadillac Shop Notes for oil pump data and oil pressure regulator specifications.*
Normal Oil Pressure:—15 lbs. idling, 25 lbs. at 30 MPH.
Oil Pressure Regulator:—Opens at 30 lbs. On oil pump. Not adjustable.
Crankcase Capacity:—7 quarts.

COOLING SYSTEM:—**Capacity**—25 quarts.
Pressure Valve—In filler cap.
Water Pump:—Self-adjusting packing type.
For complete data, refer to 1941 Mech. Equip. Index.
Thermostat:—Mounted in radiator top tank, linked to radiator shutters by rod on forward side.
Setting—(Std. Type) Starts to open 153-158° F., fully open 175° F. (High Reading Type—use with Heaters) Starts to open 168-173° F. Fully open 190°.
See Cadillac Shop Notes for Thermostat Tests and Radiator Shutter servicing and Radiator Core removal.
Temperature Gauge:—AC Electric. #1510773 (dash unit), #1510774 (engine unit).
For complete data, refer to 1941 Mech. Equip. Index.

CLUTCH:—**Long Model 11CF-10½TI (61, 62, 63, 60S), 11CF-TI (67, 75, 62 & 75 Comm'l).** Semi-centrifugal, single plate, dry disc type.
For complete data, refer to 1941 Mech. Equip. Index.
Facings—Woven (spirally grooved) type, 2 required. Inside Diameter 7" (all). Outside Diameter 10½" (61, 62, 63, 60S), 11" (others). Thickness .135".
Pedal Adjustment:—Pedal free travel ⅞-1⅛" (adjusting nut on connector link at clutch fork).
Removal:—Remove transmission (see below), drop clutch housing pan, remove release yoke and sleeve, punch mark clutch cover, pressure plate and flywheel, remove 6 cover screws. NOTE—Install driven member with oil guard to rear.
See Cadillac Shop Notes for clutch locking pin removal (on replacement clutches) and balancing data.

TRANSMISSION:—**Own Make.** All helical gear, constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse) with remote shift.
For complete data, refer to 1941 Mech. Equip. Index.
Production Change—*See Cadillac Shop Notes for Transmission Extension Housing change.*
Transmission Control:—Remote steering col. shift.
For complete data, refer to 1941 Mech. Equip. Index.
Removal:—Support engine with jack under rear end of oil pan (use wooden block to avoid damage to pan), remove propeller shaft (disconnect front and rear universals), free transmission extension at engine rear support, remove crossmember with engine rear support, disconnect speedometer cable, remove shifter rods from levers at transmission, support transmission at rear, take out mounting screws, pull straight back (plug clutch connection shaft bearing drain hole as soon as accessible to prevent lubricant loss), lower front end of transmission and remove.
See Mechanical Equipment Section for shifter linkage adjustment when transmission installed.

UNIVERSAL JOINTS:—**Mechanics 3C.** Needle bearing. NOTE—One piece propeller shaft used. Slip joint at rear of transmission ahead of front universal.
For complete data, refer to 1941 Mech. Equip. Index.

REAR AXLE:—**Own Make.** Hypoid gear, semi-floating type with Hotchkiss drive. NOTE—Manufacturer recommends Carrier Assembly be serviced by factory.
For complete data, refer to 1941 Mech. Equip. Index.
Ratio—**3.77-1** (Std. 61, 62, 63, 60S; Optl. 67, 75). **3.36-1** Economy (Optl. 61, 62, 63, 60S). **4.27-1** (Std. 67, 75, 62 & 75 Comm'l.). **4.58-1** (75 Special Bus). NOTE—Ratio identified by number stamped on bottom of differential case beneath pinion shaft as follows: 3.77-1 (no mark), 3.36-1 ("6"), 4.27-1 ("4").
Backlash—.004-.010". Screw adjustment.
Removal:—Disconnect rear universal (do not disengage spline joint at transmission), remove axle shafts (see below) and carrier mounting bolt nuts.
Axle Shaft Removal:—Remove wheel, dust cap and axle shaft nut. Pull hub and drum, disconnect brake line, remove brake backing plate. Pull shaft and bearing assembly (Tool J-838). NOTE—Install new oil seal and bleed brake line which was disconnected.
Wheel Bearing Adjustment—None.

SHOCK ABSORBERS:—**Delco.** FRONT 1946-G, H (all). REAR 1754-N, P (61, 62, 63, 60S), 2008-C, D (67), 2007-N, P (75), 1751-V, W (62 & 75 Comm'l.). Double acting, opposed-piston, hydraulic types.
For complete data, refer to 1941 Mech. Equip. Index.

STEERING:—**Steering Gear**—Saginaw Ball Bearing Worm-and-Nut (Recirculating Ball) type.
For complete data, refer to 1941 Mech. Equip. Index.
Front Suspension:—Independent, linked parallelogram type with coil springs.
For complete data, refer to 1941 Mech. Equip. Index.
NOTE—Specifications below correct with car at curb weight (car unloaded with full gas tank).
Kingpin Inclination—5°51' crosswise (for 0° camber).
Caster—Neg. 1¾° to Neg. 2¾°. Equal within ½°.
Camber—Neg. ⅜° to Pos. ⅜°. Equal within ½°.
Toe In—1/32-3/32" (at rest). Loosen clamp bolts, turn adjusters at outer end of each rod equally.
Steering Geometry (Toe-out on turns)—Outer wheel turned 20°. Inner wheel as follows:

	61, 62, 63, 60S	67, 75, 62 & 75 Comm'l.
Left turn	25°25'	24°7'
Right turn	24°42'	23°6'

BRAKES:—**Service**—Bendix hydraulic, duo-servo, single anchor type without eccentric adjustment. Hand lever applies rear wheel service brakes.
For complete data, refer to 1941 Mech. Equip. Index.
Drums—Centrifuse. Diameter 11.995-12.005".
Lining—Molded. Length 11 17/32" (primary), 12 31/32" (secondary). Width 2¼" (front), 2" (rear 61, 62, 63, 60S), 2½" (rear Others), Thickness 3/16".
Clearance—.015" at both ends of secondary shoe with primary shoe forced out against drum.
Hand Brake:—See Service Brakes above.

TORQUE WRENCH SPECIFICATIONS:—*See Torque Wrench article in Mechanical Equipment Section for tightening specifications for Cylinder Head, Main & Connectng Rod Bolts, etc.*

HOOD LOCK & HOOD ADJUSTMENT:—Alligator type hood with control knob under left side of instrument panel. To open hood, pull out on control knob (hood will raise slightly), reach under front of hood opening, press up on safety catch, lift hood.

Hood Lock Adjustment:—Hood latching lever located beneath grille plate. To adjust, raise hood, loosen lock screw on control cable adjusting sleeve (in hole in grille plate), push dash control knob all the way in, see that latch plate in locked position, move sleeve to contact latch lever, tighten lock screw.

Hood Alignment (at Cowl):—Cowl panel and hinge bracket holes slotted for hood adjustment. To adjust, raise hood, release hood springs, loosen front and rear hinge bracket-to-cowl attaching bolts at each side, close hood. Position hood for proper alignment (while closed). Hold rear end of hood firmly on cowl and tighten rear hinge bracket bolt at each side (inside of cowl). Raise hood, tighten front hinge bracket-to-cowl bracket bolt at each side, connect hinge springs.

(At Radiator Grille)—Clearance between hood nose and top of radiator grille should be 1/16". To adjust, turn hood locking bolt in or out of retainer for correct clearance, tighten lock nut.

FRONT END REMOVAL:—Front Fenders, Radiator, and Grille may be removed as a unit for work on front of engine or for Independent Suspension Unit removal as follows: Raise hood, loosen lockscrew at hood lock control cable adjusting sleeve and disconnect cable. Drain radiator and disconnect upper and lower hose connections. Remove bolts attaching radiator brace rod to top of radiator support. Disconnect headlamp wires from junction block on each side, remove wiring harness from clip at radiator. Remove bolts attaching fenders to body, two fender skirt brace bolts at frame, nuts from 2 bolts attaching radiator support to front cross-member. From under fenders, remove sheet metal screws from lower grille panel reinforcing strips across openings in panel under bumper brackets. Remove front end sheet metal assembly from car.

Radiator Grille Removal:—Raise hood, disconnect hood latch control cable at latch and at clip to rear of latch, remove one grille-to-fender screw at each side on top, working through opening between grille and radiator core remove one bolt and three nuts at each side and center baffle-to-lower baffle bolt, remove grille molding bolt nuts along bottom and at each side (below fenders and lower grille panel). Pull grille assembly off car.

Lower Baffle & Lower Grille Panel Removal:—Remove Radiator Grille (see above). Working from beneath fenders (all bolts and screws under fenders), remove two lower panel-to-fender return flange bolts, two sheet metal screws attaching reinforcing strips across bottom of bumper bracket openings in panel, three lower baffle-to-side baffle sheet metal screws. Remove baffle. Lower baffle and grille panel riveted together and must be removed and installed as an assembly. Use 3/16" x ½" stove bolts when reassembling lower baffle and lower grille panel.

RADIATOR CORE REMOVAL:—To remove radiator core (without disturbing grille), drain radiator, remove lower hose connection, disconnect upper hose. Pull out control knob on dash and raise hood, disconnect front end of radiator brace rods, loosen both sides of brace rod at dash and turn rod up to allow clearance for radiator core. Remove headlamp wiring harness from clip at each top corner of radiator core. Remove 2 core-to-shell bolts at each side, tilt top of core to rear and lift out.

ENGINE REMOVAL:—Drain radiator and cylinder block of all cooling liquid and remove the hood. Remove Fenders, Radiator, and Grille as an assembly (see Front End Removal above). Disconnect generator leads and free wiring loom from support clip, remove battery and starting cables. Disconnect distributor low and high tension leads, take out ignition coil mounting screws, lay coil on cowl. Disconnect gas line at fuel pump, throttle and choke controls at carburetor, and accelerator rod at bellcrank. Disconnect exhaust pipe from manifold. Remove front floor mat and floor plate over transmission, disconnect vacuum and air lines at shift cylinder. Remove front floor mat and body floor cover over transmission. Remove outer half of reactionary metal boot (work under car) by taking out two bolts fastening halves together. On all cars except Cabriolet proceed as follows: Loosen reactionary lever assembly-to-transmission operating shaft clamp bolt, drive assembly from shaft carefully, disconnect selector rod from selector lever by taking out cotter pin in transmission end of rod, remove 3 vacuum cylinder bracket-to-transmission capscrews and move assembly clear of transmission. On Cabriolet only proceed as follows: Disconnect vacuum cylinder piston rod and valve link from reactionary lever system (to prevent upsetting vacuum valve adjustment, replace clevis pin thru piston rod yoke and valve link). Then for all cars continue as follows: Disconnect clutch pedal link and pullback spring. Remove bolts in universal joint ball retainer, slide retainer and ball back on shaft, take out 4 screws holding universal trunnion bearings on front yoke, remove trunnion bearings. Remove 4 bolts from transmission rear support, remove front and side engine mounting bolts, remove bolts in starter cross-shaft. Remove third cylinder head bolt from rear on left side, install engine lifting eye bolt in this bolt hole, attach hoist and lift engine until clear of mountings, pull engine forward and lift to clear front cross-member, then roll chassis back until engine is free. When engine re-installed, adjust mountings, align hood (see above).

ENGINE MOUNTINGS:—Adjustment—Tighten front engine mounting bolts (replace mountings if oil-soaked), tighten rear mounting bolts at transmission (studs must be tight in case), clearance between cross-member and 'U' section plate should be .005-.015" **(limits fore and aft engine movement)**, if clearance excessive, remove mounting and bend plate to obtain correct clearance. Tighten side engine mounting bracket bolts. Take out engine side mounting bolts, check clearance between mounting and bracket at each side, clearance must be 1/16" (if clearance excessive, use ⅜" plain washer to shim for proper clearance, if clearance less than 1/16", loosen bracket bolts and push mounting up or if necessary remove brackets and file holes with round file to give 1/16" clearance). Tension on side mountings must be equal at each side.

HARMONIC BALANCER:—Serviced as complete assembly only (component parts not serviced separately). 1941 balancer cannot be used on earlier cars.

Removal—Remove Front End Assembly as a unit first (see directions above). Use Chevrolet Harmonic Balancer Puller and Driver (consists of puller body, puller screw and pinned driver head), attach puller body to balancer by means of 2 capscrews in two tapped holes in balancer, pull balancer by turning up puller screw.

Installation—Place driver in starting crank jaws of balancer, install puller body (as above), line up keyway in balancer and key in crankshaft, turn puller screw down to contact driver, then use puller screw as driver and drive balancer in place.

MAIN BEARINGS:—Installation—Front intermediate bearing shell marked 'I' in oil groove and must be used in #2 bearing cap. Rear intermediate bearing shell flanged to take crankshaft end thrust. Front intermediate (#2) and Rear intermediate (#3) bearing caps must be installed with mark 'FRONT' (#2 cap) to front, 'REAR' (#3 cap) to the rear.

Line-Boring—Bearings must be line-bored with .008" shims (four .002" shims) under each end of bearing caps. After line-boring, Rear intermediate (#3) bearing must be faced to provide endplay.

Endplay Adjustment—Taken by rear intermediate (#3) bearing. When installing new bearings, this bearing should be machined on front flange just enough to clean up the face of the bearing flange. Then machine rear flange of bearing to obtain endplay of .004-.007" (measure with feeler gauge inserted between rear side of #3 bearing and crankshaft with shaft in extreme rear position.

CRANKSHAFT OIL SEALS:—Rear. Same as 1940. Rear main bearing cap (mounted on four bolts with two locating dowels) with wick type oil seal installed in groove in cap and crankcase used. Seal bears on outer rim of crankshaft flange (oil slinger and check valve in oil return hole in bearing cap have been discontinued). To install new seal in bearing cap, insert packing in groove and roll firmly in place with rounded tool (roll from both ends toward center). Use round block of wood (same diameter as crankshaft flange) to hold packing in place, cut both ends off evenly and flush with bearing cap face. Install upper half of seal in crankcase in same manner with engine out of car.

Front (Timing Gear Cover) Oil Seal—Spring-loaded leather type installed in pocket in timing gear cover. To install new seal, place seal on special Oil Seal Replacer J-995 with free end of leather toward end of tool, seat seal in cover with few light hammer blows on tool. NOTE—Timing gear cover must be centered on crankshaft when installed on engine to prevent balancer damaging oil seal. To install cover, coat seal with grease, install centering guide J-966 on crankshaft, install cover and tighten cover screws.

CAMSHAFT BEARINGS:—Installation. Oil groove extends 70° around bearing from oil hole. To insure proper alignment with oil hole in block, mark front of bore opposite oil hole. Align oil hole in bearing with mark (with groove toward bottom of engine away from oil hole in block), press bearings in, stake in place, and line-ream (see below).

Reaming—Special reamer with four cutters on one bar recommended by car manufacturer (for proper alignment). Insert reamer through #1, #2, and #3 bearings. Start reamer cutters in all four bearings at the same time (wash metal cuttings away with liberal supply of kerosene while reaming), turn reamer slowly until cutters pass through bearings. Remove reamer by rotating in same direction as when reaming bearings and withdraw from engine. Bearing cuttings must be blown out with compressed air. Install camshaft and check bearing clearances with narrow feeler gauge. Clearance should be .002-.004". Install expansion plug to rear of rear bearing.

TIMING GEARS:—Alignment—Timing gear alignment controlled by number of gaskets assembled between Crankcase Front End Plate and Cylinder Block.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

With timing gears and camshaft out of engine, assemble End Plate on cylinder block using two gaskets and hold in place with three screws. Place a new Camshaft Thrust Plate in hole in End Plate. Lay a straightedge across thrust plate and shoulder on crankshaft (for timing gear). Align these two surfaces (add one gasket if straightedge strikes shoulder on crankshaft, remove one gasket if space between straightedge and shoulder). Install screws and bolts in End Plate and set screws with punch. **Gear Installation**—Crankshaft gear made of steel and should be removed and installed with puller and driver. Gear drive fit on end of crankshaft and held in place with a key. Composition camshaft gear must be removed using a removing sleeve (to support gear on hub) in an arbor press. New thrust plate must be used whenever gear removed (plate damaged by gear removal sleeve). Install new thrust plate on camshaft and press gear on shaft with arbor press (support back of front camshaft journal and use hub of gear only as pressing medium). Gear is press fit on shaft (press gear on shaft for Free Fit to .003" maximum clearance for Thrust Plate). Install camshaft in engine with gear punch marks opposite each other. Check timing gear runout with dial indicator (.003" max. crankshaft, .004" max. camshaft). Timing gear backlash .002-.005".

TAPPET CLEARANCE ADJUSTMENT:—Normalizing Engine—Tappet clearance changes while engine is warming up and should be adjusted only after engine has been 'normalized' as follows: Run engine at 600 RPM and check oil temperature with thermometer at overflow pipe on valve rocker shaft connector until no change noted in oil temperature for period of five minutes (oil temperature will become stabilized at some point between 150-225° F.). This normalizing period will be from 5 to 30 minutes depending on engine temp. when started.

VALVE GUIDE INSTALLATION:—Use special valve guide drivers J-1089 (Intake), J-1090 (Exhaust) to install guides. Drivers have stop-collars which correctly position guides so that distance from cylinder head to top of guide is 1 1/16" (Intake), 61/64" (Exhaust). After guides installed, rough ream to inside diameter of .341", then finish ream to .343" diameter.

ROCKER ARMS:—New design rocker arms used. Rocker arms are diamond-bored and 'granodized' (no bushings used) and fit directly on rocker arm shafts. Four different rocker arms used (offset at an angle), **Left Hand Exhaust (marked 1 or 9), Right Hand Exhaust (0 or 2), Left Hand Intake (3 or 5), Right Hand Intake (4 or 6).** Number carried on side of each arm (1, 2, 5, 6 Flint production; 0,3,4,9, Tonawanda production—rocker arms of same type interchangeable regardless of manufacturing plant). Install rocker arms in following order (numbered front to rear), on front shaft: **#1,** L.H. Exhaust (1 or 9); **#2,** R.H. Intake (4 or 6); **#3,** L.H. Intake (3 or 5); **#4,** R.H. Exhaust (0 or 2); **#5,** L.H. Exhaust (1 or 9); **#6,** R.H. Intake (4 or 6); on rear shaft: **#7,** L.H. Intake (3 or 5); **#8,** R.H. Exhaust (0 or 2); **#9,** L.H. Exhaust (1 or 9); **#10,** R.H. Intake (4 or 6); **#11,** L.H. Intake (3 or 5); **#12,** R.H. Exhaust (0 or 2). Rocker arms installed on tubular shafts and held against side of shaft brackets by spring installed on shaft between adjacent rocker arms and locked in position by hairpin spring installed in groove in plugged end of each shaft. Rocker shafts must be removed and installed as an assembly. Shafts should be assembled as follows: Open end of each shaft must be toward the center, stamped steel baffle in open end of rear shaft must be in vertical position, connect shafts by slipping brass oil connector over open end of each shaft.

OIL DISTRIBUTOR:—Distributor located within recess in left side of engine block (under cover plate). Distributor valve mounted on plate which is clamped on block by cover so that entire valve assembly is within engine. Oil Distributor operates in same manner as units used on previous models. CAUTION—Inner and outer gaskets used with valve assembly plate must not be interchanged. **Removal**—To dismantle oil distributor, take out three screws in cover plate, remove cover plate, outer gasket, valve assembly plate, inner gasket. **Assembly**—Install cork gasket with **two center holes** between valve assembly plate and block, and use cork gasket with **center cut out** between valve assembly plate and cover, tighten cover screws.

OIL LEAD TO VALVE ROCKER ARMS:—Installation— New assembly must be used (nipple and pipe assembly Part No. 839186) whenever assembly removed from engine. To install proceed as follows: insert pipe in block, coat threads of nipple with white lead and screw in block (on right side), install nipple and sleeve nut on lower end of pipe (left side of block) and secure in place, then bend pipe in upward loop and connect to oil distributor, bend pipe on right side of engine to clear push rod cover and bend upper end so that it passes through hole in cylinder head, connect pipe to valve rocker shaft coupling. Fill cooling system, run engine and check all connections for oil and water leaks.

CHECKING OILING SYSTEM:—Oil Pan. Oil nozzle height, oil trough height and aiming of oil nozzles should be checked whenever oil pan removed. To check proceed as follows: Remove oil pan gasket. Use Oil Nozzle Depth Gauge J-969-3 to check oil nozzle height for connecting rod dipper clearance. Hook end of gauge over pan rail, position gauge in trough with side marked 'FRONT' toward front of oil pan. Open end of nozzle in trough should clear gauge. Repeat check for all 6 troughs. Use Oil Trough Depth and Connecting Rod Dipper Height Gauge J-696-2 (regular 216.5 cu. in. engine), J-1646 (for Heavy Duty 235.5 cu. in. engine) to check oil trough height. Gauge stem (center bar extending down) should just touch edge of all troughs (with bar resting on oil pan rail). Check oil nozzle aim with Oil Pan Target Gauge J-696-1 (for regular and Heavy Duty Engines). Install gauge and position it with dowels engaging screw holes in oil pan. Install Water Nozzle J-793-3 in main oil line. Tilt oil pan 45° so that nozzles are not covered by water in troughs. Use enough water to just straighten water streams from nozzles. Nozzle streams must hit holes in gauge. Use Oil Nozzle Wrench J-793-2 to adjust nozzles so that each water stream passes through center of its target hole. Recheck oil nozzle height (height may be disturbed when nozzles adjusted).

Connecting Rod Dipper Height—Use Oil Trough Depth & Connector Rod Dipper Height Gauge J-969-2 (regular engine), J-1646 (Heavy Duty 235 cu. in. Engine). Place gauge over connecting rod with two side pins on gauge resting on lower face of crankcase (pan gasket must be removed). End of dipper should just touch face of cross bar on gauge with rod in lowest position. If dipper does not touch gauge, it should be replaced; if dipper interferes with gauge, correct by bending dipper.

REAR SPRING SEATS (ALL PASSENGER CARS):— Bracket welded on front of housing at each spring. Spring seat attached to bracket by means of rubber bushed bolt (spacer sleeve through which bolt passes, used to prevent collapse of bracket when tightening bolts with great deal of pressure). Rubber washers used between bracket and each end of spring seat. Spring seat attached to springs through conventional U-bolts. IMPORTANT—When reassembling spring seat to bracket (when installing rear axle), **eye bolt nut must not be tightened until** all other connections made and car weight resting on all 4 wheels.

REAR SPRING REAR SHACKLE (PASS. CARS):—Two types of rear spring rear shackles used as follows: **Threaded Design**—Same as 1940 type.

Tight Shackle Pin Correction—If shackle pins tight or seized, remove pin and bushing assembly from rear spring hanger, enlarge eye in hanger approximately .005-.010" with a drift, install new pin and bushing assembly.

Rubber-bushed Design—New type used on some 1941 cars. Shackle assembly consists of outer shackle plate with two pins serrated through plate and swaged in place, two split-type synthetic rubber bushings (each bushing consists of two halves with a shoulder on the outer end of each half), an inner shackle plate, and two castellated lock nuts. Rubber bushings extend out ¼" beyond space between two shackle plates when tightened in place. When inner plate bottoms on pin shoulders (by tightening lock nuts) excess rubber (¼" extension) forced into eye and around pins forming a tightly locked joint.

Servicing—Rubber-bushed shackle may be removed by merely raising car to relieve load, removing two lock nuts and inner shackle plate (releasing pressure on bushings) and taking out outer shackle plate with pins, and removing bushings from spring and hanger eyes. Shackle can be installed as follows: Raise car to properly position spring hanger and spring eye for shackle installation, clean bushing holes, bushings (inside and outside), shackle plates and pins, install bushings in spring and hanger eyes with shoulder on each half on outside, install shackle plate with pins (insert pins through bushings with pins extending in toward center of car), install inner shackle plate, tighten lock nuts half way on pins, set car on wheels at curb weight (no load or passengers in car), bounce rear end of car to seat bushings, then without disturbing normal rest position of car, tighten lock nuts on inner shackle until plate bottoms on shoulders of pins. These shackles require no lubrication.

REAR SPRING SEATS (½ TON TRUCKS):—Fitting. Whenever rear spring seats are adjusted, clearance between spring seat and rear axle housing must be checked as follows: Block up rear of car under frame side rails, drop rear of spring by disconnecting spring shackle, take out spring U-bolts, remove spring seats (lower spring cap secured by means of 2 screws). File face of each spring seat half evenly (place in bench vise) until spring seat gives slight drag when placed on housing and rotated. CAUTION—File both halves evenly.

CAB-OVER-ENGINE MODELS

REMOTE CONTROL TYPE GEARSHIFT LEVER:—Removal—Disconnect gearshift lever from top of engine cover, loosen wire on cloth boot, raise boot above transmission cover tower. Remove nut from stub gearshift lever and raise reverse latch Bowden cable support onto top of lever. Use gearshift lever removing tool K-353 to remove lever assembly from transmission cover. When installing lever, see that end of reverse latch shift rod seats in upper part of 'U' shaped bracket at end of reverse latch Bowden cable and that retaining nuts are tight so that rod anchored in bracket.

ENGINE HOOD & RADIATOR GRILLE:—Alligator type hood with dash-controlled hood lock and safety catch. *See Chevrolet Shop Notes for Hood Lock Operation and Adjustment, and Radiator Grille Removal.*

Front End Assembly Removal—Fenders and Radiator Grille may be removed as a unit for access to Front Suspension. *See Chevrolet Shop Notes for data.*

FLEET MODEL NOTE:—Special Economy Engine available for all models. May be identified by special Tune Up Specification Plate on Push Rod Cover listing special settings and Fleet Car Identification Plate on instrument panel to right of the glove compartment. Special carburetor used has stop-pin to limit throttle opening to ½ throttle.

SERIAL NUMBER:—First number 1001 with model prefix as follows: AG (Master Deluxe), AH (Special Deluxe). Stamped on plate on right front floor.

ENGINE NUMBER:—First number AA-1001 (Flint), AC-1001 (Buffalo-Tonawanda). On boss on right side of engine to rear of distributor.

ENGINE SPECIFICATIONS:—6 cylinder, valve-in-head type.

Bore—3½". **Stroke** 3¾".

Displacement—216.5 cu. ins. **Rated HP**—29.4.

Developed Horsepower—90 HP at 3300 RPM (Passenger Cars and Trucks except Cab-Over-Engine), 90 HP at 3100 RPM (Cab-Over-Engine Trucks).

Compression Ratio—6.50-1 Std. cast-iron head.

Compression Pressure—110 lbs. min. at cranking speed (all cylinders equal within 5-10 lbs.).

NOTE—Engine must be at normal operating temperature (idle at 600 RPM for 20 minutes).

Vacuum Reading—Steady 20-22" idling at 450 RPM.

Engine Removal & Engine Mounting Adjustment:—*See Chevrolet Shop Notes for Instructions.*

Cylinder Head Installation:—Use new gasket and install with mark 'This Side Up' upward. Use cylinder head guide pins to align head.

PISTONS:—**Passenger Cars**—Cast-iron, flat head, cam ground, tin plated with slipper type skirt.

Trucks—Same as Pass. Cars except 1½ ozs. heavier and may be identified by a small forged boss on the lower center of each piston pin boss.

Weight—27.15 ozs. (Pass. Car), 28.56 ozs. (Trucks) with bushings installed. **Length**—3¾".

Removal—Pistons and rods removed from above.

Clearance—Top .0147-.0183". Skirt .0017-.0023".

Replacement Pistons:—Finished pistons with bushings and pins fitted furnished Standard and .003", .010", .020", .030", .040" oversize. NOTE—Hone cylinder for .003" oversize, rebore and hone for other sizes (rebore .002" less than piston oversize, finish by honing for piston clearance below). Bore taper and out-of-round must not exceed .001".

Fitting Pistons:—Use feeler gauge between piston and cylinder wall at right angles to pin bosses. Piston should pass through bore with light pressure on .002" feeler and lock on .003" feeler.

PISTON RINGS:—Two compression, one oil control ring per piston, all above pin. Oil ring groove drilled for oil drainage. NOTE—Taper faced compression ring used. Install with side mark 'TOP' upward.

Ring	Width	End Gap①	Side Clearance
Compr.	.1235-.1240"	.005-.015"	.0015-.003"
Oil Cont.	.1860-.1865"	.005-.015"	.002-.0035"

①—Worn end gap limit 1/32" maximum.

Replacement Rings:—Furnished standard size and .005", .010", .020", .030", .040" oversize.

PISTON PIN:—**Diameter**—.8645-.8650". **Length**—3.135-3.165". Pin locked in rod, piston bronze bushed.

Pin Fit in Piston—Thumb push fit (room temp.).

Replacement Pins:—Std. & .003", .005", .010" oversize. NOTE—New pistons fitted with bushings and pins.

CONNECTING ROD:—**Length** 6 13/16". **Weight** 28.3 ozs.

Crankpin Journal Diameters—2.311-2.312".

Lower Bearing—Spun babbitt-lined type.

Clearance—.001-.0025". **Sideplay**—.004-.012" (side clearance between rod and pin bosses .025" min.).

Bearing Adjustment:—Solid shims. Remove shims equally at both sides to secure 'snap fit' (rod tight to hand but should snap from one side to other with light tap of 8 oz. hammer), **then replace one .002" shim for clearance** (if unequal number, place extra shim on camshaft side). Rod should snap from side to side with one hand pressure with proper bearing fit.

Palnut Note—Palnuts used to lock rod bolts. Use new palnut, install with open side toward end of bolt, turn finger tight against rod nut, then tighten ½ turn additional.

Installing Rods:—Numbers on rods and caps must be together and installed in same numbered cylinder with numbers and pin clamp bolt toward camshaft side. Install oil dippers on rods with mouth toward camshaft side of engine. Check dipper heights. *See Chevrolet Shop Notes for Oil Dipper Height data.*

CRANKSHAFT:—4 bearing, 7 integral counterweights. NOTE—Wick-type rear bearing oil seal (no slinger). *See Chevrolet Shop Notes for Crankshaft Front and Rear Oil Seals and Harmonic Balancer servicing data.*

Journal Diameters—#1, 2.6835-2.6845"; #2, 2.7145-2.7155"; #3, 2.7455-2.7465"; #4, 2.7765-2.7775". NOTE—Journal taper or out-of-round limits .001". Run-out limits for #2 and #3 bearings .002".

Bearing Type—Steel-backed, babbitt-lined.

Clearance—.002-.004". *See Chevrolet Shop Notes for Main Bearing Line-boring and Bearing Installation.*

Bearing Adjustment:—Solid shims. Remove shims until slight drag secured when shaft turned by hand, **then replace one .002" shim for clearance** (if unequal number of shims used, place extra shim on same side for all bearings).

End Thrust:—Taken by #3 bearing (adjusted by facing new bearings). **Endplay** .004-.007". *See Chevrolet Shop Notes for Endplay Adjustment.*

CAMSHAFT:—Four bearing. Helical gear drive.

Journal Diameters—#1, 2.0282-2.0292; #2, 1.9657-1.9667"; #3, 1.9032-1.9042"; #4, 1.8407-1.8417". NOTE—Journal out-of-round limits .001". Run-out limits .002" (straighten if excessive).

Bearing Type—Steel-backed, babbitt-lined bushings. *See Chevrolet Shop Notes for Camshaft Bearing installation and line-reaming instructions.*

Clearance—.002-.004".

End Thrust:—Taken by thrust plate behind camshaft gear (gear position controlls endplay). *See Timing Gear installation in Chevrolet Shop Notes for data.*

Endplay—Free fit to .003" maximum.

Timing Gears:—Crankshaft gear Steel. Camshaft gear Bakelite & Fabric. Maximum gear run-out .003" crankshaft, .004" camshaft. *See Chevrolet Shop Notes for Timing Gear installation instructions.*

Backlash—.002-.005".

Camshaft Setting:—Gears punchmarked. Mesh marked tooth of crankshaft gear with marked space between teeth of camshaft gear.

VALVES:—

	Head Diameter	Stem Diameter	Length
Intake	1 41/64"	.3407-.3417"	6 7/32"
Exhaust	1 15/32"	.3397-.3407"	4 55/64"

	Seat Angle	Lift	Stem Clearance
Intake	30°	.2947"	.001-.003"
Exhaust	30°	.3118"	.002-.004"

NOTE—1941 valves not interchangeable with earlier type.

Tappet Clearance:—.006-.008" Int., .013-.015" Exh. Hot (Engine 'normalized'). Use lower figure for ordinery service, higher figure for severe Truck operation.

See Chevrolet Shop Notes for Tappet Adjustment.

Economy Engines—Intake .010", Exhaust .016", Hot.

Valve Guides:—Pressed in head (new types—longer exhaust guide used—guides not interchangeable with earlier types). *See Chevrolet Shop Notes for Valve Guide Installation and Reaming instructions.*

Valve Springs:—Free length 2⅛". When checked with U15 Tester, spring pressure should be 125-133 lbs. at 1½".

	Spring Pressure	Length
Valve Closed	49-56 lbs.	1 13/16"
Valve Open	121-133 lbs.	1½"

NOTE—New umbrella type valve spring cap covers used on Intake Valves only (diverts oil from valve end of rocker arm out over spring, reducing oil on valve stem thereby diminishing oil consumption and exhaust smoke when idling). Install springs with close-coil end toward cylinder head. Use round valve caps on Intake Valves (also covers as noted above), hexagonal caps on Exhaust Valves.

Valve Lifters:—Same as 1940 (pushrod seat brazed on top). **Clearance**—.001" (free fit in guide holes).

Rocker Arm Assembly:—New Armasteel type (no bushing used). 4 different types of arms. *See Chevrolet Shop Notes for Rocker Arm data.*

Valve Timing:—See Camshaft Setting above.

Intake Valves—Open 3° BTDC. Close 35° ALDC.

Exhaust Valves—Open 46° BLDC. Close 5° ATDC.

Valve Timing Check—With .006" tappet clearance #1 intake valve should open with #1 piston 3° or .0032" BTDC with point on flywheel approx. 1.158 teeth before 'U/C' mark aligned with indicator in inspection hole in right front face of housing.

LUBRICATION:—Pressure and positive splash system. *See Chevrolet Shop Notes for Oil Distributor, and Rocker Arm Lead & Overflow Pipe servicing.*

Oil Pump Installation—Assemble ground side of idler gear toward cover. Oil pump assembly mounted in crankcase by tapered setscrew. See that screw seated firmly in tapered hole in pump housing before tightening locknut.

Normal Oil Pressure:—14 lbs. at 21 MPH (Pass. Cars), 14 lbs. at 2000 RPM (Trucks).

Oil Pressure Regulator:—Located on oil pump cover. Opens at 75 lbs. Non-adjustable type. Pressure normally controlled by Oil Distributor Valve on left side of engine which opens at 15 lbs.

Oil Distributor:—*See Chevrolet Shop Notes for data.*

Checking Oiling System:—Should be checked whenever pan removed. *See Chevrolet Shop Notes for data.*

Crankcase Capacity:—5½ qts. dry, 5 qts. refill (All).

COOLING SYSTEM:—**Capacity**—14 qts. (except Cab-Over-Engine), 16½ qts. (Cab-Over Engine). *See Chevrolet Shop Notes for Radiator Core Removal.*

Water Pump:—New two outlet packless type with sealed ball-bearing shaft. NOTE—Pumps not interchangeable with earlier models (same on all 1941 models except for fan).

For complete data, refer to 1941 Mech. Equip. Index.

Thermostat:—Harrison. In cylinder head outlet.

Setting—Starts to open 142°F (Regular), 150°F (Alcohol Anti-freeze), 162°F (Permanent Anti-freeze & Economy Engines). Temperature marked on valve top.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CLUTCH:—Own Make. Diaphragm spring, single plate, dry disc type. NOTE—New clutch driven member (with revised spring cushions), clutch linkage (for proper release of new driven member) and flywheel oil groove (just inside clutch plate driving surface to prevent any excess grease thrown out by clutch pilot bearing from reaching facings) used.

For complete data, refer to 1941 Mech. Equip. Index.

Facings—Woven asbestos, 2 used. Inside Diam. 6⅛". Outside Diam. 9⅛". Thickness .132-.138".

Adjustment:—Pedal free travel ¾-1". To adjust, loosen checknut and turn adjusting nut on connecting link at clutch throwout fork. NOTE—Use finger pressure (not foot) when checking free travel.

Removal:—Remove transmission and flywheel underpan (see Transmission Removal below). Remove throwout bearing from fork, remove fork by prying fork off ball, remove fork mounting (use ¾" wrench). Install Clutch Pilot Tool K-411 (to support clutch), loosen all six cover bolts evenly, remove assembly from below. CAUTION—Do not allow pressure plate to hang on retracting springs (support by hand). When installing clutch align 'X' mark on cover with 'X' mark on flywheel.

TRANSMISSION:—Own Make. All helical gear type. Constant-mesh, synchro-mesh (second and high), sliding gear (low and reverse).

For complete data, refer to 1941 Mech. Equip. Index.

Trannsmission Control:—Remote control, steering column shift, vacuum power type.

For complete data, refer to 1941 Mech. Equip. Index.

Removal (except Cabriolet):—Remove front floor mat and floor cover over transmission. Remove outer half of reactionary lever metal boot (work under car) by taking out two bolts fastening halves together. Loosen 3 vacuum cylinder bracket-to-transmission capscrews and reactionary lever assembly-to-transmission operating shaft clamp bolt. Drive assembly from end of shaft with care. Disconnect selector rod from selector lever after removing cotter pin from transmission end of selector rod. Remove 3 vacuum cylinder bracket-to-transmission capscrews and move assembly (bracket, vacuum cylinder and reactionary levers) away from transmission. Disconnect pull rod and brake cables from brake cross shaft and remove cross-shaft. Disconnect speedometer cable. Remove 4 universal joint ball collar-to-retainer capscrews and slide ball back on propeller shaft housing. Remove 4 capscrews which secure front trunnion bearings to the front yoke. Remove 2 front yoke trunnion bearings and split the joint. Push front end of propeller shaft down for clearance. Remove 4 rear transmission mounting-to-frame cross member bolts. Remove two upper transmission-to-clutch housing capscrews and insert guide pins. Remove clutch underpan and two lower transmission-to-clutch housing capscrews. Slide transmission back and lift out through opening in floor.

Removal (Cabriolet):—Transmission removal on this model differs from regular passenger car removal (above) due to use of special 'VK' frame. Removal procedure for Cabriolet as follows: Remove front floor mat and floor cover over transmission. Remove outer half of reactionary lever metal boot by taking out two bolts fastening halves together. Disconnect selector rod from selector lever after removing cotter pin from transmission end of selector rod. Disconnect gearshift control rod by removing cotter pin, washer and anti-rattle spring from transmission end of rod. Disconnect vacuum cylinder piston rod and valve link from reactionary levers. **To prevent upsetting vacuum valve adjustment, replace clevis pin through piston rod yoke and valve link.** Remove vacuum cylinder from mounting bracket. Disconnect pull rod and brake cables from brake cross-shaft and remove cross-shaft. Disconnect speedometer cable. Remove 4 universal joint ball collar-to-retainer capscrews and slide ball back on propeller shaft housing. Remove 4 capscrews which secure front trunnion bearings to front yoke. Remove 2 front yoke trunnion bearings and split the joint. Push front end of propeller shaft down for clearance. Remove 4 rear transmission mounting-to-frame cross member bolts. Remove two upper transmission-to-clutch housing capscrews and insert guide pins. Remove clutch underpan and two lower transmission-to-clutch housing capscrews. Slide transmission back until clutch shaft just free of driven member, raise rear end sufficient to remove transmission rear mounting (free mounting from transmission and move it forward enabling removal of mounting through opening in frame). Pull transmission back and turn it toward the left as required for sufficient clearance to lift it out through opening in floor.

UNIVERSAL JOINT:—Own Make—Needle bearing 'cross' type. One used.

For complete data, refer to 1941 Mech. Equip. Index.

Service Note—Floating bushings (replacing roller bearings) available for servicing universal joint.

For complete data, refer to 1941 Mechanical Equipment Index, for 'Chevrolet Universal Joint' article.

REAR AXLE:—Own Make. Semi-floating, Hypoid gear type with Torque Tube drive.
